i.MX 6UltraLite Applications Processor Reference Manual

Document Number: IMX6ULRM
Rev. 1, 04/2016

Contents

Section number **Title** **Page**

Chapter 1
Introduction

1.1 About This Document....147

1.1.1 Audience....147

1.1.2 Organization....148

1.1.3 Suggested Reading....148

1.1.3.1 General Information....148

1.1.3.2 Related Documentation....148

1.1.4 Conventions....148

1.1.5 Register Access....150

1.1.5.1 Register Diagram Field Access Type Legend....150

1.1.5.2 Register Macro Usage....151

1.1.6 Signal Conventions....152

1.1.7 Acronyms and Abbreviations....153

1.2 Introduction....155

1.3 Target Applications....156

1.4 Features....156

1.5 Architectural Overview....159

1.5.1 Simplified Block Diagram....159

1.5.2 Architectural Partitioning....160

1.5.3 Endianness Support....162

1.5.4 Memory Interfaces....162

Chapter 2
Memory Maps

2.1 Memory system overview....163

2.2 ARM Platform Memory Map....163

2.3 DMA memory map....168

Chapter 3

Section number Title Page

Interrupts and DMA Events

3.1 Overview....169
3.2 Cortex A7 interrupts....169
3.3 SDMA event mapping....173

Chapter 4
External Signals and Pin Multiplexing

4.1 Overview....177
4.1.1 Muxing Options....177

Chapter 5
Fusemap

5.1 Boot Fusemap....201
5.2 Lock Fusemap....212
5.3 Fusemap Descriptions Table....212

Chapter 6
External Memory Controllers

6.1 Overview....221
6.2 Multi-mode DDR controller (MMDC) overview and feature summary....221
6.3 EIM-PSRAM/NOR Flash controller overview....222
6.3.1 EIM features....222
6.3.2 EIM boot scenarios....223
6.3.3 EIM boot configuration....223
6.3.4 OneNAND requirements....224

Chapter 7
System Debug

7.1 Overview....225
7.2 Chip and ARM Platform Debug Architecture....225
7.2.1 Debug Features....226
7.2.2 Debug System components....226
7.2.2.1 AMBA trace bus (ATB)....227
7.2.2.2 ATB replicator....227

7.2.2.3 Embedded Cross Triggering ... 227
7.2.2.3.1 Cross-Trigger Matrix (CTM) ... 228
7.2.2.3.2 Cross-Trigger Interface (CTI) ... 229
7.2.2.4 Debug Access Port (DAP) ... 229
7.2.3 Chip-Specific SJC Features ... 230
7.2.3.1 JTAG Disable Mode ... 230
7.2.3.2 JTAG ID ... 230
7.2.4 System JTAG Controller - SJC ... 230
7.2.5 System JTAG controller main features ... 231
7.2.6 SJC TAP Port ... 231
7.2.7 SJC main blocks ... 231
7.3 Smart DMA (SDMA) core ... 232
7.3.1 SDMA On Chip Emulation Module (OnCE) Feature Summary ... 232
7.3.1.1 Other SDMA Debug Functionality ... 233
7.3.1.2 SDMA ROM Patching ... 234
7.4 Miscellaneous ... 234
7.4.1 Clock/Reset/Power ... 234
7.5 Supported tools ... 234

Chapter 8
System Boot

8.1 Overview ... 237
8.2 Boot modes ... 238
8.2.1 Boot mode pin settings ... 239
8.2.2 High level boot sequence ... 239
8.2.3 Boot From Fuses Mode (BOOT_MODE[1:0] = 00b) ... 240
8.2.4 Serial Downloader ... 241
8.2.5 Internal Boot Mode (BOOT_MODE[1:0] = 0b10) ... 243
8.2.6 Boot security settings ... 243
8.3 Device Configuration ... 244

8.3.1 Boot eFUSE Descriptions ... 244
8.3.2 GPIO Boot Overrides ... 246
8.3.3 Device Configuration Data (DCD) ... 247
8.4 Device Initialization ... 248
8.4.1 Internal ROM /RAM memory map ... 248
8.4.2 Boot Block Activation ... 249
8.4.3 Clocks at Boot Time ... 249
8.4.4 Enabling MMU and Caches ... 251
8.4.5 Exception Handling ... 252
8.4.6 Interrupt Handling During Boot ... 252
8.4.7 Persistent Bits ... 253
8.5 Boot Devices (Internal Boot) ... 253
8.5.1 NOR Flash/OneNAND using EIM Interface ... 254
8.5.1.1 NOR Flash Boot Operation ... 255
8.5.1.2 OneNAND Flash Boot Operation ... 255
8.5.1.3 IOMUX Configuration for EIM Devices ... 256
8.5.2 NAND Flash ... 257
8.5.2.1 NAND eFUSE Configuration ... 257
8.5.2.2 NAND Flash Boot Flow and Boot Control Blocks (BCB) ... 259
8.5.2.3 Firmware Configuration Block ... 263
8.5.2.4 Discovered Bad Block Table (DBBT) ... 266
8.5.2.5 Bad Block Handling in the ROM ... 266
8.5.2.6 Read Retry Handling in the ROM ... 267
8.5.2.7 Toggle Mode DDR NAND Boot ... 269
8.5.2.7.1 GPMI and BCH Clocks Configuration ... 269
8.5.2.7.2 Setup DMA for DDR Transfers ... 270
8.5.2.7.3 Reconfigure Timing and Speed Using Values in FCB ... 270
8.5.2.8 Typical NAND Page Organization ... 271
8.5.2.8.1 BCH ECC Page Organization ... 271

8.5.2.8.2 Metadata....272
8.5.2.9 IOMUX Configuration for NAND....272
8.5.3 Expansion Device....273
8.5.3.1 Expansion Device eFUSE Configuration....273
8.5.3.2 MMC and eMMC Boot....276
8.5.3.3 SD, eSD and SDXC....285
8.5.3.4 IOMUX Configuration for SD/MMC....285
8.5.3.5 Redundant Boot Support for Expansion Device....286
8.5.4 Serial ROM through SPI....288
8.5.4.1 Serial ROM eFUSE Configuration....288
8.5.4.2 ECSPI Boot....289
8.5.4.2.1 ECSPI IOMUX Pin Configuration....290
8.6 QuadSPI Serial Flash Memory Boot....291
8.6.1 QuadSPI eFUSE Configuration....291
8.6.2 QuadSPI Serial Flash BOOT Operation....291
8.6.3 QuadSPI Configuration Parameters....292
8.6.4 IOMUX Configuration for QSPI Devices....295
8.6.5 QuadSPI boot flow chart....296
8.7 Program image....297
8.7.1 Image Vector Table and Boot Data....297
8.7.1.1 Image Vector Table Structure....298
8.7.1.2 Boot Data Structure....299
8.7.2 Device Configuration Data (DCD)....299
8.7.2.1 Write Data Command....300
8.7.2.2 Check Data Command....302
8.7.2.3 NOP Command....303
8.7.2.4 Unlock Command....304
8.8 Plugin Image....304
8.9 Serial Downloader....305

8.9.1 USB....308
8.9.1.1 USB Configuration Details....308
8.9.1.2 IOMUX Configuration for USB....309
8.9.2 UART....309
8.9.2.1 UART Configuration Details....309
8.9.2.2 UART eFUSE Configuration....309
8.9.2.3 IOMUX Configuration for UART....310
8.9.3 Serial Download protocol....310
8.9.3.1 SDP Command....311
8.9.3.1.1 READ REGISTER....311
8.9.3.1.2 WRITE REGISTER....312
8.9.3.1.3 WRITE_FILE....313
8.9.3.1.4 ERROR_STATUS....314
8.9.3.1.5 DCD WRITE....314
8.9.3.1.6 SKIP_DCD_HEADER....315
8.9.3.1.7 JUMP ADDRESS....316
8.10 Recovery Devices....317
8.11 USB Low Power Boot....317
8.12 SD/MMC Manufacture Mode....319
8.13 High Assurance Boot (HAB)....320
8.13.1 HAB API Vector Table Addresses....322

Chapter 9
Multimedia

9.1 Display and graphics subsystem....323
9.1.1 PiXel Processing Pipeline....324
9.1.2 LCD Interface....324
9.1.3 Parallel CMOS Sensor Interface....324
9.2 Audio subsystem....325
9.2.1 Audio Subsystem Module Overview....326

9.2.2 Medium Quality Sound (MQS)....327
9.2.3 Synchronous Audio Interface (SAI)....327
9.2.4 Sony/Philips Digital Interface (SPDIF)....327
9.2.5 Asynchronous Sample Rate Converter (ASRC)....328

Chapter 10
Clock and Power Management

10.1 Introduction....331
10.2 Device Power Management Architecture Components....331
10.2.1 Centralized components of clock generation and management....332
10.2.2 Centralized components of power generation, distribution and management....333
10.2.3 Reset generation and distribution system....333
10.2.4 Power and clock management framework....333
10.3 Clock Management....334
10.3.1 Centralized components of clock management system....334
10.3.2 Clock generation....336
10.3.2.1 Crystal Oscillator (XTALOSC)....337
10.3.2.2 Low Voltage Differential Signaling (LVDS) I/O ports....337
10.3.2.3 PLLs....337
10.3.2.3.1 General PLL Control and Status Functions....338
10.3.2.4 CCM....340
10.3.2.5 Low Power Clock Gating unit (LPCG)....340
10.3.3 Peripheral components of clock management system....341
10.3.3.1 Interface and functional clock....341
10.3.3.2 Block level clock management....342
10.3.3.2.1 Master clock protocol....342
10.3.3.2.2 Slave clock protocol....343
10.3.3.3 Clock Domain(s)....343
10.3.3.4 Domain level clock management....343
10.3.3.5 Domain dependencies....343

10.4 Power management....344
10.4.1 Centralized Components of Power Management System....344
10.4.1.1 Integrated PMU....345
10.4.1.1.1 Digital LDO Regulators....347
10.4.1.1.2 Analog LDO regulators....348
10.4.1.1.3 USB LDO....348
10.4.1.1.4 SNVS regulator....348
10.4.1.2 GPC - General Power Controller....349
10.4.1.3 SRC - System reset Controller....349
10.4.1.4 Power domain(s)....350
10.4.1.4.1 Power distribution....351
10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating. 352
10.4.1.4.3 Power Gating Domain Management....352
10.4.1.4.3.1 Cortex-A7 Core Platform....353
10.4.1.4.3.2 SOC_PD....353
10.4.1.4.3.3 SoC....354
10.4.1.4.4 Power Gating domain dependencies....354
10.4.1.5 Voltage domains....355
10.4.1.6 Voltage domain management....355
10.4.1.6.1 Dynamic....355
10.4.1.6.1.1 DVFS....355
10.4.1.6.1.2 Voltage Scaling....357
10.4.1.6.2 Static....357
10.4.1.6.2.1 Standby Leakage reduction (SLR)....357
10.4.1.6.2.2 ANALOG PHYs IPs -....357
10.4.1.6.3 Voltage domain dependencies....357
10.4.1.6.4 IO voltage....358
10.4.1.7 System domains layout....358
10.4.2 Power management techniques....360

10.4.2.1 Power saving techniques....361
10.4.2.2 Thermal-aware power management....361
10.4.2.3 Peripheral Power management....362
10.4.2.3.1 Main memory power management....362
10.4.2.3.2 Video-Graphics system power management....363
10.4.2.3.3 IO power reduction....363
10.4.3 Examples of External Power Supply Interface....364
10.5 ONOFF (Button)....366

Chapter 11
System Security

11.1 Overview....369
11.2 Central Security Unit (CSU)....370
11.2.1 CSU Overview....370
11.2.2 CSU Features....370
11.2.3 CSU Functional Description....371
11.2.3.1 CSU Peripheral Access Policy....371
11.3 Cryptographic Acceleration and Assurance Module (CAAM)....372
11.3.1 CAAM Overview....372
11.4 Secure Non-Volatile Storage (SNVS)....373
11.4.1 SNVS Overview....373
11.4.2 Tamper Detection....373
11.5 High Assurance Boot (HAB)....374
11.6 System JTAG Controller (SJC)....375
11.7 Bus Encryption Engine (BEE)....375

Chapter 12
ARM Cortex A7 Platform (CA7)

12.1 Overview....377
12.2 External Signals....378
12.3 Clocks....378

12.4 Platform Configuration..... 378
12.5 Low-Power and Performance..... 379

Chapter 13
Analog-to-Digital Converter (ADC)

13.1 Overview.....381
13.1.1 Features..... 381
13.1.2 ADC I/F block diagram.....382
13.1.3 ADC block diagram..... 382
13.1.4 ADC module interface..... 383
13.1.5 Modes of Operation..... 383
13.2 External Signals..... 383
13.3 Functional Description.....384
13.3.1 Clock Select and Divide Control..... 385
13.3.2 Voltage Reference Selection 386
13.3.3 Hardware Triggering and Channel Selection.....387
13.3.4 Conversion Control..... 388
13.3.4.1 Initiating Conversions..... 388
13.3.4.2 Completing Conversions.....389
13.3.4.3 Aborting Conversions..... 390
13.3.4.4 Power Control..... 391
13.3.4.5 Sample Time and Total Conversion Time..... 391
13.3.4.6 Conversion Time Examples..... 394
13.3.4.6.1 Typical conversion time configuration..... 394
13.3.4.6.2 Long conversion time configuration.....394
13.3.4.6.3 Short conversion time configuration.....395
13.3.4.7 Hardware Average Function..... 395
13.3.5 Automatic Compare Function.....396
13.3.6 Calibration Function..... 397
13.3.7 User Defined Offset Function 398

13.3.8 Temperature Sensor ... 399
13.3.9 MCU Wait Mode Operation ... 399
13.3.10 MCU Stop Mode Operation ... 400
13.3.10.1 Stop Mode With ADACK Disabled ... 400
13.3.10.2 Stop Mode With ADACK Enabled ... 400
13.4 Initialization Information ... 401
13.4.1 ADC Module Initialization Example ... 401
13.4.1.1 Initialization Sequence ... 401
13.4.1.2 Pseudo-Code Example ... 401
13.5 Application Information ... 403
13.5.1 Sources of Error ... 403
13.5.1.1 Sampling Error ... 403
13.5.1.2 Pin Leakage Error ... 403
13.5.1.3 Noise-Induced Errors ... 403
13.5.1.4 Code Width and Quantization Error ... 404
13.5.1.5 Linearity Errors ... 405
13.5.1.6 Code Jitter, Non-Monotonicity, and Missing Codes ... 406
13.6 Memory map and register definition ... 406
13.6.1 Control register for hardware triggers (ADC*x*_HC0) ... 408
13.6.2 Control register for hardware triggers (ADC*x*_HC1) ... 409
13.6.3 Status register for HW triggers (ADC*x*_HS) ... 411
13.6.4 Data result register for HW triggers (ADC*x*_R0) ... 412
13.6.5 Data result register for HW triggers (ADC*x*_R1) ... 413
13.6.6 Configuration register (ADC*x*_CFG) ... 414
13.6.7 General control register (ADC*x*_GC) ... 416
13.6.8 General status register (ADC*x*_GS) ... 418
13.6.9 Compare value register (ADC*x*_CV) ... 419
13.6.10 Offset correction value register (ADC*x*_OFS) ... 420
13.6.11 Calibration value register (ADC*x*_CAL) ... 421

Chapter 14
AHB to IP Bridge (AIPSTZ)

14.1 Overview....423
14.1.1 Features....423
14.2 Clocks....423
14.3 Functional Description....424
14.4 Access Protections....425
14.5 Access Support....425
14.6 Initialization Information....426
14.6.1 Security Block....426
14.7 AIPSTZ Memory Map/Register Definition....427
14.7.1 Master Priviledge Registers (AIPSTZ_MPR)....428
14.7.2 Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR)....431
14.7.3 Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR1)....434
14.7.4 Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR2)....437
14.7.5 Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR3)....440
14.7.6 Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR4)....443

Chapter 15
AHB-to-APBH Bridge with DMA (APBH-Bridge-DMA)

15.1 Overview....445
15.2 Clocks....446
15.3 APBH DMA....447
15.4 NAND Read Status Polling Example....452
15.5 APBH Memory Map/Register Definition....454
15.5.1 AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0*n*)....460
15.5.2 AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1*n*)....461
15.5.3 AHB to APBH Bridge Control and Status Register 2 (APBH_CTRL2*n*)....465
15.5.4 AHB to APBH Bridge Channel Register (APBH_CHANNEL_CTRL*n*)....470
15.5.5 AHB to APBH DMA Device Assignment Register (APBH_DEVSEL)....471

15.5.6 AHB to APBH DMA burst size (APBH_DMA_BURST_SIZE)....472
15.5.7 AHB to APBH DMA Debug Register (APBH_DEBUG)....473
15.5.8 APBH DMA Channel n Current Command Address Register (APBH_CH*n*_CURCMDAR)....474
15.5.9 APBH DMA Channel n Next Command Address Register (APBH_CH*n*_NXTCMDAR)....475
15.5.10 APBH DMA Channel n Command Register (APBH_CH*n*_CMD)....475
15.5.11 APBH DMA Channel n Buffer Address Register (APBH_CH*n*_BAR)....477
15.5.12 APBH DMA Channel n Semaphore Register (APBH_CH*n*_SEMA)....478
15.5.13 AHB to APBH DMA Channel n Debug Information (APBH_CH*n*_DEBUG1)....479
15.5.14 AHB to APBH DMA Channel n Debug Information (APBH_CH*n*_DEBUG2)....482
15.5.15 APBH Bridge Version Register (APBH_VERSION)....483

Chapter 16
Asynchronous Sample Rate Converter (ASRC)

16.1 Overview....485
16.1.1 Features....487
16.1.2 Modes of Operation....488
16.1.2.1 Data Transfer Schemes....488
16.1.2.1.1 Data Input Modes....488
16.1.2.1.2 Data Output Modes....489
16.1.2.2 Word Alignment Supported....490
16.1.2.2.1 Input Data Alignment Modes....491
16.1.2.2.2 Output Data Alignment Modes....491
16.2 Clocks....492
16.3 Interrupts....492
16.4 DMA requests....493
16.5 Functional Description....493
16.5.1 Algorithm Description....493
16.5.1.1 Signal processing flow....493
16.5.1.2 Operation of the Filter....497
16.5.1.2.1 Support of Physical Clocks....497

16.6 Startup Procedure....497
16.7 ASRC Memory Map/Register Definition....502
16.7.1 ASRC Control Register (ASRC_ASRCTR)....504
16.7.2 ASRC Interrupt Enable Register (ASRC_ASRIER)....507
16.7.3 ASRC Channel Number Configuration Register (ASRC_ASRCNCR)....508
16.7.4 ASRC Filter Configuration Status Register (ASRC_ASRCFG)....510
16.7.5 ASRC Clock Source Register (ASRC_ASRCSR)....512
16.7.6 ASRC Clock Divider Register 1 (ASRC_ASRCDR1)....515
16.7.7 ASRC Clock Divider Register 2 (ASRC_ASRCDR2)....516
16.7.8 ASRC Status Register (ASRC_ASRSTR)....518
16.7.9 ASRC Parameter Register n (ASRC_ASRPMn*n*)....521
16.7.10 ASRC ASRC Task Queue FIFO Register 1 (ASRC_ASRTFR1)....522
16.7.11 ASRC Channel Counter Register (ASRC_ASRCCR)....523
16.7.12 ASRC Data Input Register for Pair *x* (ASRC_ASRDI*n*)....524
16.7.13 ASRC Data Output Register for Pair *x* (ASRC_ASRDO*n*)....524
16.7.14 ASRC Ideal Ratio for Pair A-High Part (ASRC_ASRIDRHA)....525
16.7.15 ASRC Ideal Ratio for Pair A -Low Part (ASRC_ASRIDRLA)....526
16.7.16 ASRC Ideal Ratio for Pair B-High Part (ASRC_ASRIDRHB)....526
16.7.17 ASRC Ideal Ratio for Pair B-Low Part (ASRC_ASRIDRLB)....527
16.7.18 ASRC Ideal Ratio for Pair C-High Part (ASRC_ASRIDRHC)....527
16.7.19 ASRC Ideal Ratio for Pair C-Low Part (ASRC_ASRIDRLC)....528
16.7.20 ASRC 76 kHz Period in terms of ASRC processing clock (ASRC_ASR76K)....529
16.7.21 ASRC 56 kHz Period in terms of ASRC processing clock (ASRC_ASR56K)....530
16.7.22 ASRC Misc Control Register for Pair A (ASRC_ASRMCRA)....531
16.7.23 ASRC FIFO Status Register for Pair A (ASRC_ASRFSTA)....533
16.7.24 ASRC Misc Control Register for Pair B (ASRC_ASRMCRB)....534
16.7.25 ASRC FIFO Status Register for Pair B (ASRC_ASRFSTB)....536
16.7.26 ASRC Misc Control Register for Pair C (ASRC_ASRMCRC)....537
16.7.27 ASRC FIFO Status Register for Pair C (ASRC_ASRFSTC)....539

16.7.28 ASRC Misc Control Register 1 for Pair X (ASRC_ASRMCR1*n*)....540

Chapter 17
40-BIT Correcting ECC Accelerator (BCH)

17.1 Overview....543

17.2 Operation....545

17.2.1 BCH Limitations and Assumptions....546

17.2.2 Flash Page Layout....547

17.2.3 Determining the ECC layout for a device....549

17.2.3.1 4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(213)....549

17.2.3.2 4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(213) for data and GF(214) for metadata....550

17.2.4 Data Buffers in System Memory....550

17.3 Memory to Memory (Loopback) Operation....553

17.4 Programming the BCH/GPMI Interfaces....554

17.4.1 BCH Encoding for NAND Writes....555

17.4.1.1 DMA Structure Code Example....557

17.4.1.2 Using the BCH Encoder....562

17.4.2 BCH Decoding for NAND Reads....563

17.4.2.1 DMA Structure Code Example....567

17.4.2.2 Using the Decoder....570

17.4.3 Interrupts....572

17.5 Behavior During Reset....573

17.6 BCH Memory Map/Register Definition....574

17.6.1 Hardware BCH ECC Accelerator Control Register (BCH_CTRL*n*)....578

17.6.2 Hardware ECC Accelerator Status Register 0 (BCH_STATUS0*n*)....580

17.6.3 Hardware ECC Accelerator Mode Register (BCH_MODE*n*)....582

17.6.4 Hardware BCH ECC Loopback Encode Buffer Register (BCH_ENCODEPTR*n*)....583

17.6.5 Hardware BCH ECC Loopback Data Buffer Register (BCH_DATAPTR*n*)....583

17.6.6 Hardware BCH ECC Loopback Metadata Buffer Register (BCH_METAPTR*n*)....584

17.6.7 Hardware ECC Accelerator Layout Select Register (BCH_LAYOUTSELECT*n*)..... 584
17.6.8 Hardware BCH ECC Flash 0 Layout 0 Register (BCH_FLASH0LAYOUT0*n*).....585
17.6.9 Hardware BCH ECC Flash 0 Layout 1 Register (BCH_FLASH0LAYOUT1*n*).....587
17.6.10 Hardware BCH ECC Flash 1 Layout 0 Register (BCH_FLASH1LAYOUT0*n*).....588
17.6.11 Hardware BCH ECC Flash 1 Layout 1 Register (BCH_FLASH1LAYOUT1*n*).....590
17.6.12 Hardware BCH ECC Flash 2 Layout 0 Register (BCH_FLASH2LAYOUT0*n*).....591
17.6.13 Hardware BCH ECC Flash 2 Layout 1 Register (BCH_FLASH2LAYOUT1*n*).....593
17.6.14 Hardware BCH ECC Flash 3 Layout 0 Register (BCH_FLASH3LAYOUT0*n*).....594
17.6.15 Hardware BCH ECC Flash 3 Layout 1 Register (BCH_FLASH3LAYOUT1*n*).....596
17.6.16 Hardware BCH ECC Debug Register0 (BCH_DEBUG0*n*)..... 597
17.6.17 KES Debug Read Register (BCH_DBGKESREAD*n*)..... 599
17.6.18 Chien Search Debug Read Register (BCH_DBGCSFEREAD*n*)..... 600
17.6.19 Syndrome Generator Debug Read Register (BCH_DBGSYNDGENREAD*n*).....600
17.6.20 Bus Master and ECC Controller Debug Read Register (BCH_DBGAHBMREAD*n*).....601
17.6.21 Block Name Register (BCH_BLOCKNAME*n*).....601
17.6.22 BCH Version Register (BCH_VERSION*n*)..... 602
17.6.23 Hardware BCH ECC Debug Register 1 (BCH_DEBUG1*n*)..... 603

Chapter 18
Clock Controller Module (CCM)

18.1 Overview.....605
18.1.1 Features..... 605
18.1.2 CCM Block Diagram..... 606
18.2 External Signals..... 608
18.3 CCM Clock Tree.....608
18.4 System Clocks.....610
18.5 Functional Description.....623
18.5.1 Clock Generation..... 623
18.5.1.1 External Low Frequency Clock - CKIL 623
18.5.1.1.1 CKIL synchronizing to IPG_CLK.....623

18.5.1.2 External High Frequency Clock - CKIH and internal oscillator....623
18.5.1.3 PLL reference clock....623
18.5.1.3.1 ARM PLL....624
18.5.1.3.2 USB PLLs....624
18.5.1.3.3 System PLL....624
18.5.1.3.4 Audio / Video PLL....625
18.5.1.3.5 Ethernet PLL....625
18.5.1.4 Phase Fractional Dividers (PFD)....626
18.5.1.5 CCM internal clock generation....626
18.5.1.5.1 Clock Switcher....626
18.5.1.5.2 PLL bypass procedure....628
18.5.1.5.3 PLL clock change....628
18.5.1.5.4 Clock Root Generator....628
18.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC)....630
18.5.1.5.6 Divider change handshake....630
18.5.1.6 Disabling / Enabling PLLs....630
18.5.1.7 Clock Switching Multiplexers....631
18.5.1.8 Low Power Clock Gating module (LPCG)....632
18.5.1.8.1 MMDC handshake....633
18.5.2 DVFS support....634
18.5.3 Power modes....634
18.5.3.1 RUN mode....634
18.5.3.2 WAIT mode....634
18.5.3.2.1 Entering WAIT mode....634
18.5.3.2.2 Exiting WAIT mode....635
18.5.3.3 STOP mode....635
18.5.3.3.1 Entering STOP mode....635
18.5.3.3.2 Exiting STOP mode....636
18.6 CCM Memory Map/Register Definition....637

18.6.1 CCM Control Register (CCM_CCR)....639
18.6.2 CCM Control Divider Register (CCM_CCDR)....640
18.6.3 CCM Status Register (CCM_CSR)....642
18.6.4 CCM Clock Switcher Register (CCM_CCSR)....643
18.6.5 CCM Arm Clock Root Register (CCM_CACRR)....644
18.6.6 CCM Bus Clock Divider Register (CCM_CBCDR)....645
18.6.7 CCM Bus Clock Multiplexer Register (CCM_CBCMR)....648
18.6.8 CCM Serial Clock Multiplexer Register 1 (CCM_CSCMR1)....650
18.6.9 CCM Serial Clock Multiplexer Register 2 (CCM_CSCMR2)....652
18.6.10 CCM Serial Clock Divider Register 1 (CCM_CSCDR1)....654
18.6.11 CCM SAI1 Clock Divider Register (CCM_CS1CDR)....656
18.6.12 CCM SAI2 Clock Divider Register (CCM_CS2CDR)....657
18.6.13 CCM D1 Clock Divider Register (CCM_CDCDR)....659
18.6.14 CCM HSC Clock Divider Register (CCM_CHSCCDR)....660
18.6.15 CCM Serial Clock Divider Register 2 (CCM_CSCDR2)....662
18.6.16 CCM Serial Clock Divider Register 3 (CCM_CSCDR3)....663
18.6.17 CCM Wakeup Detector Register (CCM_CWDR)....664
18.6.17 CCM Divider Handshake In-Process Register (CCM_CDHIPR)....665
18.6.18 CCM Low Power Control Register (CCM_CLPCR)....668
18.6.19 CCM Interrupt Status Register (CCM_CISR)....670
18.6.20 CCM Interrupt Mask Register (CCM_CIMR)....673
18.6.21 CCM Clock Output Source Register (CCM_CCOSR)....675
18.6.22 CCM General Purpose Register (CCM_CGPR)....677
18.6.23 CCM Clock Gating Register 0 (CCM_CCGR0)....678
18.6.24 CCM Clock Gating Register 1 (CCM_CCGR1)....680
18.6.25 CCM Clock Gating Register 2 (CCM_CCGR2)....682
18.6.26 CCM Clock Gating Register 3 (CCM_CCGR3)....683
18.6.27 CCM Clock Gating Register 4 (CCM_CCGR4)....684
18.6.28 CCM Clock Gating Register 5 (CCM_CCGR5)....686

18.6.29 CCM Clock Gating Register 6 (CCM_CCGR6)....687
18.6.30 CCM Module Enable Overide Register (CCM_CMEOR)....689
18.7 CCM Analog Memory Map/Register Definition....690
18.7.1 Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM*n*)....694
18.7.2 Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1*n*)....696
18.7.3 Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2*n*)....698
18.7.4 Analog System PLL Control Register (CCM_ANALOG_PLL_SYS*n*)....700
18.7.5 528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS)....702
18.7.6 Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM)....702
18.7.7 Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM)....703
18.7.8 Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIO*n*)....704
18.7.9 Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM)....706
18.7.10 Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM)....707
18.7.11 Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEO*n*)....708
18.7.12 Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM)....710
18.7.13 Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM)....711
18.7.14 Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENET*n*)....712
18.7.15 480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480*n*)....714
18.7.16 528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528*n*)....716
18.7.17 Miscellaneous Register 0 (CCM_ANALOG_MISC0*n*)....719
18.7.18 Miscellaneous Register 1 (CCM_ANALOG_MISC1*n*)....723
18.7.19 Miscellaneous Register 2 (CCM_ANALOG_MISC2*n*)....726

Chapter 19
CMOS Sensor Interface (CSI)

19.1 Overview....731
19.2 External Signals....732

19.3 Clocks ... 734
19.4 Principles of Operation ... 734
19.4.1 Data Transfer with the Embedded DMA Controllers ... 736
19.4.2 Gated Clock Mode ... 737
19.4.3 Non-Gated Clock Mode ... 737
19.4.4 CCIR656 Interlace Mode ... 738
19.4.5 CCIR656 Progressive Mode ... 741
19.4.6 Error Correction for CCIR656 Coding ... 741
19.5 Interrupt Generation ... 742
19.5.1 Start Of Frame Interrupt (SOF_INT) ... 742
19.5.2 End Of Frame Interrupt (EOF_INT) ... 742
19.5.3 Change Of Field Interrupt (COF_INT) ... 742
19.5.4 CCIR Error Interrupt (ECC_INT) ... 743
19.5.5 RxFIFO Full Interrupt (RxFF_INT) ... 743
19.5.6 Statistic FIFO Full Interrupt (STATFF_INT) ... 743
19.5.7 RxFIFO Overrun Interrupt (RFF_OR_INT) ... 743
19.5.8 Statistic FIFO Overrun Interrupt (SFF_OR_INT) ... 743
19.5.9 Frame Buffer1 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB1) ... 744
19.5.10 Frame Buffer2 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB2) ... 744
19.5.11 Statistic FIFO DMA Transfer Done Interrupt (DMA_TSF_DONE_SFF) ... 744
19.5.12 AHB Bus Response Error Interrupt (HRESP_ERR_INT) ... 744
19.5.13 DMA Field 0 Transfer Done Interrupt (DMA_FIELD0_DONE) ... 744
19.5.14 DMA Field 1 Transfer Done Interrupt (DMA_FIELD1_DONE) ... 744
19.5.15 Base Address Change Error Interrupt (BASEADDR_CHANGE_ERROR) ... 745
19.6 Data Packing Style ... 745
19.6.1 RX FIFO Path ... 746
19.6.1.1 Bayer Data ... 746
19.6.1.2 RGB565 Data ... 746
19.6.1.3 RGB888 Data ... 747

19.6.2 STAT FIFO Path....749
19.7 CSI Memory Map/Register Definition....749
19.7.1 CSI Control Register 1 (CSI_CSICR1)....751
19.7.2 CSI Control Register 2 (CSI_CSICR2)....755
19.7.3 CSI Control Register 3 (CSI_CSICR3)....757
19.7.4 CSI Statistic FIFO Register (CSI_CSISTATFIFO)....759
19.7.5 CSI RX FIFO Register (CSI_CSIRFIFO)....760
19.7.6 CSI RX Count Register (CSI_CSIRXCNT)....760
19.7.7 CSI Status Register (CSI_CSISR)....761
19.7.8 CSI DMA Start Address Register - for STATFIFO (CSI_CSIDMASA_STATFIFO)....764
19.7.9 CSI DMA Transfer Size Register - for STATFIFO (CSI_CSIDMATS_STATFIFO)....764
19.7.10 CSI DMA Start Address Register - for Frame Buffer1 (CSI_CSIDMASA_FB1)....765
19.7.11 CSI DMA Transfer Size Register - for Frame Buffer2 (CSI_CSIDMASA_FB2)....766
19.7.12 CSI Frame Buffer Parameter Register (CSI_CSIFBUF_PARA)....766
19.7.13 CSI Image Parameter Register (CSI_CSIIMAG_PARA)....767
19.7.14 CSI Control Register 18 (CSI_CSICR18)....768
19.7.15 CSI Control Register 19 (CSI_CSICR19)....770

Chapter 20
Enhanced Configurable SPI (ECSPI)

20.1 Overview....771
20.1.1 Features....772
20.1.2 Modes and Operations....772
20.2 External Signals....773
20.3 Clocks....774
20.4 Functional Description....774
20.4.1 Master Mode....775
20.4.2 Slave Mode....775
20.4.3 Low Power Modes....775
20.4.4 Operations....775

20.4.4.1 Typical Master Mode....775
20.4.4.1.1 Master Mode with SPI_RDY....776
20.4.4.1.2 Master Mode with Wait States....778
20.4.4.1.3 Master Mode with SS_CTL[3:0] Control....778
20.4.4.1.4 Master Mode with Phase Control....779
20.4.4.2 Typical Slave Mode....780
20.4.5 Reset....781
20.4.6 Interrupts....781
20.4.7 DMA....782
20.4.8 Byte Order....783
20.5 Initialization....784
20.6 Applications....784
20.7 ECSPI Memory Map/Register Definition....785
20.7.1 Receive Data Register (ECSPI*x*_RXDATA)....787
20.7.2 Transmit Data Register (ECSPI*x*_TXDATA)....788
20.7.3 Control Register (ECSPI*x*_CONREG)....788
20.7.4 Config Register (ECSPI*x*_CONFIGREG)....791
20.7.5 Interrupt Control Register (ECSPI*x*_INTREG)....793
20.7.6 DMA Control Register (ECSPI*x*_DMAREG)....794
20.7.7 Status Register (ECSPI*x*_STATREG)....796
20.7.8 Sample Period Control Register (ECSPI*x*_PERIODREG)....797
20.7.9 Test Control Register (ECSPI*x*_TESTREG)....799
20.7.10 Message Data Register (ECSPI*x*_MSGDATA)....800

Chapter 21
External Interface Module (EIM)

21.1 Overview....801
21.1.1 Features....803
21.1.2 Modes of Operation....803
21.1.2.1 Asynchronous Mode....804

21.1.2.2 Asynchronous Page Read Mode 804
21.1.2.3 Multiplexed Address/Data Mode 804
21.1.2.4 Burst Clock Mode 805
21.1.2.5 Low Power Modes 805
21.1.2.6 Boot Mode 806
21.2 External Signals 806
21.2.1 Other Important Block I/O Signals Internal to the SoC 806
21.3 Clocks 806
21.4 Chip Select Memory Map 807
21.5 Functional Description 807
21.5.1 Bus Sizing Configuration 808
21.5.1.1 8 BIT PORT SUPPORT 808
21.5.1.1.1 MOTOROLA 68000 808
21.5.1.1.2 INTEL 386 808
21.5.2 EIM Operational Modes 809
21.5.3 Burst Mode (Synchronous) Memory Operation 809
21.5.4 Burst Clock Divisor (BCD) 810
21.5.5 Burst Clock Start (BCS) 811
21.5.6 Multiplexed Address/Data Mode Support 811
21.5.7 Mixed Master/Memory Burst Modes Support 811
21.5.8 AXI (Master) Bus Cycles Support 812
21.5.9 WAIT_B Signal, RWSC and WWSC bit fields Usage 814
21.5.10 IPS Register Interface 814
21.5.11 MRS Set for PSRAM 815
21.5.12 EIM Access Termination 815
21.5.13 Error Conditions 815
21.5.14 DTACK Mode 816
21.5.15 EIM_GRANT / EIM_BUSY Handshake Description 816
21.5.16 LPMD / LPACK Handshake Description 817

21.5.17 Endianness ... 817
21.5.18 Strobe Signal Use ... 818
21.6 Initialization Information ... 819
21.6.1 Booting from EIM ... 819
21.7 Typical Application ... 819
21.7.1 Access to Intel Sibley Flash ... 820
21.7.1.1 Intel Sibley Flash Asynchronous Mode Configuration ... 820
21.7.1.2 Intel Sibley Flash Synchronous Mode Configuration ... 820
21.7.1.3 Intel Sibley Flash Utility ... 820
21.7.2 Access to MDOC Device ... 821
21.7.2.1 MDOC Device Boot ... 821
21.7.2.2 MDOC Device Asynchronous Mode Configuration ... 821
21.7.2.3 MDOC Device Utility ... 821
21.7.3 Access to Micron PSRAM ... 821
21.7.3.1 Micron PSRAM Asynchronous Mode Configuration ... 822
21.7.3.2 Micron PSRAM Synchronous Mode Configuration ... 822
21.7.4 Access to Samsung OneNAND ... 822
21.7.4.1 Samsung OneNAND Boot ... 822
21.7.4.2 Samsung OneNAND Asynchronous Mode Configuration ... 823
21.7.4.3 Samsung OneNAND Synchronous Mode Configuration ... 823
21.7.4.4 Samsung OneNAND Utility ... 823
21.7.5 Access to Samsung UtRAM ... 824
21.7.5.1 Samsung UtRAM Asynchronous Mode Configuration ... 824
21.7.5.2 Samsung UtRAM Synchronous Mode Configuration ... 824
21.7.6 Access to Spansion Flash ... 824
21.7.6.1 Spansion Flash Asynchronous Mode Configuration ... 824
21.7.6.2 Spansion Flash Synchronous Mode Configuration ... 825
21.7.6.3 Spansion Flash Utility ... 825
21.7.7 8 bit support ... 826

21.8 External Bus Timing Diagrams ... 827
21.8.1 Asynchronous Read Memory Accesses Timing Diagram ... 827
21.8.2 Asynchronous Write Memory Accesses Timing Diagram ... 828
21.8.3 Asynchronous Read/Write Memory Accesses Timing Diagram ... 829
21.8.4 Asynchronous Read/Write Using RAL, WAL and CSREC ... 831
21.8.5 Consecutive Asynchronous Write Memory Accesses Timing Diagram ... 832
21.8.6 Consecutive Asynchronous Read Memory Accesses Timing Diagram ... 835
21.8.7 Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=0 ... 837
21.8.8 Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=1 ... 838
21.8.9 Burst (Synchronous Mode) Write Memory Access Timing - BCD=1 ... 839
21.8.10 Asynchronous Page Mode Access ... 841
21.8.11 DTACK Mode - AXI Single Access ... 841
21.8.12 DTACK Mode - AXI Single Write Access ... 844
21.8.13 DTACK Mode - AXI Burst Access ... 845
21.9 EIM Memory Map/Register Definition ... 846
21.9.1 Chip Select n General Configuration Register 1 (EIM_CS*n*GCR1) ... 849
21.9.2 Chip Select n General Configuration Register 2 (EIM_CS*n*GCR2) ... 853
21.9.3 Chip Select n Read Configuration Register 1 (EIM_CS*n*RCR1) ... 854
21.9.4 Chip Select n Read Configuration Register 2 (EIM_CS*n*RCR2) ... 857
21.9.5 Chip Select n Write Configuration Register 1 (EIM_CS*n*WCR1) ... 858
21.9.6 Chip Select n Write Configuration Register 2 (EIM_CS*n*WCR2) ... 861
21.9.7 EIM Configuration Register (EIM_WCR) ... 862

Chapter 22
10/100-Mbps Ethernet MAC (ENET)

22.1 Introduction ... 865
22.2 Overview ... 865
22.2.1 Features ... 866
22.2.1.1 Ethernet MAC features ... 866
22.2.1.2 IP protocol performance optimization features ... 867

22.2.1.3 IEEE 1588 features ... 868
22.2.2 Block diagram ... 868
22.3 External Signals ... 869
22.4 Clocks ... 878
22.5 Memory map/register definition ... 879
22.5.1 Interrupt Event Register (ENET*x*_EIR) ... 888
22.5.2 Interrupt Mask Register (ENET*x*_EIMR) ... 891
22.5.3 Receive Descriptor Active Register (ENET*x*_RDAR) ... 894
22.5.4 Transmit Descriptor Active Register (ENET*x*_TDAR) ... 894
22.5.5 Ethernet Control Register (ENET*x*_ECR) ... 896
22.5.6 MII Management Frame Register (ENET*x*_MMFR) ... 898
22.5.7 MII Speed Control Register (ENET*x*_MSCR) ... 898
22.5.8 MIB Control Register (ENET*x*_MIBC) ... 901
22.5.9 Receive Control Register (ENET*x*_RCR) ... 902
22.5.10 Transmit Control Register (ENET*x*_TCR) ... 905
22.5.11 Physical Address Lower Register (ENET*x*_PALR) ... 907
22.5.12 Physical Address Upper Register (ENET*x*_PAUR) ... 907
22.5.13 Opcode/Pause Duration Register (ENET*x*_OPD) ... 908
22.5.14 Transmit Interrupt Coalescing Register (ENET*x*_TXIC) ... 908
22.5.15 Receive Interrupt Coalescing Register (ENET*x*_RXIC) ... 909
22.5.16 Descriptor Individual Upper Address Register (ENET*x*_IAUR) ... 910
22.5.17 Descriptor Individual Lower Address Register (ENET*x*_IALR) ... 911
22.5.18 Descriptor Group Upper Address Register (ENET*x*_GAUR) ... 911
22.5.19 Descriptor Group Lower Address Register (ENET*x*_GALR) ... 912
22.5.20 Transmit FIFO Watermark Register (ENET*x*_TFWR) ... 912
22.5.21 Receive Descriptor Ring Start Register (ENET*x*_RDSR) ... 913
22.5.22 Transmit Buffer Descriptor Ring Start Register (ENET*x*_TDSR) ... 914
22.5.23 Maximum Receive Buffer Size Register (ENET*x*_MRBR) ... 915
22.5.24 Receive FIFO Section Full Threshold (ENET*x*_RSFL) ... 916

22.5.25 Receive FIFO Section Empty Threshold (ENETx_RSEM)....916
22.5.26 Receive FIFO Almost Empty Threshold (ENETx_RAEM)....917
22.5.27 Receive FIFO Almost Full Threshold (ENETx_RAFL)....917
22.5.28 Transmit FIFO Section Empty Threshold (ENETx_TSEM)....918
22.5.29 Transmit FIFO Almost Empty Threshold (ENETx_TAEM)....918
22.5.30 Transmit FIFO Almost Full Threshold (ENETx_TAFL)....919
22.5.31 Transmit Inter-Packet Gap (ENETx_TIPG)....919
22.5.32 Frame Truncation Length (ENETx_FTRL)....920
22.5.33 Transmit Accelerator Function Configuration (ENETx_TACC)....920
22.5.34 Receive Accelerator Function Configuration (ENETx_RACC)....921
22.5.35 Reserved Statistic Register (ENETx_RMON_T_DROP)....922
22.5.36 Tx Packet Count Statistic Register (ENETx_RMON_T_PACKETS)....923
22.5.37 Tx Broadcast Packets Statistic Register (ENETx_RMON_T_BC_PKT)....923
22.5.38 Tx Multicast Packets Statistic Register (ENETx_RMON_T_MC_PKT)....924
22.5.39 Tx Packets with CRC/Align Error Statistic Register (ENETx_RMON_T_CRC_ALIGN)....924
22.5.40 Tx Packets Less Than Bytes and Good CRC Statistic Register (ENETx_RMON_T_UNDERSIZE)....924
22.5.41 Tx Packets GT MAX_FL bytes and Good CRC Statistic Register (ENETx_RMON_T_OVERSIZE)....925
22.5.42 Tx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENETx_RMON_T_FRAG)....925
22.5.43 Tx Packets Greater Than MAX_FL bytes and Bad CRC Statistic Register (ENETx_RMON_T_JAB)....926
22.5.44 Tx Collision Count Statistic Register (ENETx_RMON_T_COL)....926
22.5.45 Tx 64-Byte Packets Statistic Register (ENETx_RMON_T_P64)....927
22.5.46 Tx 65- to 127-byte Packets Statistic Register (ENETx_RMON_T_P65TO127)....927
22.5.47 Tx 128- to 255-byte Packets Statistic Register (ENETx_RMON_T_P128TO255)....928
22.5.48 Tx 256- to 511-byte Packets Statistic Register (ENETx_RMON_T_P256TO511)....928
22.5.49 Tx 512- to 1023-byte Packets Statistic Register (ENETx_RMON_T_P512TO1023)....929
22.5.50 Tx 1024- to 2047-byte Packets Statistic Register (ENETx_RMON_T_P1024TO2047)....929
22.5.51 Tx Packets Greater Than 2048 Bytes Statistic Register (ENETx_RMON_T_P_GTE2048)....930
22.5.52 Tx Octets Statistic Register (ENETx_RMON_T_OCTETS)....930
22.5.53 Reserved Statistic Register (ENETx_IEEE_T_DROP)....930

22.5.54 Frames Transmitted OK Statistic Register (ENET*x*_IEEE_T_FRAME_OK)..... 931
22.5.55 Frames Transmitted with Single Collision Statistic Register (ENET*x*_IEEE_T_1COL).....931
22.5.56 Frames Transmitted with Multiple Collisions Statistic Register (ENET*x*_IEEE_T_MCOL)..... 932
22.5.57 Frames Transmitted after Deferral Delay Statistic Register (ENET*x*_IEEE_T_DEF).....932
22.5.58 Frames Transmitted with Late Collision Statistic Register (ENET*x*_IEEE_T_LCOL)..... 932
22.5.59 Frames Transmitted with Excessive Collisions Statistic Register (ENET*x*_IEEE_T_EXCOL).....933
22.5.60 Frames Transmitted with Tx FIFO Underrun Statistic Register (ENET*x*_IEEE_T_MACERR)..... 933
22.5.61 Frames Transmitted with Carrier Sense Error Statistic Register (ENET*x*_IEEE_T_CSERR).....934
22.5.62 Reserved Statistic Register (ENET*x*_IEEE_T_SQE)..... 934
22.5.63 Flow Control Pause Frames Transmitted Statistic Register (ENET*x*_IEEE_T_FDXFC).....934
22.5.64 Octet Count for Frames Transmitted w/o Error Statistic Register (ENET*x*_IEEE_T_OCTETS_OK)..... 935
22.5.65 Rx Packet Count Statistic Register (ENET*x*_RMON_R_PACKETS)..... 935
22.5.66 Rx Broadcast Packets Statistic Register (ENET*x*_RMON_R_BC_PKT)..... 936
22.5.67 Rx Multicast Packets Statistic Register (ENET*x*_RMON_R_MC_PKT)..... 936
22.5.68 Rx Packets with CRC/Align Error Statistic Register (ENET*x*_RMON_R_CRC_ALIGN)..... 936
22.5.69 Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENET*x*_RMON_R_UNDERSIZE)..... 937
22.5.70 Rx Packets Greater Than MAX_FL and Good CRC Statistic Register (ENET*x*_RMON_R_OVERSIZE)..... 937
22.5.71 Rx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET*x*_RMON_R_FRAG).....938
22.5.72 Rx Packets Greater Than MAX_FL Bytes and Bad CRC Statistic Register (ENET*x*_RMON_R_JAB)..938
22.5.73 Reserved Statistic Register (ENET*x*_RMON_R_RESVD_0)..... 938
22.5.74 Rx 64-Byte Packets Statistic Register (ENET*x*_RMON_R_P64)..... 939
22.5.75 Rx 65- to 127-Byte Packets Statistic Register (ENET*x*_RMON_R_P65TO127)..... 939
22.5.76 Rx 128- to 255-Byte Packets Statistic Register (ENET*x*_RMON_R_P128TO255)..... 940
22.5.77 Rx 256- to 511-Byte Packets Statistic Register (ENET*x*_RMON_R_P256TO511)..... 940
22.5.78 Rx 512- to 1023-Byte Packets Statistic Register (ENET*x*_RMON_R_P512TO1023)..... 940
22.5.79 Rx 1024- to 2047-Byte Packets Statistic Register (ENET*x*_RMON_R_P1024TO2047)..... 941
22.5.80 Rx Packets Greater than 2048 Bytes Statistic Register (ENET*x*_RMON_R_P_GTE2048)..... 941

22.5.81 Rx Octets Statistic Register (ENET*x*_RMON_R_OCTETS)..... 942
22.5.82 Frames not Counted Correctly Statistic Register (ENET*x*_IEEE_R_DROP)..... 942
22.5.83 Frames Received OK Statistic Register (ENET*x*_IEEE_R_FRAME_OK)..... 942
22.5.84 Frames Received with CRC Error Statistic Register (ENET*x*_IEEE_R_CRC)..... 943
22.5.85 Frames Received with Alignment Error Statistic Register (ENET*x*_IEEE_R_ALIGN).....943
22.5.86 Receive FIFO Overflow Count Statistic Register (ENET*x*_IEEE_R_MACERR).....944
22.5.87 Flow Control Pause Frames Received Statistic Register (ENET*x*_IEEE_R_FDXFC)..... 944
22.5.88 Octet Count for Frames Received without Error Statistic Register (ENET*x*_IEEE_R_OCTETS_OK)... 944
22.5.89 Adjustable Timer Control Register (ENET*x*_ATCR).....945
22.5.90 Timer Value Register (ENET*x*_ATVR)..... 947
22.5.91 Timer Offset Register (ENET*x*_ATOFF)..... 947
22.5.92 Timer Period Register (ENET*x*_ATPER).....947
22.5.93 Timer Correction Register (ENET*x*_ATCOR)..... 948
22.5.94 Time-Stamping Clock Period Register (ENET*x*_ATINC)..... 948
22.5.95 Timestamp of Last Transmitted Frame (ENET*x*_ATSTMP)..... 949
22.5.96 Timer Global Status Register (ENET*x*_TGSR).....949
22.5.97 Timer Control Status Register (ENET*x*_TCSR*n*).....950
22.5.98 Timer Compare Capture Register (ENET*x*_TCCR*n*)..... 952
22.6 Functional description.....952
22.6.1 Ethernet MAC frame formats..... 952
22.6.1.1 Pause Frames.....954
22.6.1.2 Magic packets..... 955
22.6.2 IP and higher layers frame format.....955
22.6.2.1 Ethernet types.....955
22.6.2.2 IPv4 datagram format.....956
22.6.2.3 IPv6 datagram format.....957
22.6.2.4 Internet Control Message Protocol (ICMP) datagram format..... 958
22.6.2.5 User Datagram Protocol (UDP) datagram format.....958
22.6.2.6 TCP datagram format.....959

22.6.3 IEEE 1588 message formats ... 960
22.6.3.1 Transport encapsulation ... 960
22.6.3.1.1 UDP/IP ... 960
22.6.3.1.2 Native Ethernet (PTPv2) ... 960
22.6.3.2 PTP header ... 961
22.6.3.2.1 PTPv1 header ... 961
22.6.3.2.2 PTPv2 header ... 962
22.6.4 MAC receive ... 963
22.6.4.1 Collision detection in half-duplex mode ... 964
22.6.4.2 Preamble processing ... 964
22.6.4.3 MAC address check ... 965
22.6.4.3.1 Unicast address check ... 965
22.6.4.3.2 Multicast and unicast address resolution ... 965
22.6.4.3.3 Broadcast address reject ... 966
22.6.4.3.4 Miss-bit implementation ... 966
22.6.4.4 Frame length/type verification: payload length check ... 967
22.6.4.5 Frame length/type verification: frame length check ... 967
22.6.4.6 VLAN frames processing ... 967
22.6.4.7 Pause frame termination ... 968
22.6.4.8 CRC check ... 968
22.6.4.9 Frame padding removal ... 968
22.6.5 MAC transmit ... 969
22.6.5.1 Frame payload padding ... 970
22.6.5.2 MAC address insertion ... 970
22.6.5.3 CRC-32 generation ... 970
22.6.5.4 Inter-packet gap (IPG) ... 971
22.6.5.5 Collision detection and handling — half-duplex operation only ... 971
22.6.6 Full-duplex flow control operation ... 973
22.6.6.1 Remote device congestion ... 973

22.6.6.2 Local device/FIFO congestion....974
22.6.7 Magic packet detection....975
22.6.7.1 Sleep mode....975
22.6.7.2 Magic packet detection....975
22.6.7.3 Wakeup....975
22.6.8 IP accelerator functions....976
22.6.8.1 Checksum calculation....976
22.6.8.2 Additional padding processing....977
22.6.8.3 32-bit Ethernet payload alignment....977
22.6.8.3.1 Receive processing....978
22.6.8.3.2 Transmit processing....978
22.6.8.4 Received frame discard....978
22.6.8.5 IPv4 fragments....979
22.6.8.6 IPv6 support....979
22.6.8.6.1 Receive processing....979
22.6.8.6.2 Transmit processing....980
22.6.9 Resets and stop controls....980
22.6.9.1 Hardware reset....980
22.6.9.2 Soft reset....980
22.6.9.3 Hardware freeze....981
22.6.9.4 Graceful stop....981
22.6.9.4.1 Graceful transmit stop (GTS)....982
22.6.9.4.2 Graceful receive stop (GRS)....982
22.6.9.4.3 Graceful stop interrupt (GRA)....983
22.6.10 IEEE 1588 functions....983
22.6.10.1 Adjustable timer module....984
22.6.10.1.1 Adjustable timer implementation....984
22.6.10.2 Transmit timestamping....986
22.6.10.3 Receive timestamping....986

22.6.10.4 Time synchronization....986
22.6.10.5 Input Capture and Output Compare....987
22.6.10.5.1 Input capture....987
22.6.10.5.2 Output compare....987
22.6.10.5.3 DMA requests....987
22.6.11 FIFO thresholds....987
22.6.11.1 Receive FIFO....988
22.6.11.2 Transmit FIFO....989
22.6.12 Loopback options....990
22.6.13 Legacy buffer descriptors....991
22.6.13.1 Legacy receive buffer descriptor....991
22.6.13.2 Legacy transmit buffer descriptor....991
22.6.14 Enhanced buffer descriptors....992
22.6.14.1 Enhanced receive buffer descriptor....992
22.6.14.2 Enhanced transmit buffer descriptor....996
22.6.15 Client FIFO application interface....998
22.6.15.1 Data structure description....999
22.6.15.2 Data structure examples....1000
22.6.15.3 Frame status....1001
22.6.16 FIFO protection....1001
22.6.16.1 Transmit FIFO underflow....1002
22.6.16.2 Transmit FIFO overflow....1002
22.6.16.3 Receive FIFO overflow....1003
22.6.17 PHY management interface....1004
22.6.17.1 MDIO clause 22 frame format....1004
22.6.17.2 MDIO clause 45 frame format....1005
22.6.17.3 MDIO clock generation....1006
22.6.17.4 MDIO operation....1006
22.6.18 Ethernet interfaces....1007

22.6.18.1 RMII interface....1007
22.6.18.2 MII Interface — transmit....1008
22.6.18.2.1 Transmit with collision — half-duplex....1009
22.6.18.3 MII interface — receive....1010
22.6.19 Interrupt coalescence....1011
22.6.19.1 Interrupt coalescence setup....1011
22.6.19.2 Updating the frame count threshold on-the-fly....1012
22.6.19.3 Updating the timer threshold on-the-fly....1012

Chapter 23
Enhanced Periodic Interrupt Timer (EPIT)

23.1 Overview....1013
23.1.1 EPIT features....1013
23.1.2 EPIT modes and operations....1014
23.2 External signals....1014
23.3 Clocks....1014
23.4 Functional Description....1016
23.4.1 Operating modes....1016
23.4.1.1 Operating in set-and-forget mode....1016
23.4.1.2 Operating in free-running mode....1016
23.4.2 Operations....1017
23.4.3 Compare Event....1017
23.4.3.1 Counter Value Overwrite....1018
23.4.3.2 Low-Power Mode Behavior....1019
23.4.3.3 Debug Mode Behavior....1019
23.5 Initialization/ Application Information....1019
23.5.1 Change of Clock Source....1019
23.6 EPIT Memory Map/Register Definition....1020
23.6.1 Control register (EPIT*x*_CR)....1020
23.6.2 Status register (EPIT*x*_SR)....1023

23.6.3 Load register (EPIT*x*_LR)..... 1023
23.6.4 Compare register (EPIT*x*_CMPR)..... 1024
23.6.5 Counter register (EPIT*x*_CNR)..... 1024

Chapter 24
Flexible Controller Area Network (FLEXCAN)

24.1 Overview..... 1025
24.1.1 Block Diagram..... 1025
24.1.2 FLEXCAN Module Features..... 1027
24.1.3 Modes of Operation..... 1028
24.2 External Signals..... 1029
24.3 Clocks..... 1030
24.4 Message Buffer Structure..... 1030
24.5 Rx FIFO Structure..... 1034
24.6 Functional Description..... 1038
24.6.1 Functional Overview..... 1038
24.6.2 Transmit Process..... 1038
24.6.3 Arbitration process..... 1039
24.6.3.1 Lowest Mailbox number first..... 1040
24.6.3.2 Highest Mailbox priority first..... 1040
24.6.3.2.1 Local Priority disabled..... 1040
24.6.3.2.2 Local Priority enabled..... 1041
24.6.4 Receive Process..... 1043
24.6.5 Matching Process..... 1044
24.6.6 Move Process..... 1049
24.6.6.1 Move-in..... 1049
24.6.6.2 Move-out..... 1050
24.6.7 Data Coherence..... 1050
24.6.7.1 Transmission Abort Mechanism..... 1051
24.6.7.2 Message Buffer Inactivation..... 1052

24.6.7.3 Message Buffer Lock Mechanism ... 1052
24.6.8 Rx FIFO ... 1054
24.6.9 CAN Protocol Related Features ... 1055
24.6.9.1 Remote Frames ... 1055
24.6.9.2 Overload Frames ... 1056
24.6.9.3 Time Stamp ... 1056
24.6.9.4 Protocol Timing ... 1056
24.6.9.5 Arbitration and Matching Timing ... 1059
24.6.10 Modes of Operation Details ... 1061
24.6.10.1 Freeze Mode ... 1061
24.6.10.2 Module Disable Mode ... 1062
24.6.10.3 Stop Mode ... 1063
24.6.11 Interrupts ... 1064
24.7 Initialization/Application Information ... 1065
24.7.1 FLEXCAN Initialization Sequence ... 1065
24.8 FLEXCAN Memory Map/Register Definition ... 1066
24.8.1 Module Configuration Register (FLEXCAN*x*_MCR) ... 1068
24.8.2 Control 1 Register (FLEXCAN*x*_CTRL1) ... 1073
24.8.3 Free Running Timer Register (FLEXCAN*x*_TIMER) ... 1076
24.8.4 Rx Mailboxes Global Mask Register (FLEXCAN*x*_RXMGMASK) ... 1076
24.8.5 Rx Buffer 14 Mask Register (FLEXCAN*x*_RX14MASK) ... 1077
24.8.6 Rx Buffer 15 Mask Register (FLEXCAN*x*_RX15MASK) ... 1078
24.8.7 Error Counter Register (FLEXCAN*x*_ECR) ... 1079
24.8.8 Error and Status 1 Register (FLEXCAN*x*_ESR1) ... 1080
24.8.9 Interrupt Masks 2 Register (FLEXCAN*x*_IMASK2) ... 1084
24.8.10 Interrupt Masks 1 Register (FLEXCAN*x*_IMASK1) ... 1084
24.8.11 Interrupt Flags 2 Register (FLEXCAN*x*_IFLAG2) ... 1085
24.8.12 Interrupt Flags 1 Register (FLEXCAN*x*_IFLAG1) ... 1085
24.8.13 Control 2 Register (FLEXCAN*x*_CTRL2) ... 1087

24.8.14 Error and Status 2 Register (FLEXCAN*x*_ESR2)..... 1093
24.8.15 CRC Register (FLEXCAN*x*_CRCR)..... 1095
24.8.16 Rx FIFO Global Mask Register (FLEXCAN*x*_RXFGMASK)..... 1096
24.8.17 Rx FIFO Information Register (FLEXCAN*x*_RXFIR)..... 1097
24.8.18 Rx Individual Mask Registers (FLEXCAN*x*_RXIMR0_RXIMR63)..... 1098
24.8.19 Glitch Filter Width Registers (FLEXCAN*x*_GFWR)..... 1098

Chapter 25
General Power Controller (GPC)

25.1 Overview..... 1101
25.2 Clocks..... 1101
25.3 DVFS overview..... 1101
25.3.1 Features..... 1102
25.4 DVFS output event/interrupt configuration..... 1102
25.4.1 Interrupts..... 1102
25.4.2 DVFS Change Request Sequence Diagrams..... 1103
25.5 Power Gating Control (PGC)..... 1104
25.5.1 Overview..... 1105
25.5.1.1 Features..... 1106
25.6 GPC Interrupt Controller (INTC)..... 1106
25.6.1 Interrupt Controller features..... 1106
25.7 GPC Memory Map/Register Definition..... 1107
25.7.1 GPC Interface control register (GPC_CNTR)..... 1107
25.7.2 GPC Power Gating Register (GPC_PGR)..... 1110
25.7.3 IRQ masking register 1 (GPC_IMR1)..... 1110
25.7.4 IRQ masking register 2 (GPC_IMR2)..... 1111
25.7.5 IRQ masking register 3 (GPC_IMR3)..... 1111
25.7.6 IRQ masking register 4 (GPC_IMR4)..... 1112
25.7.7 IRQ status resister 1 (GPC_ISR1)..... 1112
25.7.8 IRQ status resister 2 (GPC_ISR2)..... 1113

25.7.9 IRQ status resister 3 (GPC_ISR3)..... 1113
25.7.10 IRQ status resister 4 (GPC_ISR4)..... 1114
25.8 PGC Memory Map/Register Definition..... 1114
25.8.1 PGC Control Register (PGC_MEGA_CTRL)..... 1115
25.8.2 Power Up Sequence Control Register (PGC_MEGA_PUPSCR)..... 1116
25.8.3 Pull Down Sequence Control Register (PGC_MEGA_PDNSCR)..... 1116
25.8.4 Power Gating Controller Status Register (PGC_MEGA_SR)..... 1117
25.8.5 PGC Control Register (PGC_CPU_CTRL)..... 1118
25.8.6 Power Up Sequence Control Register (PGC_CPU_PUPSCR)..... 1118
25.8.7 Pull Down Sequence Control Register (PGC_CPU_PDNSCR)..... 1119
25.8.8 Power Gating Controller Status Register (PGC_CPU_SR)..... 1120
25.9 DVFSC Memory Map/Register Definition..... 1120
25.9.1 DVFS Thresholds (DVFSC_THRS)..... 1121
25.9.2 DVFS Counters thresholds (DVFSC_COUN)..... 1122
25.9.3 DVFS general purpose bits weight (DVFSC_SIG1)..... 1122
25.9.4 DVFS general purpose bits weight (DVFSC_DVFSSIG0)..... 1123
25.9.5 DVFS general purpose bit 0 weight counter (DVFSC_DVFSGPC0)..... 1124
25.9.6 DVFS general purpose bit 1 weight counter (DVFSC_DVFSGPC1)..... 1125
25.9.7 DVFS general purpose bits enables (DVFSC_DVFSGPBT)..... 1126
25.9.8 DVFS EMAC settings (DVFSC_DVFSEMAC)..... 1128
25.9.9 DVFS Control (DVFSC_CNTR)..... 1129
25.9.10 DVFS Load Tracking Register 0, portion 0 (DVFSC_DVFSLTR0_0)..... 1132
25.9.11 DVFS Load Tracking Register 0, portion 1 (DVFSC_DVFSLTR0_1)..... 1133
25.9.12 DVFS Load Tracking Register 1, portion 0 (DVFSC_DVFSLTR1_0)..... 1133
25.9.13 DVFS Load Tracking Register 3, portion 1 (DVFSC_DVFSLTR1_1)..... 1134
25.9.14 DVFS pattern 0 length (DVFSC_DVFSPT0)..... 1135
25.9.15 DVFS pattern 1 length (DVFSC_DVFSPT1)..... 1135
25.9.16 DVFS pattern 2 length (DVFSC_DVFSPT2)..... 1136
25.9.17 DVFS pattern 3 length (DVFSC_DVFSPT3)..... 1137

Chapter 26
General Purpose Input/Output (GPIO)

26.1 Overview....1139
26.1.1 Block Diagram....1141
26.1.2 Features....1142
26.2 External Signals....1143
26.3 Clocks....1146
26.4 GPIO Functional Description....1146
26.4.1 GPIO Function....1147
26.4.2 GPIO pad structure....1147
26.4.2.1 Input Driver....1148
26.4.2.1.1 Schmitt trigger....1148
26.4.2.1.2 Input keeper....1149
26.4.2.2 Output Driver....1149
26.4.2.2.1 Drive strength....1150
26.4.2.2.2 Output keeper....1150
26.4.2.2.3 PU / PD / Keeper Logic....1151
26.4.2.2.4 Open drain....1151
26.4.3 GPIO Programming....1152
26.4.3.1 GPIO Read Mode....1152
26.4.3.2 GPIO Write Mode....1153
26.4.4 Interrupt Control Unit....1153
26.5 GPIO Memory Map/Register Definition....1153
26.5.1 GPIO data register (GPIO*x*_DR)....1155
26.5.2 GPIO direction register (GPIO*x*_GDIR)....1156
26.5.3 GPIO pad status register (GPIO*x*_PSR)....1156
26.5.4 GPIO interrupt configuration register1 (GPIO*x*_ICR1)....1157
26.5.5 GPIO interrupt configuration register2 (GPIO*x*_ICR2)....1161
26.5.6 GPIO interrupt mask register (GPIO*x*_IMR)....1164

26.5.7 GPIO interrupt status register (GPIO*x*_ISR)..... 1165
26.5.8 GPIO edge select register (GPIO*x*_EDGE_SEL)..... 1166

Chapter 27
General Purpose Media Interface (GPMI)

27.1 Overview.....1167
27.2 External Signals..... 1168
27.3 Clocks..... 1169
27.4 GPMI NAND Mode.....1170
27.4.1 Multiple NAND Support.....1170
27.4.2 GPMI NAND Timing and Clocking.....1171
27.4.3 Basic NAND Timing..... 1171
27.4.3.1 NAND Asynchronous Timing..... 1171
27.4.3.2 NAND Asynchronous EDO Mode Timing.....1173
27.4.3.3 NAND ONFI Source Synchronous Mode Timing.....1176
27.4.3.4 NAND Toggle Mode Timing.....1181
27.4.4 Hardware BCH Interface..... 1188
27.5 Behavior During Reset.....1189
27.6 GPMI Memory Map/Register Definition.....1189
27.6.1 GPMI Control Register 0 Description (GPMI_CTRL0*n*).....1191
27.6.2 GPMI Compare Register Description (GPMI_COMPARE)..... 1193
27.6.3 GPMI Integrated ECC Control Register Description (GPMI_ECCCTRL*n*).....1194
27.6.4 GPMI Integrated ECC Transfer Count Register Description (GPMI_ECCCOUNT)..... 1195
27.6.5 GPMI Payload Address Register Description (GPMI_PAYLOAD)..... 1195
27.6.6 GPMI Auxiliary Address Register Description (GPMI_AUXILIARY)..... 1196
27.6.7 GPMI Control Register 1 Description (GPMI_CTRL1*n*).....1197
27.6.8 GPMI Timing Register 0 Description (GPMI_TIMING0).....1199
27.6.9 GPMI Timing Register 1 Description (GPMI_TIMING1).....1200
27.6.10 GPMI Timing Register 2 Description (GPMI_TIMING2).....1201
27.6.11 GPMI DMA Data Transfer Register Description (GPMI_DATA).....1202

27.6.12 GPMI Status Register Description (GPMI_STAT)..... 1202
27.6.13 GPMI Debug Information Register Description (GPMI_DEBUG)..... 1205
27.6.14 GPMI Version Register Description (GPMI_VERSION)..... 1205
27.6.15 GPMI Debug2 Information Register Description (GPMI_DEBUG2)..... 1206
27.6.16 GPMI Debug3 Information Register Description (GPMI_DEBUG3)..... 1209
27.6.17 GPMI Double Rate Read DLL Control Register Description (GPMI_READ_DDR_DLL_CTRL)..... 1209
27.6.18 GPMI Double Rate Write DLL Control Register Description (GPMI_WRITE_DDR_DLL_CTRL)..... 1211
27.6.19 GPMI Double Rate Read DLL Status Register Description (GPMI_READ_DDR_DLL_STS)..... 1213
27.6.20 GPMI Double Rate Write DLL Status Register Description (GPMI_WRITE_DDR_DLL_STS)..... 1214

Chapter 28
General Purpose Timer (GPT)

28.1 Overview..... 1217
28.1.1 Features..... 1219
28.1.2 Modes and Operation..... 1219
28.2 External Signals..... 1219
28.2.1 External Clock Input..... 1221
28.2.2 Input Capture Trigger Signals..... 1221
28.2.3 Output Compare Signals..... 1221
28.3 Signals..... 0
28.3.1 External Clock Input..... 0
28.3.2 Input Capture Trigger Signals..... 0
28.3.3 Output Compare Signals..... 0
28.4 Clocks..... 1221
28.5 Functional Description..... 1223
28.5.1 Operating Modes..... 1223
28.5.1.1 Restart Mode..... 1223
28.5.1.2 Free-Run Mode..... 1224
28.5.2 Operation..... 1224
28.5.2.1 Input Capture..... 1225

28.5.2.2 Output Compare ... 1226
28.5.2.3 Interrupts ... 1226
28.5.2.4 Low Power Mode Behavior ... 1227
28.5.2.5 Debug Mode Behavior ... 1227
28.6 Initialization/ Application Information ... 1228
28.6.1 Selecting the Clock Source ... 1228
28.7 GPT Memory Map/Register Definition ... 1228
28.7.1 GPT Control Register (GPT*x*_CR) ... 1230
28.7.2 GPT Prescaler Register (GPT*x*_PR) ... 1234
28.7.3 GPT Status Register (GPT*x*_SR) ... 1235
28.7.4 GPT Interrupt Register (GPT*x*_IR) ... 1236
28.7.5 GPT Output Compare Register 1 (GPT*x*_OCR1) ... 1237
28.7.6 GPT Output Compare Register 2 (GPT*x*_OCR2) ... 1238
28.7.7 GPT Output Compare Register 3 (GPT*x*_OCR3) ... 1238
28.7.8 GPT Input Capture Register 1 (GPT*x*_ICR1) ... 1239
28.7.9 GPT Input Capture Register 2 (GPT*x*_ICR2) ... 1239
28.7.10 GPT Counter Register (GPT*x*_CNT) ... 1240

Chapter 29
I2C Controller (I2C)

29.1 Overview ... 1241
29.1.1 Features ... 1243
29.1.2 Modes and operations ... 1244
29.2 External Signals ... 1244
29.3 Clocks ... 1245
29.4 Functional description ... 1245
29.4.1 I2C system configuration ... 1246
29.4.2 Arbitration procedure ... 1246
29.4.3 Clock synchronization ... 1246
29.4.4 Handshaking ... 1247

29.4.5 Clock stretching ... 1247
29.4.6 Peripheral bus accesses ... 1248
29.4.7 Generation of transfer error on IP bus ... 1248
29.4.8 Reset ... 1248
29.4.9 Interrupts ... 1248
29.4.10 Byte order ... 1248
29.5 Initialization ... 1249
29.5.1 Initialization sequence ... 1249
29.5.2 Generation of Start ... 1249
29.5.3 Post-transfer software response ... 1249
29.5.4 Generation of Stop ... 1250
29.5.5 Generation of Repeated Start ... 1250
29.5.6 Slave mode ... 1251
29.5.7 Arbitration lost ... 1251
29.6 Software restriction ... 1257
29.7 I2C Memory Map/Register Definition ... 1258
29.7.1 I2C Address Register (I2C*x*_IADR) ... 1259
29.7.2 I2C Frequency Divider Register (I2C*x*_IFDR) ... 1259
29.7.3 I2C Control Register (I2C*x*_I2CR) ... 1261
29.7.4 I2C Status Register (I2C*x*_I2SR) ... 1262
29.7.5 I2C Data I/O Register (I2C*x*_I2DR) ... 1264

Chapter 30
IOMUX Controller (IOMUXC)

30.1 Overview ... 1265
30.1.1 Features ... 1266
30.2 Clocks ... 1267
30.3 Functional description ... 1267
30.3.1 ALT6 and ALT7 extended muxing modes ... 1268
30.3.2 SW Loopback through SION bit ... 1269

30.3.3 Daisy chain - multi pads driving same module input pin..... 1269
30.4 IOMUXC GPR Memory Map/Register Definition.....1270
30.4.1 GPR0 General Purpose Register (IOMUXC_GPR_GPR0).....1271
30.4.2 GPR1 General Purpose Register (IOMUXC_GPR_GPR1).....1274
30.4.3 GPR2 General Purpose Register (IOMUXC_GPR_GPR2).....1277
30.4.4 GPR3 General Purpose Register (IOMUXC_GPR_GPR3).....1280
30.4.5 GPR4 General Purpose Register (IOMUXC_GPR_GPR4).....1283
30.4.6 GPR5 General Purpose Register (IOMUXC_GPR_GPR5).....1286
30.4.7 GPR9 General Purpose Register (IOMUXC_GPR_GPR9).....1288
30.4.8 GPR10 General Purpose Register (IOMUXC_GPR_GPR10).....1289
30.4.9 GPR14 General Purpose Register (IOMUXC_GPR_GPR14).....1290
30.5 IOMUXC Memory Map/Register Definition..... 1291
30.5.1 SW_MUX_CTL_PAD_BOOT_MODE0 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_BOOT_MODE0)..... 1311
30.5.2 SW_MUX_CTL_PAD_BOOT_MODE1 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_BOOT_MODE1)..... 1312
30.5.3 SW_MUX_CTL_PAD_SNVS_TAMPER0 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SNVS_TAMPER0)..... 1313
30.5.4 SW_MUX_CTL_PAD_SNVS_TAMPER1 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SNVS_TAMPER1)..... 1314
30.5.5 SW_MUX_CTL_PAD_SNVS_TAMPER2 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SNVS_TAMPER2)..... 1315
30.5.6 SW_MUX_CTL_PAD_SNVS_TAMPER3 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SNVS_TAMPER3)..... 1316
30.5.7 SW_MUX_CTL_PAD_SNVS_TAMPER4 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SNVS_TAMPER4)..... 1317
30.5.8 SW_MUX_CTL_PAD_SNVS_TAMPER5 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SNVS_TAMPER5)..... 1318
30.5.9 SW_MUX_CTL_PAD_SNVS_TAMPER6 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SNVS_TAMPER6)..... 1319

30.5.10 SW_MUX_CTL_PAD_SNVS_TAMPER7 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SNVS_TAMPER7)..... 1320
30.5.11 SW_MUX_CTL_PAD_SNVS_TAMPER8 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SNVS_TAMPER8)..... 1321
30.5.12 SW_MUX_CTL_PAD_SNVS_TAMPER9 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SNVS_TAMPER9)..... 1322
30.5.13 SW_MUX_CTL_PAD_JTAG_MOD SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_MOD)..... 1323
30.5.14 SW_MUX_CTL_PAD_JTAG_TMS SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_TMS)..... 1324
30.5.15 SW_MUX_CTL_PAD_JTAG_TDO SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_TDO)..... 1325
30.5.16 SW_MUX_CTL_PAD_JTAG_TDI SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_TDI)..... 1326
30.5.17 SW_MUX_CTL_PAD_JTAG_TCK SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_TCK)..... 1327
30.5.18 SW_MUX_CTL_PAD_JTAG_TRST_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_TRST_B)..... 1328
30.5.19 SW_MUX_CTL_PAD_GPIO1_IO00 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO00)..... 1329
30.5.20 SW_MUX_CTL_PAD_GPIO1_IO01 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO01)..... 1330
30.5.21 SW_MUX_CTL_PAD_GPIO1_IO02 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO02)..... 1331
30.5.22 SW_MUX_CTL_PAD_GPIO1_IO03 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO03)..... 1332
30.5.23 SW_MUX_CTL_PAD_GPIO1_IO04 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO04)..... 1333
30.5.24 SW_MUX_CTL_PAD_GPIO1_IO05 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO05)..... 1334
30.5.25 SW_MUX_CTL_PAD_GPIO1_IO06 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO06)..... 1335

30.5.26 SW_MUX_CTL_PAD_GPIO1_IO07 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO07)..... 1336

30.5.27 SW_MUX_CTL_PAD_GPIO1_IO08 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO08)..... 1337

30.5.28 SW_MUX_CTL_PAD_GPIO1_IO09 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO09)..... 1338

30.5.29 SW_MUX_CTL_PAD_UART1_TX_DATA SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART1_TX_DATA).....1339

30.5.30 SW_MUX_CTL_PAD_UART1_RX_DATA SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART1_RX_DATA)..... 1340

30.5.31 SW_MUX_CTL_PAD_UART1_CTS_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART1_CTS_B)..... 1341

30.5.32 SW_MUX_CTL_PAD_UART1_RTS_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART1_RTS_B)..... 1342

30.5.33 SW_MUX_CTL_PAD_UART2_TX_DATA SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART2_TX_DATA).....1343

30.5.34 SW_MUX_CTL_PAD_UART2_RX_DATA SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART2_RX_DATA)..... 1344

30.5.35 SW_MUX_CTL_PAD_UART2_CTS_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART2_CTS_B)..... 1345

30.5.36 SW_MUX_CTL_PAD_UART2_RTS_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART2_RTS_B)..... 1346

30.5.37 SW_MUX_CTL_PAD_UART3_TX_DATA SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART3_TX_DATA).....1347

30.5.38 SW_MUX_CTL_PAD_UART3_RX_DATA SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART3_RX_DATA)..... 1348

30.5.39 SW_MUX_CTL_PAD_UART3_CTS_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART3_CTS_B)..... 1349

30.5.40 SW_MUX_CTL_PAD_UART3_RTS_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART3_RTS_B)..... 1350

30.5.41 SW_MUX_CTL_PAD_UART4_TX_DATA SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART4_TX_DATA).....1351

30.5.42 SW_MUX_CTL_PAD_UART4_RX_DATA SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART4_RX_DATA)..... 1352
30.5.43 SW_MUX_CTL_PAD_UART5_TX_DATA SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART5_TX_DATA).....1353
30.5.44 SW_MUX_CTL_PAD_UART5_RX_DATA SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_UART5_RX_DATA)..... 1354
30.5.45 SW_MUX_CTL_PAD_ENET1_RX_DATA0 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_RX_DATA0)..... 1355
30.5.46 SW_MUX_CTL_PAD_ENET1_RX_DATA1 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_RX_DATA1)..... 1356
30.5.47 SW_MUX_CTL_PAD_ENET1_RX_EN SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_RX_EN).....1357
30.5.48 SW_MUX_CTL_PAD_ENET1_TX_DATA0 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_TX_DATA0)..... 1358
30.5.49 SW_MUX_CTL_PAD_ENET1_TX_DATA1 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_TX_DATA1)..... 1359
30.5.50 SW_MUX_CTL_PAD_ENET1_TX_EN SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_TX_EN)..... 1360
30.5.51 SW_MUX_CTL_PAD_ENET1_TX_CLK SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_TX_CLK)..... 1361
30.5.52 SW_MUX_CTL_PAD_ENET1_RX_ER SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_RX_ER)..... 1362
30.5.53 SW_MUX_CTL_PAD_ENET2_RX_DATA0 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_RX_DATA0)..... 1363
30.5.54 SW_MUX_CTL_PAD_ENET2_RX_DATA1 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_RX_DATA1)..... 1364
30.5.55 SW_MUX_CTL_PAD_ENET2_RX_EN SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_RX_EN).....1365
30.5.56 SW_MUX_CTL_PAD_ENET2_TX_DATA0 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_TX_DATA0)..... 1366
30.5.57 SW_MUX_CTL_PAD_ENET2_TX_DATA1 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_TX_DATA1)..... 1367

30.5.58 SW_MUX_CTL_PAD_ENET2_TX_EN SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_TX_EN)..... 1368

30.5.59 SW_MUX_CTL_PAD_ENET2_TX_CLK SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_TX_CLK)..... 1369

30.5.60 SW_MUX_CTL_PAD_ENET2_RX_ER SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_RX_ER)..... 1370

30.5.61 SW_MUX_CTL_PAD_LCD_CLK SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_CLK)..... 1371

30.5.62 SW_MUX_CTL_PAD_LCD_ENABLE SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_ENABLE)..... 1372

30.5.63 SW_MUX_CTL_PAD_LCD_HSYNC SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_HSYNC)..... 1373

30.5.64 SW_MUX_CTL_PAD_LCD_VSYNC SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_VSYNC)..... 1374

30.5.65 SW_MUX_CTL_PAD_LCD_RESET SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_RESET)..... 1375

30.5.66 SW_MUX_CTL_PAD_LCD_DATA00 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA00)..... 1376

30.5.67 SW_MUX_CTL_PAD_LCD_DATA01 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA01)..... 1377

30.5.68 SW_MUX_CTL_PAD_LCD_DATA02 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA02)..... 1378

30.5.69 SW_MUX_CTL_PAD_LCD_DATA03 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA03)..... 1379

30.5.70 SW_MUX_CTL_PAD_LCD_DATA04 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA04)..... 1380

30.5.71 SW_MUX_CTL_PAD_LCD_DATA05 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA05)..... 1381

30.5.72 SW_MUX_CTL_PAD_LCD_DATA06 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA06)..... 1382

30.5.73 SW_MUX_CTL_PAD_LCD_DATA07 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA07)..... 1383

30.5.74 SW_MUX_CTL_PAD_LCD_DATA08 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA08)....1384
30.5.75 SW_MUX_CTL_PAD_LCD_DATA09 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA09)....1385
30.5.76 SW_MUX_CTL_PAD_LCD_DATA10 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA10)....1386
30.5.77 SW_MUX_CTL_PAD_LCD_DATA11 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA11)....1387
30.5.78 SW_MUX_CTL_PAD_LCD_DATA12 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA12)....1388
30.5.79 SW_MUX_CTL_PAD_LCD_DATA13 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA13)....1389
30.5.80 SW_MUX_CTL_PAD_LCD_DATA14 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA14)....1390
30.5.81 SW_MUX_CTL_PAD_LCD_DATA15 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA15)....1391
30.5.82 SW_MUX_CTL_PAD_LCD_DATA16 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA16)....1392
30.5.83 SW_MUX_CTL_PAD_LCD_DATA17 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA17)....1393
30.5.84 SW_MUX_CTL_PAD_LCD_DATA18 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA18)....1394
30.5.85 SW_MUX_CTL_PAD_LCD_DATA19 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA19)....1395
30.5.86 SW_MUX_CTL_PAD_LCD_DATA20 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA20)....1396
30.5.87 SW_MUX_CTL_PAD_LCD_DATA21 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA21)....1397
30.5.88 SW_MUX_CTL_PAD_LCD_DATA22 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA22)....1398
30.5.89 SW_MUX_CTL_PAD_LCD_DATA23 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_LCD_DATA23)....1399

30.5.90 SW_MUX_CTL_PAD_NAND_RE_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_RE_B)....1400
30.5.91 SW_MUX_CTL_PAD_NAND_WE_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_WE_B).... 1401
30.5.92 SW_MUX_CTL_PAD_NAND_DATA00 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA00).... 1402
30.5.93 SW_MUX_CTL_PAD_NAND_DATA01 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA01).... 1403
30.5.94 SW_MUX_CTL_PAD_NAND_DATA02 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA02).... 1404
30.5.95 SW_MUX_CTL_PAD_NAND_DATA03 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA03).... 1405
30.5.96 SW_MUX_CTL_PAD_NAND_DATA04 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA04).... 1406
30.5.97 SW_MUX_CTL_PAD_NAND_DATA05 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA05).... 1407
30.5.98 SW_MUX_CTL_PAD_NAND_DATA06 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA06).... 1408
30.5.99 SW_MUX_CTL_PAD_NAND_DATA07 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA07).... 1409
30.5.100 SW_MUX_CTL_PAD_NAND_ALE SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_ALE)....1410
30.5.101 SW_MUX_CTL_PAD_NAND_WP_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_WP_B)....1411
30.5.102 SW_MUX_CTL_PAD_NAND_READY_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_READY_B).... 1412
30.5.103 SW_MUX_CTL_PAD_NAND_CE0_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_CE0_B)....1413
30.5.104 SW_MUX_CTL_PAD_NAND_CE1_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_CE1_B)....1414
30.5.105 SW_MUX_CTL_PAD_NAND_CLE SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_CLE)....1415

30.5.106 SW_MUX_CTL_PAD_NAND_DQS SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DQS)..... 1416
30.5.107 SW_MUX_CTL_PAD_SD1_CMD SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SD1_CMD).....1417
30.5.108 SW_MUX_CTL_PAD_SD1_CLK SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SD1_CLK).....1418
30.5.109 SW_MUX_CTL_PAD_SD1_DATA0 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SD1_DATA0).....1419
30.5.110 SW_MUX_CTL_PAD_SD1_DATA1 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SD1_DATA1).....1420
30.5.111 SW_MUX_CTL_PAD_SD1_DATA2 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SD1_DATA2).....1421
30.5.112 SW_MUX_CTL_PAD_SD1_DATA3 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_SD1_DATA3).....1422
30.5.113 SW_MUX_CTL_PAD_CSI_MCLK SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_CSI_MCLK)..... 1423
30.5.114 SW_MUX_CTL_PAD_CSI_PIXCLK SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_CSI_PIXCLK)..... 1424

Chapter 31
Keypad Port (KPP)

31.1 Overview....1907
31.1.1 Features....1909
31.1.2 Modes and Operations....1909
31.2 Clocks....1909
31.3 External Signals....1909
31.3.1 Input Pins....1910
31.3.2 Output Pins....1911
31.3.3 Generation of Transfer Error Signal on Peripheral Bus....1911
31.4 Functional Description....1911
31.4.1 Keypad Matrix Construction....1912
31.4.2 Keypad Port Configuration....1912
31.4.3 Keypad Matrix Scanning....1912
31.4.4 Keypad Standby....1913
31.4.5 Glitch Suppression on Keypad Inputs....1913
31.4.6 Multiple Key Closures....1915
31.4.6.1 Ghost Key Problem and Correction....1917
31.4.7 3-Point Contact Keys Support....1919
31.5 Initialization/Application Information....1920
31.5.1 Typical Keypad Configuration and Scanning Sequence....1921
31.5.2 Key Press Interrupt Scanning Sequence....1921
31.5.3 Additional Comments....1921

31.6 KPP Memory Map/Register Definition ... 1922
31.6.1 Keypad Control Register (KPP_KPCR) ... 1922
31.6.2 Keypad Status Register (KPP_KPSR) ... 1923
31.6.3 Keypad Data Direction Register (KPP_KDDR) ... 1925
31.6.4 Keypad Data Register (KPP_KPDR) ... 1925

Chapter 32
Enhanced LCD Interface (eLCDIF)

32.1 Overview ... 1927
32.2 External Signals ... 1927
32.3 Clocks ... 1928
32.4 Functional Description ... 1929
32.4.1 Bus Interface Mechanisms ... 1930
32.4.1.1 Bus Master Operation in Write/Display Modes ... 1931
32.4.1.2 System Bus Master Performance ... 1931
32.4.2 Write Data Path ... 1932
32.4.3 Read Data Path ... 1938
32.4.4 eLCDIF Interrupts ... 1943
32.4.5 Initializing the eLCDIF ... 1943
32.4.5.1 Write Modes ... 1943
32.4.5.2 MPU Read Mode ... 1944
32.4.6 MPU Interface ... 1945
32.4.6.1 Code Example to Initialize the eLCDIF in MPU Write Mode ... 1947
32.4.7 VSYNC Interface ... 1947
32.4.7.1 Code Example to Initialize eLCDIF in VSYNC Mode ... 1948
32.4.8 DOTCLK Interface ... 1949
32.4.8.1 Code Example ... 1951
32.4.9 CSI HANDSHAKE INTERFACE ... 1951
32.4.10 Alpha Blending Interface ... 1952
32.4.11 ITU-R BT.656 Digital Video Interface (DVI) ... 1952

32.4.12 eLCDIF Pin Usage by Interface Mode 1954
32.5 Behavior During Reset 1957
32.6 ELCDIF Memory Map/Register Definition 1957
32.6.1 eLCDIF General Control Register (LCDIF_RL*n*) 1960
32.6.2 eLCDIF General Control1 Register (LCDIF_CTRL1*n*) 1963
32.6.3 eLCDIF General Control2 Register (LCDIF_CTRL2*n*) 1965
32.6.4 eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIF_TRANSFER_COUNT) 1968
32.6.5 LCD Interface Current Buffer Address Register (LCDIF_CUR_BUF) 1968
32.6.6 LCD Interface Next Buffer Address Register (LCDIF_NEXT_BUF) 1969
32.6.7 LCD Interface Timing Register (LCDIF_TIMING) 1969
32.6.8 eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF_VDCTRL0*n*) 1970
32.6.9 eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF_VDCTRL1) 1972
32.6.10 LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF_VDCTRL2) 1972
32.6.11 eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF_VDCTRL3) 1973
32.6.12 eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF_VDCTRL4) 1974
32.6.13 Digital Video Interface Control0 Register (LCDIF_DVICTRL0) 1975
32.6.14 Digital Video Interface Control1 Register (LCDIF_DVICTRL1) 1975
32.6.15 Digital Video Interface Control2 Register (LCDIF_DVICTRL2) 1976
32.6.16 Digital Video Interface Control3 Register (LCDIF_DVICTRL3) 1977
32.6.17 Digital Video Interface Control4 Register (LCDIF_DVICTRL4) 1978
32.6.18 RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIF_CSC_COEFF0) 1979
32.6.19 RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIF_CSC_COEFF1) 1980
32.6.20 RGB to YCbCr 4:2:2 CSC Coefficent2 Register (LCDIF_CSC_COEFF2) 1981
32.6.21 RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIF_CSC_COEFF3) 1981
32.6.22 RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIF_CSC_COEFF4) 1982
32.6.23 RGB to YCbCr 4:2:2 CSC Offset Register (LCDIF_CSC_OFFSET) 1983
32.6.24 RGB to YCbCr 4:2:2 CSC Limit Register (LCDIF_CSC_LIMIT) 1983
32.6.25 LCD Interface Data Register (LCDIF_DATA) 1984
32.6.26 Bus Master Error Status Register (LCDIF_BM_ERROR_STAT) 1985

32.6.27 CRC Status Register (LCDIF_CRC_STAT)..... 1985
32.6.28 LCD Interface Status Register (LCDIF_STAT)..... 1986
32.6.29 LCD Interface Version Register (LCDIF_VERSION)..... 1988
32.6.30 LCD Interface Debug0 Register (LCDIF_DEBUG0)..... 1988
32.6.31 LCD Interface Debug1 Register (LCDIF_DEBUG1)..... 1991
32.6.32 LCD Interface Debug2 Register (LCDIF_DEBUG2)..... 1992
32.6.33 eLCDIF Threshold Register (LCDIF_THRES)..... 1992
32.6.34 eLCDIF AS Buffer Control Register (LCDIF_AS_CTRL)..... 1994
32.6.35 Alpha Surface Buffer Pointer (LCDIF_AS_BUF)..... 1996
32.6.36 LCDIF_AS_NEXT_BUF..... 1997
32.6.37 eLCDIF Overlay Color Key Low (LCDIF_AS_CLRKEYLOW)..... 1997
32.6.38 eLCDIF Overlay Color Key High (LCDIF_AS_CLRKEYHIGH)..... 1998
32.6.39 LCD working insync mode with CSI for VSYNC delay (LCDIF_SYNC_DELAY)..... 1998
32.6.40 eLCDIF Interface Debug3 Register (LCDIF_DEBUG3)..... 1999
32.6.41 LCD Interface Debug4 (LCDIF_DEBUG4)..... 2000
32.6.42 LCD Interface Debug5 (LCDIF_DEBUG5)..... 2001

Chapter 33
Multi Mode DDR Controller (MMDC)

33.1 Overview..... 2003
33.1.1 MMDC feature summary..... 2004
33.2 External Signals..... 2006
33.3 Clocks..... 2007
33.4 Functional Description..... 2007
33.4.1 Write/Read data flow..... 2007
33.4.1.1 Write data flow..... 2007
33.4.1.2 Read data flow..... 2008
33.4.2 MMDC initialization..... 2008
33.4.3 Configuring the MMDC registers..... 2010
33.4.4 MMDC Address Space..... 2010

33.4.4.1 Address decoding 2010
33.4.4.2 Chip select settings..... 2013
33.4.4.2.1 Creating 4 Gbyte address space with 2 Gbyte CS density..... 2013
33.4.4.2.2 Creating 2 Gbyte address spaces with 1 Gbyte CS density..... 2013
33.4.4.3 Translation of AXI accesses to DDR accessess..... 2014
33.4.4.3.1 Example 1..... 2014
33.4.4.3.2 Example 2..... 2015
33.4.4.3.3 Example 3..... 2016
33.4.4.3.4 Example 4..... 2016
33.4.4.3.5 Example 5..... 2017
33.4.4.4 Address mirroring 2018
33.4.5 LPDDR2 and DDR3 pin mux mapping..... 2018
33.4.6 Power Saving and Clock Frequency Change modes..... 2019
33.4.6.1 Power saving general..... 2020
33.4.6.2 Self refresh and Frequency change entry/exit..... 2021
33.4.7 Reset 2022
33.4.7.1 Hard reset..... 2022
33.4.7.2 Warm reset..... 2022
33.4.7.3 Software reset 2023
33.4.8 Refresh Scheme..... 2024
33.4.9 Burst Length options towards DDR..... 2024
33.4.10 Exclusive accesses handling..... 2025
33.4.11 AXI Error Handling..... 2026
33.5 Performance..... 2026
33.5.1 Arbitration and reordering mechanism..... 2026
33.5.1.1 Arbitration General..... 2026
33.5.1.2 Real time channel mode..... 2027
33.5.1.3 Dynamic scoring mode (Arbitration Winning Conditions)..... 2027
33.5.1.4 Guarding (aging) mechanism..... 2028

33.5.2 Prediction mechanism 2029
33.5.3 Special Optimization for accesses towards DDR3 2029
33.6 MMDC Debug 2030
33.6.1 Hardware debug monitor 2030
33.6.2 Step By Step (SBS) software monitor 2031
33.7 MMDC Profiling 2031
33.8 LPDDR2 Refresh Rate Update and Timing Derating 2032
33.9 Changing MMDC SDCLK Frequency 2033
33.9.1 Changing MMDC SDCLK Frequency Using DDR3/DDR3L Memories 2033
33.9.1.1 High Frequency to Low Frequency Transition (DLL On to DLL Off) 2036
33.9.1.2 Low Frequency to High Frequency Transition (DLL Off to DLL On) 2037
33.9.2 Changing MMDC Frequency Using LPDDR2 2038
33.9.2.1 High Frequency to Low Frequency Transition 2038
33.9.2.2 Low Frequency to High Frequency Transition 2039
33.10 ODT Configuration 2040
33.11 Calibration Process 2041
33.11.1 Delay-line 2042
33.11.2 ZQ calibration 2042
33.11.2.1 ZQ automatic (hardware) calibration process 2043
33.11.2.1.1 ZQ automatic Pull-up calibration 2044
33.11.2.1.2 ZQ automatic Pull-down calibration 2044
33.11.2.2 ZQ software calibration process 2045
33.11.2.3 ZQ calibration commands 2045
33.11.3 Read DQS Gating Calibration 2045
33.11.3.1 Hardware DQS Gating Calibration 2045
33.11.3.1.1 Hardware DQS Calibration with MPR 2046
33.11.3.1.2 Hardware DQS Calibration with pre-defined value 2046
33.11.3.2 SW read DQS gating Calibration 2049
33.11.3.2.1 SW read Calibration with MPR 2049

33.11.3.2.2 SW read Calibration with pre-defined value..... 2049
33.11.4 Read Calibration..... 2051
33.11.4.1 Hardware (automatic) Read Calibration..... 2052
33.11.4.1.1 Hardware (automatic) Calibration with MPR (DDR3) /DQ Calibration (LPDDR2)..... 2052
33.11.4.1.2 Hardware (automatic) Calibration with pre-defined value..... 2052
33.11.4.2 SW Read Calibration..... 2054
33.11.4.2.1 Calibration with MPR(DDR3)/DQ calibration(LPDDR2)..... 2054
33.11.4.2.2 Calibration with pre-defined value..... 2055
33.11.5 Write Calibration..... 2056
33.11.5.1 HW (automatic) Write Calibration..... 2057
33.11.5.2 SW Write Calibration..... 2058
33.11.6 Write leveling Calibration..... 2060
33.11.6.1 Hardware Write Leveling Calibration..... 2060
33.11.6.2 SW Write Leveling Calibration..... 2062
33.11.7 Write fine tuning..... 2063
33.11.8 Read fine tuning..... 2063
33.11.9 ZQ Fine Tuning..... 2063
33.11.10 Duty cycle adjustment..... 2064
33.12 MMDC Memory Map/Register Definition..... 2064
33.12.1 MMDC Core Control Register (MMDC_MDCTL)..... 2067
33.12.2 MMDC Core Power Down Control Register (MMDC_MDPDC)..... 2069
33.12.3 MMDC Core ODT Timing Control Register (MMDC_MDOTC)..... 2071
33.12.4 MMDC Core Timing Configuration Register 0 (MMDC_MDCFG0)..... 2073
33.12.5 MMDC Core Timing Configuration Register 1 (MMDC_MDCFG1)..... 2075
33.12.6 MMDC Core Timing Configuration Register 2 (MMDC_MDCFG2)..... 2077
33.12.7 MMDC Core Miscellaneous Register (MMDC_MDMISC)..... 2079
33.12.8 MMDC Core Special Command Register (MMDC_MDSCR)..... 2082
33.12.9 MMDC Core Refresh Control Register (MMDC_MDREF)..... 2085

33.12.10 MMDC Core Read/Write Command Delay Register (MMDC_MDRWD)..... 2087
33.12.11 MMDC Core Out of Reset Delays Register (MMDC_MDOR)..... 2089
33.12.12 MMDC Core MRR Data Register (MMDC_MDMRR)..... 2090
33.12.13 MMDC Core Timing Configuration Register 3 (MMDC_MDCFG3LP)..... 2091
33.12.14 MMDC Core MR4 Derating Register (MMDC_MDMR4)..... 2093
33.12.15 MMDC Core Address Space Partition Register (MMDC_MDASP)..... 2095
33.12.16 MMDC Core AXI Reordering Control Register (MMDC_MAARCR)..... 2096
33.12.17 MMDC Core Power Saving Control and Status Register (MMDC_MAPSR)..... 2099
33.12.18 MMDC Core Exclusive ID Monitor Register0 (MMDC_MAEXIDR0)..... 2101
33.12.19 MMDC Core Exclusive ID Monitor Register1 (MMDC_MAEXIDR1)..... 2102
33.12.20 MMDC Core Debug and Profiling Control Register 0 (MMDC_MADPCR0)..... 2103
33.12.21 MMDC Core Debug and Profiling Control Register 1 (MMDC_MADPCR1)..... 2104
33.12.22 MMDC Core Debug and Profiling Status Register 0 (MMDC_MADPSR0)..... 2105
33.12.23 MMDC Core Debug and Profiling Status Register 1 (MMDC_MADPSR1)..... 2105
33.12.24 MMDC Core Debug and Profiling Status Register 2 (MMDC_MADPSR2)..... 2106
33.12.25 MMDC Core Debug and Profiling Status Register 3 (MMDC_MADPSR3)..... 2106
33.12.26 MMDC Core Debug and Profiling Status Register 4 (MMDC_MADPSR4)..... 2107
33.12.27 MMDC Core Debug and Profiling Status Register 5 (MMDC_MADPSR5)..... 2107
33.12.28 MMDC Core Step By Step Address Register (MMDC_MASBS0)..... 2108
33.12.29 MMDC Core Step By Step Address Attributes Register (MMDC_MASBS1)..... 2108
33.12.30 MMDC Core General Purpose Register (MMDC_MAGENP)..... 2109
33.12.31 MMDC PHY ZQ HW control register (MMDC_MPZQHWCTRL)..... 2110
33.12.32 MMDC PHY ZQ SW control register (MMDC_MPZQSWCTRL)..... 2113
33.12.33 MMDC PHY Write Leveling Configuration and Error Status Register (MMDC_MPWLGCR)..... 2115
33.12.34 MMDC PHY Write Leveling Delay Control Register 0 (MMDC_MPWLDECTRL0)..... 2118
33.12.35 MMDC PHY Write Leveling delay-line Status Register (MMDC_MPWLDLST)..... 2121
33.12.36 MMDC PHY ODT control register (MMDC_MPODTCTRL)..... 2122
33.12.37 MMDC PHY Read DQ Byte0 Delay Register (MMDC_MPRDDQBY0DL)..... 2124
33.12.38 MMDC PHY Read DQ Byte1 Delay Register (MMDC_MPRDDQBY1DL)..... 2127

33.12.39 MMDC PHY Write DQ Byte0 Delay Register (MMDC_MPWRDQBY0DL)..... 2130
33.12.40 MMDC PHY Write DQ Byte1 Delay Register (MMDC_MPWRDQBY1DL)..... 2132
33.12.41 MMDC PHY Read DQS Gating Control Register 0 (MMDC_MPDGCTRL0)..... 2134
33.12.42 MMDC PHY Read DQS Gating delay-line Status Register (MMDC_MPDGDLST0)..... 2137
33.12.43 MMDC PHY Read delay-lines Configuration Register (MMDC_MPRDDLCTL)..... 2139
33.12.44 MMDC PHY Read delay-lines Status Register (MMDC_MPRDDLST)..... 2141
33.12.45 MMDC PHY Write delay-lines Configuration Register (MMDC_MPWRDLCTL)..... 2143
33.12.46 MMDC PHY Write delay-lines Status Register (MMDC_MPWRDLST)..... 2145
33.12.47 MMDC PHY CK Control Register (MMDC_MPSDCTRL)..... 2146
33.12.48 MMDC ZQ LPDDR2 HW Control Register (MMDC_MPZQLP2CTL)..... 2147
33.12.49 MMDC PHY Read Delay HW Calibration Control Register (MMDC_MPRDDLHWCTL)..... 2149
33.12.50 MMDC PHY Write Delay HW Calibration Control Register (MMDC_MPWRDLHWCTL)..... 2152
33.12.51 MMDC PHY Read Delay HW Calibration Status Register 0 (MMDC_MPRDDLHWST0)..... 2154
33.12.52 MMDC PHY Write Delay HW Calibration Status Register 0 (MMDC_MPWRDLHWST0)..... 2155
33.12.53 MMDC PHY Write Leveling HW Error Register (MMDC_MPWLHWERR)..... 2156
33.12.54 MMDC PHY Read DQS Gating HW Status Register 0 (MMDC_MPDGHWST0)..... 2156
33.12.55 MMDC PHY Read DQS Gating HW Status Register 1 (MMDC_MPDGHWST1)..... 2157
33.12.56 MMDC PHY Pre-defined Compare Register 1 (MMDC_MPPDCMPR1)..... 2157
33.12.57 MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDC_MPPDCMPR2)..... 2159
33.12.58 MMDC PHY SW Dummy Access Register (MMDC_MPSWDAR0)..... 2162
33.12.59 MMDC PHY SW Dummy Read Data Register 0 (MMDC_MPSWDRDR0)..... 2164
33.12.60 MMDC PHY SW Dummy Read Data Register 1 (MMDC_MPSWDRDR1)..... 2164
33.12.61 MMDC PHY SW Dummy Read Data Register 2 (MMDC_MPSWDRDR2)..... 2165
33.12.62 MMDC PHY SW Dummy Read Data Register 3 (MMDC_MPSWDRDR3)..... 2165
33.12.63 MMDC PHY SW Dummy Read Data Register 4 (MMDC_MPSWDRDR4)..... 2165
33.12.64 MMDC PHY SW Dummy Read Data Register 5 (MMDC_MPSWDRDR5)..... 2166
33.12.65 MMDC PHY SW Dummy Read Data Register 6 (MMDC_MPSWDRDR6)..... 2166
33.12.66 MMDC PHY SW Dummy Read Data Register 7 (MMDC_MPSWDRDR7)..... 2167

33.12.67 MMDC PHY Measure Unit Register (MMDC_MPMUR0)....2167
33.12.68 MMDC Write CA delay-line controller (MMDC_MPWRCADL)....2168
33.12.69 MMDC Duty Cycle Control Register (MMDC_MPDCCR)....2170

Chapter 34
Medium Quality Sound (MQS)

34.1 Overview....2173
34.2 Block Diagram....2173
34.3 External Signals....2174
34.4 Programmability....2175
34.5 Usage Model....2175

Chapter 35
On-Chip OTP Controller (OCOTP_CTRL)

35.1 Overview....2177
35.1.1 Features....2177
35.2 Clocks....2177
35.3 Top-Level Symbol and Functional Overview....2178
35.3.1 Operation....2178
35.3.1.1 Shadow Register Reload....2179
35.3.1.2 Fuse and Shadow register read....2179
35.3.1.3 Fuse and Shadow Register Writes....2179
35.3.1.4 Write Postamble....2181
35.3.2 Fuse Shadow Memory Footprint....2181
35.3.3 OTP Read/Write Timing Parameters....2183
35.3.4 Hardware Visible Fuses....2183
35.3.5 Behavior During Reset....2183
35.3.6 Secure JTAG control....2183
35.4 Fuse Map....2184
35.5 OCOTP Memory Map/Register Definition....2184
35.5.1 OTP Controller Control Register (OCOTP_CTRL*n*)....2190

35.5.2 OTP Controller Timing Register (OCOTP_TIMING)..... 2192
35.5.3 OTP Controller Write Data Register (OCOTP_DATA)..... 2193
35.5.4 OTP Controller Write Data Register (OCOTP_READ_CTRL)..... 2193
35.5.5 OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA)..... 2194
35.5.6 Sticky bit Register (OCOTP_SW_STICKY)..... 2195
35.5.7 Software Controllable Signals Register (OCOTP_SCS*n*)..... 2196
35.5.8 OTP Controller CRC test address (OCOTP_CRC_ADDR)..... 2197
35.5.9 OTP Controller CRC Value Register (OCOTP_CRC_VALUE)..... 2198
35.5.10 OTP Controller Version Register (OCOTP_VERSION)..... 2198
35.5.11 Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK)..... 2199
35.5.12 Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0)..... 2201
35.5.13 Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1)..... 2202
35.5.14 Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (OCOTP_CFG2)..... 2202
35.5.15 Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3)..... 2203
35.5.16 Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4)..... 2203
35.5.17 Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5)..... 2204
35.5.18 Value of OTP Bank0 Word7 (Configuration and Manufacturing Info.) (OCOTP_CFG6)..... 2204
35.5.19 Value of OTP Bank1 Word0 (Memory Related Info.) (OCOTP_MEM0)..... 2205
35.5.20 Value of OTP Bank1 Word1 (Memory Related Info.) (OCOTP_MEM1)..... 2205
35.5.21 Value of OTP Bank1 Word2 (Memory Related Info.) (OCOTP_MEM2)..... 2206
35.5.22 Value of OTP Bank1 Word3 (Memory Related Info.) (OCOTP_MEM3)..... 2206
35.5.23 Value of OTP Bank1 Word4 (Memory Related Info.) (OCOTP_MEM4)..... 2207
35.5.24 Value of OTP Bank1 Word5 (Memory Related Info.) (OCOTP_ANA0)..... 2207
35.5.25 Value of OTP Bank1 Word6 (General Purpose Customer Defined Info.) (OCOTP_ANA1)..... 2208
35.5.26 Value of OTP Bank1 Word7 (General Purpose Customer Defined Info.) (OCOTP_ANA2)..... 2208
35.5.27 Value of OTP Bank2 Word0 (OTPMK Key) (OCOTP_OTPMK0)..... 2209
35.5.28 Value of OTP Bank2 Word1 (OTPMK Key) (OCOTP_OTPMK1)..... 2209
35.5.29 Value of OTP Bank2 Word2 (OTPMK Key) (OCOTP_OTPMK2)..... 2210
35.5.30 Value of OTP Bank2 Word3 (OTPMK Key) (OCOTP_OTPMK3)..... 2210

35.5.31 Value of OTP Bank2 Word4 (OTPMK Key) (OCOTP_OTPMK4)....2211
35.5.32 Value of OTP Bank2 Word5 (OTPMK Key) (OCOTP_OTPMK5)....2211
35.5.33 Value of OTP Bank2 Word6 (OTPMK Key) (OCOTP_OTPMK6)....2212
35.5.34 Value of OTP Bank2 Word7 (OTPMK Key) (OCOTP_OTPMK7)....2212
35.5.35 Shadow Register for OTP Bank3 Word0 (SRK Hash) (OCOTP_SRK0).... 2213
35.5.36 Shadow Register for OTP Bank3 Word1 (SRK Hash) (OCOTP_SRK1).... 2213
35.5.37 Shadow Register for OTP Bank3 Word2 (SRK Hash) (OCOTP_SRK2).... 2214
35.5.38 Shadow Register for OTP Bank3 Word3 (SRK Hash) (OCOTP_SRK3).... 2214
35.5.39 Shadow Register for OTP Bank3 Word4 (SRK Hash) (OCOTP_SRK4).... 2215
35.5.40 Shadow Register for OTP Bank3 Word5 (SRK Hash) (OCOTP_SRK5).... 2215
35.5.41 Shadow Register for OTP Bank3 Word6 (SRK Hash) (OCOTP_SRK6).... 2216
35.5.42 Shadow Register for OTP Bank3 Word7 (SRK Hash) (OCOTP_SRK7).... 2216
35.5.43 Value of OTP Bank4 Word0 (Secure JTAG Response Field) (OCOTP_SJC_RESP0).... 2217
35.5.44 Value of OTP Bank4 Word1 (Secure JTAG Response Field) (OCOTP_SJC_RESP1).... 2217
35.5.45 Value of OTP Bank4 Word2 (MAC Address) (OCOTP_MAC0).... 2218
35.5.46 Value of OTP Bank4 Word3 (MAC Address) (OCOTP_MAC1).... 2218
35.5.47 Value of OTP Bank4 Word4 (MAC Address) (OCOTP_RESERVED) (OCOTP_MAC).... 2218
35.5.48 Value of OTP Bank4 Word5 (CRC Key) (OCOTP_CRC)....2219
35.5.49 Value of OTP Bank4 Word6 (General Purpose Customer Defined Info) (OCOTP_GP1)....2219
35.5.50 Value of OTP Bank4 Word7 (General Purpose Customer Defined Info) (OCOTP_GP2)....2220
35.5.51 Value of OTP Bank5 Word0 (SW GP) (OCOTP_SW_GP0).... 2220
35.5.52 Value of OTP Bank5 Word1 (SW GP) (OCOTP_SW_GP1).... 2221
35.5.53 Value of OTP Bank5 Word2 (SW GP) (OCOTP_SW_GP2).... 2221
35.5.54 Value of OTP Bank5 Word3 (SW GP) (OCOTP_SW_GP3).... 2221
35.5.55 Value of OTP Bank5 Word4 (SW GP) (OCOTP_SW_GP4).... 2222
35.5.56 Value of OTP Bank5 Word5 (Misc Conf) (OCOTP_MISC_CONF).... 2222
35.5.57 Value of OTP Bank5 Word6 (Field Return) (OCOTP_FIELD_RETURN).... 2223
35.5.58 Value of OTP Bank5 Word7 (SRK Revoke) (OCOTP_SRK_REVOKE).... 2223
35.5.59 Value of OTP Bank6 Word0 (ROM Patch) (OCOTP_ROM_PATCH0).... 2224

35.5.60 Value of OTP Bank6 Word1 (ROM Patch) (OCOTP_ROM_PATCH1)..... 2224
35.5.61 Value of OTP Bank6 Word2 (ROM Patch) (OCOTP_ROM_PATCH2)..... 2224
35.5.62 Value of OTP Bank6 Word3 (ROM Patch) (OCOTP_ROM_PATCH3)..... 2225
35.5.63 Value of OTP Bank6 Word4 (ROM Patch) (OCOTP_ROM_PATCH4)..... 2225
35.5.64 Value of OTP Bank6 Word5 (ROM Patch) (OCOTP_ROM_PATCH5)..... 2226
35.5.65 Value of OTP Bank6 Word6 (ROM Patch) (OCOTP_ROM_PATCH6)..... 2226
35.5.66 Value of OTP Bank6 Word7 (ROM Patch) (OCOTP_ROM_PATCH7)..... 2227
35.5.67 Value of OTP Bank7 Word0 (ROM Patch) (OCOTP_ROM_PATCH8)..... 2227
35.5.68 Value of OTP Bank7 Word1 (ROM Patch) (OCOTP_ROM_PATCH9)..... 2227
35.5.69 Value of OTP Bank7 Word2 (ROM Patch) (OCOTP_ROM_PATCH10)..... 2228
35.5.70 Value of OTP Bank7 Word3 (ROM Patch) (OCOTP_ROM_PATCH11)..... 2228
35.5.71 Value of OTP Bank7 Word4 (ROM Patch) (OCOTP_ROM_PATCH12)..... 2229
35.5.72 Value of OTP Bank7 Word5 (ROM Patch) (OCOTP_ROM_PATCH13)..... 2229
35.5.73 Value of OTP Bank7 Word6 (ROM Patch) (OCOTP_ROM_PATCH14)..... 2230
35.5.74 Value of OTP Bank7 Word7 (ROM Patch) (OCOTP_ROM_PATCH15)..... 2230
35.5.75 Value of OTP Bank8 Word0 (General Purpose Customer Defined Info) (OCOTP_GP30).....2230
35.5.76 Value of OTP Bank8 Word1 (General Purpose Customer Defined Info) (OCOTP_GP31).....2231
35.5.77 Value of OTP Bank8 Word2 (General Purpose Customer Defined Info) (OCOTP_GP32).....2231
35.5.78 Value of OTP Bank8 Word3 (General Purpose Customer Defined Info) (OCOTP_GP33).....2232
35.5.79 Value of OTP Bank8 Word4 (General Purpose Customer Defined Info) (OCOTP_GP34).....2232
35.5.80 Value of OTP Bank8 Word5 (General Purpose Customer Defined Info) (OCOTP_GP35).....2233
35.5.81 Value of OTP Bank8 Word6 (General Purpose Customer Defined Info) (OCOTP_GP36).....2233
35.5.82 Value of OTP Bank8 Word7 (General Purpose Customer Defined Info) (OCOTP_GP37).....2233
35.5.83 Value of OTP Bank9 Word0 (General Purpose Customer Defined Info) (OCOTP_GP38).....2234
35.5.84 Value of OTP Bank9 Word1 (General Purpose Customer Defined Info) (OCOTP_GP39).....2234
35.5.85 Value of OTP Bank9 Word2 (General Purpose Customer Defined Info) (OCOTP_GP310).....2235
35.5.86 Value of OTP Bank9 Word3 (General Purpose Customer Defined Info) (OCOTP_GP311).....2235
35.5.87 Value of OTP Bank9 Word4 (General Purpose Customer Defined Info) (OCOTP_GP312).....2236
35.5.88 Value of OTP Bank9 Word5 (General Purpose Customer Defined Info) (OCOTP_GP313).....2236

35.5.89 Value of OTP Bank9 Word6 (General Purpose Customer Defined Info) (OCOTP_GP314).....2236
35.5.90 Value of OTP Bank9 Word7 (General Purpose Customer Defined Info) (OCOTP_GP315).....2237
35.5.91 Value of OTP Bank10 Word0 (General Purpose Customer Defined Info) (OCOTP_GP40).....2237
35.5.92 Value of OTP Bank10 Word1 (General Purpose Customer Defined Info) (OCOTP_GP41).....2238
35.5.93 Value of OTP Bank10 Word2 (General Purpose Customer Defined Info) (OCOTP_GP42).....2238
35.5.94 Value of OTP Bank10 Word3 (General Purpose Customer Defined Info) (OCOTP_GP43).....2239
35.5.95 Value of OTP Bank10 Word4 (General Purpose Customer Defined Info) (OCOTP_GP44).....2239
35.5.96 Value of OTP Bank10 Word5 (General Purpose Customer Defined Info) (OCOTP_GP45).....2239
35.5.97 Value of OTP Bank10 Word6 (General Purpose Customer Defined Info) (OCOTP_GP46).....2240
35.5.98 Value of OTP Bank10 Word7 (General Purpose Customer Defined Info) (OCOTP_GP47).....2240
35.5.99 Value of OTP Bank11 Word0 (General Purpose Customer Defined Info) (OCOTP_GP48).....2241
35.5.100 Value of OTP Bank11 Word1 (General Purpose Customer Defined Info) (OCOTP_GP49).....2241
35.5.101 Value of OTP Bank11 Word2 (General Purpose Customer Defined Info) (OCOTP_GP410).....2242
35.5.102 Value of OTP Bank11 Word3 (General Purpose Customer Defined Info) (OCOTP_GP411).....2242
35.5.103 Value of OTP Bank11 Word4 (General Purpose Customer Defined Info) (OCOTP_GP412).....2242
35.5.104 Value of OTP Bank11 Word5 (General Purpose Customer Defined Info) (OCOTP_GP413).....2243
35.5.105 Value of OTP Bank11 Word6 (General Purpose Customer Defined Info) (OCOTP_GP414).....2243
35.5.106 Value of OTP Bank11 Word7 (General Purpose Customer Defined Info) (OCOTP_GP415).....2244
35.5.107 Value of OTP Bank12 Word0 (General Purpose Customer Defined Info) (OCOTP_GP50).....2244
35.5.108 Value of OTP Bank12 Word1 (General Purpose Customer Defined Info) (OCOTP_GP51).....2245
35.5.109 Value of OTP Bank12 Word2 (General Purpose Customer Defined Info) (OCOTP_GP52).....2245
35.5.110 Value of OTP Bank12 Word3 (General Purpose Customer Defined Info) (OCOTP_GP53).....2245
35.5.111 Value of OTP Bank12 Word4 (General Purpose Customer Defined Info) (OCOTP_GP54).....2246
35.5.112 Value of OTP Bank12 Word5 (General Purpose Customer Defined Info) (OCOTP_GP55).....2246
35.5.113 Value of OTP Bank12 Word6 (General Purpose Customer Defined Info) (OCOTP_GP56).....2247
35.5.114 Value of OTP Bank12 Word7 (General Purpose Customer Defined Info) (OCOTP_GP57).....2247
35.5.115 Value of OTP Bank13 Word0 (General Purpose Customer Defined Info) (OCOTP_GP58).....2248
35.5.116 Value of OTP Bank13 Word1 (General Purpose Customer Defined Info) (OCOTP_GP59).....2248
35.5.117 Value of OTP Bank13 Word2 (General Purpose Customer Defined Info) (OCOTP_GP510).....2248

35.5.118 Value of OTP Bank13 Word3 (General Purpose Customer Defined Info) (OCOTP_GP511).....2249
35.5.119 Value of OTP Bank13 Word4 (General Purpose Customer Defined Info) (OCOTP_GP512).....2249
35.5.120 Value of OTP Bank13 Word5 (General Purpose Customer Defined Info) (OCOTP_GP513).....2250
35.5.121 Value of OTP Bank13 Word6 (General Purpose Customer Defined Info) (OCOTP_GP514).....2250
35.5.122 Value of OTP Bank13 Word7 (General Purpose Customer Defined Info) (OCOTP_GP515).....2251
35.5.123 Value of OTP Bank14 Word0 (General Purpose Customer Defined Info) (OCOTP_GP60).....2251
35.5.124 Value of OTP Bank14 Word1 (General Purpose Customer Defined Info) (OCOTP_GP61).....2251
35.5.125 Value of OTP Bank14 Word2 (General Purpose Customer Defined Info) (OCOTP_GP62).....2252
35.5.126 Value of OTP Bank14 Word3 (General Purpose Customer Defined Info) (OCOTP_GP63).....2252
35.5.127 Value of OTP Bank14 Word4 (General Purpose Customer Defined Info) (OCOTP_GP64).....2253
35.5.128 Value of OTP Bank14 Word5 (General Purpose Customer Defined Info) (OCOTP_GP65).....2253
35.5.129 Value of OTP Bank14 Word6 (General Purpose Customer Defined Info) (OCOTP_GP66).....2254
35.5.130 Value of OTP Bank14 Word7 (General Purpose Customer Defined Info) (OCOTP_GP67).....2254
35.5.131 Value of OTP Bank15 Word0 (General Purpose Customer Defined Info) (OCOTP_GP70).....2254
35.5.132 Value of OTP Bank15 Word1 (General Purpose Customer Defined Info) (OCOTP_GP71).....2255
35.5.133 Value of OTP Bank15 Word2 (General Purpose Customer Defined Info) (OCOTP_GP72).....2255
35.5.134 Value of OTP Bank15 Word3 (General Purpose Customer Defined Info) (OCOTP_GP73).....2256
35.5.135 Value of OTP Bank15 Word4 (General Purpose Customer Defined Info) (OCOTP_GP80).....2256
35.5.136 Value of OTP Bank15 Word5 (General Purpose Customer Defined Info) (OCOTP_GP81).....2257
35.5.137 Value of OTP Bank15 Word6 (General Purpose Customer Defined Info) (OCOTP_GP82).....2257
35.5.138 Value of OTP Bank15 Word7 (General Purpose Customer Defined Info) (OCOTP_GP83).....2257

Chapter 36
On-Chip RAM Memory Controller (OCRAM)

36.1 Overview.....2259
36.2 Basic Functions.....2260
36.2.1 Read/Write Arbitration..... 2260
36.3 Advanced Features.....2261
36.3.1 Read Data Wait State..... 2261
36.3.2 Read Address Pipeline..... 2261

36.3.3 Write Data Pipeline....2262
36.3.4 Write Address Pipeline....2262
36.4 Programmable Registers....2263

Chapter 37
Power Management Unit (PMU)

37.1 Overview....2265
37.2 Digital LDO Regulators....2267
37.3 Analog LDO Regulators....2268
37.3.1 LDO 1P1....2268
37.3.2 LDO 2P5....2268
37.3.3 Low Power Operation....2269
37.4 USB LDO Regulator....2270
37.5 SNVS Regulator....2270
37.6 PMU Memory Map/Register Definition....2270
37.6.1 Regulator 1P1 Register (PMU_REG_1P1)....2272
37.6.2 Regulator 3P0 Register (PMU_REG_3P0)....2275
37.6.3 Regulator 2P5 Register (PMU_REG_2P5)....2277
37.6.4 Digital Regulator Core Register (PMU_REG_CORE)....2279
37.6.5 Miscellaneous Register 0 (PMU_MISC0)....2281
37.6.6 Miscellaneous Register 1 (PMU_MISC1*n*)....2284
37.6.7 Miscellaneous Control Register (PMU_MISC2*n*)....2287
37.6.8 Low Power Control Register (PMU_LOWPWR_CTRL*n*)....2291

Chapter 38
Pulse Width Modulation (PWM)

38.1 Overview....2295
38.2 External Signals....2296
38.3 Clocks....2298
38.4 Functional Description....2299
38.4.1 Operation....2299

38.4.1.1 FIFO ... 2300
38.4.1.2 Rollover and Compare Event ... 2300
38.4.1.3 Low Power Mode Behavior ... 2300
38.4.1.4 Debug Mode Behavior ... 2301
38.5 Enable Sequence for the PWM ... 2301
38.6 Disable Sequence for the PWM ... 2301
38.7 PWM Memory Map/Register Definition ... 2302
38.7.1 PWM Control Register (PWM*x*_PWMCR) ... 2304
38.7.2 PWM Status Register (PWM*x*_PWMSR) ... 2306
38.7.3 PWM Interrupt Register (PWM*x*_PWMIR) ... 2307
38.7.4 PWM Sample Register (PWM*x*_PWMSAR) ... 2308
38.7.5 PWM Period Register (PWM*x*_PWMPR) ... 2309
38.7.6 PWM Counter Register (PWM*x*_PWMCNR) ... 2310

Chapter 39
Pixel Pipeline (PXP)

39.1 Overview ... 2311
39.2 Clocks ... 2312
39.3 Top-level architecture ... 2312
39.3.1 Processing Details ... 2314
39.3.2 Scaling Operation ... 2315
39.3.3 Decimation Image Scaling ... 2316
39.3.4 Bilinear Image Scaling Filter ... 2318
39.3.5 YUV 4:2:2 Image Scaling ... 2320
39.3.6 YUV 4:2:0 Image Scaling ... 2321
39.3.7 RGB/YUV444 Image Scaling ... 2323
39.3.8 Color Space Conversion (CSC) ... 2323
39.3.9 CSC1 Operation ... 2324
39.3.10 YUV versus YCbCr Support ... 2325
39.3.11 CSC2 operation ... 2325

39.3.12 Alpha Blending/Color Key 2325
39.3.13 Alpha Blend..... 2326
39.3.14 Color Key..... 2327
39.3.15 LUT..... 2327
39.3.16 Lookup Modes..... 2328
39.3.17 DIRECT_Y8..... 2328
39.3.18 DIRECT_RGB444..... 2328
39.3.19 DIRECT_RGB454..... 2328
39.3.20 CACHE_RGB565..... 2329
39.3.21 Output Modes..... 2330
39.3.22 Y8 2330
39.3.23 RGBW4444CFA..... 2331
39.3.23.1 CFA Correction..... 2331
39.3.24 RGB888..... 2332
39.3.25 Rotation..... 2332
39.3.26 Output Buffer..... 2335
39.3.27 Address calculator..... 2335
39.3.28 Block size selection..... 2335
39.3.29 Interlaced Video Support..... 2335
39.3.30 LCDIF Handshake..... 2336
39.3.31 LCDIF Abort..... 2339
39.3.32 Theory of Operation..... 2339
39.3.33 Pixel Handling..... 2340
39.3.34 Output Buffer Composition..... 2341
39.3.35 PS Image Processing..... 2341
39.3.36 Letterboxing..... 2342
39.3.37 Clipping source images..... 2342
39.3.38 Color Key Processing..... 2344
39.3.39 In Place Processing (PS buffer is destination buffer)..... 2346

39.3.40 Alpha Surface (AS) Processing....2346
39.3.41 Alpha Handling....2346
39.3.42 Color Key Processing (AS_CTRL)....2346
39.4 Output Image Processing....2347
39.4.1 Output Image Size....2347
39.4.2 Output Format....2347
39.4.3 Rotation/Flip operations....2347
39.5 Queuing PXP transactions....2348
39.6 Error Handling....2348
39.6.1 Known PXP Limitations/Issues....2349
39.7 PXP Memory Map/Register Definition....2349
39.7.1 Control Register 0 (PXP_CTRL)....2352
39.7.2 Status Register (PXP_STAT)....2354
39.7.3 Output Buffer Control Register (PXP_OUT_CTRL)....2356
39.7.4 Output Frame Buffer Pointer (PXP_OUT_BUF)....2358
39.7.5 Output Frame Buffer Pointer #2 (PXP_OUT_BUF2)....2359
39.7.6 Output Buffer Pitch (PXP_OUT_PITCH)....2359
39.7.7 Output Surface Lower Right Coordinate (PXP_OUT_LRC)....2360
39.7.8 Processed Surface Upper Left Coordinate (PXP_OUT_PS_ULC)....2361
39.7.9 Processed Surface Lower Right Coordinate (PXP_OUT_PS_LRC)....2362
39.7.10 Alpha Surface Upper Left Coordinate (PXP_OUT_AS_ULC)....2363
39.7.11 Alpha Surface Lower Right Coordinate (PXP_OUT_AS_LRC)....2364
39.7.12 Processed Surface (PS) Control Register (PXP_PS_CTRL)....2365
39.7.13 PS Input Buffer Address (PXP_PS_BUF)....2366
39.7.14 PS U/Cb or 2 Plane UV Input Buffer Address (PXP_PS_UBUF)....2367
39.7.15 PS V/Cr Input Buffer Address (PXP_PS_VBUF)....2368
39.7.16 Processed Surface Pitch (PXP_PS_PITCH)....2368
39.7.17 PS Background Color (PXP_PS_BACKGROUND)....2369
39.7.18 PS Scale Factor Register (PXP_PS_SCALE)....2370

39.7.19 PS Scale Offset Register (PXP_PS_OFFSET)..... 2371
39.7.20 PS Color Key Low (PXP_PS_CLRKEYLOW).....2372
39.7.21 PS Color Key High (PXP_PS_CLRKEYHIGH)..... 2373
39.7.22 Alpha Surface Control (PXP_AS_CTRL)..... 2373
39.7.23 Alpha Surface Buffer Pointer (PXP_AS_BUF).....2376
39.7.24 Alpha Surface Pitch (PXP_AS_PITCH).....2376
39.7.25 Overlay Color Key Low (PXP_AS_CLRKEYLOW)..... 2377
39.7.26 Overlay Color Key High (PXP_AS_CLRKEYHIGH).....2377
39.7.27 Color Space Conversion Coefficient Register 0 (PXP_CSC1_COEF0)..... 2378
39.7.28 Color Space Conversion Coefficient Register 1 (PXP_CSC1_COEF1)..... 2380
39.7.29 Color Space Conversion Coefficient Register 2 (PXP_CSC1_COEF2)..... 2380
39.7.30 Color Space Conversion Control Register. (PXP_CSC2_CTRL)..... 2381
39.7.31 Color Space Conversion Coefficient Register 0 (PXP_CSC2_COEF0)..... 2383
39.7.32 Color Space Conversion Coefficient Register 1 (PXP_CSC2_COEF1)..... 2383
39.7.33 Color Space Conversion Coefficient Register 2 (PXP_CSC2_COEF2)..... 2384
39.7.34 Color Space Conversion Coefficient Register 3 (PXP_CSC2_COEF3)..... 2384
39.7.35 Color Space Conversion Coefficient Register 4 (PXP_CSC2_COEF4)..... 2385
39.7.36 Color Space Conversion Coefficient Register 5 (PXP_CSC2_COEF5)..... 2386
39.7.37 Lookup Table Control Register. (PXP_LUT_CTRL).....2386
39.7.38 Lookup Table Control Register. (PXP_LUT_ADDR)..... 2388
39.7.39 Lookup Table Data Register. (PXP_LUT_DATA)..... 2390
39.7.40 Lookup Table External Memory Address Register. (PXP_LUT_EXTMEM)..... 2390
39.7.41 Color Filter Array Register. (PXP_CFA)..... 2391
39.7.42 Histogram Control Register. (PXP_HIST_CTRL)..... 2391
39.7.43 2-level Histogram Parameter Register. (PXP_HIST2_PARAM).....2392
39.7.44 4-level Histogram Parameter Register. (PXP_HIST4_PARAM).....2393
39.7.45 8-level Histogram Parameter 0 Register. (PXP_HIST8_PARAM0).....2394
39.7.46 8-level Histogram Parameter 1 Register. (PXP_HIST8_PARAM1).....2395
39.7.47 16-level Histogram Parameter 0 Register. (PXP_HIST16_PARAM0).....2396

39.7.48 16-level Histogram Parameter 1 Register. (PXP_HIST16_PARAM1)..... 2397
39.7.49 16-level Histogram Parameter 2 Register. (PXP_HIST16_PARAM2)..... 2398
39.7.50 16-level Histogram Parameter 3 Register. (PXP_HIST16_PARAM3)..... 2399
39.7.51 PXP Power Control Register. (PXP_POWER)..... 2399
39.7.52 Next Frame Pointer (PXP_NEXT)..... 2400

Chapter 40
Quad Serial Peripheral Interface (QuadSPI)

40.1 Overview..... 2403
40.1.1 Features..... 2405
40.1.2 QuadSPI Modes of Operation..... 2406
40.1.2.1 Normal Mode..... 2406
40.1.2.2 Module Disable Mode..... 2406
40.1.3 Acronyms and Abbreviations..... 2406
40.1.4 Glossary for QuadSPI module..... 2407
40.2 External Signals..... 2408
40.2.1 Driving External Signals..... 2409
40.3 Memory Map and Register Definition..... 2411
40.3.1 Register Write Access..... 2411
40.3.2 Serial Flash Address Assignment..... 2412
40.3.3 AMBA Bus Register Memory Map..... 2413
40.3.4 AHB Bus Register Memory Map Descriptions..... 2414
40.3.4.1 AHB Bus Access Considerations..... 2414
40.3.4.2 Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A..... 2415
40.3.4.3 Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B..... 2416
40.3.4.4 Parallel Flash Mode..... 2417
40.4 Interrupt Signals..... 2418
40.5 Functional Description..... 2418
40.5.1 Serial Flash Access Schemes..... 2418
40.5.2 Modes of Operation..... 2419

40.5.3 Normal Mode....2420
40.5.3.1 Programmable Sequence Engine....2420
40.5.3.2 Flexible AHB buffers....2422
40.5.3.3 Suspend-Abort Mechanism....2424
40.5.3.4 Look-up Table....2425
40.5.3.5 Issuing SFM Commands....2426
40.5.3.6 Flash Programming....2427
40.5.3.7 Flash Read....2428
40.5.3.8 Byte Ordering of Serial Flash Read Data....2432
40.5.3.9 Normal Mode Interrupt and DMA Requests....2435
40.5.3.10 TX Buffer Operation....2437
40.5.3.11 Address scheme....2437
40.6 Initialization/Application Information....2438
40.6.1 Power Up and Reset....2438
40.6.2 Available Status/Flag Information....2439
40.6.2.1 IP Commands....2439
40.6.2.2 AHB Commands....2439
40.6.2.3 Overview of Error Flags....2440
40.6.2.4 IP Bus and AHB Access Command Collisions....2441
40.6.3 Exclusive Access to Serial Flash for AHB Commands....2441
40.6.3.1 RX Buffer Read via QSPI_ARDB Registers....2442
40.6.3.2 RX Buffer Read via QSPI_RBDR Registers....2442
40.6.4 Command Arbitration....2442
40.6.5 Flash Device Selection....2443
40.6.6 DMA Usage....2444
40.6.6.1 DMA Usage in Normal Mode....2444
40.6.6.1.1 Bandwidth considerations....2444
40.6.7 Parallel mode....2446
40.7 Byte Ordering - Endianness....2448

40.7.1 Programming Flash Data ... 2449
40.7.2 Reading Flash Data into the RX Buffer ... 2450
40.7.2.1 Readout of the RX Buffer via QSPI_RBDRn ... 2450
40.7.2.2 Readout of the RX Buffer via ARDBn ... 2450
40.7.3 Reading Flash Data into the AHB Buffer ... 2451
40.7.3.1 Readout of the AHB Buffer via Memory Mapped Read ... 2451
40.8 Serial Flash Devices ... 2451
40.8.1 Example Sequences ... 2451
40.8.1.1 Fast Read Sequence (Macronix/Numonyx/Spansion/Winbond) ... 2452
40.8.1.2 Fast Dual I/O DT Read Sequence (Macronix) ... 2452
40.8.1.3 Fast Read Quad Output (Winbond) ... 2453
40.8.1.4 4 x I/O Read Enhance Performance Mode (XIP) (Macronix) ... 2453
40.8.1.5 Dual Command Page Program (Numonyx) ... 2454
40.8.1.6 Sector Erase (Macronix/Spansion/Numonyx) ... 2454
40.8.1.7 Read Status Register (Macronix/Spansion/Numonyx/Winbond) ... 2454
40.8.2 Dual Die Flashes ... 2455
40.8.3 Boot initialization sequence ... 2455
40.9 Sampling of Serial Flash Input Data ... 2456
40.9.1 Internal Sampling of Serial Flash Input Data ... 2456
40.9.2 DDR Mode ... 2459
40.10 Serial Flash Data Input Timing ... 2459
40.10.1 Input timing in SDR mode with internal sampling ... 2461
40.10.2 Input timing in DDR mode with internal sampling ... 2461
40.10.3 Input timing in SDR mode with loopback DQS sampling ... 2462
40.10.4 Input timing in DDR mode with loopback DQS sampling ... 2463
40.10.5 Input timing in SDR mode with flash DQS sampling ... 2464
40.10.6 Input timing in DDR mode with flash DQS sampling ... 2465
40.10.7 Data Strobe Signal functionality ... 2466
40.11 Output timing in SDR mode ... 2466

40.12 Output timing in DDR mode 2467
40.13 AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31) 2468
40.13.1 AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31) 2468
40.13.1.1 AHB RX Data Buffer register (ARDB*n*) 2468
40.14 Peripheral Bus Register Descriptions 2470
40.14.1 Module Configuration Register (QuadSPI_MCR) 2476
40.14.2 IP Configuration Register (QuadSPI_IPCR) 2479
40.14.3 Flash Configuration Register (QuadSPI_FLSHCR) 2480
40.14.4 Buffer0 Configuration Register (QuadSPI_BUF0CR) 2480
40.14.5 Buffer1 Configuration Register (QuadSPI_BUF1CR) 2481
40.14.6 Buffer2 Configuration Register (QuadSPI_BUF2CR) 2482
40.14.7 Buffer3 Configuration Register (QuadSPI_BUF3CR) 2483
40.14.8 Buffer Generic Configuration Register (QuadSPI_BFGENCR) 2484
40.14.9 Buffer0 Top Index Register (QuadSPI_BUF0IND) 2484
40.14.10 Buffer1 Top Index Register (QuadSPI_BUF1IND) 2485
40.14.11 Buffer2 Top Index Register (QuadSPI_BUF2IND) 2486
40.14.12 Serial Flash Address Register (QuadSPI_SFAR) 2487
40.14.13 Sampling Register (QuadSPI_SMPR) 2487
40.14.14 RX Buffer Status Register (QuadSPI_RBSR) 2488
40.14.15 RX Buffer Control Register (QuadSPI_RBCT) 2489
40.14.16 TX Buffer Status Register (QuadSPI_TBSR) 2490
40.14.17 TX Buffer Data Register (QuadSPI_TBDR) 2490
40.14.18 Status Register (QuadSPI_SR) 2492
40.14.19 Flag Register (QuadSPI_FR) 2495
40.14.20 Interrupt and DMA Request Select and Enable Register (QuadSPI_RSER) 2498
40.14.21 Sequence Suspend Status Register (QuadSPI_SPNDST) 2501
40.14.22 Sequence Pointer Clear Register (QuadSPI_SPTRCLR) 2503
40.14.23 Serial Flash A1 Top Address (QuadSPI_SFA1AD) 2503
40.14.24 Serial Flash A2 Top Address (QuadSPI_SFA2AD) 2504

40.14.25 Serial Flash B1Top Address (QuadSPI_SFB1AD)..... 2504
40.14.26 Serial Flash B2Top Address (QuadSPI_SFB2AD)..... 2505
40.14.27 RX Buffer Data Register (QuadSPI_RBDR*n*)..... 2505
40.14.28 LUT Key Register (QuadSPI_LUTKEY)..... 2506
40.14.29 LUT Lock Configuration Register (QuadSPI_LCKCR)..... 2507
40.14.30 Look-up Table register (QuadSPI_LUT0)..... 2508
40.14.31 Look-up Table register (QuadSPI_LUT1)..... 2509
40.14.32 Look-up Table register (QuadSPI_LUT*n*)..... 2510

Chapter 41
ROM Controller with Patch (ROMC)

41.1 Overview..... 2511
41.1.1 Features..... 2512
41.1.2 Modes of Operation..... 2512
41.1.2.1 Low Power Mode..... 2513
41.2 Clocks..... 2513
41.3 Memory Map..... 2513
41.3.1 ROM Memory Map in detail..... 2513
41.4 Functional Description..... 2514
41.4.1 ROM Controller (ROMC) Functional Description..... 2514
41.4.1.1 Functionality overview..... 2514
41.4.2 ROMC Functional Description..... 2514
41.4.2.1 ROMC Disabling..... 2515
41.4.2.2 ROMC Event Priority..... 2515
41.4.2.3 Data Fixing..... 2515
41.4.2.4 Opcode Patching..... 2516
41.4.2.4.1 Typical Software Response to Opcode Patch..... 2517
41.4.2.5 External Boot Feature..... 2518
41.4.2.6 Alternate Masters and ROMC..... 2519
41.5 ROMCP Memory Map/Register Definition..... 2519

41.5.1 ROMC Data Registers (ROMC_ROMPATCH*n*D) 2520
41.5.2 ROMC Control Register (ROMC_ROMPATCHCNTL) 2521
41.5.3 ROMC Enable Register High (ROMC_ROMPATCHENH) 2522
41.5.4 ROMC Enable Register Low (ROMC_ROMPATCHENL) 2522
41.5.5 ROMC Address Registers (ROMC_ROMPATCH*n*A) 2523
41.5.6 ROMC Status Register (ROMC_ROMPATCHSR) 2524

Chapter 42
Synchronous Audio Interface (SAI)

42.1 Overview 2527
42.1.1 Features 2527
42.1.2 Block diagram 2527
42.1.3 Modes of operation 2528
42.1.3.1 Run mode 2528
42.1.3.2 Stop modes 2528
42.1.3.3 Debug mode 2528
42.2 External Signals 2529
42.3 Functional description 2531
42.3.1 SAI clocking 2531
42.3.1.1 Audio master clock 2531
42.3.1.2 Bit clock 2531
42.3.1.3 Bus clock 2532
42.3.2 SAI resets 2532
42.3.2.1 Software reset 2532
42.3.2.2 FIFO reset 2532
42.3.3 Synchronous modes 2533
42.3.3.1 Synchronous mode 2533
42.3.4 Frame sync configuration 2533
42.3.5 Data FIFO 2534
42.3.5.1 Data alignment 2534

42.3.5.2 FIFO pointers ... 2535
42.3.6 Word mask register ... 2536
42.3.7 Interrupts and DMA requests ... 2536
42.3.7.1 FIFO request flag ... 2536
42.3.7.2 FIFO warning flag ... 2537
42.3.7.3 FIFO error flag ... 2537
42.3.7.4 Sync error flag ... 2537
42.3.7.5 Word start flag ... 2538
42.4 Memory map and register definition ... 2538
42.4.1 SAI Transmit Control Register (I2S*x*_TCSR) ... 2541
42.4.2 SAI Transmit Configuration 1 Register (I2S*x*_TCR1) ... 2544
42.4.3 SAI Transmit Configuration 2 Register (I2S*x*_TCR2) ... 2544
42.4.4 SAI Transmit Configuration 3 Register (I2S*x*_TCR3) ... 2546
42.4.5 SAI Transmit Configuration 4 Register (I2S*x*_TCR4) ... 2547
42.4.6 SAI Transmit Configuration 5 Register (I2S*x*_TCR5) ... 2548
42.4.7 SAI Transmit Data Register (I2S*x*_TDR*n*) ... 2549
42.4.8 SAI Transmit FIFO Register (I2S*x*_TFR*n*) ... 2550
42.4.9 SAI Transmit Mask Register (I2S*x*_TMR) ... 2550
42.4.10 SAI Receive Control Register (I2S*x*_RCSR) ... 2551
42.4.11 SAI Receive Configuration 1 Register (I2S*x*_RCR1) ... 2554
42.4.12 SAI Receive Configuration 2 Register (I2S*x*_RCR2) ... 2555
42.4.13 SAI Receive Configuration 3 Register (I2S*x*_RCR3) ... 2556
42.4.14 SAI Receive Configuration 4 Register (I2S*x*_RCR4) ... 2557
42.4.15 SAI Receive Configuration 5 Register (I2S*x*_RCR5) ... 2559
42.4.16 SAI Receive Data Register (I2S*x*_RDR*n*) ... 2559
42.4.17 SAI Receive FIFO Register (I2S*x*_RFR*n*) ... 2560
42.4.18 SAI Receive Mask Register (I2S*x*_RMR) ... 2560

Chapter 43
Smart Direct Memory Access Controller (SDMA)

43.1 Overview....2563
43.1.1 Block Diagram....2563
43.1.2 Features....2565
43.2 External Signals....2567
43.3 Clocks....2567
43.4 Functional Description....2567
43.4.1 SDMA Core....2568
43.4.1.1 SDMA Core Structure....2569
43.4.1.2 Program Control Unit (PCU)....2572
43.4.1.2.1 Instruction Types....2572
43.4.1.2.2 PCU States....2573
43.4.1.3 SDMA Core Memory....2576
43.4.2 Scheduler....2576
43.4.2.1 Primary Functions....2576
43.4.2.2 Channels and DMA Requests....2577
43.4.2.2.1 Channels....2577
43.4.2.2.2 DMA Requests....2577
43.4.2.2.3 Mapping from DMA Requests to Channels and Priorities....2577
43.4.2.3 Scheduler Functional Description....2577
43.4.2.3.1 Scheduler Overview....2577
43.4.2.3.2 DMA Requests Scanning....2578
43.4.2.3.3 Mapping DMA Requests to Pending Channels....2579
43.4.2.3.4 Channel Overflow....2582
43.4.2.3.5 Runnable Channels Evaluation....2582
43.4.2.3.6 Next Channel Decision Tree....2584
43.4.2.3.7 Scheduler State Diagram....2586
43.4.2.3.8 Scheduler Pipeline Timing Diagram....2588
43.4.2.3.9 Channel-DMA Request Mapping....2588
43.4.2.3.10 Examples: How to Start a Channel....2588

43.4.2.4 Context Switching....2589
43.4.2.4.1 Context Switch Modes....2590
43.4.2.4.2 Context Switch Procedure....2590
43.4.2.4.3 Context Map in Memory....2592
43.4.3 Functional Units....2592
43.4.3.1 Burst DMA Unit....2592
43.4.3.1.1 Burst DMA Structure....2593
43.4.3.1.2 Burst DMA Registers....2594
43.4.3.1.3 Burst DMA Data Transfers....2595
43.4.3.1.3.1 Data Retrieval from the ARM platform Memory....2595
43.4.3.1.3.2 Storing Data Into the ARM platform Memory....2595
43.4.3.1.3.3 Transferring Data Between Two ARM platform Memory Locations-Burst DMA Unit....2596
43.4.3.2 Peripheral DMA Unit....2596
43.4.3.2.1 Peripheral DMA Structure....2597
43.4.3.2.2 Peripheral DMA Registers....2598
43.4.3.2.3 Peripheral DMA Data Transfers....2599
43.4.3.2.3.1 Data Retrieval from the ARM platform Memory or Peripheral....2599
43.4.3.2.3.2 Storing Data into the ARM platform Memory or Peripheral. 2599
43.4.3.2.3.3 Transferring Data Between Two ARM platform Memory Locations-Peripheral DMA Unit....2600
43.4.4 SDMA Security Support....2600
43.4.4.1 Locked Mode....2600
43.4.5 OnCE and PCU Debug States....2601
43.4.6 SDMA Clocks and Low Power Modes....2603
43.4.6.1 Clock Gating and Low Power Modes....2604
43.4.6.1.1 Coarse Clock Gating....2604
43.4.6.1.2 Refined Clock Gating....2605
43.4.6.1.3 Low Power Modes and User Control....2605

43.4.6.1.3.1 SLEEP Mode....2606
43.4.6.1.3.2 RUN Mode....2606
43.4.6.1.3.3 DEBUG Mode....2607
43.4.6.1.4 Stop Mode Response....2607
43.4.6.2 Reset....2607
43.4.7 Software Interface....2607
43.4.8 Initialization Information....2608
43.4.8.1 Hardware Reset....2608
43.4.8.2 Channel Script Execution....2609
43.4.8.3 Initialization and Script Execution Setup Sequence....2609
43.4.9 SDMA Programming Model....2610
43.4.9.1 State and Registers Per Channel....2610
43.4.9.2 General Purpose Registers....2611
43.4.9.3 Functional Unit State....2611
43.4.9.3.1 Program Counter Register (PC)....2611
43.4.9.3.2 Flags....2611
43.4.9.3.3 Return Program Counter (RPC)....2612
43.4.9.3.4 Loop Mode Start Program Counter (SPC)....2612
43.4.9.3.5 Loop Mode End Program Counter (EPC)....2612
43.4.9.4 Context Switching-Programming....2613
43.4.9.5 Address Space....2614
43.4.9.5.1 Instruction Memory Map....2615
43.4.9.5.2 Data Memory Map....2615
43.4.10 SDMA Initialization....2617
43.4.10.1 Hardware Reset-SDMA....2617
43.4.10.2 Standard Boot Sequence....2617
43.4.10.3 User-Defined Boot Sequence....2618
43.4.10.4 Script Loading and Context Initialization....2618
43.4.11 Instruction Description....2619

43.4.11.1 Scheduling Instructions....2619
43.4.11.2 Conditional Branch Instructions....2619
43.4.11.3 Unconditional Jump Instructions....2620
43.4.11.4 Subroutine Return Instructions....2620
43.4.11.5 Loop Instruction....2620
43.4.11.6 Miscellaneous Instructions....2621
43.4.11.7 Logic Instructions....2621
43.4.11.8 Arithmetic Instructions....2621
43.4.11.9 Compare Instructions....2622
43.4.11.10 Test Instructions....2622
43.4.11.11 Byte Permutation Instructions....2622
43.4.11.12 Bit Shift Instructions....2623
43.4.11.13 Bit Manipulation Instructions....2623
43.4.11.14 SDMA Memory Access Instructions....2623
43.4.11.15 Functional Unit Instructions....2624
43.4.11.16 Illegal Instructions....2624
43.4.11.17 Debug Instructions....2624
43.4.12 Functional Units Programming Model....2625
43.4.12.1 Burst DMA Unit Programming....2626
43.4.12.1.1 Memory Source Address Register (MSA)....2626
43.4.12.1.2 Memory Destination Address Register (MDA)....2627
43.4.12.1.3 Memory Data Buffer Register (MD)....2627
43.4.12.1.4 State Register (MS)....2628
43.4.12.1.5 Burst DMA Write (stf)....2629
43.4.12.1.6 Burst DMA Read (ldf)....2632
43.4.12.1.7 Prefetch/Flush and Auto-Flush Management-Burst DMA Unit....2633
43.4.12.1.8 Data Alignment and Endianness-Burst DMA Unit....2635
43.4.12.1.8.1 Burst DMA in Read Mode....2635
43.4.12.1.8.2 Burst DMA in Write Mode....2636

43.4.12.1.8.3 Endianness-Burst DMA Unit ... 2637
43.4.12.1.9 Burst DMA Unit Copy Mode ... 2638
43.4.12.1.10 Burst DMA Unit Error Management ... 2639
43.4.12.1.11 Conditional Yielding-Burst DMA Unit ... 2640
43.4.12.2 Peripheral DMA Unit Programming ... 2641
43.4.12.2.1 Peripheral Source Address Register (PSA) ... 2642
43.4.12.2.2 Peripheral Destination Address Register (PDA) ... 2643
43.4.12.2.3 Peripheral Data Register (PD) ... 2643
43.4.12.2.4 Peripheral State Register (PS) ... 2644
43.4.12.2.5 Peripheral DMA Write (stf)-Write Mode ... 2645
43.4.12.2.6 Peripheral DMA Read (ldf)-Read Mode ... 2648
43.4.12.2.7 Peripheral DMA Unit Copy Mode ... 2649
43.4.12.2.8 Error Management ... 2650
43.4.12.2.8.1 Immediate Errors ... 2650
43.4.12.2.8.2 Data Transfer Errors ... 2650
43.4.12.2.8.3 Read Error (First Phase) ... 2651
43.4.12.2.8.4 Write Error and Read Error (Second Phase) ... 2651
43.4.12.2.8.5 Copy Mode Errors ... 2652
43.4.12.2.8.6 Error Check Example ... 2652
43.4.12.2.9 Peripheral DMA Unit Prefetch/Flush Management ... 2653
43.4.12.3 OnCE and Real-Time Debug ... 2653
43.4.12.3.1 Memory and Register Access ... 2653
43.4.12.3.2 Hardware Breakpoints ... 2654
43.4.12.3.3 Watchpoints ... 2654
43.4.12.3.4 Software Breakpoints ... 2654
43.4.12.3.5 Core Control ... 2654
43.4.13 The OnCE Controller ... 2654
43.4.13.1 OnCE Commands ... 2655
43.4.13.2 Sending Commands to the OnCE Controller ... 2656

43.4.13.2.1 Using the JTAG Interface..... 2656
43.4.13.2.2 Using the ARM platform..... 2656
43.4.13.2.3 Conflicts Between the JTAG and the ARM platform Accesses..... 2658
43.4.13.3 Executing a Command from the OnCE..... 2658
43.4.13.3.1 Nature of the Commands..... 2658
43.4.13.3.2 Execution Request..... 2659
43.4.13.3.3 Command Execution..... 2659
43.4.13.4 Registers Descriptions..... 2661
43.4.13.4.1 Event Cell Counter Register (ECOUNT)..... 2661
43.4.13.4.2 Event Cell Address Registers (EAA or EAB)..... 2662
43.4.13.4.3 Event Cell Address Mask Register (EAM)..... 2662
43.4.13.4.4 Event Cell Data Register (ED)..... 2662
43.4.13.4.5 Event Cell Data Mask Register (EDM)..... 2662
43.4.13.4.6 Real Time Buffer Register (RTB)..... 2662
43.4.13.4.7 Event Control Register (ECTL)..... 2663
43.4.13.4.8 Trace Buffer (TB)..... 2663
43.4.13.4.9 OnCE Status Register (OSTAT)..... 2663
43.4.13.5 JTAG Interface Requirements..... 2664
43.4.13.5.1 TCK Speed Limitation..... 2664
43.4.13.5.2 Synchronization Implementation..... 2664
43.4.13.5.3 JTAG Controller Start-Up Recommended Procedure..... 2666
43.4.14 Using the OnCE..... 2666
43.4.14.1 Activating Clocks in Debug Mode..... 2666
43.4.14.2 Getting the Current Status..... 2667
43.4.14.3 Methods of Entering Debug Mode..... 2667
43.4.14.3.1 External Debug Request During Reset..... 2667
43.4.14.3.2 Debug Request During Normal Activity..... 2668
43.4.14.3.3 Software Breakpoint Instruction..... 2668
43.4.14.3.4 Event Detection Unit Matching Condition..... 2668

43.4.14.4 Executing Instructions in Debug Mode ... 2668
43.4.14.5 Command Sequences Examples ... 2668
43.4.14.5.1 Getting the SDMA Status ... 2669
43.4.14.5.2 Saving the Context ... 2669
43.4.14.5.3 Restoring the Context ... 2670
43.4.14.5.4 Accessing the Memory ... 2671
43.4.14.5.5 Resuming Program Execution ... 2672
43.4.14.5.6 Single Stepping in RAM ... 2673
43.4.14.5.7 Single Stepping in ROM ... 2673
43.4.14.6 OnCE Event Detection Unit ... 2673
43.4.14.7 Clock Gating and Reset ... 2675
43.4.14.7.1 Clocks ... 2675
43.4.14.7.2 Resets ... 2676
43.4.14.8 Real Time Features ... 2676
43.4.14.8.1 Trace Buffer ... 2676
43.4.14.8.2 Real Time Buffer ... 2678
43.4.14.8.3 Emulation Pin ... 2678
43.4.14.8.4 Real-Time Debug Outputs ... 2678
43.5 Instruction Set ... 2682
43.5.1 Instruction Encoding ... 2682
43.5.2 SDMA Instruction Set ... 2684
43.5.2.1 ADD (Addition) ... 2685
43.5.2.2 ADDI (Add with Immediate Value) ... 2686
43.5.2.3 AND (Logical AND) ... 2687
43.5.2.4 ANDI (Logical AND with Immediate Value) ... 2688
43.5.2.5 ANDN (Logical AND NOT) ... 2689
43.5.2.6 ANDNI (Logical AND with Negated Immediate Value) ... 2690
43.5.2.7 ASR1 (Arithmetic Shift Right by 1 Bit) ... 2691
43.5.2.8 BCLRI1 (Bit Clear Immediate) ... 2692

43.5.2.9 BDF (Conditional Branch if Destination Fault)....2693
43.5.2.10 BF (Conditional Branch if False)....2694
43.5.2.11 BSETI (Bit Set Immediate)....2695
43.5.2.12 BSF (Conditional Branch if Source Fault)....2696
43.5.2.13 BT (Conditional Branch if True)....2697
43.5.2.14 BTSTI (Bit Test immediate)....2698
43.5.2.15 CLRF (Clear ARM platform flags)....2699
43.5.2.16 CMPEQ (Compare for Equal)....2700
43.5.2.17 CMPEQI (Compare with Immediate for Equal)....2701
43.5.2.18 CMPHS (Compare for Higher or Same)....2702
43.5.2.19 CMPLT (Compare for Less Than)....2703
43.5.2.20 cpShReg (Update Context of PCU Registers and Flag)....2704
43.5.2.21 DONE (DONE, Yield)....2704
43.5.2.22 ILLEGAL (ILLEGAL Instruction)....2706
43.5.2.23 JMP (Unconditional Jump Immediate)....2707
43.5.2.24 JMPR (Unconditional Jump)....2707
43.5.2.25 JSR (Unconditional Jump to Subroutine Immediate)....2708
43.5.2.26 JSRR (Unconditional Jump to Subroutine)....2709
43.5.2.27 LD (Load Register)....2710
43.5.2.28 LDF (Load Register from Functional Unit)....2711
43.5.2.29 LDI (Load Register with Immediate Value)....2713
43.5.2.30 LDRPC (Load from RPC to Register)....2714
43.5.2.31 LOOP (Hardware Loop)....2715
43.5.2.32 LSL1 (Logical Shift Left by 1 Bit)....2717
43.5.2.33 LSR1 (Logical Shift Right by 1 Bit)....2718
43.5.2.34 MOV (Logical Move)....2719
43.5.2.35 NOTIFY (Notify to ARM platform)....2720
43.5.2.36 OR (Logical OR)....2721
43.5.2.37 ORI (Logical OR with Immediate Value)....2722

43.5.2.38 RET (Return from Subroutine)..... 2723
43.5.2.39 REVB (Reverse Byte Order).....2724
43.5.2.40 Reverse Low Order Bytes(REVBLO)..... 2724
43.5.2.41 ROR1 (Rotate Right by 1 Bit).....2725
43.5.2.42 RORB (Rotate Right by 1 Byte)..... 2726
43.5.2.43 SOFTBKPT (Software Breakpoint).....2727
43.5.2.44 ST (Store Register).....2727
43.5.2.45 STF (Store Register in Functional Unit)..... 2729
43.5.2.46 SUB (Subtract)..... 2732
43.5.2.47 SUBI (Subtract with Immediate)..... 2733
43.5.2.48 TST (Test with Zero)..... 2734
43.5.2.49 TSTI (Test Immediate).....2735
43.5.2.50 XOR (Logical Exclusive OR)..... 2736
43.5.2.51 XORI (Exclusive OR with Immediate).....2737
43.5.2.52 YIELD, YIELDGE (DONE, Yield).....2738
43.6 Software Restrictions.....2738
43.6.1 Unsupported Burst DMA Access Sequence..... 2738
43.7 Application Notes..... 2739
43.7.1 Data Structures for Boot Code and Channel Scripts.....2739
43.7.1.1 Buffer Descriptor Format.....2740
43.7.1.2 Buffer Descriptor Commands for Bootload scripts..... 2743
43.7.1.3 Example of Buffer Descriptors for Channel 0..... 2744
43.7.1.4 Channel Context.....2747
43.7.2 Typical Data Transfer Supported by SDMA DMA Units..... 2747
43.7.2.1 External Memory to External Memory.....2748
43.7.2.2 Peripheral to Peripheral Transfer..... 2749
43.7.2.2.1 Source and Destination Target Have the Same Data Path Width.....2749
43.7.2.2.2 Source and Destination Target Have a Different Data Path Width..... 2750
43.7.2.3 Transfer Between Peripheral and External Memory.....2751

43.7.2.3.1 Peripheral to External Memory Transfer 2751
43.7.2.3.2 External Memory to Peripheral Transfer 2753
43.7.2.4 Transfer Between External Memory and Internal Memory 2754
43.7.2.4.1 Internal Memory to Internal Memory 2754
43.7.2.4.2 Transfer Between Peripheral and Internal Memory 2754
43.8 ARM Platform Memory Map and Control Register Definitions 2754
43.8.1 ARM platform Channel 0 Pointer (SDMAARM_MC0PTR) 2760
43.8.2 Channel Interrupts (SDMAARM_INTR) 2760
43.8.3 Channel Stop/Channel Status (SDMAARM_STOP_STAT) 2760
43.8.4 Channel Start (SDMAARM_HSTART) 2761
43.8.5 Channel Event Override (SDMAARM_EVTOVR) 2761
43.8.6 Channel BP Override (SDMAARM_DSPOVR) 2762
43.8.7 Channel ARM platform Override (SDMAARM_HOSTOVR) 2762
43.8.8 Channel Event Pending (SDMAARM_EVTPEND) 2762
43.8.9 Reset Register (SDMAARM_RESET) 2763
43.8.10 DMA Request Error Register (SDMAARM_EVTERR) 2764
43.8.11 Channel ARM platform Interrupt Mask (SDMAARM_INTRMASK) 2764
43.8.12 Schedule Status (SDMAARM_PSW) 2765
43.8.13 DMA Request Error Register (SDMAARM_EVTERRDBG) 2765
43.8.14 Configuration Register (SDMAARM_CONFIG) 2766
43.8.15 SDMA LOCK (SDMAARM_SDMA_LOCK) 2767
43.8.16 OnCE Enable (SDMAARM_ONCE_ENB) 2768
43.8.17 OnCE Data Register (SDMAARM_ONCE_DATA) 2769
43.8.18 OnCE Instruction Register (SDMAARM_ONCE_INSTR) 2769
43.8.19 OnCE Status Register (SDMAARM_ONCE_STAT) 2769
43.8.20 OnCE Command Register (SDMAARM_ONCE_CMD) 2771
43.8.21 Illegal Instruction Trap Address (SDMAARM_ILLINSTADDR) 2772
43.8.22 Channel 0 Boot Address (SDMAARM_CHN0ADDR) 2772
43.8.23 DMA Requests (SDMAARM_EVT_MIRROR) 2773

43.8.24 DMA Requests 2 (SDMAARM_EVT_MIRROR2)..... 2773
43.8.25 Cross-Trigger Events Configuration Register 1 (SDMAARM_XTRIG_CONF1)..... 2774
43.8.26 Cross-Trigger Events Configuration Register 2 (SDMAARM_XTRIG_CONF2)..... 2776
43.8.27 Channel Priority Registers (SDMAARM_SDMA_CHNPRI*n*)..... 2777
43.8.28 Channel Enable RAM (SDMAARM_CHNENBL*n*)..... 2777
43.9 BP Memory Map and Control Register Definitions..... 2778
43.9.1 Channel 0 Pointer (SDMABP_DC0PTR)..... 2778
43.9.2 Channel Interrupts (SDMABP_INTR)..... 2779
43.9.3 Channel Stop/Channel Status (SDMABP_STOP_STAT)..... 2779
43.9.4 Channel Start (SDMABP_DSTART)..... 2780
43.9.5 DMA Request Error Register (SDMABP_EVTERR)..... 2780
43.9.6 Channel DSP Interrupt Mask (SDMABP_INTRMASK)..... 2781
43.9.7 DMA Request Error Register (SDMABP_EVTERRDBG)..... 2781
43.10 SDMA Internal (Core) Memory Map and Internal Register Definitions..... 2781
43.10.1 ARM platform Channel 0 Pointer (SDMACORE_MC0PTR)..... 2783
43.10.2 Current Channel Pointer (SDMACORE_CCPTR)..... 2783
43.10.3 Current Channel Register (SDMACORE_CCR)..... 2783
43.10.4 Highest Pending Channel Register (SDMACORE_NCR)..... 2784
43.10.5 External DMA Requests Mirror (SDMACORE_EVENTS)..... 2785
43.10.6 Current Channel Priority (SDMACORE_CCPRI)..... 2786
43.10.7 Next Channel Priority (SDMACORE_NCPRI)..... 2786
43.10.8 OnCE Event Cell Counter (SDMACORE_ECOUNT)..... 2787
43.10.9 OnCE Event Cell Control Register (SDMACORE_ECTL)..... 2787
43.10.10 OnCE Event Address Register A (SDMACORE_EAA)..... 2789
43.10.11 OnCE Event Cell Address Register B (SDMACORE_EAB)..... 2789
43.10.12 OnCE Event Cell Address Mask (SDMACORE_EAM)..... 2789
43.10.13 OnCE Event Cell Data Register (SDMACORE_ED)..... 2790
43.10.14 OnCE Event Cell Data Mask (SDMACORE_EDM)..... 2790
43.10.15 OnCE Real-Time Buffer (SDMACORE_RTB)..... 2791

43.10.16 OnCE Trace Buffer (SDMACORE_TB)..... 2791
43.10.17 OnCE Status (SDMACORE_OSTAT)..... 2792
43.10.18 Channel 0 Boot Address (SDMACORE_MCHN0ADDR)..... 2794
43.10.19 ENDIAN Status Register (SDMACORE_ENDIANNESS)..... 2795
43.10.20 Lock Status Register (SDMACORE_SDMA_LOCK)..... 2796
43.10.21 External DMA Requests Mirror #2 (SDMACORE_EVENTS2)..... 2797
43.11 SDMA Peripheral Registers.....2797

Chapter 44
Subscriber Identification Module (SIM)

44.1 SIM Overview.....2799
44.1.1 Features..... 2800
44.1.2 Modes of Operation..... 2800
44.1.3 SIM Bus Interface Overview..... 2800
44.1.4 SIM Clock Generator Overview..... 2801
44.1.5 SIM Transmitter Overview..... 2801
44.1.6 SIM Receiver Overview.....2802
44.1.7 SIM Port Control Overview.....2803
44.1.8 SIM General Purpose Counter Overview..... 2803
44.1.9 SIM LRC Block Overview..... 2803
44.1.10 SIM CRC Block Overview..... 2804
44.2 External Signal Description..... 2804
44.2.1 External Signals Overview.....2804
44.2.2 Detailed Signal Descriptions.....2805
44.2.2.1 SIM_CLK.....2805
44.2.2.2 SIM_RST_B.....2805
44.2.2.3 SIM_SVEN..... 2805
44.2.2.4 SIM_TRXD.....2805
44.2.2.5 SIM_PD..... 2806
44.3 SIM Functional Description.....2806

44.3.1 SIM Bus Interface ... 2807
44.3.2 SIM Clocking ... 2810
44.3.3 SIM Clock Generator ... 2811
44.3.3.1 Scan Test ... 2812
44.3.3.2 Baud Clock Generation ... 2812
44.3.3.3 Transmitter Clock Generation ... 2813
44.3.3.4 Receiver Clock Generation ... 2813
44.3.3.5 Port Control Clock Generation ... 2813
44.3.3.6 Low Power Mode Clock Control ... 2813
44.3.4 SIM Transmitter ... 2814
44.3.4.1 Transmit State Machine ... 2814
44.3.4.2 Transmit Shift Register ... 2816
44.3.4.3 Transmit FIFO ... 2816
44.3.4.4 Transmit Guard Time Generator ... 2816
44.3.4.5 Transmit NACK Generator ... 2817
44.3.4.6 Transmit Data Convention Logic ... 2818
44.3.5 SIM Receiver ... 2819
44.3.5.1 Receive State Machine ... 2819
44.3.5.2 Data Sampling / Voting ... 2821
44.3.5.3 Start Bit Detection ... 2821
44.3.5.4 Parity Error Detection ... 2822
44.3.5.5 Framing Error Detection ... 2822
44.3.5.6 NACK Detection ... 2823
44.3.5.7 Initial Character Detection ... 2823
44.3.5.8 Receive FIFO ... 2824
44.3.5.9 Overrun Detection ... 2825
44.3.5.10 Character Wait Time Counter ... 2825
44.3.6 SIM Port Control ... 2826
44.3.6.1 SIM Card Interface ... 2826

44.3.6.2 SIM Card Presence Detect ... 2826
44.3.6.3 SIM Card Automatic Power Down ... 2826
44.3.7 SIM General Purpose Counter ... 2827
44.3.8 SIM LRC Block ... 2828
44.3.9 SIM CRC Block ... 2829
44.3.10 Module Interrupts ... 2831
44.4 Initialization/Application Information ... 2831
44.4.1 Configuring SIM for Operation ... 2832
44.4.1.1 Configuring SIM Receiver ... 2832
44.4.1.2 Configuring SIM Transmitter ... 2833
44.4.1.3 Configuring SIM General Purpose Counter ... 2834
44.4.1.4 Configuring SIM to Measure WWT (Work Wait Time) for Type=0 Smartcards ... 2834
44.4.1.5 Configuring SIM to measure CWT, BWT, BGT for type=1 SmartCards ... 2835
44.4.1.6 Configuring SIM Linear Redundancy Check (LRC) Block ... 2836
44.4.1.7 Configuring SIM Cyclic Redundancy Check (CRC) Block ... 2836
44.4.2 Using the SIM Receiver ... 2837
44.4.2.1 Receive Parity Errors and Parity NACK Generation ... 2837
44.4.2.2 Receive Frame Errors ... 2838
44.4.2.3 Receive Overrun Errors and Overrun NACK Generation ... 2839
44.4.2.4 Using Initial Character Mode and Resulting Receive Data Formats ... 2839
44.4.2.5 Initial Character Mode Programming Notes ... 2840
44.4.2.6 Automatic Receiver Mode ... 2841
44.4.2.7 Using the SIM Receiver with "T=1" SIM Cards ... 2841
44.4.3 Using the SIM Transmitter ... 2842
44.4.3.1 Transmit Data Formats ... 2843
44.4.3.2 Transmit NACK ... 2843
44.4.3.3 Transmit Guard Time ... 2844
44.4.3.4 Using SIM Transmit with "T=1" SIM Cards ... 2844
44.4.4 Suggested "T=1" Compliant Programming Model ... 2845

44.4.4.1 Answer To Reset (ATR) Detection....2845
44.4.4.2 Programming Considerations for Geldkarte Cards....2847
44.4.4.3 Programming Considerations for T=0 SIM Cards....2848
44.4.4.4 Programming Considerations for T=1 SIM Cards....2849
44.5 SIM Memory Map/Register Definition....2851
44.5.1 SIM Port1 Control Register (SIM_PORT1_CNTL)....2853
44.5.2 SIM Setup Register (SIM_SETUP)....2855
44.5.3 SIM Port 1 Detect Register (SIM_PORT1_DETECT)....2855
44.5.4 SIM Transmit Buffer Register (SIM_XMT_BUF)....2857
44.5.5 SIM Receive Buffer Register (SIM_RCV_BUF)....2858
44.5.6 SIM Port0 Control Register (SIM_PORT0_CNTL)....2859
44.5.7 SIM Control Register (SIM_CNTL)....2861
44.5.8 SIM Clock Prescaler Register (SIM_CLK_PRESCALER)....2863
44.5.9 SIM Receive Threshold Register (SIM_RCV_THRESHOLD)....2864
44.5.10 SIM Enable Register (SIM_ENABLE)....2865
44.5.11 SIM Transmit Status Register (SIM_XMT_STATUS)....2867
44.5.12 SIM Receive Status Register (SIM_RCV_STATUS)....2869
44.5.13 SIM Interrupt Mask Register (SIM_INT_MASK)....2871
44.5.14 SIM Port0 Detect Register (SIM_PORT0_DETECT)....2873
44.5.15 SIM Data Format Register (SIM_DATA_FORMAT)....2875
44.5.16 SIM Transmit Threshold Register (SIM_XMT_THRESHOLD)....2875
44.5.17 SIM Transmit Guard Control Register (SIM_GUARD_CNTL)....2876
44.5.18 SIM Open Drain Configuration Control Register (SIM_OD_CONFIG)....2877
44.5.19 SIM Reset Control Register (SIM_RESET_CNTL)....2878
44.5.20 SIM Character Wait Time Register (SIM_CHAR_WAIT)....2879
44.5.21 SIM General Purpose Counter Register (SIM_GPCNT)....2880
44.5.22 SIM Divisor Register (SIM_DIVISOR)....2880
44.5.23 SIM Block Wait Time Register (SIM_BWT)....2881
44.5.24 SIM Block Guard Time Register (SIM_BGT)....2881

44.5.25 SIM Block Wait Time Register HIGH (SIM_BWT_H)..... 2882
44.5.26 SIM Transmit FIFO Status Register (SIM_XMT_FIFO_STAT)..... 2883
44.5.27 SIM Receive FIFO Counter Register (SIM_RCV_FIFO_CNT)..... 2883
44.5.28 SIM Receive FIFO Write Pointer Register (SIM_RCV_FIFO_WPTR)..... 2884
44.5.29 SIM Receive FIFO Read Pointer Register (SIM_RCV_FIFO_RPTR)..... 2884

Chapter 45
System JTAG Controller (SJC)

45.1 Overview..... 2885
45.1.1 Features..... 2886
45.1.2 Modes of Operation..... 2887
45.2 External Signals..... 2889
45.2.1 External Signal Overview..... 2890
45.2.2 TAP Controller..... 2891
45.2.3 Accessing ExtraDebug Registers..... 2893
45.3 TAP Selection Block (TSB)..... 2895
45.3.1 Select Mode Using Software..... 2895
45.4 Boundary Scan Register (BSR)..... 2896
45.5 SoC JTAG Instruction Register (SJIR)..... 2897
45.5.1 ID_CODE Instruction (IDCODE)..... 2897
45.5.2 SAMPLE/PRELOAD Instruction..... 2899
45.5.3 EXTEST Instruction..... 2899
45.5.4 HIGHZ Instruction..... 2900
45.5.5 BYPASS Instruction..... 2900
45.5.6 ENABLE_ExtraDebug Instruction..... 2900
45.5.7 ENTER_DEBUG instruction..... 2901
45.5.8 TAP Select Instruction..... 2901
45.5.9 EXTEST_PULSE instruction..... 2902
45.5.10 EXTEST_TRAIN instruction..... 2902
45.6 Security..... 2902

45.6.1 JTAG Security Modes 2903
45.6.1.1 Mode 1: No Debug - Maximum Security 2903
45.6.1.2 Mode 2: Secure JTAG - High Security 2904
45.6.1.2.1 Challenge/Response Mechanism in System JTAG Mode 2904
45.6.1.3 Mode 3: JTAG Enabled - Low Security 2905
45.6.2 Software Enabled JTAG 2905
45.6.3 Kill Trace 2906
45.6.4 SJC Disable Fuse 2907
45.7 Functional Description 2908
45.7.1 Static Core Debug 2908
45.7.2 Reset Mechanism 2908
45.8 Initialization/Application Information 2909
45.9 SJC Memory Map/Register Definition 2910
45.9.1 General Purpose Unsecured Status Register 1 (SJC_GPUSR1) 2911
45.9.2 General Purpose Unsecured Status Register 2 (SJC_GPUSR2) 2913
45.9.3 General Purpose Unsecured Status Register 3 (SJC_GPUSR3) 2913
45.9.4 General Purpose Secured Status Register (SJC_GPSSR) 2914
45.9.5 Debug Control Register (SJC_DCR) 2915
45.9.6 Security Status Register (SJC_SSR) 2917
45.9.7 General Purpose Clocks Control Register (SJC_GPCCR) 2920

Chapter 46
Secure Non-Volatile Storage (SNVS)

46.1 SNVS overview 2921
46.1.1 SNVS features 2921
46.1.2 Modes of operation 2921
46.2 SNVS structure 2922
46.2.1 SNVS_HP (high power domain) 2923
46.2.2 Non-secure real time counter 2924
46.2.2.1 Calibrating the time counter 2924

46.2.2.2 Time counter alarm ... 2925
46.2.2.3 Periodic interrupt ... 2925
46.3 SNVS_LP (low power domain) ... 2925
46.3.1 Behavior during system power down ... 2926
46.3.2 Monotonic counter (MC) ... 2926
46.4 SNVS reset and system power up ... 2927
46.4.1 PMIC Interface ... 2927
46.5 SNVS interrupts and alarms ... 2928
46.6 Programming Guidelines ... 2929
46.6.1 RTC control bits setting ... 2929
46.6.2 RTC value read ... 2930
46.6.3 General initialization guidelines ... 2930
46.7 SNVS Register Descriptions ... 2931
46.7.1 SNVS Memory Map ... 2932
46.7.2 SNVS_HP Lock (HPLR) ... 2933
46.7.2.1 Address ... 2933
46.7.2.2 Function ... 2933
46.7.2.3 Diagram ... 2933
46.7.2.4 Fields ... 2934
46.7.3 SNVS_HP Command (HPCOMR) ... 2936
46.7.3.1 Address ... 2936
46.7.3.2 Function ... 2937
46.7.3.3 Diagram ... 2937
46.7.3.4 Fields ... 2937
46.7.4 SNVS_HP Control (HPCR) ... 2940
46.7.4.1 Address ... 2940
46.7.4.2 Function ... 2940
46.7.4.3 Diagram ... 2940
46.7.4.4 Fields ... 2940

46.7.5 SNVS_HP Security Interrupt Control (HPSICR) 2942
46.7.5.1 Address 2942
46.7.5.2 Function 2943
46.7.5.3 Diagram 2943
46.7.5.4 Fields 2943
46.7.6 SNVS_HP Security Violation Control (HPSVCR) 2944
46.7.6.1 Address 2944
46.7.6.2 Function 2944
46.7.6.3 Diagram 2945
46.7.6.4 Fields 2945
46.7.7 SNVS_HP Status (HPSR) 2946
46.7.7.1 Address 2946
46.7.7.2 Function 2946
46.7.7.3 Diagram 2946
46.7.7.4 Fields 2947
46.7.8 SNVS_HP Security Violation Status (HPSVSR) 2949
46.7.8.1 Address 2949
46.7.8.2 Function 2949
46.7.8.3 Diagram 2949
46.7.8.4 Fields 2949
46.7.9 SNVS_HP High Assurance Counter IV (HPHACIVR) 2951
46.7.9.1 Address 2951
46.7.9.2 Function 2951
46.7.9.3 Diagram 2951
46.7.9.4 Fields 2951
46.7.10 SNVS_HP High Assurance Counter (HPHACR) 2952
46.7.10.1 Address 2952
46.7.10.2 Function 2952
46.7.10.3 Diagram 2952

46.7.10.4 Fields....2952
46.7.11 SNVS_HP Real Time Counter MSB (HPRTCMR)....2953
46.7.11.1 Address....2953
46.7.11.2 Function....2953
46.7.11.3 Diagram....2953
46.7.11.4 Fields....2953
46.7.12 SNVS_HP Real Time Counter LSB (HPRTCLR)....2954
46.7.12.1 Address....2954
46.7.12.2 Function....2954
46.7.12.3 Diagram....2954
46.7.12.4 Fields....2954
46.7.13 SNVS_HP Time Alarm MSB (HPTAMR)....2955
46.7.13.1 Address....2955
46.7.13.2 Function....2955
46.7.13.3 Diagram....2955
46.7.13.4 Fields....2955
46.7.14 SNVS_HP Time Alarm LSB (HPTALR)....2956
46.7.14.1 Address....2956
46.7.14.2 Function....2956
46.7.14.3 Diagram....2956
46.7.14.4 Fields....2956
46.7.15 SNVS_LP Lock (LPLR)....2957
46.7.15.1 Address....2957
46.7.15.2 Function....2957
46.7.15.3 Diagram....2957
46.7.15.4 Fields....2957
46.7.16 SNVS_LP Control (LPCR)....2960
46.7.16.1 Address....2960
46.7.16.2 Function....2960

46.7.16.3 Diagram....2960
46.7.16.4 Fields....2960
46.7.17 SNVS_LP Master Key Control (LPMKCR)....2963
46.7.17.1 Address....2963
46.7.17.2 Function....2963
46.7.17.3 Diagram....2963
46.7.17.4 Fields....2964
46.7.18 SNVS_LP Security Violation Control (LPSVCR)....2965
46.7.18.1 Address....2965
46.7.18.2 Function....2965
46.7.18.3 Diagram....2965
46.7.18.4 Fields....2965
46.7.19 SNVS_LP Tamper Glitch Filters Configuration (LPTGFCR)....2966
46.7.19.1 Address....2966
46.7.19.2 Function....2967
46.7.19.3 Diagram....2967
46.7.19.4 Fields....2967
46.7.20 SNVS_LP Tamper Detectors Configuration (LPTDCR)....2968
46.7.20.1 Address....2968
46.7.20.2 Function....2968
46.7.20.3 Diagram....2968
46.7.20.4 Fields....2969
46.7.21 SNVS_LP Status (LPSR)....2971
46.7.21.1 Address....2971
46.7.21.2 Function....2971
46.7.21.3 Diagram....2971
46.7.21.4 Fields....2972
46.7.22 SNVS_LP Secure Real Time Counter MSB (LPSRTCMR)....2974
46.7.22.1 Address....2974

46.7.22.2 Function ... 2974
46.7.22.3 Diagram ... 2974
46.7.22.4 Fields ... 2974
46.7.23 SNVS_LP Secure Real Time Counter LSB (LPSRTCLR) ... 2975
46.7.23.1 Address ... 2975
46.7.23.2 Function ... 2975
46.7.23.3 Diagram ... 2975
46.7.23.4 Fields ... 2975
46.7.24 SNVS_LP Time Alarm (LPTAR) ... 2976
46.7.24.1 Address ... 2976
46.7.24.2 Function ... 2976
46.7.24.3 Diagram ... 2976
46.7.24.4 Fields ... 2976
46.7.25 SNVS_LP Secure Monotonic Counter MSB (LPSMCMR) ... 2977
46.7.25.1 Address ... 2977
46.7.25.2 Function ... 2977
46.7.25.3 Diagram ... 2977
46.7.25.4 Fields ... 2977
46.7.26 SNVS_LP Secure Monotonic Counter LSB (LPSMCLR) ... 2978

Chapter 47
Shared Peripheral Bus Arbiter (SPBA)

47.1 Overview....3009
47.1.1 Features....3010
47.1.2 Modes of operation....3011
47.2 Clocks....3011
47.3 Functional description....3012
47.3.1 Masters arbitration....3012
47.4 Resource ownership control....3015
47.4.1 Access control....3015
47.4.1.1 Peripheral access....3015
47.4.1.2 Peripheral Right Register access....3016
47.4.2 Owner election....3017
47.4.3 Ending ownership....3017
47.4.3.1 Software Controlled Ownership Ending....3017
47.4.4 The Un-owned State....3018
47.5 SPBA Memory Map/Register Definition....3018
47.5.1 Peripheral Rights Register (SPBA_PRR*n*)....3020

Chapter 48
Sony/Philips Digital Interface (SPDIF)

48.1 Introduction....3023
48.1.1 Overview....3025
48.2 External Signals....3025
48.3 Clocks....3026
48.4 Functional Description....3026
48.4.1 SPDIF Receiver....3026
48.4.1.1 Audio Data Reception....3027

48.4.1.1.1 Application Note....3028
48.4.1.2 Channel Status Reception....3029
48.4.1.2.1 Channel Status Interrupt....3030
48.4.1.3 User Bit Reception....3030
48.4.1.4 Validity Flag Reception....3032
48.4.1.5 SPDIF Receiver Interrupt Exception Definition....3032
48.4.1.6 Standards Compliance....3033
48.4.1.7 SPDIF PLOCK Detection and Rxclk Output....3034
48.4.1.8 Measuring Frequency of SPDIF_RxClk....3034
48.4.2 SPDIF Transmitter....3034
48.4.2.1 Audio Data Transmission....3035
48.4.2.2 Channel Status Transmission....3036
48.4.2.3 Validity Flag Transmission....3036
48.5 SPDIF Memory Map/Register Definition....3036
48.5.1 SPDIF Configuration Register (SPDIF_SCR)....3038
48.5.2 CDText Control Register (SPDIF_SRCD)....3040
48.5.3 PhaseConfig Register (SPDIF_SRPC)....3041
48.5.4 InterruptEn Register (SPDIF_SIE)....3042
48.5.5 InterruptStat Register (SPDIF_SIS)....3044
48.5.6 InterruptClear Register (SPDIF_SIC)....3046
48.5.7 SPDIFRxLeft Register (SPDIF_SRL)....3047
48.5.8 SPDIFRxRight Register (SPDIF_SRR)....3048
48.5.9 SPDIFRxCChannel_h Register (SPDIF_SRCSH)....3048
48.5.10 SPDIFRxCChannel_l Register (SPDIF_SRCSL)....3049
48.5.11 UchannelRx Register (SPDIF_SRU)....3049
48.5.12 QchannelRx Register (SPDIF_SRQ)....3050
48.5.13 SPDIFTxLeft Register (SPDIF_STL)....3050
48.5.14 SPDIFTxRight Register (SPDIF_STR)....3051
48.5.15 SPDIFTxCChannelCons_h Register (SPDIF_STCSCH)....3051

48.5.16 SPDIFTxCChannelCons_l Register (SPDIF_STCSCL)..... 3052
48.5.17 FreqMeas Register (SPDIF_SRFM)..... 3052
48.5.18 SPDIFTxClk Register (SPDIF_STC)..... 3053

Chapter 49
System Reset Controller (SRC)

49.1 SRC Overview..... 3055
49.1.1 Features..... 3055
49.2 External Signals..... 3055
49.3 Clocks..... 3056
49.4 Top-level resets, power-up sequence and external supply integration..... 3057
49.4.1 Reset and Power-up Flow..... 3057
49.4.2 Finite-State Machine (FSM)..... 3060
49.4.3 Power mode transitions..... 3061
49.5 Power-On Reset and power sequencing..... 3062
49.5.1 External POR using SRC_POR_B..... 3062
49.5.2 Internal POR..... 3063
49.6 Functional Description..... 3063
49.6.1 Reset Control..... 3063
49.6.1.1 Reset inputs and outputs..... 3063
49.6.1.2 Reset Handling..... 3065
49.6.1.2.1 Reset Qualification..... 3065
49.6.1.2.2 Reset Sequence and De-Assertion..... 3066
49.6.1.2.3 POR (SRC_POR_B)..... 3066
49.6.1.2.4 COLD RESET..... 3067
49.6.1.2.5 WARM RESET..... 3068
49.6.2 Parallel Reset Requests..... 3069
49.6.3 Boot Mode Control..... 3070
49.6.3.1 BOOT_MODE Pin Latching..... 3070
49.7 SRC Memory Map/Register Definition..... 3071

49.7.1 SRC Control Register (SRC_SCR)....3072
49.7.2 SRC Boot Mode Register 1 (SRC_SBMR1)....3075
49.7.3 SRC Reset Status Register (SRC_SRSR)....3075
49.7.4 SRC Interrupt Status Register (SRC_SISR)....3078
49.7.5 SRC Boot Mode Register 2 (SRC_SBMR2)....3080
49.7.6 SRC General Purpose Register 1 (SRC_GPR1)....3081
49.7.7 SRC General Purpose Register 2 (SRC_GPR2)....3082
49.7.8 SRC General Purpose Register 3 (SRC_GPR3)....3082
49.7.9 SRC General Purpose Register 4 (SRC_GPR4)....3083
49.7.10 SRC General Purpose Register 5 (SRC_GPR5)....3083
49.7.11 SRC General Purpose Register 6 (SRC_GPR6)....3084
49.7.12 SRC General Purpose Register 7 (SRC_GPR7)....3084
49.7.13 SRC General Purpose Register 8 (SRC_GPR8)....3085
49.7.14 SRC General Purpose Register 9 (SRC_GPR9)....3085
49.7.15 SRC General Purpose Register 10 (SRC_GPR10)....3086

Chapter 50
Temperature Monitor (TEMPMON)

50.1 Overview....3087
50.2 Software Usage Guidelines....3088
50.3 TEMPMON Memory Map/Register Definition....3090
50.3.1 Tempsensor Control Register 0 (TEMPMON_TEMPSENSE0*n*)....3091
50.3.2 Tempsensor Control Register 1 (TEMPMON_TEMPSENSE1*n*)....3093
50.3.3 Tempsensor Control Register 2 (TEMPMON_TEMPSENSE2*n*)....3094

Chapter 51
Touch Screen Controller (TSC)

51.1 Overview....3095
51.1.1 Features....3096
51.2 Functional Description....3097
51.2.1 Operating modes....3097

51.2.1.1 Idle ... 3097
51.2.1.2 Pre-charge ... 3097
51.2.1.3 Detection ... 3097
51.2.1.4 Measurement ... 3098
51.2.1.5 Data valid check ... 3098
51.2.1.6 Interrupt ... 3098
51.2.1.7 Reset ... 3098
51.2.1.8 Debug mode ... 3098
51.2.2 Configuration ... 3099
51.2.2.1 TSC configurations ... 3099
51.2.2.2 TSC-ADC-TSC analogue configuration ... 3099
51.2.2.3 TSC, TSC analogue and ADC connection ... 3100
51.2.2.4 TSC and GPIO ... 3100
51.2.2.5 ADC-TSC co-working ... 3101
51.3 TSC Memory Map/Register Definition ... 3102
51.3.1 PS Input Buffer Address (TSC_BASIC_SETTING) ... 3103
51.3.2 PS Input Buffer Address (TSC_PS_INPUT_BUFFER_ADDR) ... 3104
51.3.3 Flow Control (TSC_FLOW_CONTROL) ... 3105
51.3.4 Measure Value (TSC_MEASEURE_VALUE) ... 3106
51.3.5 Interrupt Enable (TSC_INT_EN) ... 3107
51.3.6 Interrupt Signal Enable (TSC_INT_SIG_EN) ... 3108
51.3.7 Intterrupt Status (TSC_INT_STATUS) ... 3109
51.3.8 TSC_DEBUG_MODE ... 3111
51.3.9 TSC_DEBUG_MODE2 ... 3113

Chapter 52
TrustZone Address Space Controller (TZASC)

52.1 Overview ... 3117
52.2 Clocks ... 3118
52.3 Address Mapping in various memory mapping modes ... 3118

Chapter 53
Universal Asynchronous Receiver/Transmitter (UART)

53.1 Overview....3119

53.1.1 Features....3120

53.1.2 Modes of operation....3121

53.2 External Signals....3121

53.2.1 Detailed Signal Descriptions....3126

53.2.1.1 Interrupt Signals....3126

53.2.1.1.1 interrupt_uart - UART Interrupt....3126

53.2.1.2 DMA Request Signals....3126

53.2.1.2.1 dma_req_rx - Receiver DMA Request....3126

53.2.1.2.2 dma_req_tx - Transmitter DMA Request....3126

53.2.1.3 Special Signals....3126

53.2.1.3.1 stop_req - Stop Mode....3126

53.2.1.3.2 doze_req - Doze Mode....3127

53.2.1.3.3 debug_req - Debug Mode....3127

53.3 Clocks....3127

53.4 Functional Description....3127

53.4.1 Interrupts and DMA Requests....3127

53.4.2 Clocks....3128

53.4.2.1 Clock requirements....3129

53.4.2.2 Maximum Baud Rate....3129

53.4.2.3 Clocking in Low-Power Modes....3129

53.4.3 General UART Definitions....3130

53.4.3.1 RTS_B - UART Request To Send....3131

53.4.3.2 RTS Edge Triggered Interrupt....3131

53.4.3.3 CTS_B - Clear To Send....3132

53.4.3.4 Programmable CTS_B Deassertion....3132

53.4.3.5 TX_DATA - UART Transmit....3133

53.4.3.6 RX_DATA - UART Receive....3133
53.4.4 Transmitter....3135
53.4.4.1 Transmitter FIFO Empty Interrupt Suppression....3135
53.4.4.2 Transmitting a Break Condition....3137
53.4.5 Receiver....3137
53.4.5.1 Idle Line Detect....3138
53.4.5.2 Aging Character Detect....3139
53.4.5.3 Receiver Wake....3140
53.4.5.4 Receiving a BREAK Condition....3141
53.4.5.5 Vote Logic....3141
53.4.5.6 Baud Rate Automatic Detection Logic....3143
53.4.5.6.1 Baud Rate Automatic Detection Protocol....3144
53.4.5.6.2 New Baud Rate Determination....3144
53.4.5.6.2.1 New Autobaud Counter Stopped bit and Interrupt....3145
53.4.6 Escape Sequence Detection....3145
53.5 Binary Rate Multiplier (BRM)....3147
53.6 Infrared Interface....3149
53.6.1 Generalities-Infrared....3149
53.6.2 Inverted Transmission and Reception bits (INVT & INVR)....3150
53.6.3 InfraRed Special Case (IRSC) Bit....3150
53.6.4 IrDA interrupt....3151
53.6.5 Conclusion about IrDA....3152
53.6.6 Programming IrDA Interface....3153
53.6.6.1 High Speed....3153
53.6.6.2 Low Speed....3153
53.7 9-bit RS-485 Mode....3154
53.7.1 Generalities....3154
53.7.2 Transmit 9-bit RS-485 frames....3155
53.7.3 Receive 9-bit RS-485 frames....3155

53.7.3.1 RS-485 Slave Address Normal Detect Mode ... 3155
53.7.3.2 RS-485 Slave Address Automatic Detect Mode ... 3156
53.8 Low Power Modes ... 3156
53.8.1 UART Operation in System Doze Mode ... 3157
53.8.2 UART Operation in System Stop Mode ... 3157
53.8.3 Power Saving Method in UART ... 3158
53.9 UART Operation in System Debug State ... 3158
53.10 Reset ... 3159
53.10.1 Hardware reset ... 3159
53.10.2 Software reset ... 3159
53.11 Transfer Error ... 3159
53.12 Functional Timing ... 3160
53.12.1 IrDA Mode ... 3160
53.13 Initialization ... 3160
53.13.1 Programming the UART in RS-232 mode ... 3160
53.13.2 Programming the UART in 9-bit RS-485 mode ... 3162
53.14 References ... 3163
53.15 UART Memory Map/Register Definition ... 3164
53.15.1 UART Receiver Register (UART*x*_URXD) ... 3171
53.15.2 UART Transmitter Register (UART*x*_UTXD) ... 3173
53.15.3 UART Control Register 1 (UART*x*_UCR1) ... 3174
53.15.4 UART Control Register 2 (UART*x*_UCR2) ... 3176
53.15.5 UART Control Register 3 (UART*x*_UCR3) ... 3179
53.15.6 UART Control Register 4 (UART*x*_UCR4) ... 3181
53.15.7 UART FIFO Control Register (UART*x*_UFCR) ... 3183
53.15.8 UART Status Register 1 (UART*x*_USR1) ... 3185
53.15.9 UART Status Register 2 (UART*x*_USR2) ... 3188
53.15.10 UART Escape Character Register (UART*x*_UESC) ... 3190
53.15.11 UART Escape Timer Register (UART*x*_UTIM) ... 3190

53.15.12 UART BRM Incremental Register (UART*x*_UBIR)....3191
53.15.13 UART BRM Modulator Register (UART*x*_UBMR)....3191
53.15.14 UART Baud Rate Count Register (UART*x*_UBRC)....3192
53.15.15 UART One Millisecond Register (UART*x*_ONEMS)....3193
53.15.16 UART Test Register (UART*x*_UTS)....3194
53.15.17 UART RS-485 Mode Control Register (UART*x*_UMCR)....3195

Chapter 54
Universal Serial Bus Controller (USB)

54.1 Overview....3197
54.1.1 Features....3198
54.1.2 Modes of Operation....3199
54.1.2.1 Normal Mode....3200
54.1.2.2 Low-Power Mode....3200
54.2 External Signals....3200
54.3 Functional Description....3201
54.3.1 USB 2.0 Controller Core 0....3201
54.3.1.1 Host Mode....3201
54.3.1.2 Peripheral (Device) Mode....3202
54.3.2 USB 2.0 Controller Core 1....3202
54.3.3 USB Power Control....3202
54.3.3.1 Entering Low Power Suspend Mode....3202
54.3.3.2 Wake-Up Events....3203
54.3.3.2.1 Host Mode Events....3203
54.3.4 Interrupts....3204
54.3.4.1 USB Core Interrupts....3204
54.3.4.2 USB Wake-Up Interrupts....3204
54.4 USB Operation Model....3204
54.4.1 Register Interface....3204
54.4.1.1 Configuration, Control and Status Register Set....3205

54.4.1.2 Identification Registers ... 3207
54.4.1.3 OTG Operations ... 3207
54.4.1.3.1 Register Bits ... 3207
54.4.2 Host Data Structures ... 3209
54.4.2.1 Periodic Frame List ... 3209
54.4.2.2 Asynchronous List Queue Head Pointer ... 3211
54.4.2.3 Isochronous (High-Speed) Transfer Descriptor (iTD) ... 3212
54.4.2.3.1 Next Link Pointer ... 3213
54.4.2.3.2 iTD Transaction Status and Control List ... 3214
54.4.2.3.3 iTD Buffer Page Pointer List (Plus) ... 3215
54.4.2.4 Split Transaction Isochronous Transfer Descriptor (siTD) ... 3217
54.4.2.4.1 Next Link Pointer ... 3217
54.4.2.4.2 siTD Endpoint Capabilities/Characteristics ... 3218
54.4.2.4.3 siTD Transfer State ... 3219
54.4.2.4.4 siTD Buffer Pointer List (plus) ... 3220
54.4.2.4.5 siTD Back Link Pointer ... 3221
54.4.2.5 Queue element transfer descriptor (qTD) ... 3221
54.4.2.5.1 Next qTD Pointer ... 3222
54.4.2.5.2 Alternate Next qTD Pointer ... 3223
54.4.2.5.3 qTD Token ... 3223
54.4.2.5.4 qTD Buffer Page Pointer List ... 3226
54.4.2.6 Queue Head ... 3227
54.4.2.6.1 Queue Head Horizontal Link Pointer ... 3227
54.4.2.6.2 Queue Head Endpoint Capabilities/Characteristics ... 3228
54.4.2.6.3 Transfer Overlay-Queue Head ... 3230
54.4.2.7 Periodic Frame Span Traversal Node (FSTN) ... 3231
54.4.2.7.1 FSTN Normal Path Pointer ... 3232
54.4.2.7.2 FSTN Back Path Link Pointer ... 3232
54.4.3 Host Operational Model ... 3233

54.4.3.1 Host Controller Initialization 3233
54.4.3.2 Port Routing and Control 3235
54.4.3.2.1 Port Routing Control through EHCI Configured (CF) Bit 3237
54.4.3.2.2 Port Routing Control through PortOwner and Disconnect Event 3238
54.4.3.2.3 Example Port Routing State Machine 3240
54.4.3.2.3.1 EHCI HC Owner 3240
54.4.3.2.3.2 Companion HC Owner 3241
54.4.3.2.4 Port Power 3241
54.4.3.2.5 Port Reporting Over-Current 3242
54.4.3.3 Suspend/Resume-Host Operational Model 3243
54.4.3.3.1 Port Suspend/Resume 3243
54.4.3.4 Schedule Traversal Rules 3246
54.4.3.4.1 Example - Preserving Micro-Frame Integrity 3248
54.4.3.4.1.1 Transaction Fit - A Best-Fit Approximation Algorithm 3248
54.4.3.5 Periodic Schedule Frame Boundaries vs Bus Frame Boundaries 3250
54.4.3.6 Periodic Schedule 3253
54.4.3.7 Managing Isochronous Transfers Using iTDs 3255
54.4.3.7.1 Host Controller Operational Model for iTDs 3255
54.4.3.7.2 Software Operational Model for iTDs 3257
54.4.3.7.2.1 Periodic scheduling threshold 3259
54.4.3.8 Asynchronous Schedule 3260
54.4.3.8.1 Adding Queue Heads to Asynchronous Schedule 3261
54.4.3.8.2 Removing Queue Heads from Asynchronous Schedule 3262
54.4.3.8.3 Empty Asynchronous Schedule Detection 3264
54.4.3.8.4 Restarting Asynchronous Schedule Before EOF 3265
54.4.3.8.4.1 Example Method for Restarting Asynchronous Schedule Traversal 3266
54.4.3.8.4.2 Async Sched Not Active 3267
54.4.3.8.4.3 Async Sched Active 3267

54.4.3.8.4.4 Async Sched Sleeping 3268
54.4.3.8.4.5 Example Derivation for AsyncSchedSleepTime..... 3268
54.4.3.8.5 Asynchronous schedule traversal: Start Event..... 3268
54.4.3.8.6 Reclamation Status Bit (USBSTS Register) 3269
54.4.3.9 Operational Model for Nak Counter..... 3269
54.4.3.9.1 Nak Count Reload Control 3271
54.4.3.9.1.1 Wait for List Head 3272
54.4.3.9.1.2 Do Reload 3272
54.4.3.9.1.3 Wait for Start Event 3272
54.4.3.10 Managing Control/Bulk/Interrupt Transfers through Queue Heads..... 3273
54.4.3.10.1 Fetch Queue Head 3275
54.4.3.10.2 Advance Queue 3275
54.4.3.10.3 Execute Transaction 3276
54.4.3.10.3.1 Interrupt Transfer Pre-condition Criteria 3277
54.4.3.10.3.2 Asynchronous Transfer Pre-operations and Pre-condition Criteria 3277
54.4.3.10.3.3 Transfer Type Independent Pre-operations..... 3277
54.4.3.10.3.4 Halting a Queue Head 3280
54.4.3.10.3.5 Asynchronous Schedule Park Mode 3281
54.4.3.10.4 Write Back qTD 3283
54.4.3.10.5 Follow Queue Head Horizontal Pointer 3283
54.4.3.10.6 Buffer Pointer List Use for Data Streaming with qTDs 3284
54.4.3.10.7 Adding Interrupt Queue Heads to the Periodic Schedule 3286
54.4.3.10.8 Managing Transfer Complete Interrupts from Queue Heads 3286
54.4.3.11 Ping Control..... 3287
54.4.3.12 Split Transactions 3288
54.4.3.12.1 Split Transactions for Asynchronous Transfers 3289
54.4.3.12.1.1 Asynchronous - Do Start Split..... 3290
54.4.3.12.1.2 Asynchronous - Do Complete Split 3290

54.4.3.12.2 Split Transaction Interrupt 3291
54.4.3.12.2.1 Split Transaction Scheduling Mechanisms for Interrupt 3292
54.4.3.12.2.2 Host Controller Operational Model for FSTNs.....3295
54.4.3.12.2.3 Software Operational Model for FSTNs..... 3298
54.4.3.12.2.4 Tracking Split Transaction Progress for Interrupt Transfers .3299
54.4.3.12.2.5 Split Transaction Execution State Machine for Interrupt 3300
54.4.3.12.2.6 Rebalancing the periodic schedule 3306
54.4.3.12.3 Split Transaction Isochronous 3307
54.4.3.12.3.1 Split Transaction Scheduling Mechanisms for Isochronous . 3307
54.4.3.12.3.2 Tracking Split Transaction Progress for Isochronous Transfers.....3312
54.4.3.12.3.3 Split Transaction Execution State Machine for Isochronous 3314
54.4.3.12.3.4 Periodic Isochronous - Do Start Split 3315
54.4.3.12.3.5 Periodic Isochronous - Do Complete Split 3317
54.4.3.12.3.6 Complete-Split for Scheduling Boundary Cases 2a, 2b 3320
54.4.3.12.3.7 Split Transaction for Isochronous - Processing Examples 3322
54.4.3.13 Host Controller Pause..... 3324
54.4.3.14 Port Test Modes -Host Operational Model..... 3325
54.4.3.15 Interrupts-Host Operational Model..... 3325
54.4.3.15.1 Transfer/Transaction Based Interrupts 3327
54.4.3.15.1.1 Transaction Error 3327
54.4.3.15.1.2 Serial Bus Babble..... 3327
54.4.3.15.1.3 Data Buffer Error 3328
54.4.3.15.1.4 USB Interrupt (Interrupt on Completion (IOC)) 3329
54.4.3.15.1.5 Short Packet.....3329
54.4.3.15.2 Host Controller Event Interrupts 3329
54.4.3.15.2.1 Port Change Events 3330
54.4.3.15.2.2 Frame List Rollover 3330
54.4.3.15.2.3 Interrupt on Async Advance 3330

54.4.3.15.2.4 Host System Error 3330
54.4.4 EHCI Deviation.....3331
54.4.4.1 Embedded Transaction Translator Function.....3332
54.4.4.1.1 Capability Registers.....3332
54.4.4.1.2 Operational Registers.....3333
54.4.4.1.3 Discovery-EHCI Deviation.....3333
54.4.4.1.4 Data Structures.....3333
54.4.4.1.5 Operational Model.....3334
54.4.4.1.5.1 Micro- frame Pipeline.....3334
54.4.4.1.5.2 Split State Machines.....3335
54.4.4.1.5.3 Asynchronous Transaction Scheduling and Buffer Management.....3336
54.4.4.1.5.4 Periodic Transaction Scheduling and Buffer Management....3336
54.4.4.1.5.5 Multiple Transaction Translators.....3336
54.4.4.2 Device Operation.....3337
54.4.4.2.1 USB_USBMODE Register.....3337
54.4.4.2.2 Non-Zero Fields the Register File.....3337
54.4.4.2.3 SOF Interrupt.....3337
54.4.4.3 Embedded Design Interface.....3337
54.4.4.3.1 Frame Adjust Register.....3338
54.4.4.4 Miscellaneous variations from EHCI.....3338
54.4.4.4.1 Programmable Physical Interface Behaviour.....3338
54.4.4.4.2 Discovery.....3338
54.4.4.4.2.1 Port Reset.....3338
54.4.4.4.2.2 Port Speed Detection.....3339
54.4.4.4.3 Port Test Mode.....3339
54.4.5 Device Data Structures.....3339
54.4.5.1 Endpoint Queue Head (dQH).....3340
54.4.5.1.1 Endpoint Capabilities/Characteristics.....3341

54.4.5.1.2 Transfer Overlay-Endpoint Queue Head..... 3342
54.4.5.1.3 Current dTD Pointer..... 3342
54.4.5.1.4 Set-up Buffer.....3343
54.4.5.2 Endpoint Transfer Descriptor (dTD).....3343
54.4.6 Device Operational Model..... 3345
54.4.6.1 Device Controller Initialization..... 3346
54.4.6.2 Port State and Control..... 3347
54.4.6.2.1 Bus Reset..... 3349
54.4.6.2.2 Suspend/Resume..... 3350
54.4.6.2.2.1 Suspend.....3350
54.4.6.2.2.2 Resume..... 3351
54.4.6.3 Managing Endpoints..... 3351
54.4.6.3.1 Endpoint Initialization..... 3352
54.4.6.3.2 Stalling..... 3353
54.4.6.3.3 Data Toggle 3354
54.4.6.3.3.1 Data Toggle Reset..... 3354
54.4.6.3.3.2 Data Toggle Inhibit.....3354
54.4.6.3.3.3 Priming Transmit Endpoints.....3354
54.4.6.3.3.4 Priming Receive Endpoints..... 3355
54.4.6.4 Operational Model For Packet Transfers..... 3355
54.4.6.4.1 Interrupt/Bulk Endpoint Operational Model.....3356
54.4.6.4.1.1 Interrupt/Bulk Endpoint Bus Response Matrix..... 3358
54.4.6.4.2 Control Endpoint Operation Model..... 3358
54.4.6.4.2.1 Setup Phase.....3358
54.4.6.4.2.2 Data Phase..... 3359
54.4.6.4.2.3 Status Phase..... 3360
54.4.6.4.2.4 Control Endpoint Bus Response Matrix.....3360
54.4.6.4.3 Isochronous Endpoint Operational Model..... 3361
54.4.6.4.3.1 Isochronous Pipe Synchronization..... 3363

54.4.6.4.3.2 Isochronous Endpoint Bus Response Matrix..... 3363
54.4.6.5 Managing Queue Heads..... 3363
54.4.6.5.1 Queue Head Initialization..... 3364
54.4.6.5.2 Operational Model For Setup Transfers..... 3365
54.4.6.6 Managing Transfers with Transfer Descriptors..... 3366
54.4.6.6.1 Software Link Pointers..... 3366
54.4.6.6.2 Building a Transfer Descriptor..... 3366
54.4.6.6.3 Executing A Transfer Descriptor..... 3367
54.4.6.6.4 Transfer Completion..... 3368
54.4.6.6.5 Flushing/De-priming an Endpoint..... 3368
54.4.6.6.6 Device Error Matrix..... 3369
54.4.6.7 Servicing Interrupts..... 3370
54.4.6.7.1 High-Frequency Interrupts..... 3370
54.4.6.7.2 Low-Frequency Interrupts..... 3370
54.4.6.7.3 Error Interrupts..... 3370
54.5 USB Non-Core Memory Map/Register Definition..... 3371
54.5.1 USB OTG1 Control Register (USBNC_USB_OTG1_CTRL)..... 3373
54.5.2 USB OTG2 Control Register (USBNC_USB_OTG2_CTRL)..... 3375
54.5.3 OTG1 UTMI PHY Control 0 Register (USBNC_USB_OTG1_PHY_CTRL_0)..... 3377
54.5.4 OTG2 UTMI PHY Control 0 Register (USBNC_USB_OTG2_PHY_CTRL_0)..... 3378
54.6 USB Core Memory Map/Register Definition..... 3378
54.6.1 Identification register (USB_*n*ID)..... 3383
54.6.2 Hardware General (USB_*n*HWGENERAL)..... 3383
54.6.3 Host Hardware Parameters (USB_*n*HWHOST)..... 3385
54.6.4 Device Hardware Parameters (USB_*n*HWDEVICE)..... 3386
54.6.5 TX Buffer Hardware Parameters (USB_*n*HWTXBUF)..... 3386
54.6.6 RX Buffer Hardware Parameters (USB_*n*HWRXBUF)..... 3387
54.6.7 General Purpose Timer #0 Load (USB_*n*GPTIMER0LD)..... 3388
54.6.8 General Purpose Timer #0 Controller (USB_*n*GPTIMER0CTRL)..... 3388

54.6.9 General Purpose Timer #1 Load (USB_*n*GPTIMER1LD)....3390
54.6.10 General Purpose Timer #1 Controller (USB_*n*GPTIMER1CTRL)....3390
54.6.11 System Bus Config (USB_*n*SBUSCFG)....3391
54.6.12 Capability Registers Length (USB_*n*CAPLENGTH)....3392
54.6.13 Host Controller Interface Version (USB_*n*HCIVERSION)....3393
54.6.14 Host Controller Structural Parameters (USB_*n*HCSPARAMS)....3393
54.6.15 Host Controller Capability Parameters (USB_*n*HCCPARAMS)....3395
54.6.16 Device Controller Interface Version (USB_*n*DCIVERSION)....3397
54.6.17 Device Controller Capability Parameters (USB_*n*DCCPARAMS)....3398
54.6.18 USB Command Register (USB_*n*USBCMD)....3399
54.6.19 USB Status Register (USB_*n*USBSTS)....3403
54.6.20 Interrupt Enable Register (USB_*n*USBINTR)....3407
54.6.21 USB Frame Index (USB_*n*FRINDEX)....3409
54.6.22 Frame List Base Address (USB_*n*PERIODICLISTBASE)....3410
54.6.23 Device Address (USB_*n*DEVICEADDR)....3410
54.6.24 Next Asynch. Address (USB_*n*ASYNCLISTADDR)....3411
54.6.25 Endpoint List Address (USB_*n*ENDPTLISTADDR)....3412
54.6.26 Programmable Burst Size (USB_*n*BURSTSIZE)....3412
54.6.27 TX FIFO Fill Tuning (USB_*n*TXFILLTUNING)....3413
54.6.28 Endpoint NAK (USB_*n*ENDPTNAK)....3415
54.6.29 Endpoint NAK Enable (USB_*n*ENDPTNAKEN)....3415
54.6.30 Configure Flag Register (USB_*n*CONFIGFLAG)....3416
54.6.31 Port Status & Control (USB_*n*PORTSC1)....3416
54.6.32 On-The-Go Status & control (USB_*n*OTGSC)....3423
54.6.33 USB Device Mode (USB_*n*USBMODE)....3427
54.6.34 Endpoint Setup Status (USB_*n*ENDPTSETUPSTAT)....3428
54.6.35 Endpoint Prime (USB_*n*ENDPTPRIME)....3429
54.6.36 Endpoint Flush (USB_*n*ENDPTFLUSH)....3430
54.6.37 Endpoint Status (USB_*n*ENDPTSTAT)....3430

54.6.38 Endpoint Complete (USB_*n*ENDPTCOMPLETE)..... 3431
54.6.39 Endpoint Control0 (USB_*n*ENDPTCTRL0)..... 3432
54.6.40 Endpoint Control 1 (USB_*n*ENDPTCTRL1)..... 3434
54.6.41 Endpoint Control 2 (USB_*n*ENDPTCTRL2)..... 3437
54.6.42 Endpoint Control 3 (USB_*n*ENDPTCTRL3)..... 3439
54.6.43 Endpoint Control 4 (USB_*n*ENDPTCTRL4)..... 3442
54.6.44 Endpoint Control 5 (USB_*n*ENDPTCTRL5)..... 3445
54.6.45 Endpoint Control 6 (USB_*n*ENDPTCTRL6)..... 3448
54.6.46 Endpoint Control 7 (USB_*n*ENDPTCTRL7)..... 3451

Chapter 55
Universal Serial Bus 2.0 Integrated PHY (USB-PHY)

55.1 USB PHY Overview..... 3455
55.2 Operation..... 3455
55.2.1 UTMI..... 3455
55.2.2 Digital Transmitter..... 3456
55.2.3 Digital Receiver..... 3456
55.2.4 Analog Receiver..... 3456
55.2.4.1 HS Differential Receiver..... 3457
55.2.4.2 Squelch Detector..... 3458
55.2.4.3 LS/FS Differential Receiver..... 3458
55.2.4.4 HS Disconnect Detector..... 3458
55.2.4.5 USB Plugged-In Detector..... 3458
55.2.4.6 Single-Ended USB_DP Receiver..... 3459
55.2.4.7 Single-Ended USB_DN Receiver..... 3459
55.2.4.8 9X Oversample Module..... 3459
55.2.5 Analog Transmitter..... 3459
55.2.5.1 Switchable High-Speed 45Ω Termination Resistors..... 3459
55.2.5.2 Low-Speed/Full-Speed Differential Driver..... 3460
55.2.5.3 High-Speed Differential Driver..... 3460

55.2.5.4 Switchable 1.5KΩ USB_DP Pullup Resistor....3460
55.2.5.5 Switchable 15KΩ USB_DP Pulldown Resistor....3460
55.2.6 Recommended Register Configuration for USB Certification....3462
55.2.7 Charger detection....3462
55.2.7.1 Charger detect control table....3462
55.2.7.2 Data pin contact detector....3462
55.2.7.3 Charger detector....3463
55.2.7.4 Charger detection software flow....3463
55.2.7.5 Dead Battery Protect....3465
55.3 USB PHY Memory Map/Register Definition....3465
55.3.1 USB PHY Power-Down Register (USBPHY*x*_PWD*n*)....3468
55.3.2 USB PHY Transmitter Control Register (USBPHY*x*_TX*n*)....3470
55.3.3 USB PHY Receiver Control Register (USBPHY*x*_RX*n*)....3471
55.3.4 USB PHY General Control Register (USBPHY*x*_CTRL*n*)....3473
55.3.5 USB PHY Status Register (USBPHY*x*_STATUS)....3476
55.3.6 USB PHY Debug Register (USBPHY*x*_DEBUG*n*)....3478
55.3.7 UTMI Debug Status Register 0 (USBPHY*x*_DEBUG0_STATUS)....3480
55.3.8 UTMI Debug Status Register 1 (USBPHY*x*_DEBUG1*n*)....3481
55.3.9 UTMI RTL Version (USBPHY*x*_VERSION)....3482
55.4 USB Analog Memory Map/Register Definition....3482
55.4.1 USB VBUS Detect Register (USB_ANALOG_USB1_VBUS_DETECT*n*)....3484
55.4.2 USB Charger Detect Register (USB_ANALOG_USB1_CHRG_DETECT*n*)....3485
55.4.3 USB VBUS Detect Status Register (USB_ANALOG_USB1_VBUS_DETECT_STAT)....3487
55.4.4 USB Charger Detect Status Register (USB_ANALOG_USB1_CHRG_DETECT_STAT)....3489
55.4.5 USB Misc Register (USB_ANALOG_USB1_MISC*n*)....3490
55.4.6 USB VBUS Detect Register (USB_ANALOG_USB2_VBUS_DETECT*n*)....3491
55.4.7 USB Charger Detect Register (USB_ANALOG_USB2_CHRG_DETECT*n*)....3493
55.4.8 USB VBUS Detect Status Register (USB_ANALOG_USB2_VBUS_DETECT_STAT)....3495
55.4.9 USB Charger Detect Status Register (USB_ANALOG_USB2_CHRG_DETECT_STAT)....3497

55.4.10 USB Misc Register (USB_ANALOG_USB2_MISC*n*)....3498
55.4.11 Chip Silicon Version (USB_ANALOG_DIGPROG)....3499

Chapter 56
Ultra Secured Digital Host Controller (uSDHC)

56.1 Overview....3501
56.1.1 Features....3504
56.1.2 Modes and Operations....3505
56.1.2.1 Data transfer Modes....3505
56.2 External Signals....3505
56.2.1 Signals Overview....3507
56.3 Clocks....3508
56.4 Functional Description....3508
56.4.1 Data Buffer....3508
56.4.1.1 Write Operation Sequence....3511
56.4.1.2 Read Operation Sequence....3511
56.4.1.3 Data Buffer and Block Size....3512
56.4.1.4 Dividing Large Data Transfer....3513
56.4.1.5 External DMA Request....3514
56.4.2 DMA AHB Interface....3515
56.4.2.1 Internal DMA Request....3516
56.4.2.2 DMA Burst Length....3517
56.4.2.3 AHB Master Interface....3517
56.4.2.4 ADMA Engine....3517
56.4.2.4.1 ADMA Concept and Descriptor Format....3518
56.4.2.4.2 ADMA Interrupt....3522
56.4.2.4.3 ADMA Error....3523
56.4.3 Register Bank with IP Bus Interface....3523
56.4.3.1 SD Protocol Unit....3524
56.4.3.2 SD control misc....3525

56.4.3.3 SD Clock control....3525
56.4.3.4 Command control....3525
56.4.3.5 Data control....3526
56.4.4 Clock & Reset Manager....3526
56.4.5 Clock Generator....3527
56.4.6 SDIO Card Interrupt....3527
56.4.6.1 Interrupts in 1-bit Mode....3527
56.4.6.2 Interrupt in 4-bit Mode....3528
56.4.6.3 Card Interrupt Handling....3528
56.4.7 Card Insertion and Removal Detection....3529
56.4.8 Power Management and Wake Up Events....3530
56.4.8.1 Setting Wake Up Events....3531
56.4.9 MMC fast boot....3531
56.4.9.1 Boot operation....3531
56.4.9.2 Alternative boot operation....3532
56.5 Initialization/Application of uSDHC....3533
56.5.1 Command Send & Response Receive Basic Operation....3533
56.5.2 Card Identification Mode....3534
56.5.2.1 Card Detect....3534
56.5.2.2 Reset....3535
56.5.2.3 Voltage Validation....3536
56.5.2.4 Card Registry....3538
56.5.3 Card Access....3539
56.5.3.1 Block Write....3539
56.5.3.1.1 Normal Write....3539
56.5.3.1.2 DDR Write....3541
56.5.3.1.3 Write with Pause....3541
56.5.3.2 Block Read....3543
56.5.3.2.1 Normal Read....3543

56.5.3.2.2 DDR Read....3544
56.5.3.2.3 Read with Pause....3544
56.5.3.2.4 DLL (Delay Line) in Read Path....3545
56.5.3.3 Suspend Resume....3547
56.5.3.3.1 Suspend....3547
56.5.3.3.2 Resume....3548
56.5.3.4 ADMA Usage....3548
56.5.3.5 Transfer Error....3549
56.5.3.5.1 CRC Error....3549
56.5.3.5.2 Internal DMA Error....3549
56.5.3.5.3 Transfer ADMA Error....3550
56.5.3.5.4 Auto CMD12 Error....3550
56.5.3.6 Card Interrupt....3551
56.5.4 Switch Function....3551
56.5.4.1 Query, Enable and Disable SDIO High Speed Mode....3552
56.5.4.2 Query, Enable and Disable SD High Speed Mode/SDR50/SDR104/DDR50....3552
56.5.4.3 Query, Enable and Disable MMC High Speed Mode....3553
56.5.4.4 Set MMC Bus Width....3553
56.5.5 ADMA Operation....3553
56.5.5.1 ADMA1 Operation....3554
56.5.5.2 ADMA2 Operation....3554
56.5.6 Fast Boot Operation....3555
56.5.6.1 Normal fast boot flow....3555
56.5.6.2 Alternative fast boot flow....3556
56.5.6.3 Fast boot application case (in DMA mode)....3556
56.6 Commands for MMC/SD/SDIO....3558
56.7 Software Restrictions....3563
56.7.1 Initialization Active....3563
56.7.2 Software Polling Procedure....3564

56.7.3 Suspend Operation ... 3564
56.7.4 Data Length Setting ... 3564
56.7.5 (A)DMA Address Setting ... 3564
56.7.6 Data Port Access ... 3565
56.7.7 Change Clock Frequency ... 3565
56.7.8 Multi-block Read ... 3565
56.8 uSDHC Memory Map/Register Definition ... 3565
56.8.1 DMA System Address (uSDHC*x*_DS_ADDR) ... 3568
56.8.2 Block Attributes (uSDHC*x*_BLK_ATT) ... 3569
56.8.3 Command Argument (uSDHC*x*_CMD_ARG) ... 3570
56.8.4 Command Transfer Type (uSDHC*x*_CMD_XFR_TYP) ... 3571
56.8.5 Command Response0 (uSDHC*x*_CMD_RSP0) ... 3574
56.8.6 Command Response1 (uSDHC*x*_CMD_RSP1) ... 3575
56.8.7 Command Response2 (uSDHC*x*_CMD_RSP2) ... 3575
56.8.8 Command Response3 (uSDHC*x*_CMD_RSP3) ... 3576
56.8.9 Data Buffer Access Port (uSDHC*x*_DATA_BUFF_ACC_PORT) ... 3577
56.8.10 Present State (uSDHC*x*_PRES_STATE) ... 3578
56.8.11 Protocol Control (uSDHC*x*_PROT_CTRL) ... 3583
56.8.12 System Control (uSDHC*x*_SYS_CTRL) ... 3588

Chapter 1
Introduction

1.1 About This Document

The i.MX 6UltraLite application processors are Freescale Semiconductor's latest additions to a growing family of multimedia-focused products offering high performance processing optimized for lowest power consumption.

The i.MX 6UltraLite processors feature Freescale's advanced implementation of the ARM®Cortex®-A7 core, which can be interfaced with DDR3, DDR3L and LPDDR2 (single channel) DRAM memory devices.

These products are suitable for applications such as:

- Point-of-Sale Device
- General embedded devices
- Industrial devices

The i.MX is a system on a chip (SoC) which integrates on one integrated circuit a complete microcomputer platform based on the ARM Cortex-A9 including an integrated NEON MPE coprocessor, separate 32 KByte instruction and data L1 caches and a unified 1 MByte L2 cache. Supporting the ARM Platform are a large array of system-level components such as system RAM, processor code ROM, Smart DMA controller (SDMA) and system control devices such as a power-on reset controller, voltage regulators, power management, and clock generation circuitry. Coprocessors including two Graphics Processing Units (GPUs), an Image Processing Unit (IPU), Video Processing Unit (VPU) and Asynchronous Sample Rate Converter (ASRC) accelerate computationally intensive tasks offloading the ARM Platform.

1.1.1 Audience

This manual is intended to be used by board-level product designers and product software developers. This manual assumes that the reader has a background in computer engineering and/or software engineering and understands concepts of digital system design, microprocessor architecture, Input / Output (I/O) devices, industry standard communication and device interface protocols.

1.1.2 Organization

This document covers the chip at a system level and provides an architectural overview. Also covered are system memory map, system-level interrupt events, external pins and pin multiplexing, external memory, system debug, system boot, multimedia subsystem, power management, and system security.

1.1.3 Suggested Reading

This section lists additional reading materials that provide background for the information in this manual, as well as general information about the architecture.

1.1.3.1 General Information

The following documentation provides useful background information about the ARM Cortex-A7 processor.

For information about the ARM Cortex-A7 processor see:

- **http://infocenter.arm.com**

1.1.3.2 Related Documentation

Freescale documentation is available from the sources listed on the back cover of this manual; the document order numbers are included in parentheses for ease in ordering.

For a current list of documentation, refer to **http://www.freescale.com**.

1.1.4 Conventions

This document uses the following notational conventions:

cleared / set

When a bit takes the value zero, it is said to be cleared; when it takes a value of one, it is said to be set.

mnemonics

Instruction mnemonics are shown in lowercase bold

italics

Italics indicate variable command parameters, for example, **bcctr***x*

Book titles in text are set in italics

15

An integer in decimal

0x

Prefix to denote hexadecimal number

0b

Prefix to denote binary number. Binary 0 and 1 are written without the prefix.

n'H4000CA00

n-bit Hexadecimal number

BLK_REG_NAME

Register names are all uppercase. The block mnemonic is prepended with an underscore delimiter (_).

BLK_REG[FIELD]

Fields within registers appear in brackets. For example, ESR[RLS] refers to the Receive Last Slot field of the ESAI Status Register.

BLK_REG[*n*]

Bit number *n* within register BLK.REG.

BLK_REG[*l:r*]

Register bit ranges. Ranges are indicated by the left-most bit number *l* and the right-most bit number *r* separated by a colon (:). For example, ESR[15:0] refers to the lower half word in the ESAI Status Register.

x, U

In some contexts, such as signal encodings, an unitalicized x indicates a don't care or uninitialized. The binary value could be 1 or 0.

x

An italicized *x* indicates an alphanumeric variable

n, m

Italicized *n or m* represent integer variables

!

Binary logic operator NOT

&&

Binary logic operator AND

||

Binary logic operator OR

^ or <O+>

Binary logic operator XOR. For example, A <O+> B

|

Bit-wise OR. For example, 0b0001 | 0b1000 yields the value 0b1001.

&

Bit-wise AND. For example, 0b0001 & 0b1000 yields the value 0b0000.

{A,B}

Concatenation, where the *n*-bit value A is prepended to the *m*-bit value B to form an (*n* +*m*)-bit value. For example, {0, REG*m* [14:0]} yeilds a 16-bit value with 0 in the most significant bit.

- or grey fill

Indicates a reserved bit field in an register. Although these bits can be written to as ones or zeros, they are always read as zeros.

>>

Shift right logical one position

<<

Shift left logical one posiiton

<=

Assignment

==

Compare equal

!=

Compare not equal

>

Greater than

<

Less than

1.1.5 Register Access

1.1.5.1 Register Diagram Field Access Type Legend

The following figure provides the interpretation of the notation used in register diagrams for a number of common field access types.

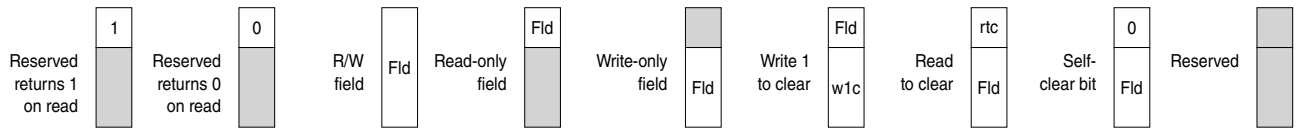

Figure 1-1. Register Field Conventions

NOTE

For reserved register fields, software should mask off the data in the field after read (software can not rely on the contents of data read from a reserved field) and always write all zeros.

1.1.5.2 Register Macro Usage

A common operation is to update one field without disturbing the contents of the remaining fields in the register. Normally, this requires a read-modify-write (RMW) operation, where the CPU reads the register, modifies the target field, then writes the results back to the register. This is an expensive operation in terms of CPU cycles, because of the initial register read.

To address this issue, some hardware registers are implemented as a group, including registers that can be used to either set, clear, or toggle (SCT) individual bits of the primary register. When writing to an SCT register, all bits set to 1 perform the associated operation on the primary register, while all bits set to 0 are not affected. The SCT registers always read back 0, and should be considered write-only. The SCT registers are not implemented if the primary register is read-only.

With this architecture, it is possible to update one or more fields using only register writes. First, all bits of the target fields are cleared by a write to the associated clear register, then the desired value of the target fields is written to the set register. This sequence of two writes is referred to as a clear-set (CS) operation.

A CS operation does have one potential drawback. Whenever a field is modified, the hardware sees a value of 0 before the final value is written. For most fields, passing through the 0 state is not a problem. Nonetheless, this behavior is something to consider when using a CS operation.

Also, a CS operation is not required for fields that are one bit wide. While the CS operation works in this case, it is more efficient to simply set or clear the target bit (that is, one write instead of two). A simple set or clear operation is also atomic, while a CS operation is not.

Note that not all macros for set, clear, or toggle (SCT) are atomic. For registers that do not provide hardware support for this functionality, these macros are implemented as a sequence of read/modify/write operations. When atomic operation is required, the developer should pay attention to this detail, because unexpected behavior might result if an interrupt occurs in the middle of the critical section comprising the update sequence.

A set of SCT registers is offered for registers in many modules on this device, as described in this manual. In a module memory map table, the suffix _SET, _CLR, or _TOG is added to the base name of the register. For example, the CCM_ANALOG_PLL_ARM register has three other registers called CCM_ANALOG_PLL_ARM_SET, CCM_ANALOG_PLL_ARM_CLR and CCM_ANALOG_PLL_ARM_TOG.

In the sub-section that describes one of these sets of registers, a short-hand convention is used to denote that a register has an SCT register set. Here there is an italicized *n* appended to the end of the short register name. Using the above example, the name used for this register is CCM_ANALOG_PLL_ARM*n*. When seeing this designation, there is a SCT register set associated with the register, and can verify this by checking it in the memory map table. The address offset for each of these registers is given in the form of the following example:

Address: 20C_8000h base + 0h offset + (4d × i), where i=0d to 3d

In this example, the address for each of the base register and its three SCT registers can be calculated as:

Register	Address
CCM_ANALOG_PLL_ARM	20C_8000h
CCM_ANALOG_PLL_ARM_SET	20C_8004h
CCM_ANALOG_PLL_ARM_CLR	20c_8008h
CCM_ANALOG_PLL_ARM_TOG	20C_800Ch

1.1.6 Signal Conventions

_b, _B

When appended to a signal name, indicates that a signal is active-low

NEG_ACTIVE

Overbar also denotes a negative active signal

UPPERCASE

Package pin names, Block I/O signals

lowercase

Lowercase is used to indicate internal signals

1.1.7 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

Acronyms and Abbreviated Terms

Term	Meaning
ADC	Analog-to-Digital Converter
AHB	Advanced High-performance Bus
AIPS	ARM IP Bus
ALU	Arithmetic Logic Unit
AMBA	Advanced Microcontroller Bus Architecture
APB	Advanced Peripheral Bus
ASRC	Asynchronous Sample Rate Converter
AXI	Advanced eXtensible Interface
BEE	Bus Encrypt Engine
BIST	Built-in self test
CA7	ARM Cortex A7
CAAM	Cryptographic Acceleration and Assurance Module
CAN	Controller Area Network
CCM	Clock Controller Module
CPU	Central Processing Unit
CSI	CMOS Sensor Interface
CSU	Central Security Unit
CTI	Cross Trigger Interface
DAP	Debug Access Port
DDR	Double data rate
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
ECC	Error correcting codes
ECSPI	Enhanced Configurable SPI
EIM	External Interface Module
ENET	Ethernet
EPIT	Enhanced Periodic Interrupt Timer
EPROM	Erasable programmable read-only memory
ETF	Embedded Trace FIFO
ETM	Embedded Trace Macrocell
FIFO	First-in-first-out
GIC	General Interrupt Controller
GPC	General Power Controller

Table continues on the next page...

Term	Meaning
GPIO	General-purpose I/O
GPR	General-purpose register
GPS	Global Positioning System
GPT	General Purpose Timer
GPU	Graphics Processing Unit
GPV	Global Programmers View
HAB	High Assurance Boot
I2C or I^2C	Inter-integrated circuit
IC	Integrated Circuit
IEEE	Institute of Electrical and Electronics Engineers
IOMUX	Input-output multiplexer
IP	Intellectual Property
IrDA	Infrared Data Association
JTAG	Joint Test Action Group (a serial bus protocol usually used for test purposes)
LCD	Liquid Crystal Display
LDO	Low-Dropout
LIFO	Last-in-first-out
LRU	Least recently used
LSB	Least-significant byte
LUT	Lookup Table
LVDS	Low Voltage Differential Signaling
MAC	Medium Access Control
MMC	MultiMedia Card
MMDC	Multi Mode DDR Controller
MSB	Most-significant byte
MT/s	Mega transfers per second
OCRAM	On-Chip Random Access Memory
OCOTP	On-Chip One-Time Programmable Controller
PCI	Peripheral Component Interconnect
PCMCIA	Personal Computer Memory Card International Association
PGC	Power Gating Controller
PIC	Programmable interrupt controller
PMU	Power Management Unit
POR	Power-on reset
PSRAM	Pseudo-Static Random Access Memory
PWM	Pulse Width Modulation
PXP	Pixel Pipeline
QoS	Quality of Service
R2D	Radians to Degrees
RISC	Reduced instruction set computing
ROM	Read-Only Memory

Table continues on the next page...

Term	Meaning
ROMCP	ROM Controller with Patch
RTOS	Real-time operating system
Rx	Receive
SAI	Synchronous Audio Interface
SCU	Snoop Control Unit
SD	Secure Digital
SDIO	Secure Digital Input/Output
SDLC	Synchronous data link control
SDMA	Smart DMA
SIM	Subscriber Identification Module
SNVS	Secure Non-Volatile Storage
SoC	System-On-Chip
SPBA	Shared Peripheral Bus Arbiter
SPDIF	Sony Phillips Digital Interface
SPI	Serial peripheral interface
SRAM	Static random access memory
SRC	System Reset Controller
TFT	Thin Film Transistor
TPIU	Trace Port Interface
TSGEN	Time Stamp Generator
Tx	Transmit
TZASC	TrustZone Address Space Controller
UART	Universal asynchronous receiver/transmitter
USB	Universal serial bus
USDHC	Ultra Secured Digital Host Controller
WDOG	Watchdog
WLAN	Wireless Local Area Network
WXGA	Wide Extended Graphics Array

1.2 Introduction

This chapter introduces the architecture of the i.MX 6UltraLite Multimedia Applications Processor. The i.MX 6UltraLite processor represents Freescale Semiconductor's latest achievement in integrated multimedia applications processors.

It is part of a growing i.MX family of multimedia-focused products, offering high performance processing optimized for the lowest power consumption.

1.3 Target Applications

The architecture's flexibility allows for use in a wide variety of general embedded applications. The i.MX 6UltraLite processor provides all of the interfaces necessary for connecting peripherals such as WLAN, Bluetooth™, GPS, camera sensors, and multiple displays.

1.4 Features

The i.MX 6UltraLite processors are based on ARM®Cortex®-A7 MPCore™ Platform, which has the following features:

- Single ARM Cortex-A7 MPCore (with TrustZone) with:
  - 32 KB L1 Instruction Cache
  - 32 KB L1 Data Cache
  - Cortex-A7 NEON MPE (Media Processing Engine) Co-processor

The ARM Cortex-A7 MPCore complex includes:

- General Interrupt Controller (GIC) with 128 interrupts support
- Snoop Control Unit (SCU)
- 128 KB unified I/D L2 cache
- Single Master AXI (128-bit) bus interface output of L2 cache
- NEON MPE coprocessor
  - SIMD Media Processing Architecture
  - NEON register file with 32x32-bit, 32x64-bit, and 16x128-bit general-purpose registers
  - NEON Integer execute pipeline (ALU, Shift, MAC)
  - NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
  - NEON load/store and permute pipeline
  - Supports single and double-precision add, subtract, multiply, divide, multiply and accumulate, and square root operations as described in the ARM VFPv4 architecture.
  - Provides conversions between 16-bit, 32-bit, and 64-bit floating-point formats and ARM integer word formats

Target frequency of the core (including Neon and L1 cache) is 528 MHz non-overdrive over the specified temperature range:

- 528 MHz non-overdrive over the specified temperature range (Please refer to the *i.MX 6UltraLite Applications Processors for Consumer Products Data Sheet*).

The i.MX 6UltraLite processors support high volume, cost effective handheld DRAM, NOR Flash, and SD memory card standards.

The memory system consists of the following components:
- Level 1 Cache—32 KB Instruction, 32 KB Data cache
- Level 2 Cache—Unified instruction and data (128 KB)
- On-Chip Memory:
  - Boot ROM, including High Assurance Boot (HAB, 96 KB)
  - Internal fast access RAM (OCRAM, 128 KB)
  - Secure / non-Secure RAM (32KB)
- External memory interfaces:
  - 16-bit LP-DDR2, 16-bit DDR3, and LV-DDR3
  - 8-bit NAND-Flash, including support for Raw MLC/TLC, 2 KB ,4KB and 8KB page size, BA-NAND, PBA-NAND, LBA-NAND, OneNAND™ and others
  - BCH ECC up to 40 bits
  - 16-bit NOR Flash
  - 16-bit PSRAM, Cellular RAM
  - One QuadSPI with dual channel capability

The i.MX 6UltraLite processor enables the following interfaces to external devices (some of them are muxed and not available simultaneously):

Displays:
- eLCDIF supporting one parallel 24-bit LCD display with up to WXGA (1366x768) resolution at 60 Hz

Camera sensors:
- One Parallel Camera port (up to 24 bit and up to 148.5 MHz peak)

Expansion cards: Four MMC/SD/SDIO card ports all supporting:
- 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
- 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max)
- 4-bit or 8-bit transfer mode specification for eMMC chips up to 200 MHz in HS200 mode (200MB/s max)

USB:
- Two High Speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB Phy

Miscellaneous IPs and interfaces:
- Three I2S/SAI/AC97

- Eight UARTs operating up to 5.0 Mbps each, providing RS232 interface and supporting 9-bit RS485 multidrop mode. Eight UARTs support 4-wire mode.
- Four eCSPI (Enhanced CSPI), three of them can support up to 52 Mbps, one can be of low speed
- Four I2C supporting 400 kHz
- Dual-Megabit Ethernet Controller (IEEE1588 compliant), 10/100 Mbps
- Eight Pulse Width Modulators (PWM)
- System JTAG Controller (SJC)
- GPIO with interrupt capabilities
- 8x8 Key Pad Port (KPP)
- Sony Philips Digital Interface (SPDIF), Rx and Tx
- Two Controller Area Network (FlexCAN), 1 Mbps each
- Three Watchdog timers (WDOG)
- Asynchronous Sample Rate Converter (ASRC)
- Medium Quality Sound (MQS)

The i.MX 6UltraLite processors integrate advanced power management unit and controllers:

- PMU includes multiple LDO supplies for on-chip resources
- Temperature Sensor for monitoring die temperature
- DVFS to support low power modes
- SW State Retention and Power Gating for ARM and MPE
- Multiple power modes
- Flexible clock gating control scheme

The use of HW accelerators is a key factor in obtaining high performance at low power consumption numbers, while having the CPU core relatively free for performing other tasks.

The i.MX 6UltraLite processors incorporate the following hardware accelerators:

- Pixel Processing Pipeline (PXP)

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- CAAM—Cryptographic Acceleration and Assurance Module, containing cryptographic and hash engines, 16 KB secure RAM, and True and Pseudo Random Number Generator (NIST certified).
- SNVS—Secure Non-Volatile Storage, including Secure Real Time Clock.

- CSU—Central Security Unit. Enhancement for the IC Identification Module (IIM). Will be configured during boot and by eFUSEs and will determine the security level operation mode as well as the TZ policy.
- A-HAB—Advanced High Assurance Boot—HABv4 with the new embedded enhancements: SHA-256, 2048-bit RSA key, version control mechanism, warm boot, CSU, and TZ initialization.
- DryICE—Blocking a physical attack by manipulating operating temperature, voltage, and frequency.[1]

NOTE

To see supported features, please refer to the *i.MX 6UltraLite Applications Processors for Consumer Products Data Sheet*.

This feature set represents the full-featured derivative of the i.MX 6UltraLite and other derivatives do not have the full set.

1.5 Architectural Overview

This section contains the chip architectural details.

1.5.1 Simplified Block Diagram

A high level block diagram is shown in the figure below. This diagram provides a view of the chip's major sub-systems(processor domains, shared peripherals domain, and memories) and logical connectivity.

1. It is only available on the derivative G3.

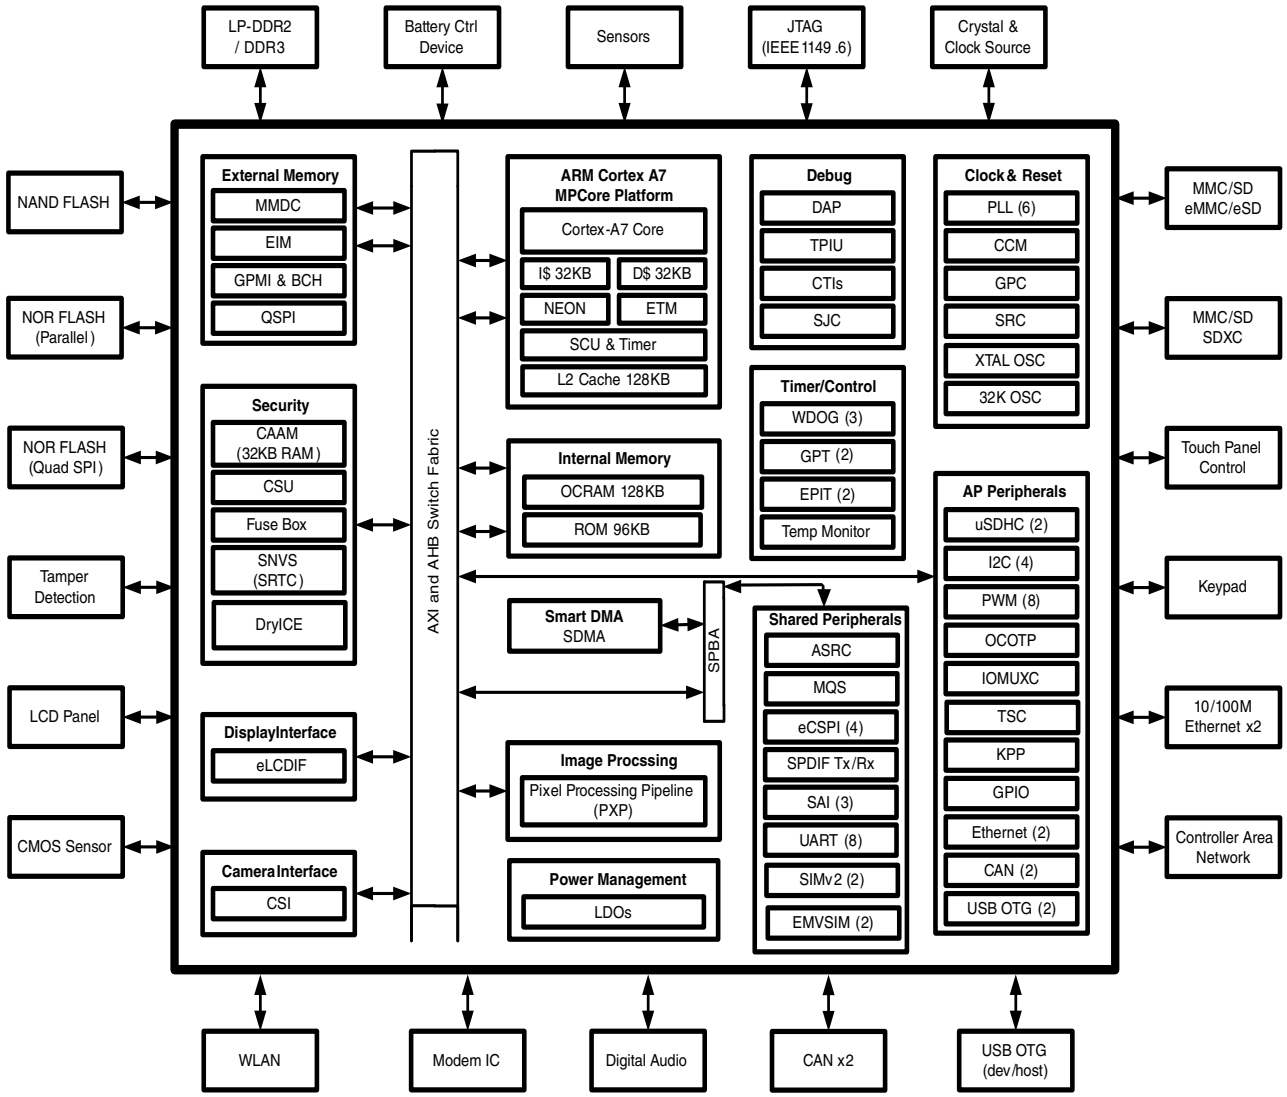

Figure 1-2. Simplified Block Diagram

1.5.2 Architectural Partitioning

Architecture supports processing-intensive tasks in the following ways:

- ARM Cortex A7 MPCore™ Platform provides hardware features for:
  - Operating System
  - User applications (including control over hardware accelerators and non-accelerated functions)
  - TrustZone applications

- Smart DMA enables data transfer between non-mastering peripherals and external or internal memories
- System Control is supported via:
  - Clock Control Module (CCM)
  - XTALOSC- 24 MHz Crystal oscillator source support
  - OSC32KHz - 32.768 Hz Crystal oscillator source support
  - System Reset Controller (SRC)
  - General Power Controller (GPC)
  - Temperature Sensor for monitoring and alarming on high temperature situations.
- Multimedia is supported with:
  - Audio
    - Audio codecs are provided by SW, which runs on ARM core, supporting (but not limited to) MP3, WMA, AAC, HE-AAC and Pro10
    - SPDIF Tx/Rx
    - Audio sample rate conversion accelerator (ASRC)
    - Medium Quality Sound (MQS)
  - Video
    - Display/graphics
    - Pixel Pipeline (PXP)
    - LCD interface (LCDIF)
    - CMOS sensor interface
- Security is supported by:
  - High Assurance Boot (HAB4) System
  - ARM TrustZone (TZ) Trusted Execution environment
  - Peripheral access policy control, using Central Security Unit (CSU)
  - System JTAG controller (SJC)
  - Secure Real Time Clock (SRTC)
  - TrustZone Watchdog (TZ WDOG)
  - DryICE
- Connectivity peripherals, timers and External Memory Interfaces:
  - Embedded DMAs
  - 3.3V IO voltage for seamless integration
  - Two USB 2.0 ports, including two PHYs: 2x HS-USB (OTG)
  - Nand-Flash (MLC up to 40-bit ECC) and NOR Flash memory interface via GPMI Nand-Flash controller
  - Timers: 2xEPIT, GPT and two Watch Dog timers (one of which is used for TZ), in addition to the timers and watchdog timers integrated within the ARM Cortex A7 MPCore™ platform.
  - Miscellaneous connectivity support - FLEXCAN, MMC/SD, I2C, SPI, UART, PWM and Keypad interface

1.5.3 Endianness Support

The chip supports Little Endian mode only.

1.5.4 Memory Interfaces

The chip DDR controller supports the following memory interfaces:

The EIM block provides an interface for SRAM and PSRAM, and 16/8-bit NOR Flash. All EIM pins are muxed on other interfaces.

Chapter 2
Memory Maps

2.1 Memory system overview

This chapter introduces the memory architecture of the chip.

2.2 ARM Platform Memory Map

The chip memory map has been provided in the following tables.

Table 2-1. System memory map

Start address	End address	Size	Description
8000_0000	FFFF_FFFF	2048 MB	MMDC - x16 DDR Controller.
7000_0000	7FFF_FFFF	256 MB	Reserved
6000_0000	6FFF_FFFF	256 MB	QSPI1 Memory
5800_0000	5FFF_FFFF	128 MB	EIM Aliased
5000_0000	57FF_FFFF	128 MB	EIM CS (NOR/SRAM)
1000_0000	4FFF_FFFF	1024 MB	AES Encryption
0E00_0000	0FFF_FFFF	32 MB	Reserved
0C00_0000	0DFF_FFFF	32 MB	QSPI1 Rx Buffer
0900_0000	0BFF_FFFF	48 MB	Reserved
0800_0000	08FF_FFFF	16 MB	Reserved
02C0_0000	07FF_FFFF	84 MB	Reserved
0230_0000	02BF_FFFF	9 MB	Reserved
0220_0000	022F_FFFF	1MB	Reserved
0210_0000	021F_FFFF	1 MB	Table 2-3 AIPS-2. See IP listing on separate map.
0200_0000	020F_FFFF	1 MB	Table 2-2 AIPS-1. See IP listing on separate map.
0181_0000	01FF_FFFF	8128 KB	Reserved
0180_C000	0180_FFFF	16KB	Reserved
0180_4000	0180_BFFF	32KB	APBH DMA

Table continues on the next page...

Table 2-1. System memory map (continued)

Start address	End address	Size	Description
0180_0000	0180_3FFF	16KB	Reserved
0120_0000	017F_FFFF	6 MB	Reserved
0110_0000	011F_FFFF	1 MB	Reserved
0100_0000	010F_FFFF	1 MB	Reserved

NOTE

Access to reserved memory regions can cause unpredictable behavior.

Chapter 3
Interrupts and DMA Events

3.1 Overview

This chapter discusses the assignments of interrupts from the ARM domain in Cortex A7 interrupts and from DMA events in SDMA event mapping

3.2 Cortex A7 interrupts

The Global Interrupt Controller (GIC) collects up to 128 interrupt requests from all chip sources and provides an interface to the Cortex A7 CPU. The first 32 interrupts are private to the CPUs interface. These interrupts are not included in the table below. All interrupts besides the ones private to the CPU are hooked up to the GPC.

Each interrupt can be configured as a normal or a secure interrupt. Software force registers and software priority masking are also supported. The following table describes the ARM Cortex A7 interrupt sources.

Table 3-1. ARM Cortex A7 domain interrupt summary

IRQ	Interrupt Source	Interrupt Description
32	IOMUXC	General Purpose Register 1 from IOMUXC. Used to notify cores on exception condition while boot.
33	DAP	Debug Access Port interrupt request.
34	SDMA	SDMA interrupt request from all channels.
35	TSC	TSC interrupt.
36	SNVS_LP / SNVS_HP	Logic OR of SNVS_LP and SNVS_HP interrupts.
37	LCDIF	LCDIF sync interrupt.
38	BEE	BEE interrupt.
39	CSI	CMOS Sensor Interface interrupt request.

Table continues on the next page...

Table 3-1. ARM Cortex A7 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
40	PXP	PXP interrupt.
41	SCTR	SCTR compare interrupt.
42	SCTR	SCTR compare interrupt.
43	WDOG3	WDOG3 timer reset interrupt request.
44	Reserved	Reserved
45	APBH DMA	Logical OR of APBH DMA channels 0-3 completion and error interrupts.
46	WEIM	WEIM interrupt request.
47	RAWNAND	BCH operation complete interrupt.
48	RAWNAND	GPMI operation timeout error interrupt.
49	UART6	UART6 interrupt request.
50	Reserved	Reserved
51	SNVS	SRTC consolidated interrupt.
52	SNVS	SRTC security interrupt.
53	CSU	CSU interrupt request 1. Indicates to the processor that one or more alarm inputs were asserted.
54	uSDHC1	uSDHC1 (Enhanced SDHC) interrupt request.
55	uSDHC2	uSDHC2 (Enhanced SDHC) interrupt request.
56	SAI3	SAI interrupt
57	SAI3	SAI interrupt.
58	UART1	UART1 interrupt request.
59	UART2	UART2 interrupt request.
60	UART3	UART3 interrupt request.
61	UART4	UART4 interrupt request.
62	UART5	UART5 interrupt request.
63	eCSPI1	eCSPI1 interrupt request.
64	eCSPI2	eCSPI2 interrupt request.
65	eCSPI3	eCSPI3 interrupt request.
66	eCSPI4	eCSPI4 interrupt request.
67	I2C4	I2C4 interrupt request.
68	I2C1	I2C1 interrupt request.
69	I2C2	I2C2 interrupt request.
70	I2C3	I2C3 interrupt request.
71	UART7	UART-7 ORed interrupt.
72	UART8	UART-8 ORed interrupt.
73	Reserved	Reserved
74	USB	USBO2 USB OTG2
75	USB	USBO2 USB OTG1
76	USB_PHY	UTMI0 interrupt request.
77	USB_PHY	UTMI1 interrupt request.

Table continues on the next page...

Table 3-1. ARM Cortex A7 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
78	CAAM	CAAM interrupt queue for JQ2.
79	CAAM	CAAM interrupt for recoverable error.
80	CAAM	CAAM interrupt for RTIC.
81	Temperature Monitor	Temperature Sensor (temperature greater than threshold) interrupt request.
82	ASRC	ASRC interrupt request.
83	Reserved	Reserved
84	SPDIF	Logic OR of SPDIF Rx/Tx interrupts.
85	Reserved	Reserved
86	PMU	Brown-out event on either the 1.1, 2.5 or 3.0 regulators.
87	GPT1	Logical OR of GPT1 rollover interrupt line, input capture 1 & 2 lines, output compare 1, 2, and 3 interrupt lines.
88	EPIT1	EPIT1 output compare interrupt.
89	EPIT2	EPIT2 output compare interrupt.
90	GPIO1	INT7 interrupt request.
91	GPIO1	INT6 interrupt request.
92	GPIO1	INT5 interrupt request.
93	GPIO1	INT4 interrupt request.
94	GPIO1	INT3 interrupt request.
95	GPIO1	INT2 interrupt request.
96	GPIO1	INT1 interrupt request.
97	GPIO1	INT0 interrupt request.
98	GPIO1	Combined interrupt indication for GPIO1 signals 0 - 15.
99	GPIO1	Combined interrupt indication for GPIO1 signals 16 - 31.
100	GPIO2	Combined interrupt indication for GPIO2 signals 0 - 15.
101	GPIO2	Combined interrupt indication for GPIO2 signals 16 - 31.
102	GPIO3	Combined interrupt indication for GPIO3 signals 0 - 15.
103	GPIO3	Combined interrupt indication for GPIO3 signals 16 - 31.
104	GPIO4	Combined interrupt indication for GPIO4 signals 0 - 15.
105	GPIO4	Combined interrupt indication for GPIO4 signals 16 - 31.
106	GPIO5	Combined interrupt indication for GPIO5 signals 0 - 15.
107	GPIO5	Combined interrupt indication for GPIO5 signals 16 - 31.
108	Reserved	Reserved
109	Reserved	Reserved
110	Reserved	Reserved
111	Reserved	Reserved
112	WDOG1	WDOG1 timer reset interrupt request.
113	WDOG2	WDOG2 timer reset interrupt request.
114	KPP	Key Pad interrupt request.

Table continues on the next page...

Table 3-1. ARM Cortex A7 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
115	PWM1	Cumulative interrupt line for PWM1. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
116	PWM2	Cumulative interrupt line for PWM2. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
117	PWM3	Cumulative interrupt line for PWM3. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
118	PWM4	Cumulative interrupt line for PWM4. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
119	CCM	CCM interrupt request 1.
120	CCM	CCM interrupt request 2.
121	GPC	GPC interrupt request 1.
122	Reserved	Reserved
123	SRC	SRC interrupt request.
124	Reserved	Reserved
125	Reserved	Reserved
126	CPU	Performance Unit interrupt.
127	CPU	CTI trigger outputs interrupt.
128	SRC	Combined CPU wdog interrupts (4x) out of SRC.
129	SAI1	SAI1 interrupt request.
130	SAI2	SAI2 interrupt request.
131	Reserved	Reserved
132	ADC1	ADC1 interrupt request.
133	ADC2	ADC2 interrupt request.
134	Reserved	Reserved
135	Reserved	Reserved
136	SJC	SJC interrupt from General Purpose register.
137	CAAM	CAAM job ring 0 interrupt.
138	CAAM	CAAM job ring 1 interrupt.
139	QSPI	QSPI interrupt request.
140	TZASC	TZASC (PL380) interrupt request.
141	GPT2	Logical OR of GPT2 rollover interrupt line, input capture 1 & 2 lines, output compare 1, 2 & 3 interrupt lines.
142	CAN1	Combined interrupt of ini_int_busoff,ini_int_error,ipi_int_mbor,ipi_int_txwarning and ipi_int_waken
143	CAN2	Combined interrupt of ini_int_busoff,ini_int_error,ipi_int_mbor,ipi_int_txwarning and ipi_int_waken
144	SIM1	SIM interrupt request.
145	SIM2	SIM interrupt request.
146	PWM5	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line

Table continues on the next page...

Table 3-1. ARM Cortex A7 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
147	PWM6	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
148	PWM7	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
149	PWM8	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
150	ENET1	ENET1 interrupt
151	ENET1	ENET1 1588 Timer interrupt [synchronous] request.
152	ENET2	ENET2 interrupt
153	ENET2	MAC 0 1588 Timer interrupt [synchronous] request.
154	Reserved	Reserved
155	Reserved	Reserved
156	Reserved	Reserved
157	Reserved	Reserved
158	Reserved	Reserved
159	PMU	Brown-out event on either core, gpu or soc regulators.

3.3 SDMA event mapping

The following table found here shows the DMA request signals for peripherals in the chip.

Table 3-2. SDMA event mapping

Event Number	DMA Source	Description
0	UART6 / SIM2	UART6 Rx FIFO; SIM2 receive DMA request
1	ADC1	ADC1 DMA request
2	EPIT2 / PXP	EPIT2 DMA request; PXP DMA Event
3	eCSPI1	eCSPI1 Rx request
4	eCSPI1	eCSPI1 Tx request
5	eCSPI2	eCSPI2 Rx request
6	eCSPI2	eCSPI2 Tx request
7	eCSPI3 / I2C1	eCSPI3 Rx request; I2C1 DMA event
8	eCSPI3 / I2C2	eCSPI3 Tx request; I2C2 DMA event
9	eCSPI4 / I2C3	eCSPI4 Rx request; I2C3 DMA event
10	eCSPI4 / I2C4	eCSPI4 Tx request; I2C4 DMA event
11	QSPI	QSPI DMA RX request

Table continues on the next page...

Table 3-2. SDMA event mapping (continued)

Event Number	DMA Source	Description
12	QSPI	QSPI DMA TX request
13	ADC2 / TSC	ADC2 DMA request; TSC interrupt
14	Mux_bottom	external DMA pad #1
15	Mux_bottom	external DMA pad #2
16	EPIT1 / CSI	EPIT1 DMA request: CSI DMA Event.
17	ASRC	ASRC DMA1 request (Pair A input Request)
18	ASRC	ASRC DMA2 request (Pair B input Request)
19	ASRC	ASRC DMA3 request (Pair C input Request)
20	ASRC	ASRC DMA4 request (Pair A output Request)
21	ASRC	ASRC DMA5 request (Pair B output Request)
22	ASRC	ASRC DMA6 request (Pair C output Request)
23	GPT1	GPT1 counter event
24	GPT2 / LCDIF	GPT2 counter event; LCDIF DMA Event
25	UART1	UART1 Rx FIFO
26	UART1	UART1 Tx FIFO
27	UART2	UART2 Rx FIFO
28	UART2	UART2 Tx FIFO
29	UART3	UART3 Rx FIFO
30	UART3	UART3 Tx FIFO
31	UART4	UART4 Rx FIFO
32	UART4	UART4 Tx FIFO
33	UART5 / SIM1	UART5 Rx FIFO; SIM1 receive DMA request
34	UART5 / SIM1	UART5 Tx FIFO; SIM1 transmit DMA request
35	SAI1	SAI1 Rx FIFO
36	SAI1	SAI1 Tx FIFO
37	SAI2	SAI2 Rx FIFO
38	SAI2	SAI2 Tx FIFO
39	SAI3	SAI3 Rx FIFO
40	SAI3	SAI3 Rx FIFO
41	SPDIF	SPDIF Rx DMA request
42	SPDIF	SPDIF Tx DMA request
43	UART7 / ENET1	UART7 Rx FIFO; ENET1 1588 Event0 out
44	UART7 / ENET1	UAR7 Tx FIFO; ENET1 1588 Event1 out
45	UART8 / ENET2	UART8 Rx FIFO; ENET2 1588 Event0 out
46	UART8 / ENET2	UART8 Tx FIFO; ENET2 1588 Event1 out
47	UART6 / SIM2	UART6 Tx FIFO; SIM2 transmit DMA request UART6 Tx FIFO; ESAI Tx FIFO DMA request

As shown in the table, some of the events are an output of a mux of two signals or triggers. The select of this mux is controlled by the general purpose registers in IOMUXC.

Chapter 4
External Signals and Pin Multiplexing

4.1 Overview

The chip contains a limited number of pins, most of which have multiple signal options. These signal to pin and pin to signal options are selected by the input-output multiplexer called IOMUX. The IOMUX is also used to configure other pin characteristics, such as voltage level, drive strength, and hysteresis.

The muxing options table lists the external signals grouped by module instance, the muxing options for each signal, and the registers used to route the signal to the chosen pad.

4.1.1 Muxing Options

Instance	Port	Pad	Mode
ADC	ADC_VREFH	ADC_VREFH	-
	ADC_VREFL	GND	-
	ADC1_IN0	GPIO1_IO00	-
	ADC1_IN1	GPIO1_IO01	-
	ADC1_IN2	GPIO1_IO02	-

Chapter 5
Fusemap

5.1 Boot Fusemap

The following section details the various modes and selection of the required boot devices.

A separate map is given for each and every boot device. The device select is specified by BOOT_CFG1[6:4] fuses listed in Table 5-1.

Table 5-1. Boot Device Select

Boot Device	BOOT_CFG1[7]	BOOT_CFG1[6]	BOOT_CFG1[5]	BOOT_CFG1[4]	BOOT_CFG1[3]
QSPI	0	0	0	1	x
WEIM	0	0	0	0	Memory Type: 0 - NOR Flash 1 - OneNAND
Serial-ROM	0	0	1	1	x
SD/eSD	0	1	0	x	x
MMC/eMMC	0	1	1	x	x
NAND	1	x	x	x	x

NOTE

Fuses marked as “Reserved” are reserved for Freescale internal (and future) use only. Customers should not attempt to burn these, as the IC behavior may be unpredictable. The reserved fuses can be read as either '0' or '1'.

Table 5-2. QSPI Boot Fusemap

Addr	7	6	5	4	3	2	1	0
0x450[7:0] (BOOT_CFG1)	0	0	0	1	x	DDRSMP: 000 - Default		

Table continues on the next page...

Table 5-2. QSPI Boot Fusemap (continued)

Addr	7	6	5	4	3	2	1	0
0x450[15:8] (BOOT_CFG2)	Reserved	HSPHS: Half Speed Phase Selection 0 - select sampling at non-inverted clock 1 - select sampling at inverted clock	HSDLY: Half Speed Delay selection 0 - one clock delay 1 - two clock delay	FSPHS: Full Speed Phase Selection 0 - select sampling at non-inverted clock 1 - select sampling at inverted clock	FSDLY: Full Speed Delay selection 0 - one clock delay 1 - two clock delay	Boot Frequencies (ARM/DDR) 0 - 500 / 400 MHz 1 - 250 / 200 MHz	Reserved	Reserved

Table 5-9. Fusemap Descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Setting	Used by
				FLASH boot 0x010XXXXX - SD/eSD 0x011XXXXX - MMC/eMMC boot Others - Reserved Refer to Fuse Map for details.	
0x450[15:8]	BOOT_CFG2	8	BOOT configuration register #2, Usage varies, depending on selected boot device.	See fuse-map tab for details.	SRC
0x450[23:16]	BOOT_CFG3	8	BOOT configuration register #3	See fuse-map tab for details.	SRC
0x450[31:24]	BOOT_CFG4	8	BOOT configuration register #3	See fuse-map tab for details.	SRC
0x460[1]	SEC_CONFIG[1]	1	Security Configuration (with SEC_CONFIG[0])	00 - FAB (Open) 01 - Open - allows any code to be flashed and executed, even if it has no valid signature. 1x - Closed (Security On)	SW (ROM), SRC, SNVS, TPSMP
0x460[3]	DIR_BT_DIS	1	Direct External Memory Boot Disable	0 - Direct boot from external memory is allowed 1 - Direct boot from external memory is not allowed	SW(ROM), SRC
0x460[4]	BT_FUSE_SEL	1	Determines, whether using fuses for boot configuration, or GPIO /Serial loader.	If boot_mode="00" (Development) 0=Boot mode configuration is taken from GPIOs. 1=Boot mode configuration is taken from fuses. If boot_mode="10" (Production) 0 - Boot using Serila Loader (USB) 1- Boot mode configuration is taken from fuses.	SRC SW(ROM)
0x460[5]	FORCE_COLD_BOOT(SBMR)	1	Force cold boot when A9 core come out of reset. Reflected in SBMR reg of SRC	Fuse Function: 0 – Default behavior equivalent to the rest of the i.MX6 family allowing a fast recovery from low power modes. That is, the ROM is allowed to jump to the address previously programmed in the SRC persistent register. 1 – Fast recovery path in the ROM is not allowed and a cold boot is always performed. Customers wanting a higher level of security should burn this fuse.	SRC
0x460[15:8]	DDR3_CONFIG[7:0]	8	DDR3 config options		SW(ROM)

Chapter 6
External Memory Controllers

6.1 Overview

This chip has the following external memory interfaces and controllers:

- Multi-mode DDR controller (MMDC)
- EIM-PSRAM/NOR Flash controller

6.2 Multi-mode DDR controller (MMDC) overview and feature summary

The MMDC module is a DDR controller that can support several types of DDR memories.

Table 6-1. MMDC feature summary

Feature	Description
Supported standards	• LPDDR2 1ch x16, LV-DDR3, DDR3 x16

DDR interface	• Density of 256 Mbytes-4Gbytes
	  • Column size of 8-12 bits
	  • Row size of 11-16 bits
	• Supports burst length of 8 (aligned) for DDR3 and burst lengths of 4 for LPDDR2

DDR performance	• Supports Real-Time priority by means of QoS sideband priority signals from the chip to enable different priority levels in the re-ordering mechanism • Page hit/page miss optimizations • Consecutive read/write access optimizations • Supports deep read and write requests queues to enable bank prediction • Drives back the critical word in a read transaction as soon as it is received by the DDR device (doesn't wait until the whole data phase has been completed) • Can track open memory pages • Supports bank interleaving • Special optimization for non-aligned wrap accesses in burst length 8
AXI interface	• AXI bus compliant with glueless interface to PL301 AXI network interconnect

Table continues on the next page...

Table 6-1. MMDC feature summary (continued)

Feature	Description

DDR calibration and delay-lines	• All calibrations can be done automatically by hardware or manually by software
	• ZQ calibration for external DDR device (in DDR3 through the ZQ calibration command and in LPDDR2 through the MRW command).
	  • Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh).
	  • Can be handled manually at ZQ INIT.

DDR general	• Configurable timing parameters • Configurable refresh scheme • Supports dynamic voltage, frequency change and low power mode entry through hardware negotiation with the system (req/ack handshake) • Suppors automatic self-refresh and power down entry and exit • Supports fast and slow precharge power down in DDR3 • Supports various ODT control schemes. • Assertion/Deassertion of ODT control per read or write accesses and for active or passive CS • Supports MRW and MRR commands for LPDDR2. • Software control for moving to derated timing parameters and derated refresh rate according to temperature variation. • Supports various debug and profiling modes

6.3 EIM-PSRAM/NOR Flash controller overview

EIM is an external interface module and manages the interface to devices external to the chip, including the generation of chip selects, clocks, and control for external peripherals and memory.

It provides asynchronous and synchronous access to devices with an SRAM-like interface.

6.3.1 EIM features

- Up to four (software configurable) chip selects for external devices
  - Flexible address decoding; each chip select memory space is determined separately according to the GPR bits in IOMUXC.
  - 128 MByte maximum supported density by default (AUS bit is cleared). When the AUS bit is set, maximum supported density is 32MBytes.
- Selectable write protection for each chip select
- Programmable wait-state generator for each chip select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals

- Independent synchronous memory burst write mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™from Toshiba)
- Supports NAND-Flash devices with NOR-Flash like interface - OneNAND™ (Samsung)
- Independent programmable variable/fix latency support for read and write synchronous (burst) mode
- Support for little endian operation
- ARM AXI slave interface accesses only handled in parallel for single AXI ID transactions
- External interrupt support using the RDY_INT signal function as an external interrupt pin
- Boot from external device support according to boot signals, using the RDY_INT signal
  - RDY signal support assertion after reset
  - INT signal support assertion after reset for OneNAND™ (Samsung) device
  - Supports little endian mode only

6.3.2 EIM boot scenarios

EIM allows booting from NOR Flash devices. To select NOR Flash as the boot source, use either the boot mode and configuration GPIO pins or the internal boot-related fuses.

See Sytem Boot for more information.

6.3.3 EIM boot configuration

The following table shows the EIM boot configuration.

Table 6-2. EIM boot configuration

EIM_BOOT_CFG bus	EIM affected bits	EIM register
12	NUM16_BYP_GRANT	CS0GCR2
11	DSZ[2]	CS0GCR1
10	AUS	CS0GCR1
[9:8]	CSREC[2:1]	CS0GCR1
[7:5]	RWSC[4:2]	CS0GCR1
	WWSC[4:2]	CS0WCR
4	ERRST	WCR
3	RAL	CS0RCR1

Table continues on the next page...

Table 6-2. EIM boot configuration (continued)

EIM_BOOT_CFG bus	EIM affected bits	EIM register
	WAL	CS0WCR
2	MUM	CS0GCR1
	OEA[1]	CS0RCR1
[1:0]	DSZ[1:0]	CS0GCR1

6.3.4 OneNAND requirements

By default Ready/Busy pin is not in use, take the following steps to configure OneNAND:

- Poll the device to see whether it is ready; software performs a read from the device.
- Connect the Ready/Busy signal of the OneNAND device to any GPIO pin and use it as an interrupt that indicates the OneNAND device's ready state.

Chapter 7
System Debug

7.1 Overview

This chapter describes the hardware and software debug and application development features and resources of the chip. It discusses the following:

- Core/platform-specific resources
- Resources associated with complex IP blocks
- Chip-wide resources
- Interface to the external debug and development tools

The debug and trace architecture is designed around the following:

- ARM's CoreSight architecture, adapted to SoC (for core debug), including a cross-trigger subsystem for cross-domain triggering of debug resources
- JTAG port used to interact with cores under debug by means of SJC, the system JTAG controller port
- DAP, the debug access port that supports the interface to the ARM RealView Debugging tools and other third party tools
- TPIU, a trace port interface unit that efficiently accesses program trace information from the system
- Various chip-wide resources, such as debug features built into the IP blocks and critical signal visibility available through alternate pin functions or observability muxes

7.2 Chip and ARM Platform Debug Architecture

ARM Debug architecture is based on CoreSight architecture by ARM Ltd. The CoreSight architecture provides a system wide solution to real-time debug and trace.

The CoreSight architecture is embodied in a set of CoreSight components and compliant processors that form CoreSight systems. Its architecture maintains the traditional requirements of debug and trace:

- To access debug functionality without software interaction;
- To connect to a running system without performing a reset.

Full access to the processor debug capability is available by the ARM debug register map through the Advanced Peripheral Bus (APB) slave port. The core includes a Processor Debug Unit allow which stops program execution, examines and alters the processor and coprocessor state, examines and alters the memory and input/output peripheral state and restarts the processor core.

7.2.1 Debug Features

- CoreSight Embedded Trace Macrocell (ETM): trace generator for ARM processors
- Support for a TrustZone-related 3-level debug scheme:
  - Debug in Non-Secure privileged and user, and Secure user
  - Debug in Non-Secure only
- EmbeddedICE-RT logic
  - Support for both monitor-mode and halt-mode debugging:
  - Core run/halt control, debug status/control
  - Breakpoint/watchpoint control
  - Core- and memory-mapped resource examination/modification
- Data communication channel between ARM core and host debugger via JTAG, and the Debug Access Port (DAP) module.
- PMU: Performance Metrics Unit used for system profiling and debug.
- CP15 register for debugging the MMU, I & D L1 cache, and TLB

The chip includes ARM CoreSight components for multicore debug and trace solutions.

7.2.2 Debug System components

CoreSight components include:

- Embedded Trace Buffer (ETB): RAM array to be used for on-chip capture of trace data output from the PTM
- ATB Replicator to connect the trace data to TPIU (Trace Port Interface) and ETB (Embedded Trace Buffer)
- Cross Triggering logic for event routing, including CTIs and CTMs

Other related IPs and functionality:

- ROMPATCH module to support modification of program/data information in the MCU ROM
- Debug Visibility, which selects critical signals routed to the I/O pads as alternate outputs for external visibility

7.2.2.1 AMBA trace bus (ATB)

ATB transfers trace data though the CoreSight infrastructure in a chip. Trace sources are ATB masters and sinks are ATB slaves. The ARM (via PTM) cores are the data generators. Link components such as the Trace Funnel and Replicator provide both master and slave interfaces.

The ATB protocol supports:

- Stalling of trace sources to enable the CoreSight components to funnel and combine sources into a single trace stream.
- Association of the trace data with the generating source using trace source IDs. A CoreSight system can trace up to 111 different items at any one time.
- Capture and transfer of multiple byte bus widths, currently to 32 bits.
- A flushing mechanism to force historic trace to drain from any sources, links, or sinks up to the point that the request was initiated

7.2.2.2 ATB replicator

The ATB replicator enables two trace sinks to be wired together and to operate from the same incoming trace stream.

There are no programmable registers. This component is invisible to the user on a particular trace path, from source to sink.

- Incoming ATB Interface—The ATB replicator accepts trace data from the trace source, either directly or through a trace funnel.
- Outgoing ATB Interfaces—The ATB replicator sends identical trace data on outgoing master port interfaces.

7.2.2.3 Embedded Cross Triggering

The ECT is a modular component from ARM Limited that supports the interaction and synchronization of multiple triggering events within a chip. The main function of the ECT (CTI and CTM) is to pass debug events from one core to another. For example, the ECT can communicate debug state information from one core to another, so that program execution on both processors can be stopped at the same time if required.

The ECT consists of the following types of modules:

- Cross trigger interfaces (CTI)
- Cross trigger matrix (CTM)

Cross trigger interfaces provide the interface between a component or subsystem and the cross trigger matrix. The system requires a CTI for each subsystem that supports cross triggering. The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

The Cross Trigger Matrix (CTM) combines the trigger request generated from the CTIs and broadcasts them to all CTIs as channel triggers. The CTM controls the distribution of channel events. It provides Channel Interfaces (CIs) to connect to either CTIs or CTMs. This enables multiple CTIs to be linked together. The ECT is composed of three/five CTIs (Cross Trigger Interface) and two CTMs (Cross Trigger Matrix). The ECT is key in the multi-core and multi-IP debug strategy. The outcome is a SWcontrolled debug signal matrix that receives signals from various sources (i.e. cores and peripherals) and propagates/ routes them to the different debug resources of the SoC. Those debug resources can include time stamping capability, profiling capabilities, real-time trace (trace enabled or disabled), triggers, SOC level multiplexing, and debug interrupts.

NOTE

As the ECT should only be used during debug sessions, it is disabled by default.

7.2.2.3.1 Cross-Trigger Matrix (CTM)

The CTM (Cross Trigger Matrix) is provided by ARM. A brief description is provided below. It is advised to refer to ARM documentation for more details.

The CTM is a relatively simple block with no configuration options. There are two CTM instances in in ARM Platform.

One of them is used to route Core's CTI's, while the second one, is used for additional CoreSight CTI. Each CTI has 4 channel lines, which CTI events are mapped to. The exact mapping is configured in the CTI logic.

7.2.2.3.2 Cross-Trigger Interface (CTI)

The Cross-Trigger Interface (CTI) component is provided by ARM. A brief description of the CTI is provided below.

There are CTIs in the chip's ARM platform. of which, dedicated to each Core, while the is used for various other signals routing.

Each of these CTIs has 8 trigger inputs and 8 trigger outputs that connect to logic in the domain to be debugged or profiled. Each CTI also includes a 4 channel interface to the CTM (4 inputs and 4 outputs).

For more information, see ARM platform chapter.

7.2.2.4 Debug Access Port (DAP)

The DAP enables debug access to the chip modules through APB-AP (the APB access port) and APB-Mux (the APB multiplexer).

AHB-AP provides system access. Debug tools can use JTAG to connect to the chip.

DAP has the following features:

- AMBA 3 Peripheral Bus Multiplexor access though AMBA 3 APB Access Port, providing debug peripheral access through the APB interface.
- External JTAG access using the JTAG Debug Port (JTAG-DP).
- Internal chip module access using:
  - AHB Access Port (AHB-AP)
  - APB Access Port (APB-AP)
  - JTAG Access Port (JTAG-AP)

APB-Mux enables system access to CoreSight components connected to the Debug APB.

The ROM table provides a list of memory locations of CoreSight components connected to the Debug APB. This is visible from both tools and system access and one configures it during system implementation.

External read/write access to the internal interface is provided by JTAG-DP. JTAG-DP provides a standard interface for debug access to the chip through DAP. It interfaces to the DAP internal bus.

Internal access to on-chip buses and other interfaces are provided by the access ports (APs). The available APs are:

- AHB-AP which provides an AHB-Lite master for access to a system AHB bus.
- APB-AP which provides an AMBA 3 APB master for access to the Debug APB that configures all CoreSight components.
- JTAG-AP which provides JTAG access to on-chip components and operates as a JTAG master port to drive JTAG chains throughout the chip.

7.2.3 Chip-Specific SJC Features

7.2.3.1 JTAG Disable Mode

In addition to different JTAG security modes that are implemented internally in the System JTAG Controller (SJC), there is an option to disable the SJC functionality by e-fuse configuration.

This creates additional JTAG mode "JTAG Disabled" with highest level of JTAG protection. In this mode all JTAG features are disabled. Specifically, the following debug features are disabled in addition to the features that were already disabled in "No Debug" JTAG mode:

- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

7.2.3.2 JTAG ID

Table 7-1. i.MX JTAG ID

Device	Silicon revision	JTAG ID (ID CODE)
i.MX 6UltraLite	Rev 1.0	0891_D01Dh 1891_D01Dh [1]

1. In follow-on silicon revisions, the ID value is subject to change by incrementing the first nibble as follows: 1891_D01Dh for Rev 1.1, 2891_D01Dh for Rev 1.2 , etc.

7.2.4 System JTAG Controller - SJC

The SJC module is the bridge between external development and test instrumentation and the internal JTAG-accessible debug and test resources.

It implements and manages the daisy-chained topology consisting of its own TAP and those of the SDMA, and the ARM Debug Access Port (DAP).

NOTE

Single Wire Debug (SWD) protocol is not supported.

7.2.5 System JTAG controller main features

- IEEE P1149.1, 1149.6 (standard JTAG) interface to off-chip test and development equipment
  - Includes an SJC-only mode for true IEEE P1149.1 compliance, used primarily for board-level implementation of boundary scan.
  - Supports IEEE P1149.6 extensions to the JTAG standard for AC testing of selected I/O signals.
- Debug-related control and status; puting selected cores into reset and/or debug mode and monitoring individual core status signals by means of JTAG
- System status, such as the state of the PLLs (locked or not locked)
- levels of security, ranging from no security to no JTAG accessibility to the chip

7.2.6 SJC TAP Port

The SJC supports the following standard JTAG pins:

- TRSTB
- TDI
- TDO
- TCK
- TMS

7.2.7 SJC main blocks

- Interface to the outside world via the standard JTAG pins
- Interface to the external Debug_Event pin
- A master TAP controller which implements the standard JTAG state machine
- Implementation of the mandatory and optional IEEE P1149.1 (JTAG) instructions

    - Mandatory: "EXTEST", "SAMPLE/PRELOAD", and "BYPASS"
    - Optional: "ID_CODE" (SOC JTAG ID register), "HIGHZ"
- Supports the SDMA's DR-path-only JTAG architecture by implementing the controller portion of its TAP (including "BYPASS" as the default state) within the SJC
- The ExtraDebug registers, which implement a variety of control and status features
    - Three 32-bit insecure general purpose status registers
    - Two 32-bit secure status registers - one predefined, one general purpose.
    - Control and status registers for debug, core, charge pump, and PLL.
- Four levels of fuse-defined security, ranging from no security to no access.

Both predefined and user-defined control and status functions are supported by the SJC.

7.3 Smart DMA (SDMA) core

SDMA is a dedicated, programmable DMA engine. It is an integration of a 32-bit RISC core and DMA-specific hardware. It includes ports for the AP domain and a peripheral domain, along with a burst-capable port for direct external memory access.

NOTE

The SDMA and its integration in the chip is unchanged from previous i.MX chips.

The main SDMA debug features are:

- OnCE - On Chip Emulator, provides the following capabilities:
    - SDMA core control - run/halt/single-step
    - SDMA core register/memory-map access
    - Event detection, watchpoints, and hardware breakpoints
    - Real time buffer and PC trace buffer capability
- Trace buffer
    - Contains information to identify the 32 last changes of flow detected during a program execution
- Context dump
    - Includes information about all the channel dump activity
    - Current contents of SDMA RAM
- ROMPATCH

7.3.1 SDMA On Chip Emulation Module (OnCE) Feature Summary

The SDMA debug features are primarily defined by the OnCE portion of its design.

They are summarized as follows:

- Memory And Register Access - dedicated logic enables user-access to SDMA memory and register locations. These accesses are supported only when the processor is in debug mode.
- Event Detection Unit - watches signals from the data memory bus (DMBus) which is used by the RISC core to access its RAM, ROM, and memory-mapped registers
- Watchpoints - one output signal is available to watch event matching conditions at the chip level. Match conditions are defined by programming memory-mapped registers.
- Hardware Breakpoint - a counter is decremented after an event detection. A debug request is sent to the SDMA core only when the counter reaches the value of zero. It is possible to program the initial value of the counter or to disable the use of the counter if a debug request must be generated after each event detection.
- Real Time Buffer - The Real Time Buffer Register (RTB) is a single 32-bit memory-mapped register which can be accessed as a regular memory location during program execution. It is used to store and retrieve run time information without putting the SDMA in debug mode. Each write to this register causes an event. This register is, in fact, located in the OnCE. Executing through JTAG, a buffer command exports the content of this register through the JTAG port.
- Core Control (Core Status / Single Stepping) - Commands are provided to monitor and control processor activity. The commands can halt the core, rerun the core from another address location, and get processor status.
- Trace Buffer - a 32x32 buffer which records the last 32 changes of flow during program execution. The buffer stores data in a modulo fashion (i.e. the 33rd instruction change replaces the 1st). Captured trace information is retrieved via reads to the Trace Buffer Register.

7.3.1.1 Other SDMA Debug Functionality

- Core Trace - basic core trace capability is available through debug visibility functionality only. PTM trace capability does not exist.
- ROM Patch - can be accomplished by manipulating the CHN0ADDR register through JTAG or via the MCU's ability to write to SDMA OnCE registers. This must be done right after reset and before the SDMA core is enabled to begin processing events.
- Additional debug control/status interaction with the SJC module

- SJC-controlled Debug Request
- SJC-readable Debug Acknowledge (in debug mode)
- Debug clock control - allows SJC to force clocks on for debug purposes
- Debug core state (SDMA RISC Core State) - 4 bits accessible from the SJC via JTAG

7.3.1.2 SDMA ROM Patching

After reset, the SDMA is in its IDLE_AFTER_RESET mode. A debug request also puts the SDMA in its DEBUG_IN_IDLE_AFTER_RESET mode. The new address boot must be stored in CHN0ADDR register (e.g., through the SDMA OnCE via debugger).

The user must then issue the exec_core <instruction> SDMA OnCE instruction to return to the IDLE_AFTER_RESET mode. The very first instructions of the boot code fetches the contents of this register (which is also mapped in the SDMA memory space) and jumps to the given address.

7.4 Miscellaneous

The Miscellaneous function described in this section provide useful general capabilities.

7.4.1 Clock/Reset/Power

CDBGPWRUPREQ and CDBGPWRUPACK are the handshake signals between the DAP and the clock control module to ensure debug power and clocks are turned on. If the debug components are always powered on, the handshake becomes a mechanism to turn debug clocks on. Similarly, there is a register bit in the CCM which allows internal software to turn debug clocks on as well because the CDBGPWRUPREQ is in the TCLK domain and is inaccessible to software.

The Cortex-A7 core can receive resets from the following sources:

- Debug Reset (CDBGRSTREQ bit within the SWJ-DP CTRL/STAT register of the DAP) in the TCLK domain. This allows the debug tools to reset the debug logic.
- System POR reset

7.5 Supported tools

DS-5 ARM Debugger is supported.

The debugger is connected to the chip from the host by the DS-5 ICE protocol converter. Other third party tools can be used via the standard JTAG interface, but may need to be adapted for individual IC. It is important to check with tool vendors for specific tool requirements, especially for on-chip IC.

Chapter 8
System Boot

8.1 Overview

The boot process begins at Power On Reset (POR) where the hardware reset logic forces the ARM core to begin execution starting from the on-chip boot ROM.

Boot ROM code uses the state of the internal register BOOT_MODE[1:0] as well as the state of various eFUSEs and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Serial downloader support (USB OTG and UART)
- Device configuration data (DCD) and plugin
- Digital signature and encryption based High Assurance Boot (HAB)
- Wake-up from low power modes

The boot ROM supports the following boot devices:

- NOR Flash
- NAND Flash
- OneNAND Flash
- SD/MMC
- Serial (SPI) NOR Flash and EEPROM
- QuadSPI (QSPI) Flash

The Boot ROM uses the state of BOOT_MODE and eFUSEs to determine the boot device. For development purposes, eFUSEs used to determine the boot device may be overridden by using GPIO pin inputs.

Boot ROM code also allows the downloading of programs to be run on the device. An example is a provisioning program that can make further use of the serial connection to provision a boot device with a new image. Typically the provisioning program is

downloaded to internal RAM and allows the programming of boot devices, such as an SD/MMC Flash. The ROM Serial Downloader uses high speed USB in a non-stream mode connection and UART in a stream mode connection.

Boot ROM allows waking up from low-power modes. On reset the ROM checks power gating status register. On waking from low power mode, the core will skip loading an image from the boot device and jump to the address saved in PERSISTENT_ENTRY0.

The device configuration data (DCD) feature allows boot ROM code to obtain SOC configuration data from an external Program Image residing on the boot device. As an example, DCD can be used to program the DDR controller for optimal settings improving the boot performance. DCD is restricted to memory areas and peripheral addresses that are considered essential for boot purposes (see Write Data Command).

A key feature of the boot ROM is the ability to perform a secure boot or High Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. HAB uses a combination of hardware and software together with a Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized programs. Before the HAB allows a user's image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as part of the final Program Image. If configured to do so, the ROM verifies the signatures using the public keys included in the Program Image. In addition to supporting digital signature verification to authenticate Program Images, Encrypted boot is also supported. Encrypted boot can be used to prevent cloning of the Program Image directly off the boot device. A secure boot with HAB can be performed on all boot devices supported on the chip in addition to the Serial Downloader. The HAB library in the boot ROM also provides API functions, allowing additional boot chain components (bootloaders) to extend the secure boot chain. The out-of-fab setting for SEC_CONFIG is the Open configuration in which the ROM/HAB performs image authentication, but all authentication errors are ignored and the image is still allowed to execute.

8.2 Boot modes

During reset, the chip checks Power Gating Controller status register.

During boot, the core's behavior is defined by the Boot Mode pins settings as described in Boot mode pin settings. On waking up from low power boot mode, the core skips clock settings. Boot ROM checks that PERSISTENT_ENTRY0 (see Persistent Bits) is a pointer to valid address space (OCRAM, DDR, QSPI, or EIM). If

PERSISTENT_ENTRY0 is a pointer to valid range, it starts execution using entry point from PERSISTENT_ENTRY0 register. If PERSISTENT_ENTRY0 is a pointer to invalid range, the core performs system reset.

8.2.1 Boot mode pin settings

The device has four boot modes (one is reserved for Freescale use). Boot mode is selected based on the binary value stored in the internal BOOT_MODE register.

BOOT_MODE is initialized by sampling the BOOT_MODE0 and BOOT_MODE1 inputs on the rising edge of POR_B. After these inputs are sampled, their subsequent state does not affect the contents of the BOOT_MODE internal register. The state of the internal BOOT_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC_SBMR2). The available boot modes are: Boot From Fuses, serial boot via USB, and Internal Boot. See the table below for settings.

Table 8-1. Boot MODE Pin Settings

BOOT_MODE[1:0]	Boot Type
00	Boot From Fuses
01	Serial Downloader
10	Internal Boot
11	Reserved

8.2.2 High level boot sequence

The figure found here shows the high-level boot ROM code flow.

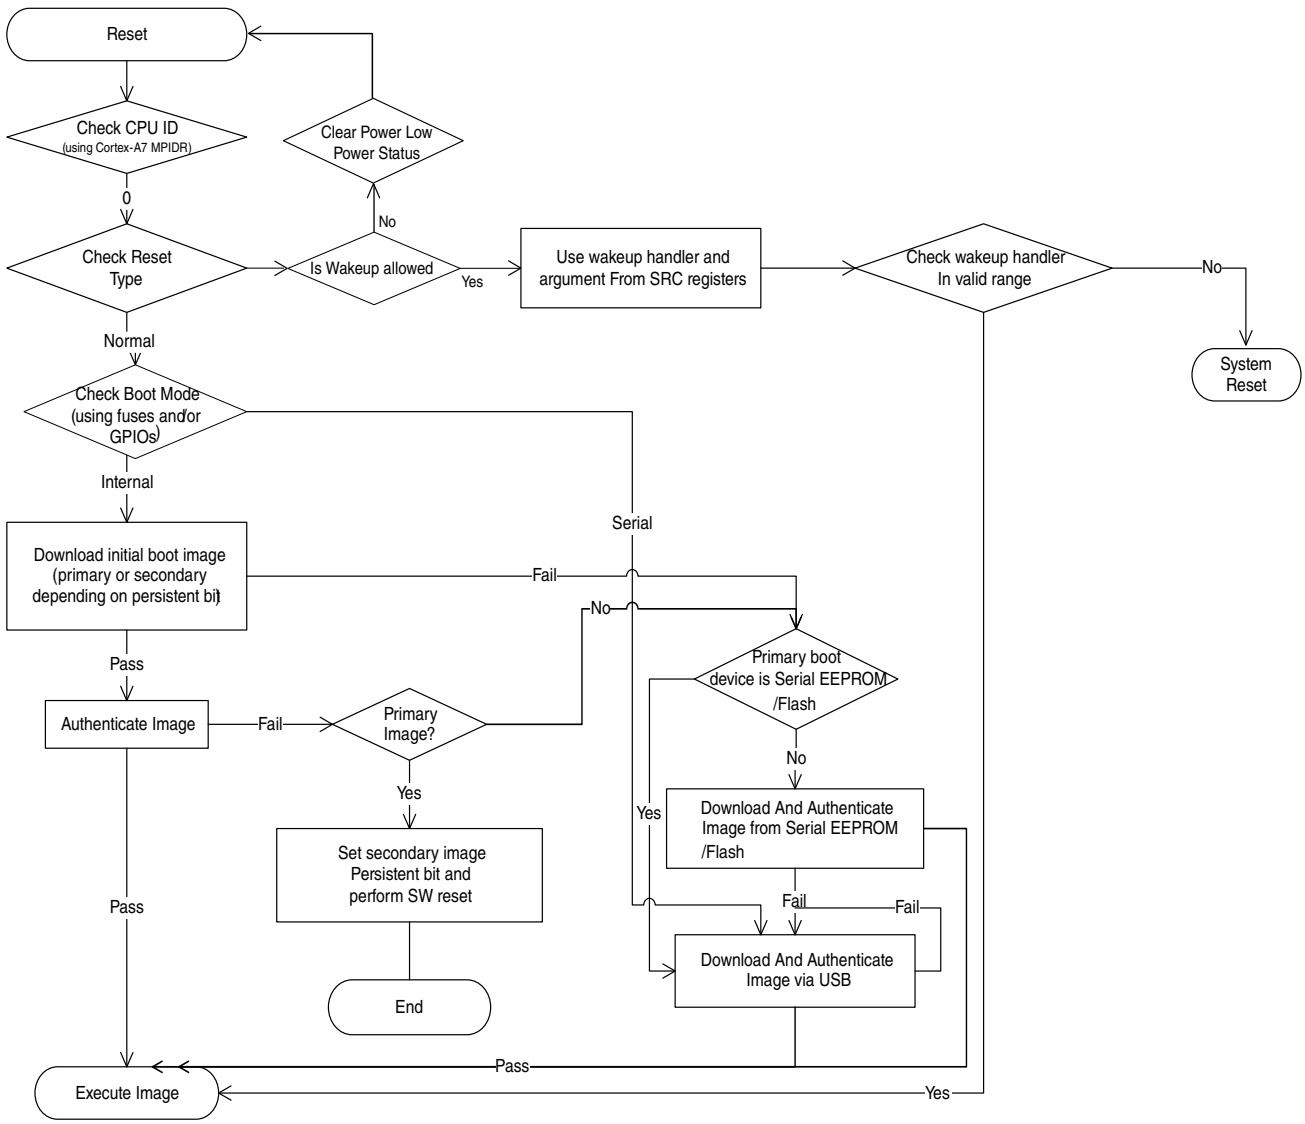

Figure 8-1. Boot Flow

8.2.3 Boot From Fuses Mode (BOOT_MODE[1:0] = 00b)

A value of 00b in the BOOT_MODE[1:0] register selects the Boot From Fuses mode.

This mode is similar to the Internal Boot mode described in Internal Boot Mode (BOOT_MODE[1:0] = 0b10) with one difference. In this mode the GPIO boot override pins are ignored. The boot ROM code uses the boot eFUSE settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the BT_FUSE_SEL eFUSE value. If BT_FUSE_SEL = 0, indicating that the boot device (for example, Flash, SD/MMC) has not yet been programmed, the boot flow jumps directly to the Serial Downloader. If BT_FUSE_SEL = 1, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device.

The first time a board is used, the default eFUSEs may be configured incorrectly for the hardware on the platform. In such a case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using Boot From Fuses mode addresses this problem.

Setting BT_FUSE_SEL=0 forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a Program Image and blow the BT_FUSE_SEL and the other boot configuration eFUSEs. After reset, the Boot ROM code determines that BT_FUSE_SEL is blown (BT_FUSE_SEL = 1) and the ROM code performs internal boot according to the new eFUSE settings. This allows a user to set BOOT_MODE[1:0]=00b on a production device and burn fuses on the same device (by forcing entry to the Serial Downloader), without changing the value of BOOT_MODE[1:0] or pullups/pulldowns on the BOOT_MODE pins.

8.2.4 Serial Downloader

The Serial Downloader provides a means to download a Program Image to the chip over USB and UART serial connection.

In this mode the ROM programs WDOG1 for a time-out specified by fuse WDOG Time-out Select (See fusemap for details) if WDOG_ENABLE eFuse is 1 and continuously polls for USB and UART connection. If no activity is found on USB OTG1, UART 1/2 and the watchdog timer expires, the ARM core is reset.

NOTE

After being loaded, the downloaded image is responsible to manage the watchdog resets properly.

Figure 8-2 shows USB and UART boot flow.

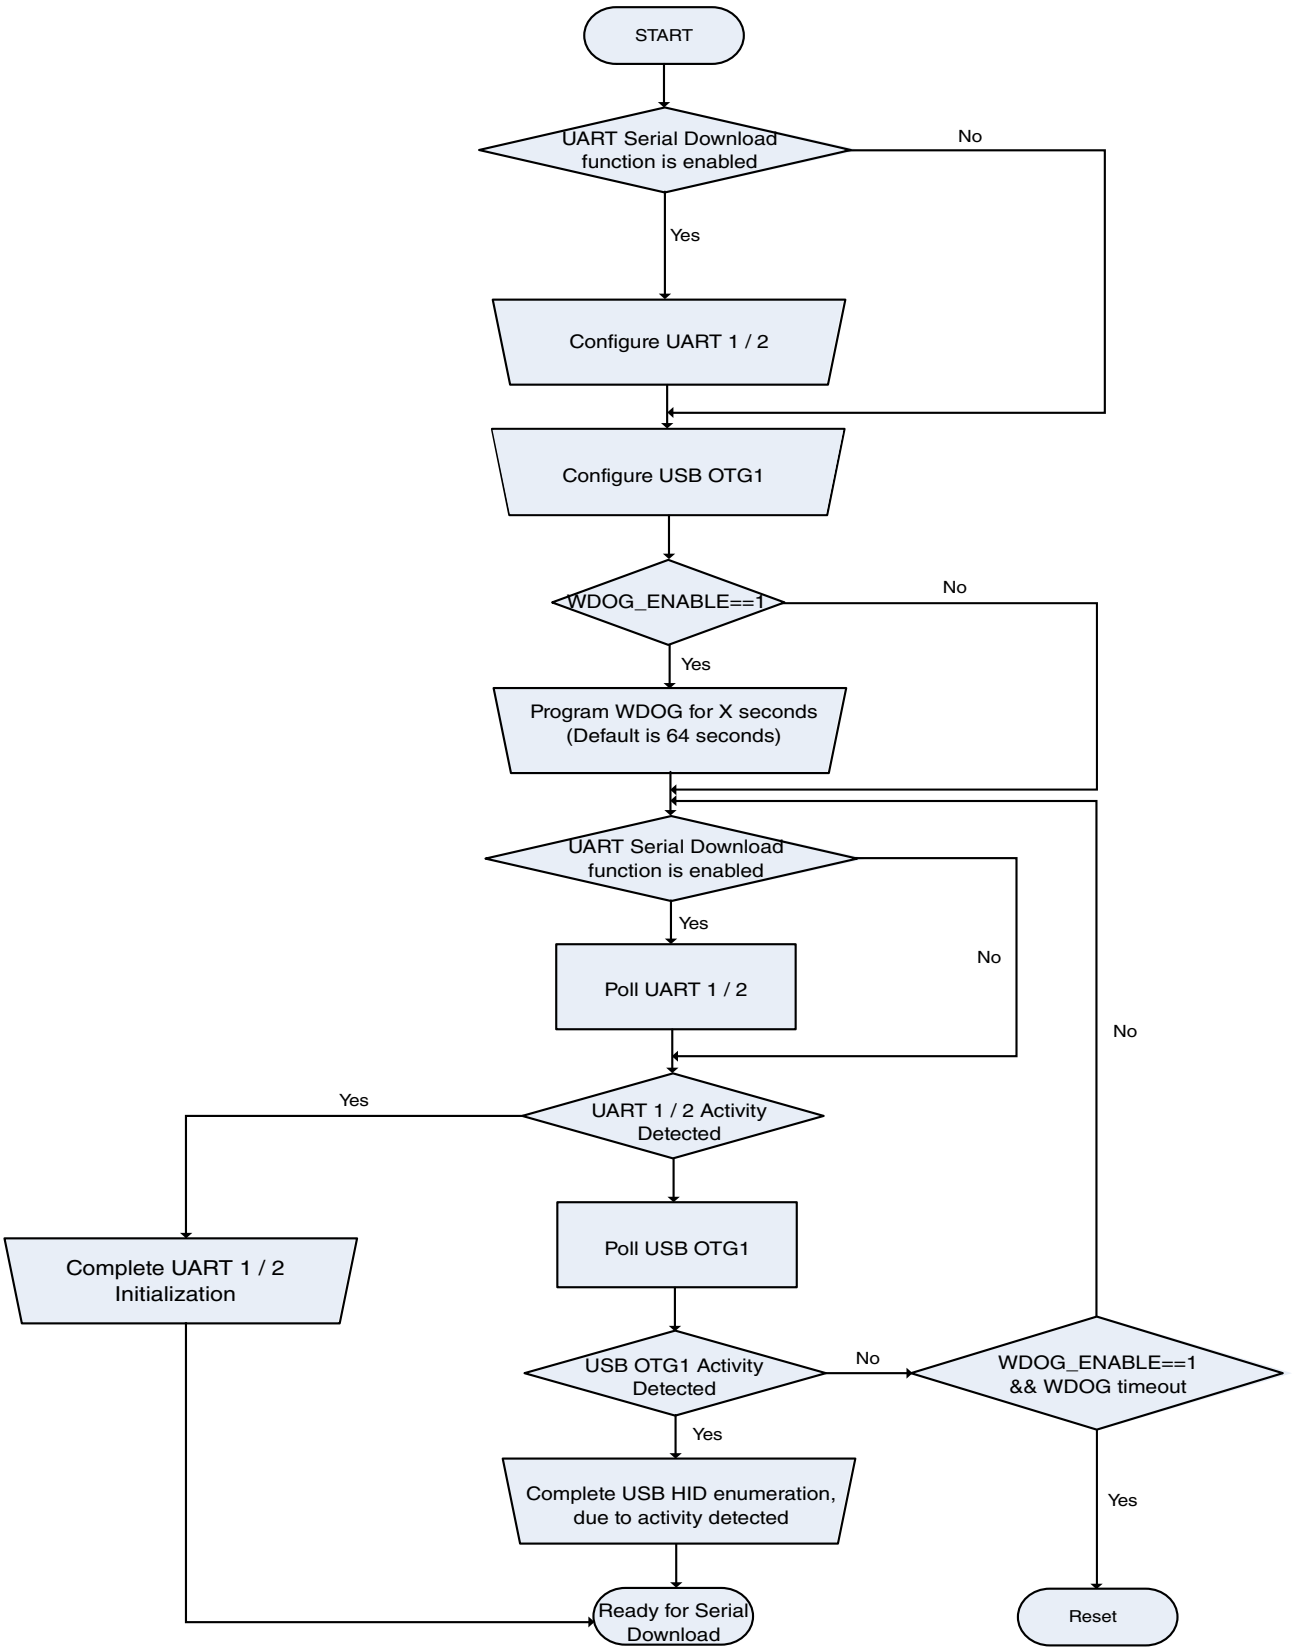

Figure 8-2. Serial Download Boot Flow

8.2.5 Internal Boot Mode (BOOT_MODE[1:0] = 0b10)

A value of 0b10 in the BOOT_MODE[1:0] register selects the internal boot mode. In this mode, the processor continues to execute boot code from the internal boot ROM.

The boot code performs hardware initialization, loads the Program Image from the chosen boot device, performs image validation using the HAB library (see Boot security settings), and then jumps to an address derived from the Program Image. If any error occurs during internal boot, the boot code jumps to the Serial Downloader (see Serial Downloader). A secure boot using the HAB is possible in all the three boot modes.

When set to internal boot, the boot flow may be controlled by a combination of eFUSE settings with an option of overriding the fuse settings using General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT_FUSE_SEL) determines whether the ROM uses GPIO pins for a select number of configuration parameters or eFUSEs in this mode.

- If BT_FUSE_SEL = 1, all boot options are controlled by the eFUSEs described in Table 8-2.
- If BT_FUSE_SEL = 0, specific boot configuration parameters may be set using GPIO pins rather than eFUSEs. The fuses that can be overridden when in this mode are indicated in the GPIO column of Table 8-2. Table 8-3 provides the details on the GPIO pins.

The use of GPIO overrides is intended for development since these pads are used for other purposes in deployed products. Freescale recommends controlling the boot configuration by eFUSEs in deployed products and reserving the use of the GPIO mode for development and testing purposes only.

8.2.6 Boot security settings

Internal boot modes use one of three security configurations:

- Closed: This level is intended for use with shipping secure products. All HAB functions are executed and security hardware is initialized (the Security Controller, or SNVS, enters Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, and the boot flow aborted with control passing to the serial downloader. At this level, execution does not leave the internal ROM unless the target executable image has been authenticated.
- Open: This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed as for a

closed device. Security hardware is initialized (except the SNVS is left in Non-Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, but have no influence on the boot flow, which continues as if the errors did not occur. This configuration is useful for secure product development, since the Program Image will run even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of authentication failure.

- Field Return: This level is intended for parts returned from shipped products.

NOTE

If the DIR_BT_DIS eFuse is not blown, authentication may be bypassed. In this case the system is not secure.

8.3 Device Configuration

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes boot device selection (SPI, EIM, NOR, SD, MMC, QSPI, etc.), boot device configuration (SD bus width, speed, etc), and so on. In general, the source for this configuration comes from eFUSEs embedded inside the chip. However, certain configuration parameters can be sourced from GPIO pins allowing further flexibility during the development process.

8.3.1 Boot eFUSE Descriptions

The table below is a comprehensive list of the configuration parameters that the ROM uses.

Table 8-2. Boot eFUSE Descriptions

Fuse	Configuration	Definition	GPIO[1]	Shipped Value	Settings[2]
DIR_BT_DIS	OEM	Disables Freescale reserved modes. Must be set for secure boot.	NA	0	0 Reserved Freescale modes enabled 1 Reserved Freescale modes disabled
BT_FUSE_SEL	OEM	In internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are	NA	0	If BOOT_MODE[1:0] = 0b10 0 Bits of SBMR are overridden by GPIO pins. 1 Specific bits of SBMR are controlled by eFUSE settings.

Table continues on the next page...

Table 8-2. Boot eFUSE Descriptions (continued)

Fuse	Configuration	Definition	GPIO[1]	Shipped Value	Settings[2]
		controlled by GPIO pins or eFUSE settings in the On-Chip OTP Controller (OCOTP). In Boot From Fuse mode BOOT_MODE[1:0] = 00, BT_FUSE_SEL fuse indicates whether bit configuration eFuses have been programmed.			If BOOT_MODE[1:0] = 0b00 0 BOOT configuration eFuses are not yet programmed. Boot flow jumps to serial downloader. 1 BOOT configuration eFuses have been programmed. Regular boot flow is performed.
SEC_CONFIG[1:0]	SEC_CONFIG[0] - Freescale SEC_CONFIG[1] - OEM	Security Configuration as defined in Boot security settings	NA	01	00 Reserved 01 Open (allows any program image, even if authentication fails) 1x Closed (Program image executes only if authenticated)
FIELD_RETURN	OEM	Enables Freescale reserved modes			0 - Freescale reserved modes are enabled/ disabled based on DIR_BT_DIS value 1 - Freescale reserved modes are enabled
SRK_HASH[255:0]	OEM	256-bit hash value of super root key (SRK_HASH)	NA	0	Settings vary - used by HAB
DIE-X-CORDINATE[7:0] DIE-Y-CORDINATE[7:0] WAFER_NO[4:0] LOT_NO_ENC[42:40] LOT_NO_ENC[39:32] LOT_NO_ENC[31:24] LOT_NO_ENC[23:16] LOT_NO_ENC[15:8] LOT_NO_ENC[7:0]	Freescale	Device Unique ID, 64-bit UID.	NA	Unique ID	Settings vary - used by HAB
BT_MMU_DISABLE	OEM	MMU/L1 D Cache/PL310 disable bit used by boot ROM for fast HAB processing	No	0	0 - MMU/L1 D Cache/PL310 is enabled by ROM during the boot 1 - MMU/L1 D Cache/PL310 is disabled by ROM during the boot
L1 I-Cache DISABLE	OEM	L1 I Cache disable bit used by boot during entire execution	No	0	0 - L1 I Cache is enabled by ROM during the boot 1 - L1 I Cache is disabled by ROM during the boot

Table continues on the next page...

Table 8-2. Boot eFUSE Descriptions (continued)

Fuse	Configuration	Definition	GPIO[1]	Shipped Value	Settings[2]
BT_FREQ	OEM	Boot Frequency Selection	Yes	0	0 - ARM - 396 MHz, DDR - 396 MHz, AXI - 198 MHz 1 - ARM - 198 MHz, DDR - 307 MHz, AXI - 153 MHz
BOOT_CFG1[7:0]	OEM	Boot Configuration1	Yes	0	Specific to selected boot mode
BOOT_CFG2[7:0]	OEM	Boot Configuration2	Yes	0	Specific to selected boot mode
BOOT_CFG4[6:0]	OEM	Boot Configuration4		0	Specific to selected boot mode
BOOT_CFG4[7]	OEM	Infinite Loop Enable at start of boot ROM. Used for debugging purposes. Ignored if DIR_BT_DIS is 1 and FIELD_RETURN is 0.	Yes	0	0 - Disabled 1 - Enabled
LPB_BOOT	OEM	USB Low Power Boot	No	0	00 - 396 MHz 01 - 396 MHz 10 - 198 MHz 11 - 99 MHz
BT_LPB_POLARITY	OEM	USB Low Power Boot GPIO polarity	No	0	0 - low on GPIO pad indicates low power condition 1 - high on GPIO pad indicates low power condition
WDOG_ENABLE	OEM	Watchdog reset counter enable	No	0	0 - watchdog reset counter is disabled during serial downloader 1 - watchdog reset counter is enabled during serial downloader
SRK_REVOKE[2:0]	OEM	SRK revocation mask	No	0	SRK revocation mask
DISABLE_SDMMC_MFG	OEM	Disable SDMMC manufacture mode	Yes	0	0: enable SD/MMC MFG mode 1: disable SD/MMC MFG mode
PAD_SETTINGS	OEM	Override values for SD/MMC and NAND boot modes	No	0	Override the following IO PAD settings: PAD_SETTINGS[0] - Slew Rate PAD_SETTINGS[3:1] Drive Strength PAD_SETTINGS[5:4] - Speed Settings .

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See GPIO Boot Overrides for corresponding GPIO pin.
2. 0 = intact fuse and 1= blown fuse

8.3.2 GPIO Boot Overrides

The table below provides a list of GPIO boot overrides.

Table 8-3. GPIO Override Contact Assignments

Package Pin	Direction on reset	eFuse
BOOT_MODE1	Input	Boot Mode Selection
BOOT_MODE0	Input	
LCD1_DATA00	Input	BOOT_CFG1[0]
LCD1_DATA01	Input	BOOT_CFG1[1]
LCD1_DATA02	Input	BOOT_CFG1[2]
LCD1_DATA03	Input	BOOT_CFG1[3]
LCD1_DATA04	Input	BOOT_CFG1[4]
LCD1_DATA05	Input	BOOT_CFG1[5]
LCD1_DATA06	Input	BOOT_CFG1[6]
LCD1_DATA07	Input	BOOT_CFG1[7]
LCD1_DATA08	Input	BOOT_CFG2[0]
LCD1_DATA09	Input	BOOT_CFG2[1]
LCD1_DATA10	Input	BOOT_CFG2[2]
LCD1_DATA11	Input	BOOT_CFG2[3]
LCD1_DATA12	Input	BOOT_CFG2[4]
LCD1_DATA13	Input	BOOT_CFG2[5]
LCD1_DATA14	Input	BOOT_CFG2[6]
LCD1_DATA15	Input	BOOT_CFG2[7]
LCD1_DATA16	Input	BOOT_CFG4[0]
LCD1_DATA17	Input	BOOT_CFG4[1]
LCD1_DATA18	Input	BOOT_CFG4[2]
LCD1_DATA19	Input	BOOT_CFG4[3]
LCD1_DATA20	Input	BOOT_CFG4[4]
LCD1_DATA21	Input	BOOT_CFG4[5]
LCD1_DATA22	Input	BOOT_CFG4[6]
LCD1_DATA23	Input	BOOT_CFG4[7]

The input pins provided are sampled at boot, and can be used to override corresponding eFUSE values, depending on the setting of the BT_FUSE_SEL fuse.

8.3.3 Device Configuration Data (DCD)

DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various on-chip peripherals. See Device Configuration Data (DCD) for more details on Device Configuration Data.

8.4 Device Initialization

This section describes the details on the ROM and provides initialization details.

This includes details on:

- The ROM Memory Map
- The RAM Memory Map
- On-chip blocks that the ROM should make use of or change POR register default values
- Clock initialization
- Enabling the MMU/L2 cache
- Exception handling and interrupt handling

8.4.1 Internal ROM /RAM memory map

The following figure shows the iROM memory map.

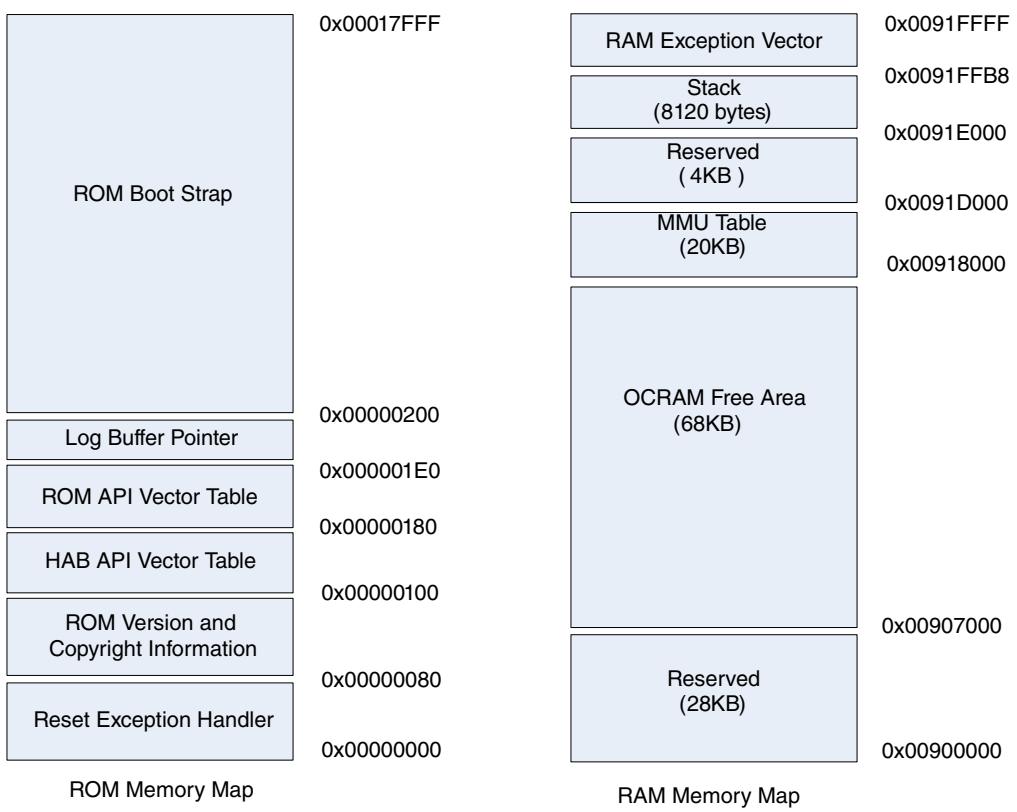

Figure 8-3. Internal ROM and RAM memory map

NOTE

The entire OCRAM region can be used freely post boot.

8.4.2 Boot Block Activation

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

The ROM configures and uses the following blocks (listed in alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and boot device selection:

- APBH - DMA engine to drive the GPMI module
- BCH - 40-bit error correction hardware engine with AXI bus master and private connection to GPMI
- CCM - Clock Control Module
- ECSPI - Enhanced Configurable Serial Peripheral Interface
- EIM - External Interface Module. Used for NOR and OneNAND devices
- GPMI - NAND controller pin interface
- OCOTP_CTRL - On-Chip OTP Controller. The OCOTP contains the eFUSEs.
- IOMUXC - I/O Multiplexer Control allows GPIO use to override eFUSE boot settings
- IOMUXC GPR - I/O Multiplexer Control General Purpose registers
- CAAM - Cryptographic Acceleration and Assurance Module
- QSPI - QuadSPI Flash
- SNVS - Secure Non-Volatile Storage
- SRC - System Reset Controller
- UART - Universal Asynchronous Receiver/Transmitter Controller
- USB - Used for serial download of a boot device provisioning program
- USDHC - Ultra Secure Digital Host Controller
- WDOG-1 - Watchdog Timer

8.4.3 Clocks at Boot Time

The table below shows the various clocks and their sources used by ROM.

Table 8-4. Normal Frequency Clocks Configuration

Clock	CCM signal	Source	Frequency(MHz) BT_FREQ=0	Frequency(MHz) BT_FREQ=1
ARM PLL	pll1_sw_clk		396	396

Table continues on the next page...

Table 8-4. Normal Frequency Clocks Configuration (continued)

Clock	CCM signal	Source	Frequency(MHz) BT_FREQ=0	Frequency(MHz) BT_FREQ=1
System PLL	pll2_sw_clk		528	528
USB PLL	pll3_sw_clk		480	480
AHB	ahb_clk_root	528 MHz PLL/PFD352	132	88
IPG	ipg_clk_root	528 MHz PLL/PFD352	66	44

Following reset, each ARM core has access to all peripherals. The ROM code will disable the clocks listed in the following table, except for the boot devices listed in the second column.

Table 8-5. List Of Disabled Clocks

Clock Name	Enabled For Boot Device
CCGR0_APBHDMA_CLK_SEL	NAND
CCGR0_ASRC_CLK_SEL

CCGR6_PWM7_CLK_SEL	
CCGR6_UART8_CLK_SEL	

8.4.4 Enabling MMU and Caches

The boot ROM includes a feature of enabling the Memory Management Unit (MMU) and caches to improve boot speed.

L1 instruction cache is enabled at the start of image download. L1 data cache, L2 cache and MMU are enabled during image authentication. Once HAB authentication completes the ROM disables the L1 data cache, L2 cache and MMU.

L1 Instruction cache, L1 data cahce, L2 cache and MMU is controlled by eFuse. By default these features are enabled.

Enabling the MMU when booting non-securely with SEC_CONFIG=Open, and setting the CSF pointer in the Image Vector Table to NULL, has no impact on the boot performance. With this configuration it is recommended to blow BT_MMU_DISABLE fuse.

8.4.5 Exception Handling

The exception vectors located at the start of ROM are used to map all the ARM exceptions (except the reset exception) to a duplicate exception vector table in internal RAM.

During the boot phase of CPU0, the RAM vectors point to the serial downloader in ROM.

After boot the program image can overwrite the vectors as required. The code shown below is used to map the ROM exception vector table to the duplicate one in RAM.

Mapping ROM Exception Vector Table

```
;; Define linker area for ROM exception vector table
AREA IROM_VECTORS, CODE, READONLY
LDR     PC, Reset_Addr
LDR     PC, Undefined_Addr
LDR     PC, SWI_Addr
LDR     PC, Prefetch_Addr

8.4.6 Interrupt Handling During Boot

No special interrupt handling routines are required during the boot process. Interrupts are disabled during boot ROM execution and may be enabled in a later boot stage.

8.4.7 Persistent Bits

Some modes of boot ROM require registers that keep their values after warm reset. SRC General Purpose registers are used for this purpose.

See the table below for persistent bits list and description.

Table 8-6. Persistent Bits

Bit Name	Bit Location	Description
PERSIST_SECONDARY_BOOT	SRC_GPR10[30]	This bit identifies which image must be used - primary and secondary. Used only for boot modes that support redundant boot.
PERSIST_BLOCK_REWRITE	SRC_GPR10[29]	This bit is used as warning. It identifies that there are errors in NAND blocks that hold the application image. See NAND Flash for more details.
PERSISTENT_ENTRY0[31:0]	SRC_GPR1[31:0]	Holds entry function for CPU0 for waking-up from low power mode.
PERSISTENT_ARG0[31:0]	SRC_GPR2[31:0]	Holds argument of entry function for CPU0 for waking-up from low power mode.
PERSIST_OVERRIDE_SBMR1	SRC_GPR10[28]	This bit instructs the ROM code to use the SRC_GPR9 register as if it is SBMR1. This allows software to override the fuse bits and boot from an alternative boot source. This feature is vaild for a WDOG time-out reset only, and can be disabled if fuse DIR_BT_DIS had been blown.
PERSIST_SBMR1_VALUE	SRC_GPR9	The value to override SBMR1.

8.5 Boot Devices (Internal Boot)

The Chip supports the following boot Flash devices:

- NOR Flash with External Interface Module (EIM), located on CS0, 16-bit bus width
- OneNAND Flash with EIM interface, located on CS0, 16-bits bus width
- Raw NAND (MLC and SLC), and Toggle-mode NAND flash through GPMI-2 interface. Page sizes of 2 Kbyte, 4 Kbyte and 8 Kbyte. Bus widths of 8-bit with 2 through 40-bit BCH Hardware ECC (Error Correction) are supported.
- Quad SPI Flash

- SD/MMC/eSD/SDXC/eMMC4.4 via USDHC interface, supporting high capacity cards
- EEPROM boot via SPI (serial flash)

The selection of external boot device type is controlled by BOOT_CFG1[7:4] eFUSEs. See the table below for more details.

Table 8-7. Boot Device Selection

BOOT_CFG1[7:4]	Boot Device
0000	NOR/OneNAND (EIM)
0001	QSPI
0011	Serial ROM (SPI)
010x	SD/eSD/SDXC
011x	MMC/eMMC
1xxx	Raw NAND

8.5.1 NOR Flash/OneNAND using EIM Interface

The External Interface Module (EIM) works in the asynchronous mode, and supports either muxed, Address/Data, or non-muxed schemes based on fuse settings.

Table 8-8. EIM Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO[1]	Shipped Value	Settings
BOOT_CFG1[7:4]	OEM	Boot Device Selection	Yes	0000	0000 - Boot from EIM Interface
BOOT_CFG1[3]	OEM	NOR/OneNAND Selection	Yes	0	0 - NOR 1 - OneNAND
BOOT_CFG2[7:6]	OEM	Muxing Scheme	Yes	00	00 - Muxed, 16-bit data (low half) interface 01 - Reserved 10 - Not muxed, 16-bit data (low half) interface 11 - Reserved
BOOT_CFG2[5:4]	OEM	OneNAND Page Size	Yes	00	00 - 1K 01 - 2K 10 - 4K 11 - Reserved

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See GPIO Boot Overrides for corresponding GPIO pin.

8.5.1.1 NOR Flash Boot Operation

Booting from the NOR Flash is supported via EIM interface. The ROM reads Image Vector Table and Boot Data structures to determine if the image can be executed directly from EIM address space or should be copied to other memory.

The start field of Boot Data Structure specifies the final location of the image (see Image Vector Table and Boot Data).

8.5.1.2 OneNAND Flash Boot Operation

At system power-up, the OneNAND device automatically copies an Initial Load Region of 1 Kbyte from the start of the flash array (sector 0 and sector 1, page 0, block 0) to its Boot RAM (OneNAND's internal RAM).

NOTE

The OneNAND boot RAM memory containing the Initial 1K Load Region must contain the IVT, DCD and the Boot Data structures.

Next, the ROM processes the DCD and then proceeds to copy the Program Image contents to the application destination pointer (located in the start entry of Boot Data (see Image Vector Table and Boot Data). The ROM determines the size of the Program Image by the length specified by size entry in Boot Data structure (see Image Vector Table and Boot Data). A failure loading data from the OneNAND device for any reason forces the Chip to enter the Serial Downloader, otherwise the booting from the OneNAND device continues.

The figure below illustrates the layout of the Program Image on a OneNAND boot device.

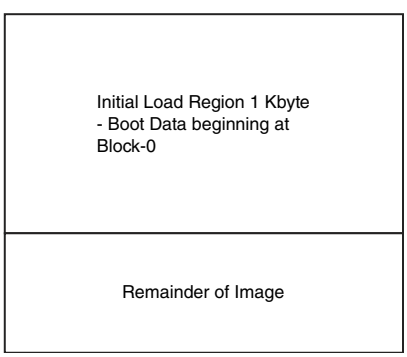

Figure 8-4. Program Image Layout on a OneNAND Flash Device

Prior to accessing the OneNAND device, the Chip waits approximately 500 µs after Power On Reset. This delay is required for the OneNAND device to become ready. After this initial 500 µs delay it can take an addition 70 µs for the OneNAND device to load the Initial Load Region of 1 Kbyte into its boot RAM. The Chip polls the OneNAND device Interrupt Status Register to confirm that the first 1 Kbytes has been loaded to the OneNAND boot RAM before continuing with the boot flow.

8.5.1.3 IOMUX Configuration for EIM Devices

The EIM interface uses dedicated contacts on the IC.

The contacts assigned to the data signals used by EIM are shown in the table below.

Table 8-9. EIM IOMUX Pin Configuration

Signal	A/D16 (Muxed, 16-bit data interface)	A+D (Not muxed, 16-bit data interface)
DATA0	CSI_DATA00.alt4	LCD_DATA08.alt4
DATA1	CSI_DATA01.alt4	LCD_DATA09.alt4

8.5.2 NAND Flash

The boot ROM supports a number of MLC/SLC NAND Flash devices from different vendors and LBA NAND Flash devices. The Error Correction and Control (ECC) subblock (BCH) is used to detect the errors.

8.5.2.1 NAND eFUSE Configuration

The boot ROM determines the configuration of external NAND flash by parameters, either provided by eFUSE, or sampled on GPIO pins, during boot. See Table 8-10 for parameters details.

NOTE

BOOT_CFGx sampled on GPIO pins depends on BT_FUSE_SEL setting. See Boot Fusemap for details.

NOTE

For BOOT_CFG[3:2], although ROM always boots from CS0_B, for multiple chip selects, such as some NAND chips which consist of multi CS. This fuse must burned correctly. The number of devices means the number of chip selects.

Table 8-10. NAND Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO[1]	Shipped Value	Settings
BOOT_CFG1[7]	OEM	Boot Device Selection	Yes	0	1 - Boot from NAND Interface
BOOT_CFG1[6]	OEM	BT_TOGGLEMODE	Yes	0	0 - raw NAND 1 - toggle mode NAND
BOOT_CFG1[5:4]	OEM	Pages In Block	Yes	0	00 - 128 01- 64 10- 32 11- 256
BOOT_CFG1[3:2]	OEM	Number of devices	Yes	00	00 - 1 device 01- 2 device 10- 4 device 11- Reserved
BOOT_CFG1[1:0]	OEM	Row Address Cycles	Yes	00	00 - 3 01 - 2 10 - 4 11 - 5
BOOT_CFG2[7:5]	OEM	Toggle Mode 33 MHz Preamble Delay, Read Latency	Yes	000	000 - 16 GPMICLK cycles 001 - 1 GPMICLK cycles 010 - 2 GPMICLK cycles 011 - 3 GPMICLK cycles 100 - 4 GPMICLK cycles 101 - 5 GPMICLK cycles 110 - 6 GPMICLK cycles 111 - 7 GPMICLK cycles

Table 8-10. NAND Boot eFUSE Descriptions (continued)

Fuse	Config	Definition	GPIO[1]	Shipped Value	Settings
					0 - Use default values 1 - Use PAD_SETTINGS value
0x6D0[5:0]	OEM	PAD_SETTINGS[5:0]	Yes	0	NAND Pad Settings Value
0x6D0[11:8]	OEM	READ_RETRY_SEQ_ID[3:0]	Yes	0000	0000 - Don't use ROM embedded read-retry sequence 0001 - use Micron 20 nm read-retry sequence 0010 - use Toshiba A19 nm read-retry sequence 0011 - use Toshiba 19 nm read-retry sequence 0100 - use SanDisk 19 nm read-retry sequence 0101 - use SanDisk 1ynm read-retry sequence 0110 - use Hynix 20 nm A die read retry sequence 0111 - use Hynix 26 nm read retry sequence 1000 - use Hynix 20 nm B die read retry sequence 1001 - use Hynix 20 nm C die read retry sequence 1010 to 1111 - Reserved

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See Table 3 for corresponding GPIO pin.

8.5.2.2 NAND Flash Boot Flow and Boot Control Blocks (BCB)

There are two BCB data structures:

- FCB
- DBBT

As part of the NAND media initialization, the ROM driver uses safe NAND timings to search for a Firmware Configuration Block (FCB) that contains the optimum NAND timings, page address of Discovered Bad Block Table (DBBT) Search Area and start page address of primary and secondary firmware.

The hardware ECC level to use is embedded inside FCB block. The FCB data structure is also protected using ECC. Driver reads raw 2112 bytes of first sector and runs through software ECC engine that determines whether FCB data is valid or not.

If the FCB is found, the optimum NAND timings are loaded for further reads. If the ECC fails, or the fingerprints do not match, the Block Search state machine increments page number to Search Stride number of pages to read for the next BCB until SearchCount pages have been read.

If search fails to find a valid FCB, the NAND driver responds with an error and the boot ROM enters into serial download mode.

The FCB contains the page address of DBBT Search Area, and the page address for primary and secondary boot images. DBBT is searched in DBBT Search Area just like how FCB is searched. After the FCB is read, the DBBT is loaded, and the primary or secondary boot image is loaded using starting page address from FCB.

Figure 8-5 shows the state diagram of FCB search.

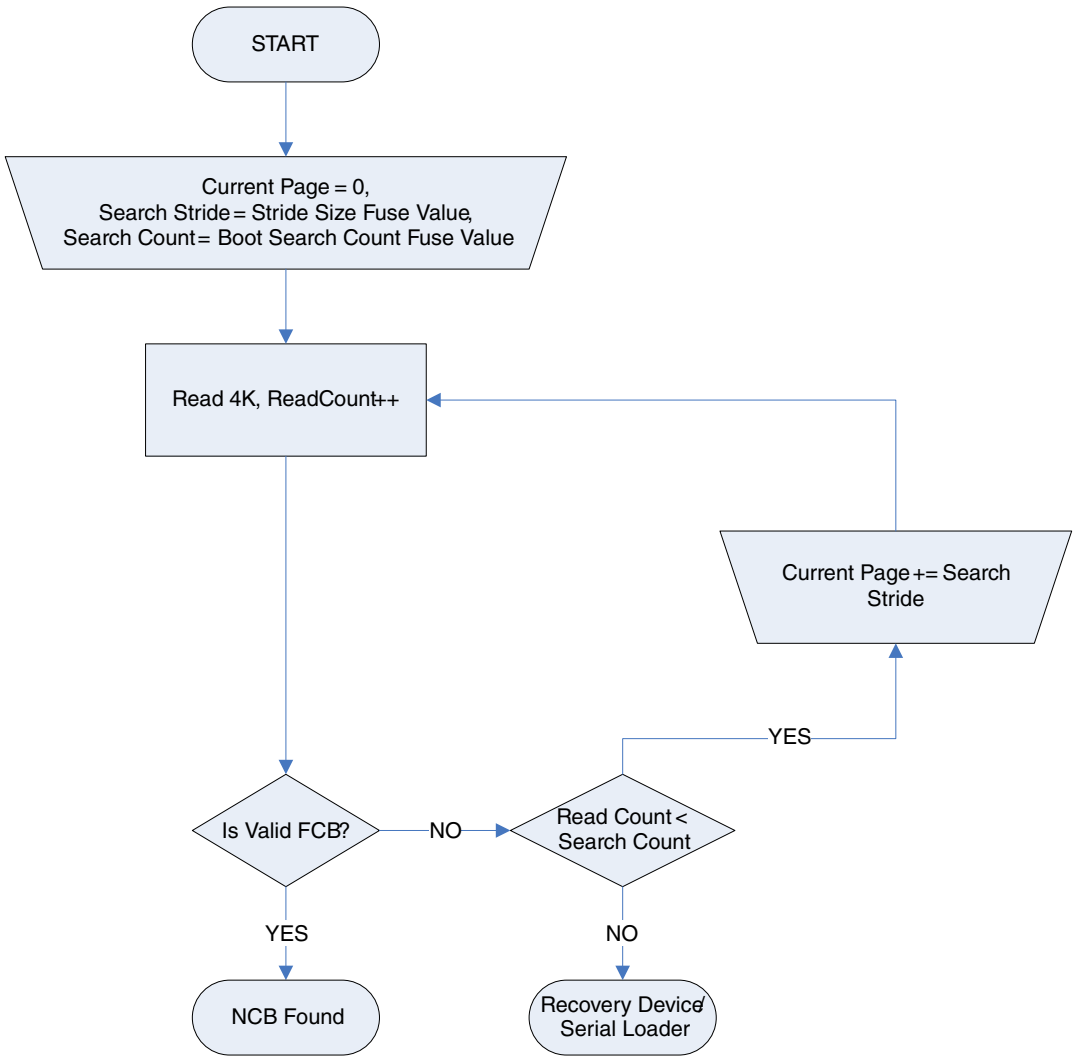

Figure 8-5. FCB Search Flow

Once FCB is found, the boot ROM searches for the Discovered Bad Blocks Table (DBBT). If DBBT Search Area is 0 in FCB, then ROM assumes that there are no bad blocks on NAND device boot area. See Figure 8-6 for the DBBT search flow.

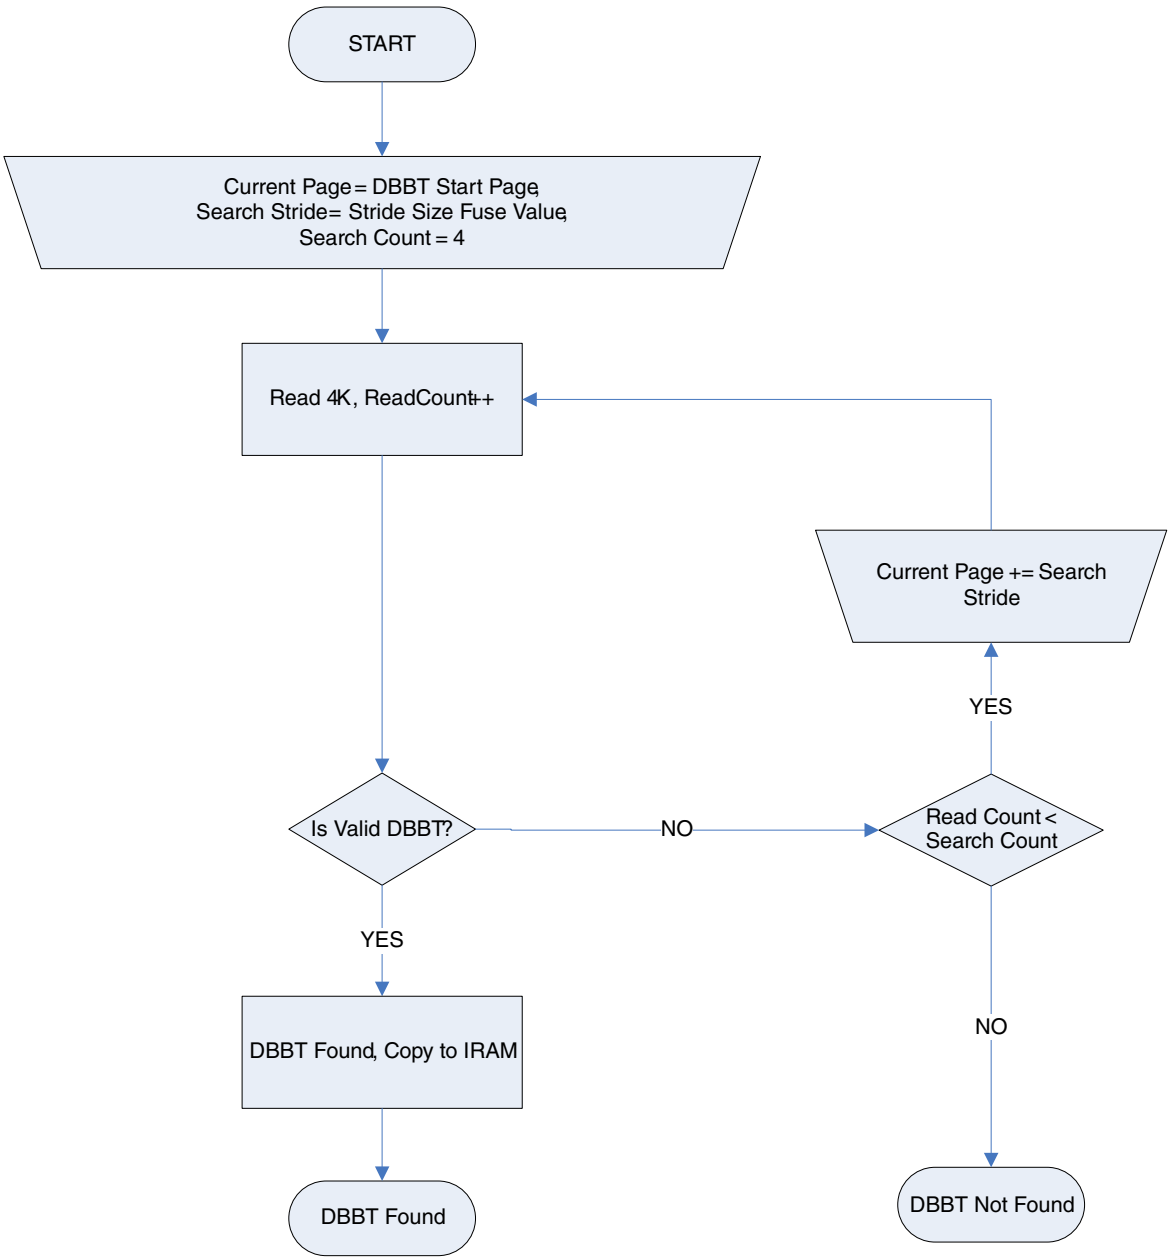

Figure 8-6. DBBT Search Flow

The BCB search and load function also monitors the ECC correction threshold and sets the PERSIST_BLOCK_REWRITE persistent bit if the threshold exceeds the maximum ECC correction ability.

If during primary image read there is a page with a number of errors higher than ECC can correct, the boot ROM will turn on PERSIST_SECONDARY_BOOT bit and perform SW reset (After SW reset, secondary image is used).

If during secondary image read there is a page with number of errors higher than ECC can correct, the boot ROM goes to serial loader.

8.5.2.3 Firmware Configuration Block

The FCB is the first sector in the first good block. The FCB should be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, so in case the first NAND block becomes corrupted, the ROM will find its copy in the next NAND block. The search area should span over at least two NAND blocks. The location information for DBBT search area, FW1, and FW2 are all specified in the FCB. Table 8-11 shows the Flash Control Block Structure.

Table 8-11. Flash Control Block Structure

Name	Start Byte	Size in Bytes	Description
Reserved	0	4	Reserved for Fingerprint #1(Checksum)
FingerPrint	4	4	32 bit word with a value of 0x4E434220, in ascii "FCB"
Version	8	4	32-bit version number; this version of FCB is 0x00000001
m_NANDTiming	12	8	8 bytes of data for 8 NAND Timing Parameters from NAND datasheet. The 8 parameters are: m_NandTiming[0]=data_setup, m_NandTiming[1]=data_hold, m_NandTiming[2]=address_setup, m_NandTiming[3]=dsample_time, m_NandTiming[4]=nand_timing_state, m_NandTiming[5]=REA, m_NandTiming[6]=RLOH, m_NandTiming[7]=RHOH. ROM only uses first 4 parameters but FCB provides space for other 4 parameters to be used by boot-loader or other applications.
PageDataSize	20	4	Number of bytes of data in a page. Typically, this is 2048 bytes for 2112 bytes page size or 4096 bytes for 4314/4224 bytes page size or 8192 for 8568 bytes page size
TotalPageSize	24	4	Total number of bytes in page. Typically, 2112 for 2 KB page or 4224 or 4314 for 4 KB page or 8568 for 8 KB page.
SectorsPerBlock	28	4	Number of pages per block. Typically 64 or 128 or depending on NAND device type.

Table continues on the next page...

Table 8-11. Flash Control Block Structure (continued)

Name	Start Byte	Size in Bytes	Description
NumberOfNANDs	32	4	Not used by ROM
TotalInternalDie	36	4	Not used by ROM
CellType	40	4	Not used by ROM
EccBlockNEccType	44	4	Value from 0 to 20 used to set BCH Error Corrrection level 0, 2, 4, .. or 40 for Block BN of ECC page, used in configuring BCH40 page layout registers
EccBlock0Size	48	4	Size of block B0, used in configuring BCH40 page layout registers
EccBlockNSize	52	4	Size of block BN, used in configuring BCH40 page layout registers
EccBlock0EccType	56	4	Value from 0 to 20 used to set BCH Error Corrrection level 0, 2, 4, .. or 40 for Block BN of ECC page, used in configuring BCH40 page layout registers
MetadataBytes	60	4	Size of metadata bytes used in configuring BCH40 page layout registers
NumEccBlocksPerPage	64	4	Number of ECC blocks BN not including B0. This value is used in configuring BCH40 page layout registers
EccBlockNEccLevelSDK	68	4	Not used by ROM
EccBlock0SizeSDK	72	4	Not used by ROM
EccBlockNSizeSDK	76	4	Not used by ROM
EccBlock0EccLevelSDK	80	4	Not used by ROM
NumEccBlocksPerPageSDK	84	4	Not used by ROM
MetadataBytesSDK	88	4	Not used by ROM
EraseThreshold	92	4	Not used by ROM
Firmware1_startingPage	104	4	Page number address where first copy of bootable firmware is located
Firmware2_startingPage	108	4	Page number address where second copy of bootable firmware is located
PagesInFirmware1	112	4	Size of first copy of firmware in pages
PagesInFirmware2	116	4	Size of second copy of firmware in pages
DBBTSearchAreaStartAddress	120	4	Page address for bad block table search area
BadBlockMarkerByte	124	4	This is an input offset in BCH page for ROM to swap with first byte of metadata after reading a page using BCH40. ROM supports restoration of manufacturer marked bad block markers in the page and this offset is the bad block marker offset location
BadBlockMarkerStartBit	128	4	This is an input bit offset in BadBlockMarkerByte for ROM to use when swapping 8 bits with fiirst byte of metadata.
BBMarkerPhysicalOffset	132	4	This is the offset where manufacturer leaves bad block marker on a page

Table continues on the next page...

Table 8-11. Flash Control Block Structure (continued)

Name	Start Byte	Size in Bytes	Description
BCHType	136	4	0 for BCH20 and 1 for BCH40. The Chip is backward compatible to BCH20 and this field tell ROM to use BCH20 or BCH40 block
TMTiming2_ReadLatency	140	4	Toggle mode NAND timing parameter read latency, ROM use this value to configure timing2 register of GPMI
TMTiming2_PreambleDelay	144	4	Toggle mode NAND timing parameter Preamble Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_CEDelay	148	4	Toggle mode NAND timing parameter CE Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_PostambleDelay	152	4	Toggle mode NAND timing parameter Postamble Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_CmdAddPause	156	4	Toggle mode NAND timing parameter Cmd Add Pause. ROM use this value to configure timing2 register of GPMI
TMTiming2_DataPause	160	4	Toggle mode NAND timing parameter Data Pause. ROM use this value to configure timing2 register of GPMI
TMSpeed	164	4	This is the toggle mode speed for ROM to configure gpmi clock. 0 for 33 MHz, 1 for 40 MHz and 2 for 66 MHz
TMTiming1_BusyTimeout	168	4	Toggle mode NAND timing parameter Busy Timeout. ROM use this value to configure timing1 register of GPMI
DISBBM	172	4	If 0 ROM will swap BadBlockMarkerByte with metadata[0] after reading a page using BCH40. If the value set is 1 then ROM will not do swapping
BBMark_spare_offset	176	4	The offset in mata data place which stores the data in Bad block marker place.
Onfi_sync_enable	180	4	Enable the Onfi nand sync mode support
Onfi_sync_speed	184	4	Speed for onfi nand sync mode: 0 - 24 MHZ, 1 - 33 MHZ, 2 - 40 MHZ, 3 - 50 MHZ, 4 - 66 MHZ, 5 - 80 MHZ, 6 - 100 MHZ, 7 - 133 MHZ, 8 - 160 MHZ, 9 - 200 MHZ
Onfi_syncNANDData	188	28	parameters for onfi nand sync mode timing. They are read latency, ce_delay, preamble_delay, postamble_delay, cmdadd_pause, data_pause, busy_timeout
DISBB_Search	216	4	Disable the badblock search function when reading the firmware, only using DBBT.
Reserved	220	64	Reserved for future use

8.5.2.4 Discovered Bad Block Table (DBBT)

See the table below for DBBT format.

Table 8-12. DBBT Structure

Name	Start Byte	Size in Bytes	Description
reserved	0	4	-
FingerPrint	4	4	32-bit word with a value of 0x44424254,in ascii "DBBT"
Version	8	4	32-bit version number; this version of DBBT is 0x00000001
reserved	12	4	-
DBBT_NUM_OF_PAGES	16	4	Size of DBBT in pages
reserved	20	4*PageSize-20	-
reserved	4*PageSize	4	-
Number of Entries	4*PageSize + 4	4	Number of bad blocks
Bad Block Number	4*PageSize + 8	4	First bad block number
Bad Block Number	4*PageSize + 12	4	Second bad block number
...-	-	-	...next bad block number
...-	-	-	...-
Last bad block number	-	-	last bad block number

8.5.2.5 Bad Block Handling in the ROM

During firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block checked.

If Bad Block table start page is null, check the manufactory made Bad Block marker. The location of Bad Block maker is at the first 3 or last 3 pages in every block of the NAND flash. NAND manufacturers normally use one byte in the spare area of certain pages within a block to mark a block is bad or not. 0xFF means good block, non FF means bad block.

In order to preserve the BI (bad block information), flash updater or gang programmer applications need to swap Bad Block Information (BI) data to byte 0 of metadata area for every page before programming NAND flash. ROM when loading firmware copies back the value at metadata[0] to BI offset in page data. The Figure 8-7 shows how the factory bad block marker is preserved.

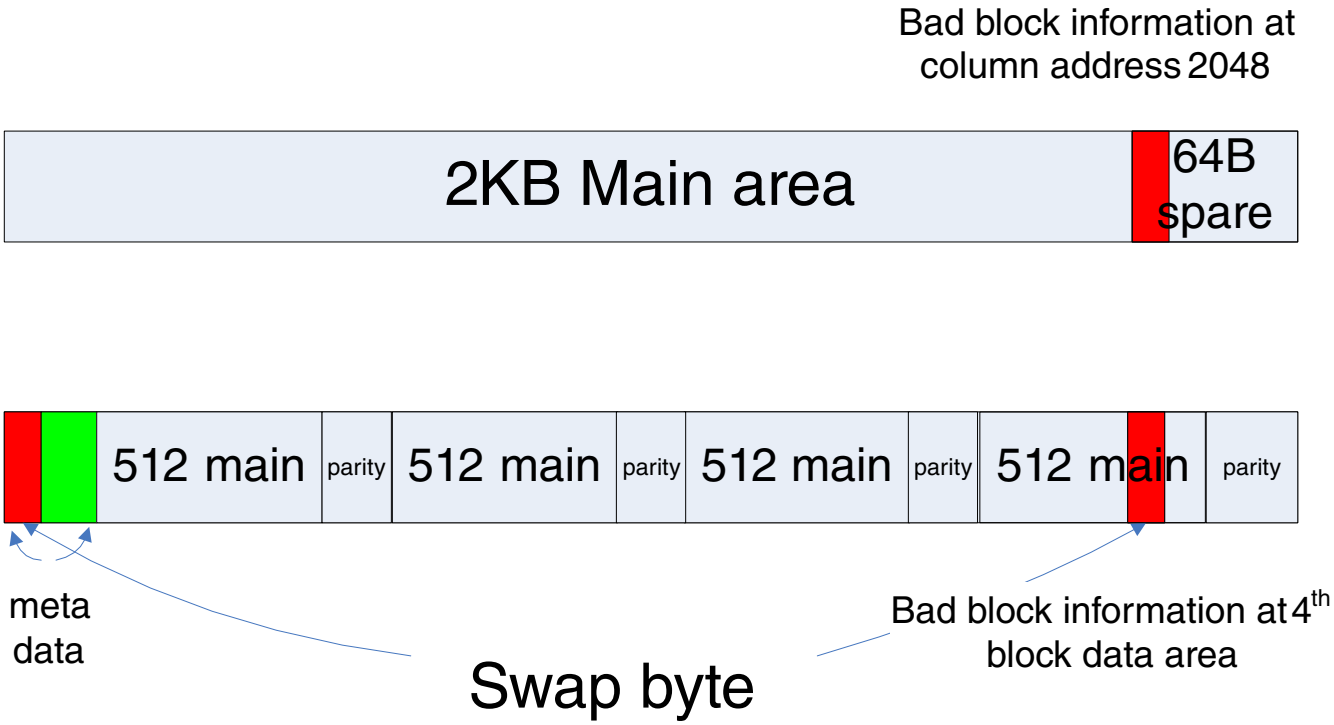

Figure 8-7. Factory Bad Block Marker Preservation

In the FCB structure, there are two elements m_u32BadBlockMarkerByte and m_u32BadBlockMarkerStartBit to indicate the byte and bit place in the page data, that manufacturer marked the bad block marker.

8.5.2.6 Read Retry Handling in the ROM

Read retry is used to recover from NAND bit errors beyond the ECC correction threshold. If reading a page failed and the read_retry_enable field in FCB is set as 1, ROM will issue read retry command sequence to shift the read level before reading the page again. If the previous reading failed, ROM keep shifting the read level until reading succeeds or all levels had been tried. The state diagram of read retry is shown in the figure below.

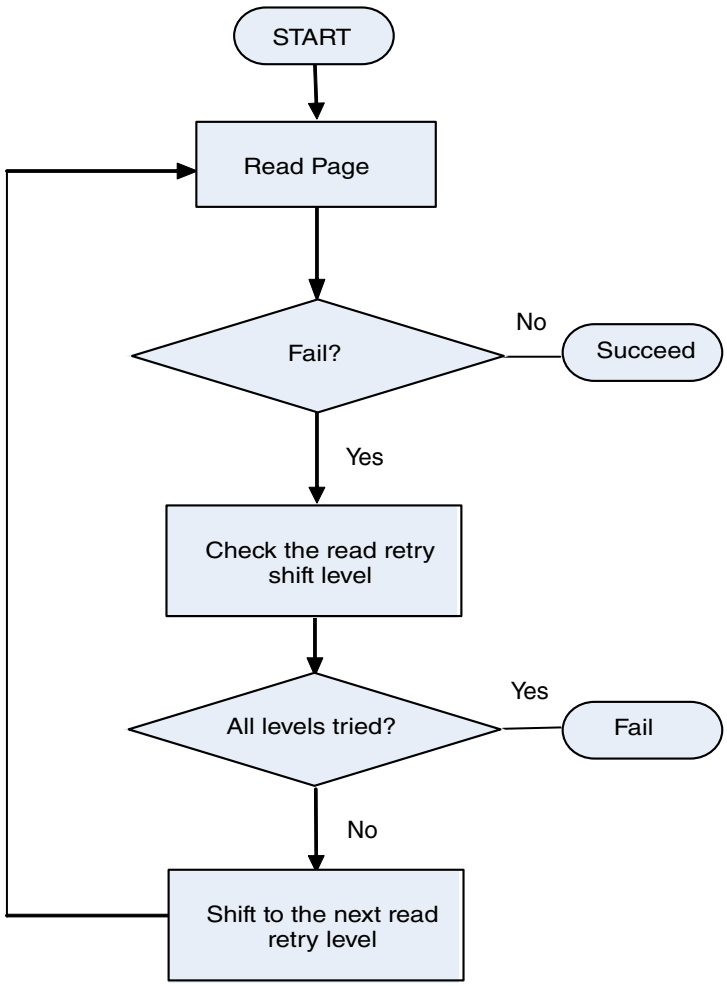

Figure 8-8. Read Retry Flow

Different vendors and different process may have different read retry sequences. At present, ROM supports five (5) read retry sequences. Blowing the fuse READ_RETRY_SEQ_ID[3:0] can select to use which sequence.

The detailed read retry sequences are listed in the table below.

Table 8-13. Read retry sequences

Vendor	Process	READ_RETRY_SEQ_ID[3:0]	Comment
Micron	20nm	2'b0001	The detail of this RR sequence is documented in "64Gb, 128Gb, 256Gb, 512Gb Asynchronous/ Synchronous NAND Features(Release: 4/20/12)", please contact Micron for this doc.

Table continues on the next page...

Table 8-13. Read retry sequences (continued)

Vendor	Process	READ_RETRY_SEQ_ID[3:0]	Comment
Toshiba	A19nm	2'b0010	The detail of this RR sequence is documented in "TOSHIBA Technical Information A19nm MLC NAND Retry Read Sequence", please contact Toshiba for this doc.
	19nm	2'b0011	The detail of this RR sequence is documented in "TOSHIBA Technical Information 19nm MLC NAND Read Retry Sequence Rev1.6", please contact Toshiba for this doc.
SanDisk	19nm	2'b0100	The detail of this RR sequence is documented in "App Note 023 (v1.0) 19nm eX2 ABL Dynamic Read Sequence & Parameter Table", please contact SanDisk for this doc.
	1ynm	2'b0101	The detail of this RR sequence is documented in "Application Note 1y_023 19nm eX2 ABL Dynamic Read Sequence & Parameter Table", please contact SanDisk for this doc.
Hynix	26nm	2'b0111	The detail of this RR sequence is documented in " 26nm 32Gb MLC RAWNAND", please contact Hynix for this doc.
	20nm A Die	2'b0110	The detail of this RR sequence is documented in " 20nm 32Gb MLC C-die Application Note", please contact Hynix for this doc.
	20nm B Die	2'b1000	The detail of this RR sequence is documented in " 20nm 32Gb MLC C-die Application Note", please contact Hynix for this doc.
	20nm C Die	2'b1001	The detail of this RR sequence is documented in " 20nm 32Gb MLC C-die Application Note", please contact Hynix for this doc.

8.5.2.7 Toggle Mode DDR NAND Boot

If BT_TOGGLEMODE efuse is blown then ROM does the following to boot from Samsung's toggle mode DDR NAND.

8.5.2.7.1 GPMI and BCH Clocks Configuration

ROM sets the clock source and the dividers in CCM registers.

If BOOT_CFG1[6] is set(toggle mode), GPMI/BCH CLK source is PLL2PFD4, and running at 66 MHZ, otherwise GPMI/ BCH CLK souce is PLL3, running at 24 MHz. ROM sets default values to timing0, timing1 and timing2 gpmi registers for 24 MHz clock speed. It uses fuse BOOT_CFG to configure GPMI timing2 register parameters preamble delay and read latency, the default value for these parameters is 2 when fuses are not blown.

Default timing parameter values used by ROM for toggle-mode device:

- Timing0.ADDRESS_SETUP = 5
- Timing0.DATA_SETUP = 10
- Timing0.DATA_HOLD = 10
- Timing1.DEVICE_BUSY_TIMEOUT = 0 x 500
- Timing2.READ_LATENCY = BOOT_CFG2[7:5] if blown, otherwise 2
- Timing2.CE_DELAY = 2
- Timing2.PREAMBLE_DELAY = BOOT_CFG2[7:5] if blown, otherwise 2
- Timing2.POSTAMBLE_DELAY = 3
- Timing2.CMDADD_PAUSE = 4
- Timing2.DATA_PAUSE = 6

Default timing parameters can be overriden by TMTiming2_ReadLatency, TMTiming2_PreambleDelay, TMTiming2_CEDelay, TMTiming2_PostambleDelay, TMTiming2_CmdAddPause, TMTiming2_DataPause parameters of FCB.

8.5.2.7.2 Setup DMA for DDR Transfers

In DMA descriptors GPMI is configured to read page data at double data rate, the word length is set to 16 and transfer count to half of page size.

8.5.2.7.3 Reconfigure Timing and Speed Using Values in FCB

After reading FCB page with GPMI set to default timings and speed 33 MHz, ROM reconfigures CCM dividers to run gpmi/bch clks to desired speed specified in FCB for rest of boot process. The GPMI timing registers are also reconfigured to values specified in FCB.

The GPMI speed can be configured using FCB parameter TMSpeed:

- 0 - 24 MHZ
- 1 - 33 MHZ
- 2 - 40 MHZ
- 3 - 50 MHz
- 4 - 66 MHz
- 5 - 80 MHz
- 6 - 100 MHz
- 7 - 133 MHz
- 8 - 160 MHz
- 9 - 200 MHz

The GPMI timing0 register fields data_setup, data_hold and address_setup are set to values specified for data_setup, data_hold and address_setup in FCB member m_NANDTiming.

The GPMI timing1.DEVICE_BUSY_TIMEOUT is set to value specified in FCB member TMTiming1_BusyTimeout.

The GPMI timing2 register values are set using FCB members TMTiming2.READ_LATENCY, CE_DELAY, PREAMBLE_DELAY, POSTAMBLE_DELAY, CMDADD_PAUSE and DATA_PAUSE.

8.5.2.8 Typical NAND Page Organization

8.5.2.8.1 BCH ECC Page Organization

The first data block is called block 0 and the rest of the blocks are called block N. Separate ECC level scan be used for block 0 and block N.

The metadata bytes should be located at the beginning of a page, starting at byte 0, followed by data block 0, followed by ECC bytes for data block 0, followed by block 1 and its ECC bytes, and so on until N data blocks. The ECC level for block 0 can be different from the ECC level of rest of the blocks.

For NAND boot, with page size restrictions and data block size restricted to 512 bytes, only few combinations of ECC for block 0 and block N are possible.

The figure below shows the valid layout for 2112 byte sized page.

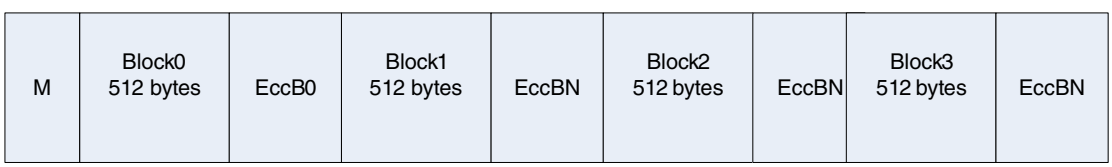

Figure 8-9. Valid Layout for 2112 bytes Sized Page

The example below is for 13 bits of parity(GF13). The number of ECC bits required for a data block is calculated using (ECC_Correction_Level * 13) bits.

In the above layout the ECC size for EccB0 and EccBN should be selected to not exceed a total page size of 2112 bytes. EccB0 and EccBN can be one of 2, 4, 6, 8, 10, 12, 14, 16, 18, 20 bits ECC correction level. The total bytes would then be:

[M + (data_block_size x 4) + ([EccB0 + (EccBN x 3)] x 13) / 8] <= 2112;

M = metadata bytes and data_block_size is 512.

There are 4 data blocks of 512 bytes each in a page of 2k page sized NAND. The values of EccB0 and EccBN should be such that the above calculation would not result in a value greater than 2112 bytes.

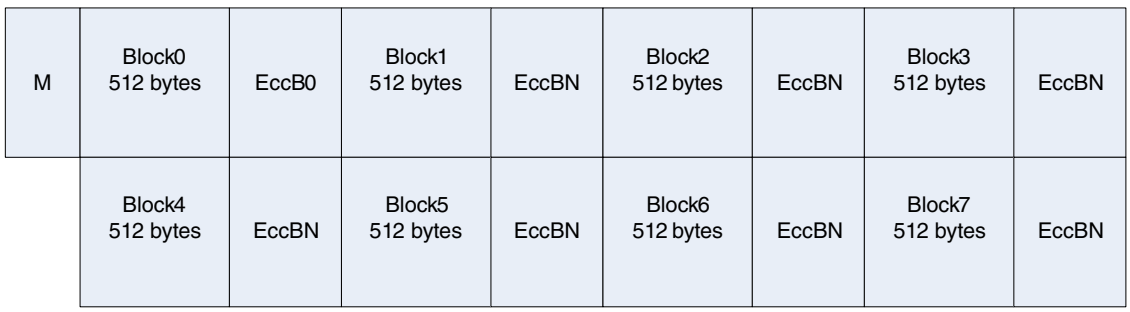

Figure 8-10. Valid Layout for 4 Kbytes Sized Page

Different NAND manufacturers have different sizes for a 4K page; 4314 bytes is typical.

[M + (data_block_size x 8) + ([EccB0 + (EccBN x 7)] x 13) / 8] <= 4314;

M= metadata bytes and data_block_size is 512.

There are 8 data blocks of 512 bytes each in a page of a 4k page sized NAND. The values of EccB0 and EccBN should be such that above calculation should not result in a value greater than the size of a page in a 4k page NAND.

8.5.2.8.2 Metadata

The number of bytes used for metadata is specified in FCB. Metadata for BCH encoded pages will be placed at the beginning of a page. ROM only cares about the first byte of metadata to swap it with bad block marker byte in page data after each page read; it is important to have at least one byte for the metadata bytes field in FCB data structure.

8.5.2.9 IOMUX Configuration for NAND

The table below shows the RawNAND IOMUX pin configuration.

Table 8-14. NAND IOMUX Pin Configuration

Signal	Pad Name
NAND.CLE	NAND_CLE.alt0
NAND.ALE	NAND_ALE.alt0
NAND.DATA00	NAND_DATA00.alt0
NAND.DATA01	NAND_DATA01.alt0
NAND.DATA02	NAND_DATA02.alt0

Table continues on the next page...

Table 8-14. NAND IOMUX Pin Configuration (continued)

Signal	Pad Name
NAND.DATA03	NAND_DATA03.alt0
NAND.DATA04	NAND_DATA04.alt0
NAND.DATA05	NAND_DATA05.alt0
NAND.DATA06	NAND_DATA06.alt0
NAND.DATA07	NAND_DATA07.alt0
NAND.RE_B	NAND_RE_B.alt0
NAND.WE_B	NAND_WE_B.alt0
NAND.CE1_B	NAND_CE1_B.alt0
NAND.CE0_B	NAND_CE0_B.alt0
NAND.DQS	NAND_DQS.alt0
NAND.READY_B	NAND_READY_B.alt0

NAND.CE3_B	CSI_PIXCLK.alt2
NAND.WP_B	NAND.WP_B.alt0

8.5.3 Expansion Device

The ROM supports booting from MMC/eMMC and SD/eSD compliant devices.

8.5.3.1 Expansion Device eFUSE Configuration

SD/MMC/eSD/eMMC/SDXC boot can be performed using either USDHC ports, based on setting of the BOOT_CFG2[4:3] (Port Select) fuse or it's associated GPIO input value at boot.

All USDHC ports support eMMC4.4 and eMMC4.5 fast boot. See the table below for details.

Table 8-15. USDHC Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO	Shipped value	Settings
0x450[7:6]	OEM	Boot Device Selection	Yes	00	01 - Boot from USDHC Interface

Boot code supports following standards.

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less
- eSDv2.10 rev-0.9, with or without FAST_BOOT.
- SDXCv3.0

MMC/SD/eSD/SDXC/eMMC can be connected to any of the USDHC blocks and can be booted by copying 4Kbyte of data from MMC/SD/eSD/eMMC device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

The maximum image size to load in SD/MMC boot is 32MB. This is due to the limited number of uSDHC ADMA Buffer Descriptors allocated by ROM.

NOTE

The Initial 4Kbyte of Program Image must contain the IVT, DCD and the Boot Data structures.

Table 8-16. SD/MMC Frequencies

	SD	MMC	MMC (DDR Mode)
Identification (KHz)	347.22		
Normal Speed Mode (MHz)	25	20	25
High Speed Mode (MHz)	50	40	50
UHSI SDR50 (MHz)	100		
UHSI SDR104 (MHz)	200		

NOTE

The boot ROM code reads application image length and application destination pointer from image.

8.5.3.2 MMC and eMMC Boot

The following table provides MMC and eMMC boot details.

Table 8-17. MMC and eMMC Boot Details

Normal Boot Mode	During initialization (normal boot mode) the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, voltage validation is performed and the ROM boot code checks high voltage settings and card capacity. The ROM boot code supports both high capacity and low capacity MMC/eMMC cards. After

Table continues on the next page...

Table 8-17. MMC and eMMC Boot Details (continued)

	initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in Normal boot mode or 40 MHz in High Speed mode). eMMC is also interfaced via USDHC and follows the same flow as MMC. The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the BOOT_PARTITION_ENABLE field in the Ext_CSD[179] to get the boot partition to be set. If there is no boot partition mentioned in BOOT_PARTITION_ENABLE field or the user partition has been mentioned, ROM boots from the user partition.
eMMC4.3 or eMMC4.4 Device Supporting Special Boot Mode	If using an eMMC4.3 or eMMC4.4 device supporting special boot mode, it can be initiated by pulling the CMD line low. If BOOT ACK is enabled, the eMMC4.3/eMMC4.4 device sends the BOOT ACK via DATA lines and ROM can read the BOOT ACK [S010E] to identify the eMMC4.3/eMMC4.4 device. eMMC4.3/eMMC4.4 device with "Boot mode" feature can only be supported via ESDHCV3-3 and with or without BOOT ACK. If BOOT ACK is enabled ROM waits 50 ms to get the BOOT ACK and if BOOT ACK is received by ROM. If BOOT ACK is disabled ROM waits 1 second for data. If BOOT ACK or data was received then eMMC4.3/eMMC4.4 is booted in "Boot mode", otherwise eMMC4.3/eMMC4.4 boots as a normal MMC card from the selected boot partition. This boot mode can be selected by BOOT_CFG1[4] (Fast Boot) fuse. BOOT ACK is selected by BOOT_CFG2[1].
eMMC4.4 Device	If using eMMC4.4 device, Double Data Rate (DDR) mode can be used. This mode can be selected by BOOT_CFG2[7:5] (Bus Width) fuse.

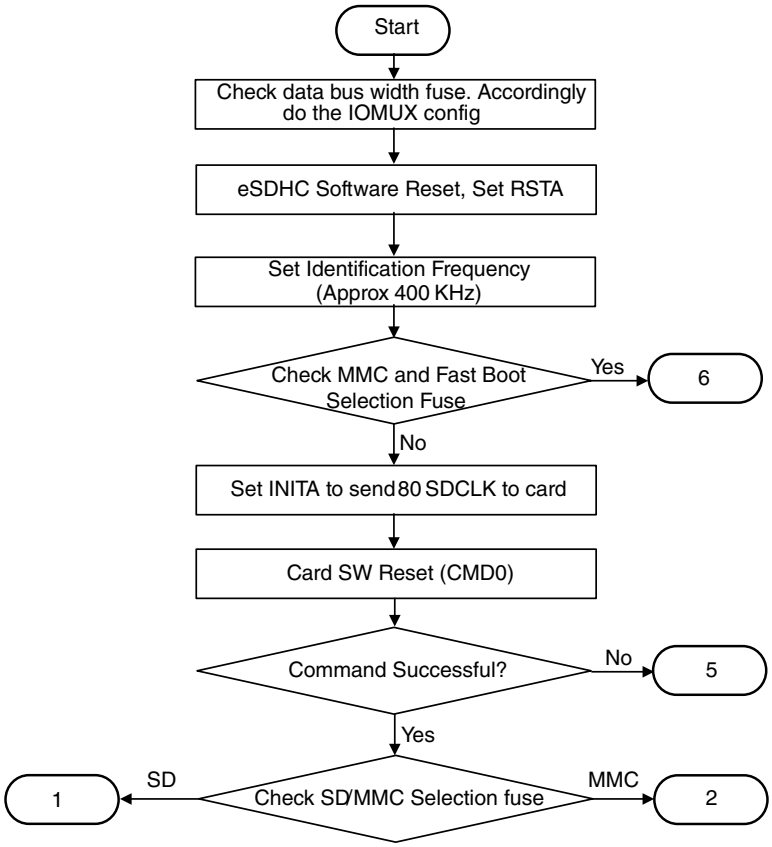

Figure 8-11. Expansion Device Boot Flow (1 of 6)

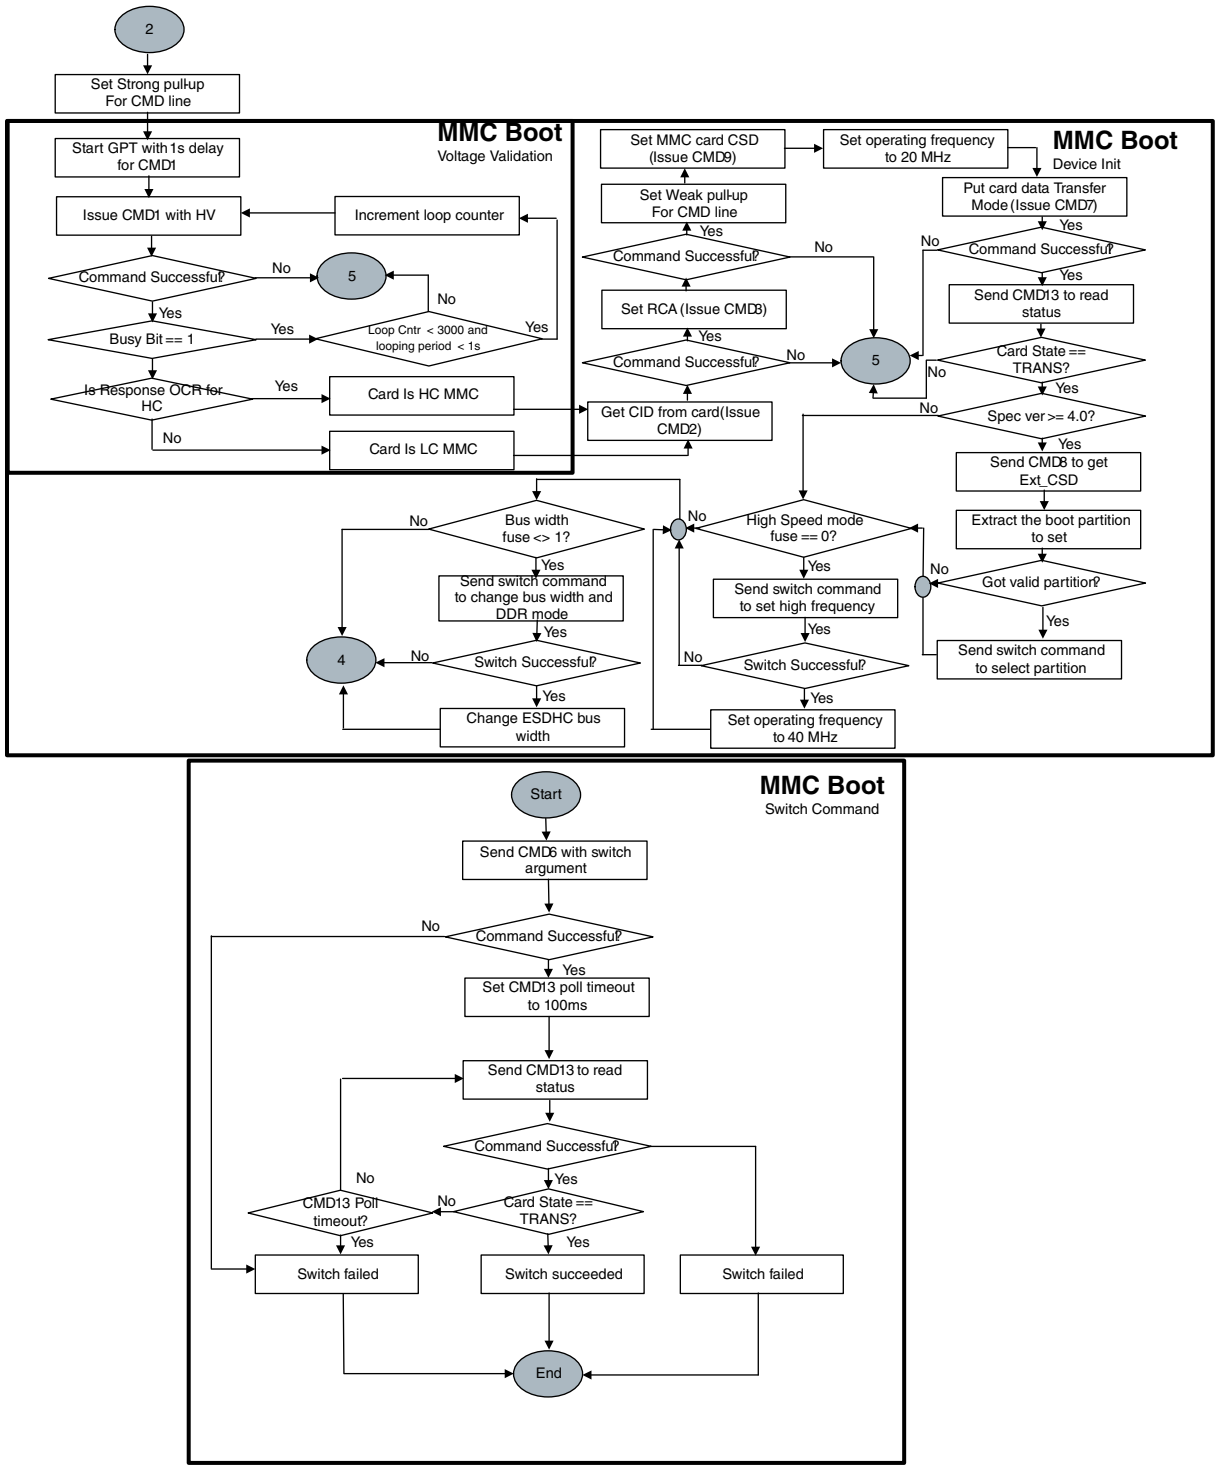

Figure 8-12. Expansion Device (MMC) Boot Flow (2 of 6)

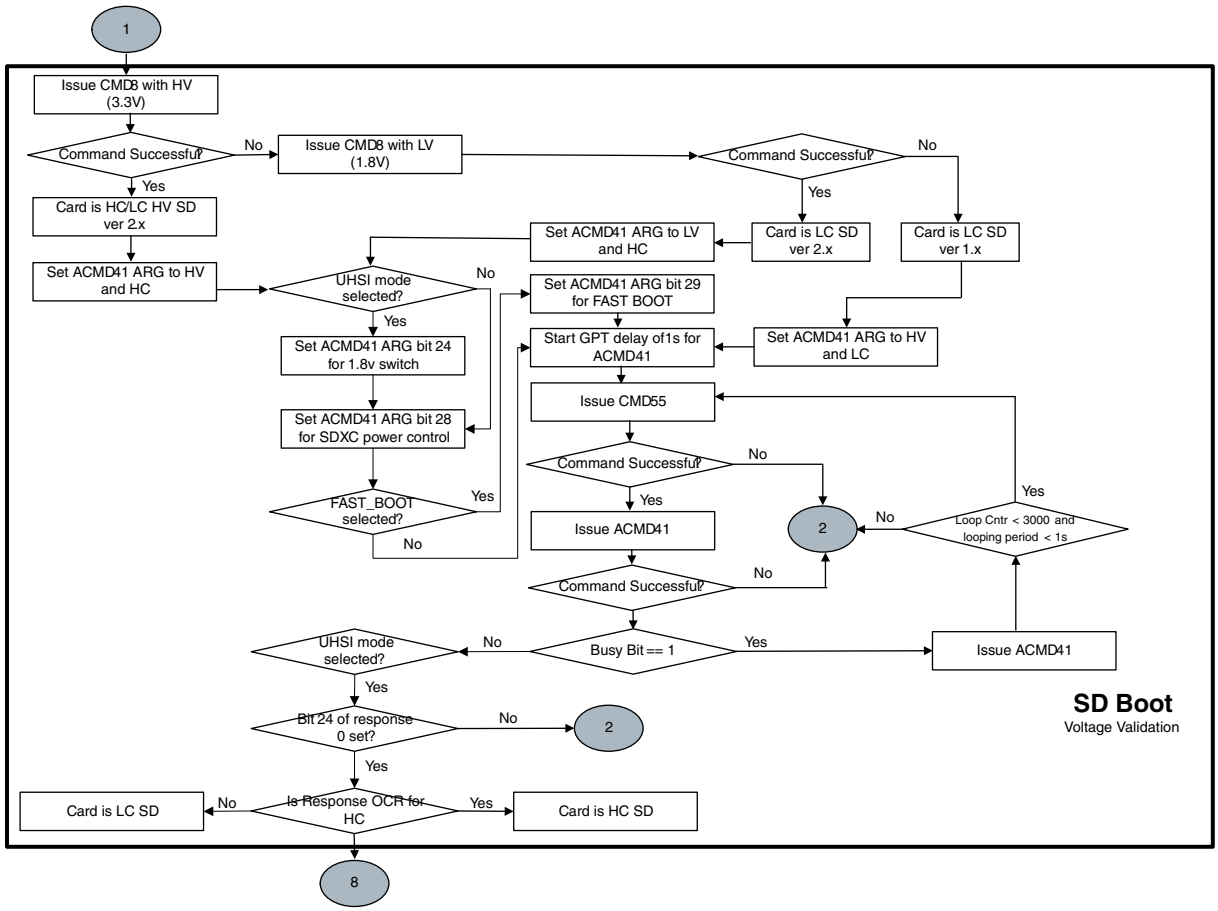

Figure 8-13. Expansion Device (SD/eSD/SDXC) Boot Flow (3 of 6) Part 1

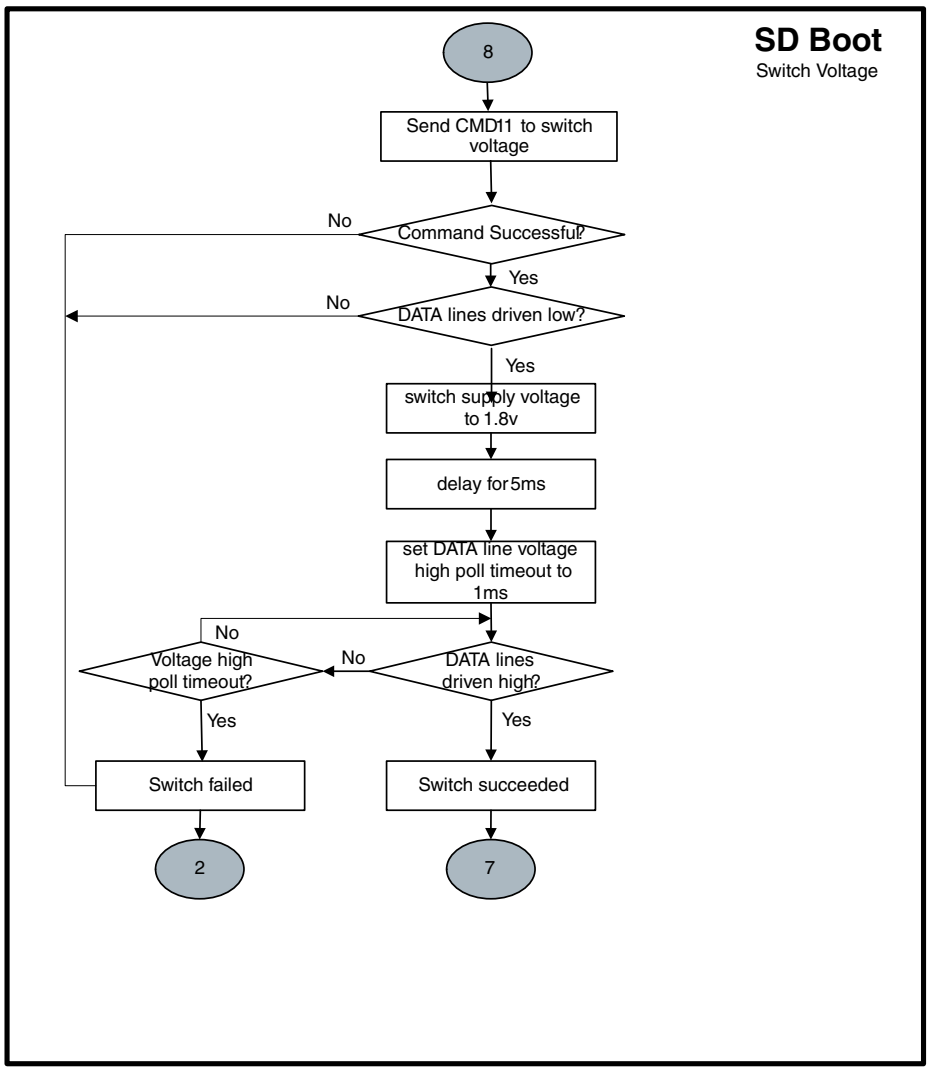

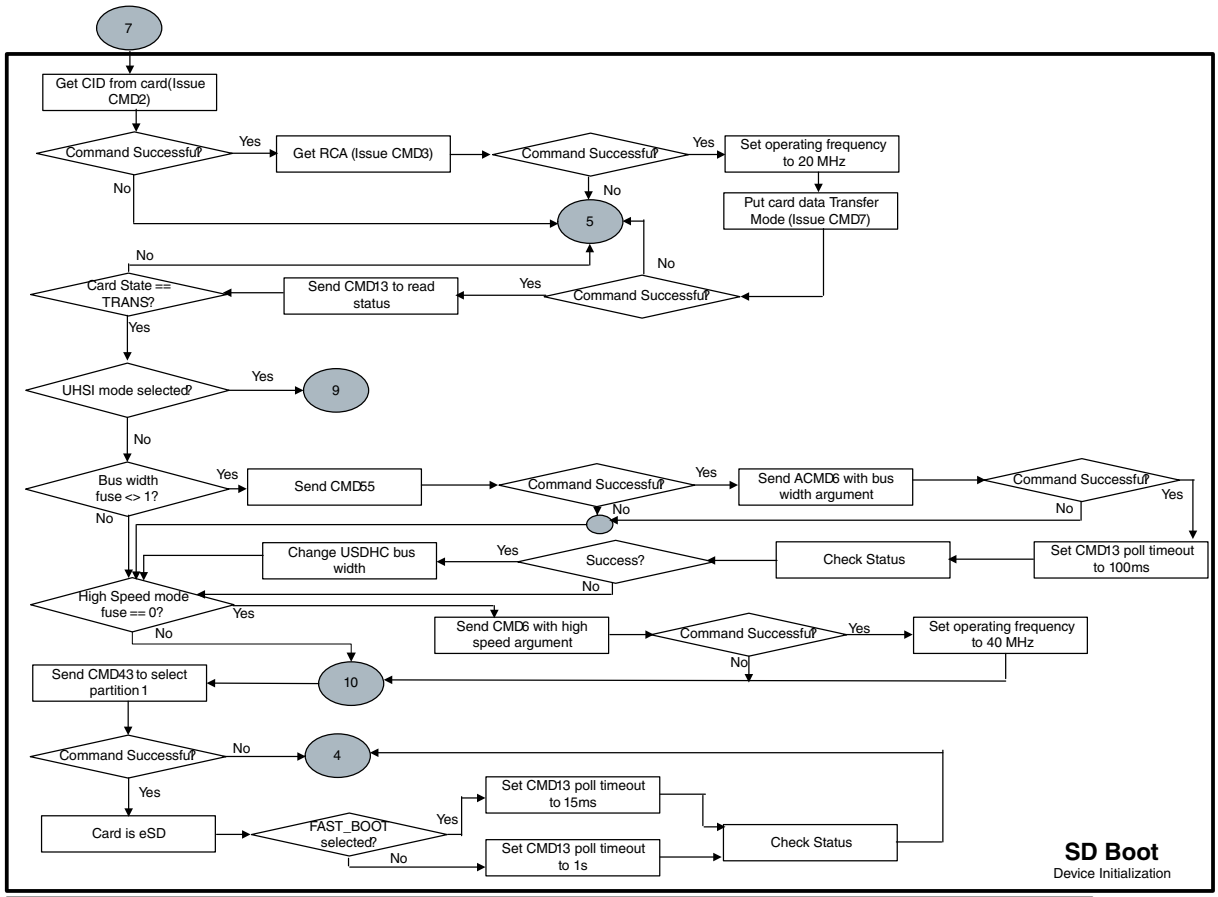

Figure 8-14. Expansion Device (SD/eSD/SDXC) Boot Flow (3 of 6) Part 2

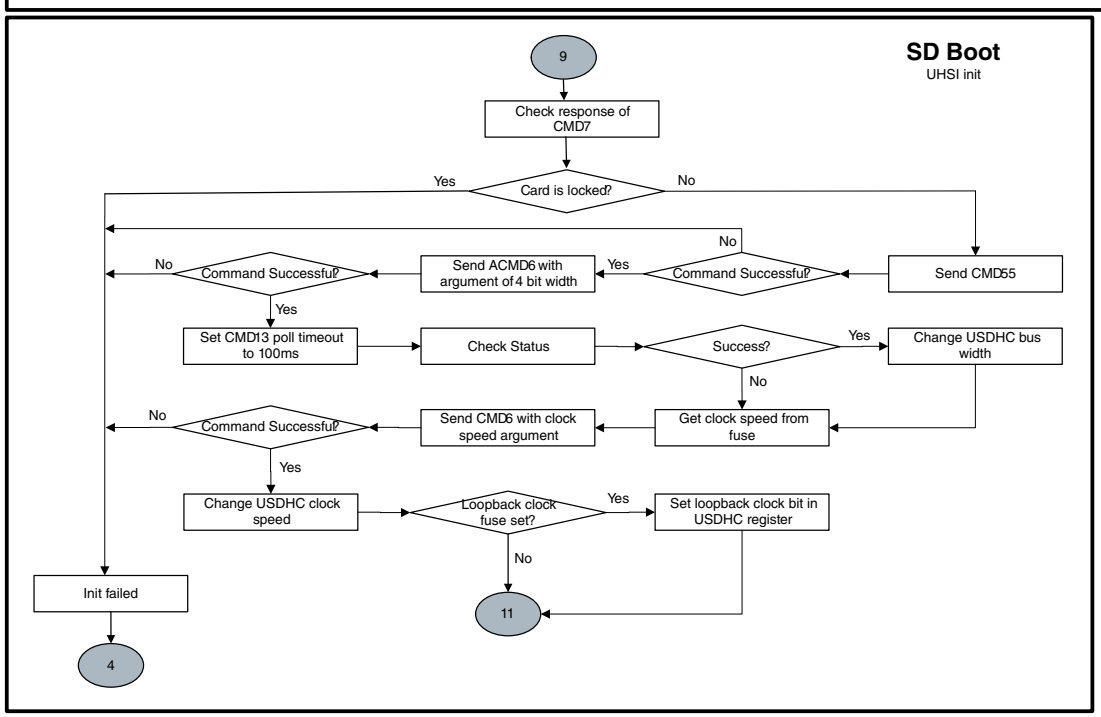

Figure 8-15. Expansion Device (MMCSD/eSD/SDXC) Boot Flow (4 of 6)

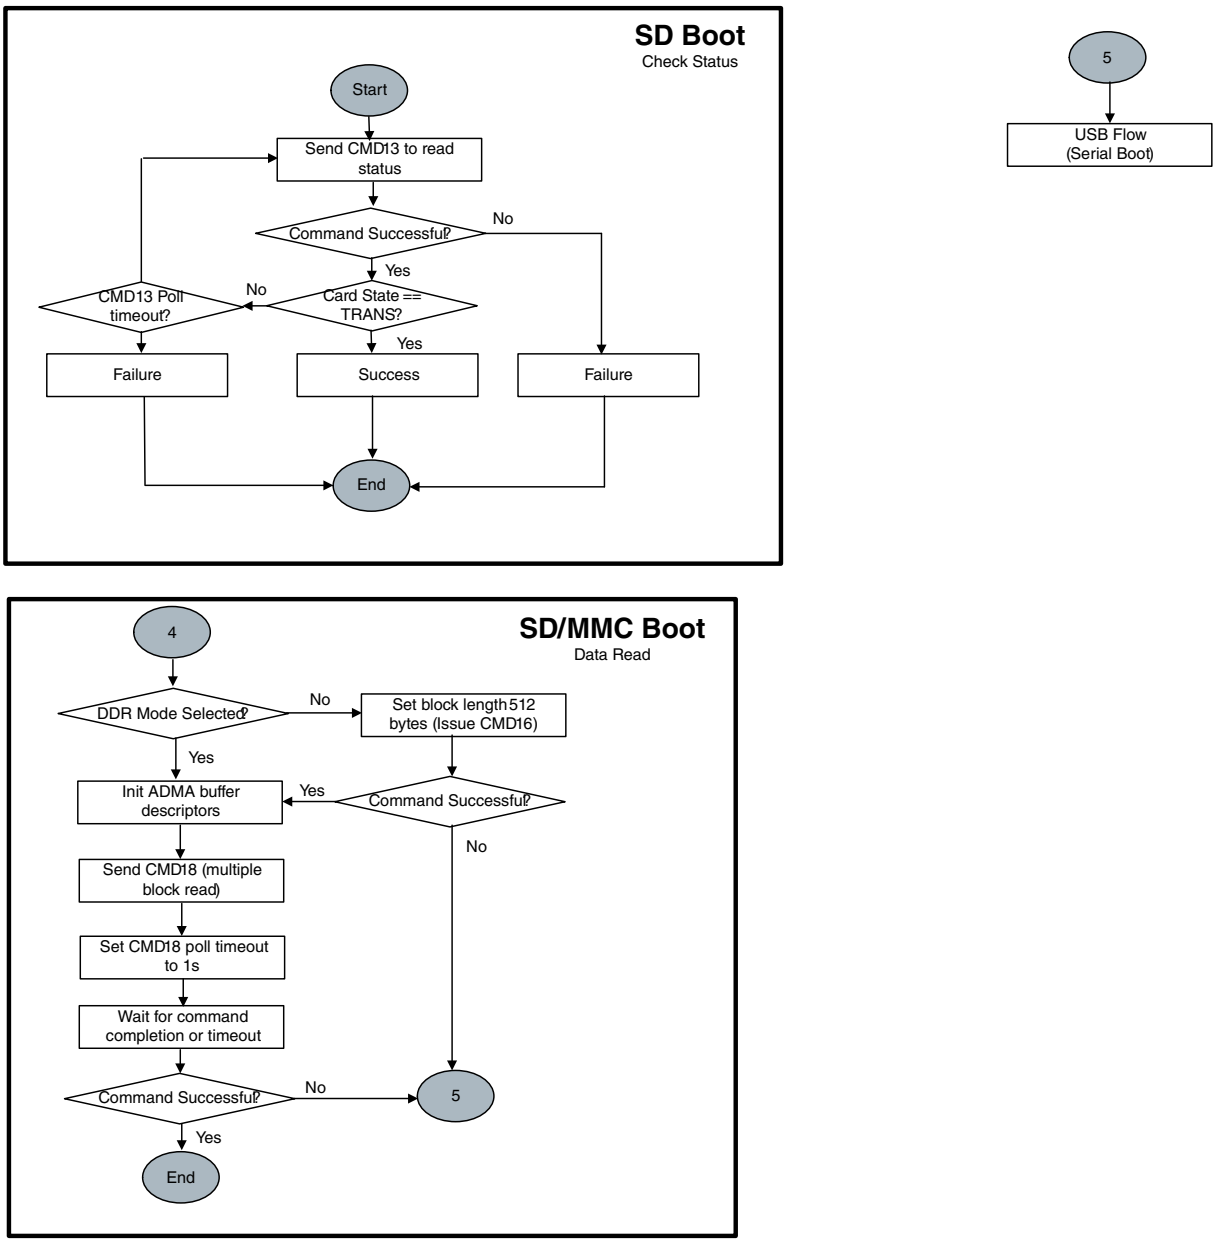

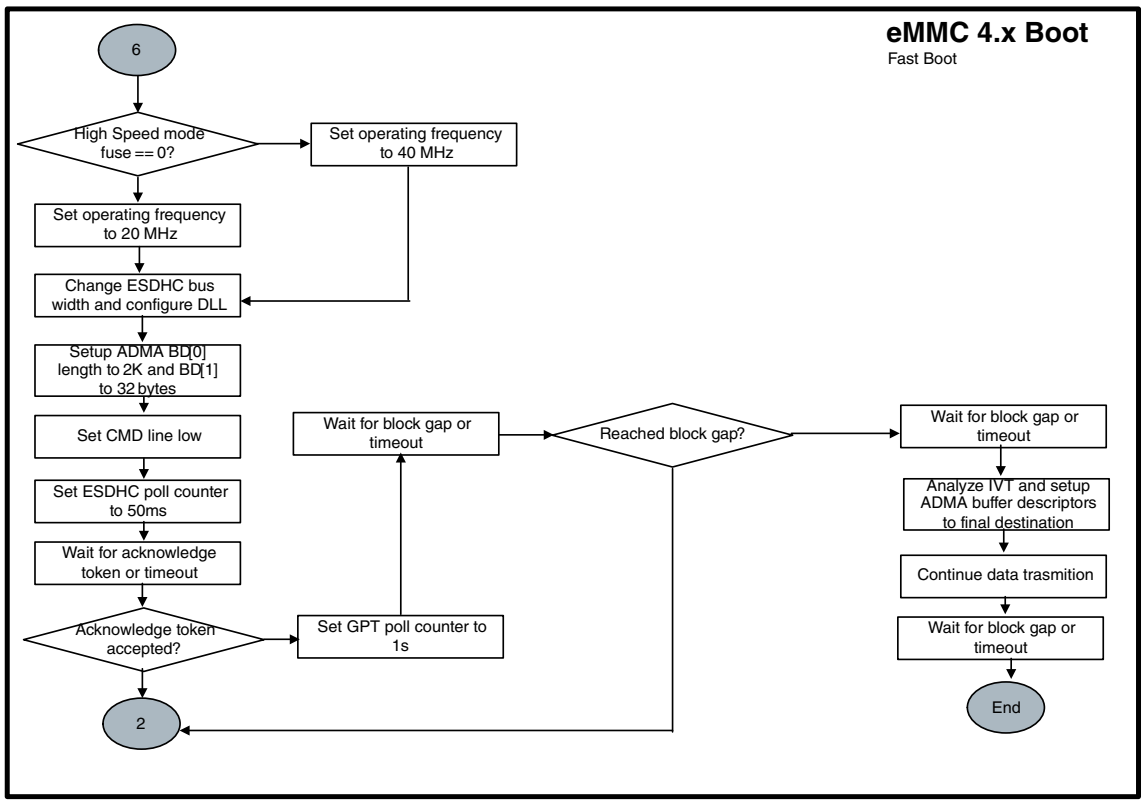

Figure 8-16. Expansion Device (SD/eSD) Boot Flow (5 of 6)

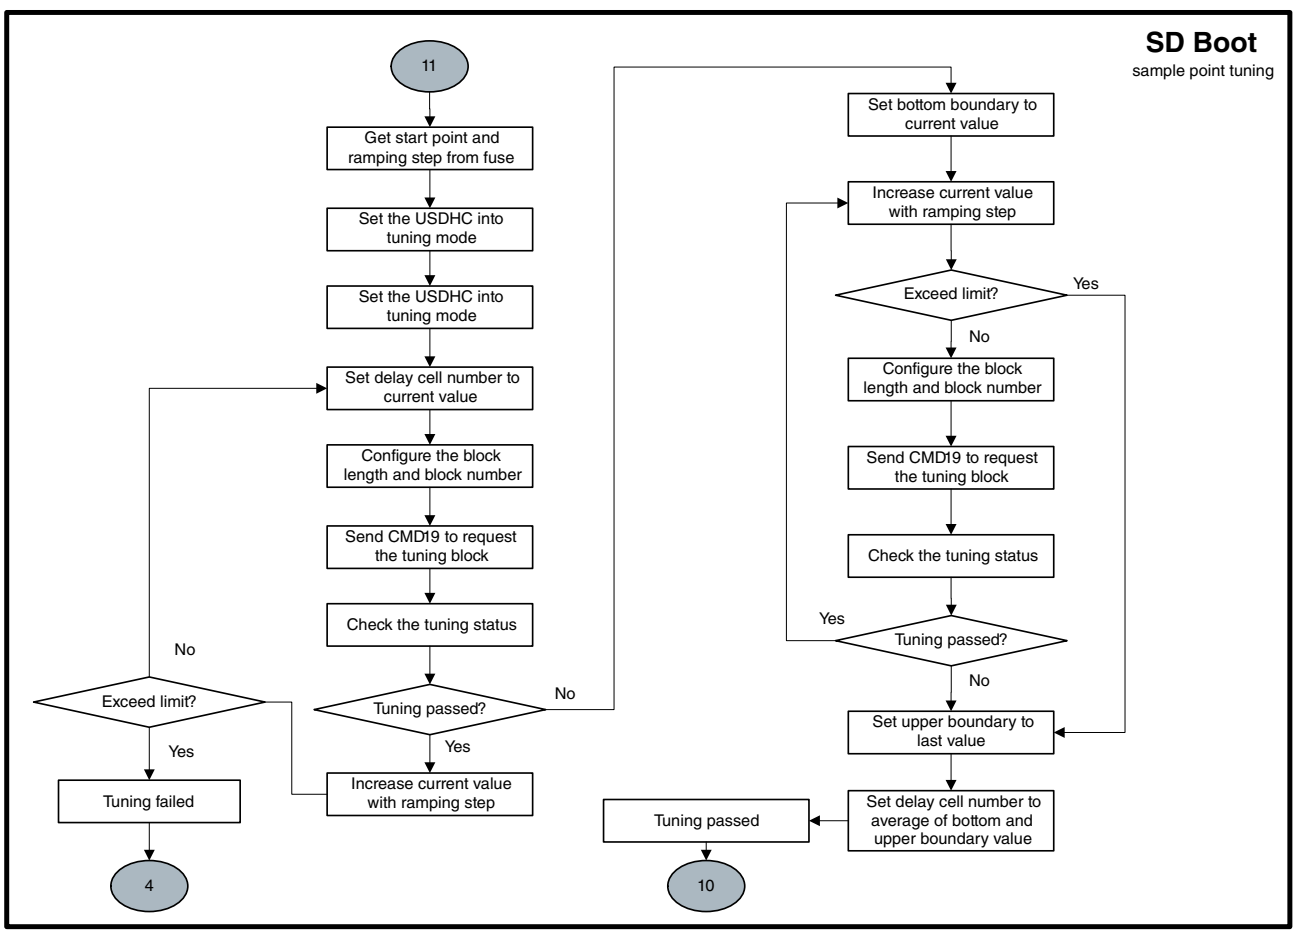

Figure 8-17. Expansion Device Boot Flow (6 of 6)

8.5.3.3 SD, eSD and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, SD/eSD/SDXC card voltage validation is performed. During voltage validation, boot code first checks with high voltage settings; if that fails, it checks with low voltage settings.

The capacity of the card is also checked. Boot code supports high capacity and low capacity SD/eSD/SDXC cards after voltage validation card initialization is done.

During card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes the card is a normal SD card or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, boot code switches to a higher frequency (25 MHz in Normal Speed mode or 50 MHz in High Speed Mode). ROM also supports FAST_BOOT mode booting from eSD card. This mode can be selected by BOOT_CFG1[4] (Fast Boot) fuse described in Table 8-15.

For UHSI cards, clock speed fuses can be set to SDR50 or SDR104 on USDHC1, USDHC2, ports. This will enable the voltage switch process to set the signaling voltage to 1.8V during voltage validation. The bus width is fixed at 4 bits wide and a sampling point tuning process is needed to calibrate the number of delay cells. If SD Loopback Clock eFuse is set, the feedback clock will come directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by BOOT_CFG1[3:2], and the SD Loopback Clock is selected by BOOT_CFG1[0].

UHSI calibration start value (MMC_DLL_DLY[6:0]) and step value (BOOT_CFG2[7:5]) can be set to optimize the sample point tuning process.

If SD Power Cycle Enable eFuse is 1, ROM will set SD_RST pad low, wait 5ms and then set SD_RST pad high. If SD_RST pad is connected to SD power supply enable logic on board, it enables power cycle of SD card. This may be crucial in case when SD logic is in 1.8V states and must be reset to 3.3V states.

SDR50 and SDR104 boot are not supported on the USDHC1 and USDHC2 ports because there are no reset signals for those ports when connected in the IOMUX.

8.5.3.4 IOMUX Configuration for SD/MMC

Table 8-18. SD/MMC IOMUX Pin Configuration

Signal	USDHC1	USDHC2
CLK	SD1_CLK.alt0	NAND_RE_B.alt1
CMD	SD1_CMD.alt0	NAND_WE_B.alt1

CD_B	UART1_RTS_B.alt2	—

8.5.3.5 Redundant Boot Support for Expansion Device

ROM supports redundant boot for expansion device. Primary or Secondary image is selected depending on PERSIST_SECONDARY_BOOT setting (see Table 8-6).

If PERSIST_SECONDARY_BOOT is 0, the boot ROM uses address 0x0 for primary image.

If PERSIST_SECONDARY_BOOT is 1, the boot ROM will read secondary image table from address 0x200 on boot media and will use address specified in the table.

Table 8-19. Secondary Image Table Format

Reserved (chipNum)
Reserved (driveType)
tag
firstSectorNumber
Reserved (sectorCount)

Where:

- tag: used as indication of valid secondary image table. Must be 0x00112233.
- firstSectorNumber is the first 512B sector number of the secondary image.

For secondary image support, the primary image must reserve space for secondary image table. See the figure below for typical structures layout on expansion device.

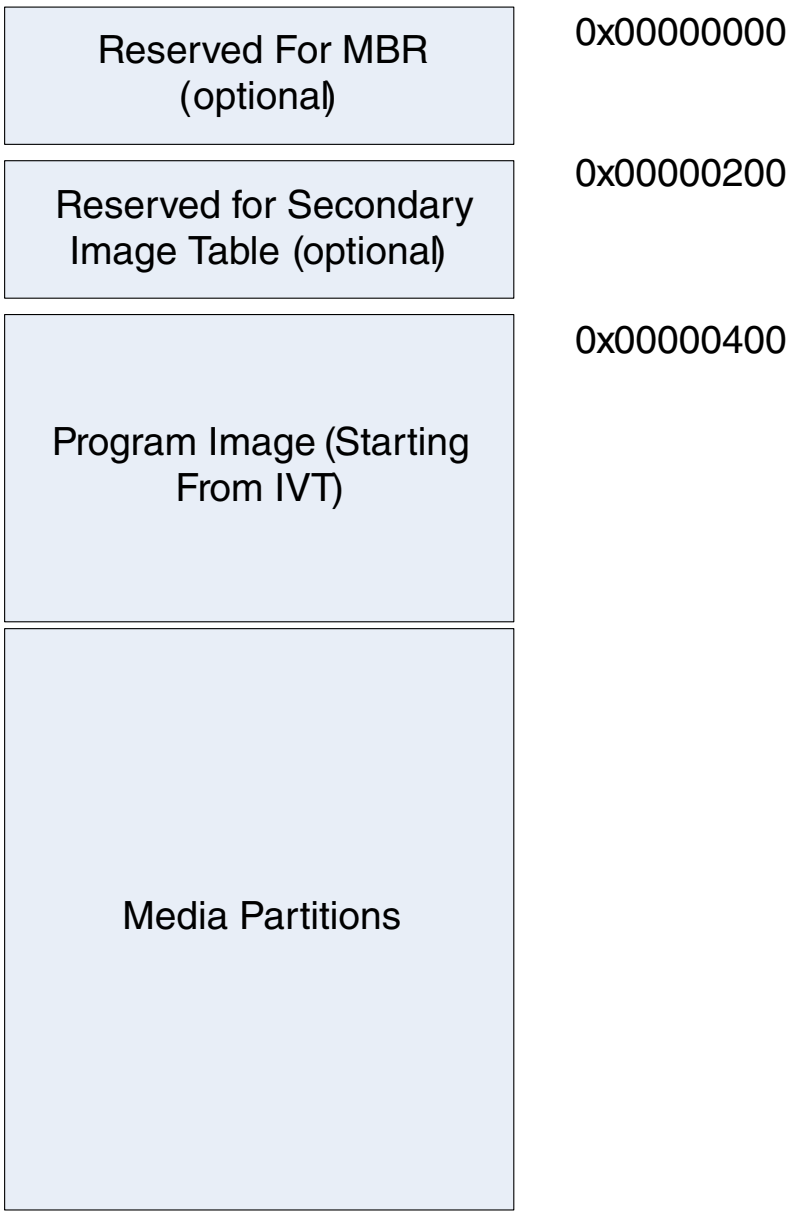

Figure 8-18. Expansion Device Structures Layout

For Closed mode, if there are failures during primary image authentication, the boot ROM will turn on PERSIST_SECONDARY_BOOT bit (see Table 8-6) and perform software reset. (After software reset, secondary image will be used.)

8.5.4 Serial ROM through SPI

The chip supports boot from serial memory devices, such as EEPROM and Serial Flash using the SPI.

The following ports are available for serial boot: eCSPI (eCSPI1, eCSPI2, eCSPI3, eCSPI4) interfaces.

8.5.4.1 Serial ROM eFUSE Configuration

The boot ROM code determines the type of device using the following parameters, either provided by eFUSE settings or sampled on the I/O pins, during boot.

See the table below for details:

Table 8-20. Serial ROM Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO[1]	Shipped Value	Settings
BOOT_CFG1[7:4]	OEM	Boot Device Selection	Yes	0000	0011 - Boot from Serial ROM
BOOT_CFG4[6]	OEM	EEPROM Recovery Enable	Yes	0	0 - Disabled EEPROM recovery 1 - Enabled EEPROM recovery
BOOT_CFG4[5:4]	OEM	CS select (SPI only)	Yes	00	00 - ECSPIx_SS0 01 - ECSPIx_SS1 10 - ECSPIx_SS2 11 - ECSPIx_SS3
BOOT_CFG4[3]	OEM	SPI Addressing (SPI only)	Yes	0	0 - 2-bytes (16-bit) 1 - 3-bytes (24-bit)
BOOT_CFG4[2:0]	OEM	Port Select	Yes	00	000 - ECSPI-1 001 - ECSPI-2 010 - ECSPI-3 011 - ECSPI-4 1xx- Reserved

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See GPIO Boot Overrides for corresponding GPIO pin.

The ECPSI-1/ECPSI-2/ECPSI-3/ECPSI-4 block can be used as boot device using ECSPI interface for serial ROM boot. The SPI interface is configured to operate at 15 MHz for 3-byte addressing device and 3.75 MHz for 2-byte addressing devices.

The boot ROM will copy 4Kbyte of data from Serial ROM device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

NOTE

The Initial 4K of Program Image must contain the IVT, DCD and the Boot Data structures.

8.5.4.2 ECSPI Boot

The Enhanced Configurable SPI (ECSPI) interface is configured in master mode and the EEPROM device is connected to ECSPI interface as a slave.

The boot ROM code copies 4 KB data from EEPROM device to the internal RAM. If DCD verification is successful, the ROM code copies the initial 4 KB data, as well as the rest of the image extracted from application image, directly to the application destination. The ECSPI can read data from EEPROM using 2 or 3 byte addressing. Its burst length is 32 bytes.

NOTE

The Serial ROM Chip Select Number is determined by BOOT_CFG4[5:4] (Chip Select) fuse.

When using the SPI as boot device, the Chip supports booting from both Serial EEPROM and Serial Flash devices. The boot code determines which device is being used by reading the appropriate eFUSE/I/O values at boot (see Table 8-20 for details).

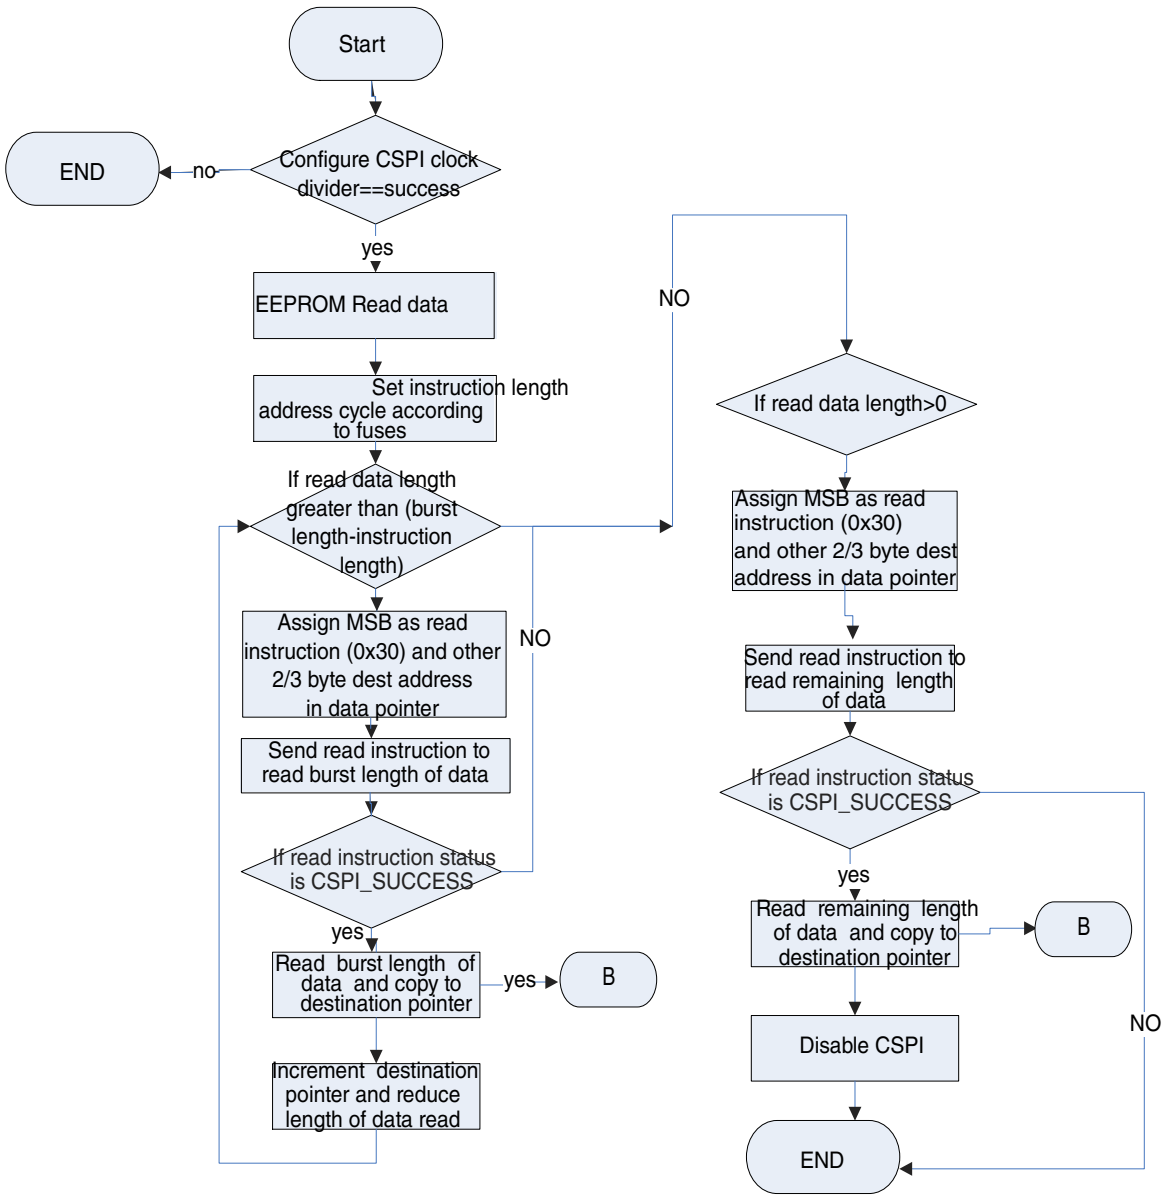

Figure 8-19. CSPI Flow chart

8.5.4.2.1 ECSPI IOMUX Pin Configuration

The contacts assigned to the signals used by the CSPI blocks is shown in the table below.

Table 8-21. ECSPI IOMUX Pin Configuration

8.6 QuadSPI Serial Flash Memory Boot

8.6.1 QuadSPI eFUSE Configuration

Table 8-22. QSPI Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO	Shipped Value	Settings
BOOT_CFG1[7:4]	OEM	Boot Device Selection	Yes	0001	0001 - Boot from QuadSPI
BOOT_CFG1[3]	OEM	QuadSPI Interface Selection	Yes	0	0 - QSPI1 1 - Reserved

8.6.2 QuadSPI Serial Flash BOOT Operation

The Boot ROM attempts to boot from QuadSPI flash if the BOOT_CFG1[7:4] fuses are programmed to 0001 as shown in the QuadSPI eFUSE Configuration table. The ROM will initialize the requested the QuadSPI Interface as selected in Fuse bit BOOT_CFG1[3] in the QuadSPI eFUSE Configuration. QuadSPI interface initialization is a two step process.

The ROM expects the QuadSPI configuration parameters as explained in the QuadSPI Configuration Parameters to be present in the Serial Flash memory from offset 0x400 of serial flash of length 512 bytes. The ROM reads these configuration parameters using the default read command configured in the LUT of the QuadSPI interface with SCLOCK operating at 18 MHz.

In the second step, ROM configures the selected QuadSPI interface with the configuration parameters read from the serial flash and starts the boot procedure. Refer to Table 19-12 for details regarding QuadSPI configuration parameters and to the QuadSPI boot flow chart for detailed boot flow chart of QuadSPI.

Both booting an XIP and non XIP image is supported from serial flash. For XIP boot, the image has to be built for QuadSPI address space and for non XIP the image can be built to execute from DDR or OCRAM.

For QUAD mode boot, the Boot ROM expects the Quad Enable bit inside the QSPI Flash to be already set before booting starts. Therefore, the QUAD enable bit must be set in the non-volatile register of the flash at the time of programming.

NOTE

If the SPI flash device requires quad enable command, it can be sent via configuration structure fields: device_quad_mode_en, device_cmd, write_cmd_ipcr, write_enable_ipcr, busy_bit_offset, read_status_ipcr.

8.6.3 QuadSPI Configuration Parameters

The QuadSPI Configuration Parameters Table is built in boot image at fixed offset 0x400 from QSPI NOR A1 base address (368 bytes). Table below lists various QuadSPI Configuration Parameters.

Table 8-23. QuadSPI Configuration Parameters

Name	Offset	Size in Bytes	Description
DQS Loopback	0	4	DQS LoopBack Mode to enable Dummy Pad, 0 - Disable, 1 - Enable
Hold Delay	4	4	Hold Delay for QSPI[0,1] A/B Value / QSPI1 B / QSPI1 A 00 / Disable / Disable 01 / Disable / Enable 10 / Enable / Disable 11 / Enable / Enable
Reserved	8	4	Reserved to 0
Reserved	12	4	Reserved to 0
device_quad_mode_en	16	4	Send Quad enable command to SPI device.
device_cmd	20	4	Command to send to SPI device.

Table continues on the next page...

Table 8-23. QuadSPI Configuration Parameters (continued)

Name	Offset	Size in Bytes	Description
Data Strobe Signal enable in Serial Flash	76	4	This field enables Data Strobe signal in Serial Flash which supports it. 0 – Disable DQS 1 – Enable DQS
Parallel Mode enable	80	4	This field enables parallel mode. Data will be read from serial Flash in parallel mode. Refer to QSP chapter for detail. 0 – Disable Parallel mode in QSPI 1 – Enable Parallel Mode in QSPI
CS1 on Port A	84	4	This field enables CS1 on port A 0 – Disable CS1 on Port A 1 – Enable CS1 on Port A
CS1 on Port B	88	4	This field enables CS1 on port B 0 – Disable CS1 on Port B 1 – Enable CS1 on Port B
Full Speed Phase Selection	92	4	Select the edge of the sampling clock valid for full speed commands: 0: Select sampling at non-inverted clock 1: Select sampling at inverted clock This bit is also used to shift the dqs_enable when DQS mode is selected
Full Speed Delay Selection	96	4	Select the delay w.r.t. the reference edge for the sample point valid for full speed commands: 0: One clock cycle delay 1: Two clock cycles delay This bit is also used to shift the dqs_enable when DQS mode is selected
DDR Sampling Point	100	4	Select the sampling point for incoming data when serial flash is in DDR mode. **NOTE:** Valid Values are (b000-b111)
LUT program sequence	104	256	256 Bytes of Look up table program sequence. ROM programs the LUT of QuadSPI with this parameter supplied. It assumes that the optimize read command sequence which will be used to read data from Serial flash and fill the AHB buffer is programmed at index 0.
read_status_ipcr	360	4	IPCR value of Read Status Reg
enable_dqs_phase	364	4	Enable DQS Phase
Reserved	368	36	Not used
dqs_pad_setting_override	404	4	DQS pin pad setting override
sclk_pad_setting_override	408	4	SCLK pin pad setting override
data_pad_setting_override	412	4	DATA pins pad setting override
cs_pad_setting_override	416	4	CS pins pad setting override

Table continues on the next page...

Table 8-23. QuadSPI Configuration Parameters (continued)

Name	Offset	Size in Bytes	Description
dqs_loopback_internal	420	4	0: dqs loopback from pad 1: dqs loopback internally
dqs_phase_sel	424	4	dqs phase selection
dqs_fa_delay_chain_sel	428	4	dqs fa delay chain selection
dqs_fb_delay_chain_sel	432	4	dqs fb delay chain selection
sclk_fa_delay_chain_sel	436	4	sclk fa delay chain selection
sclk_fb_delay_chain_sel	440	4	sclk fb delay chain selection
Reserved	444	64	Reserved
tag	508	4	End flag of QSPI parameters area

8.6.4 IOMUX Configuration for QSPI Devices

The QSPI interface uses dedicated contacts on the IC. The contacts assigned to the data signals used by QSPI are shown in the table below.

Table 8-24. QuadSPI IOMUX Pin Configuration

Signal	QSPI1
A_SCLK	NAND_WP_b.alt2
A_SS0_B	NAND_DQS.alt2
A_SS1_B	NAND_DATA07.alt2
A_DATA0	NAND_READY_B.alt2
A_DATA1	NAND_CE0_B.alt2
A_DATA2	NAND_CE1.B.alt2
A_DATA3	NAND_CLE.alt2
A_DQS	NAND_ALE.alt2
B_SCLK	NAND_RE_B.alt2
B_SS0_B	NAND_WE_B.alt2
B_SS1_B	NAND_DATA00.alt2
B_DATA0	NAND_DATA02.alt2
B_DATA1	NAND_DATA03.alt2
B_DATA2	NAND_DATA04.alt2
B_DATA3	NAND_DATA05.alt2
B_DQS	NAND_DATA01.alt2

8.6.5 QuadSPI boot flow chart

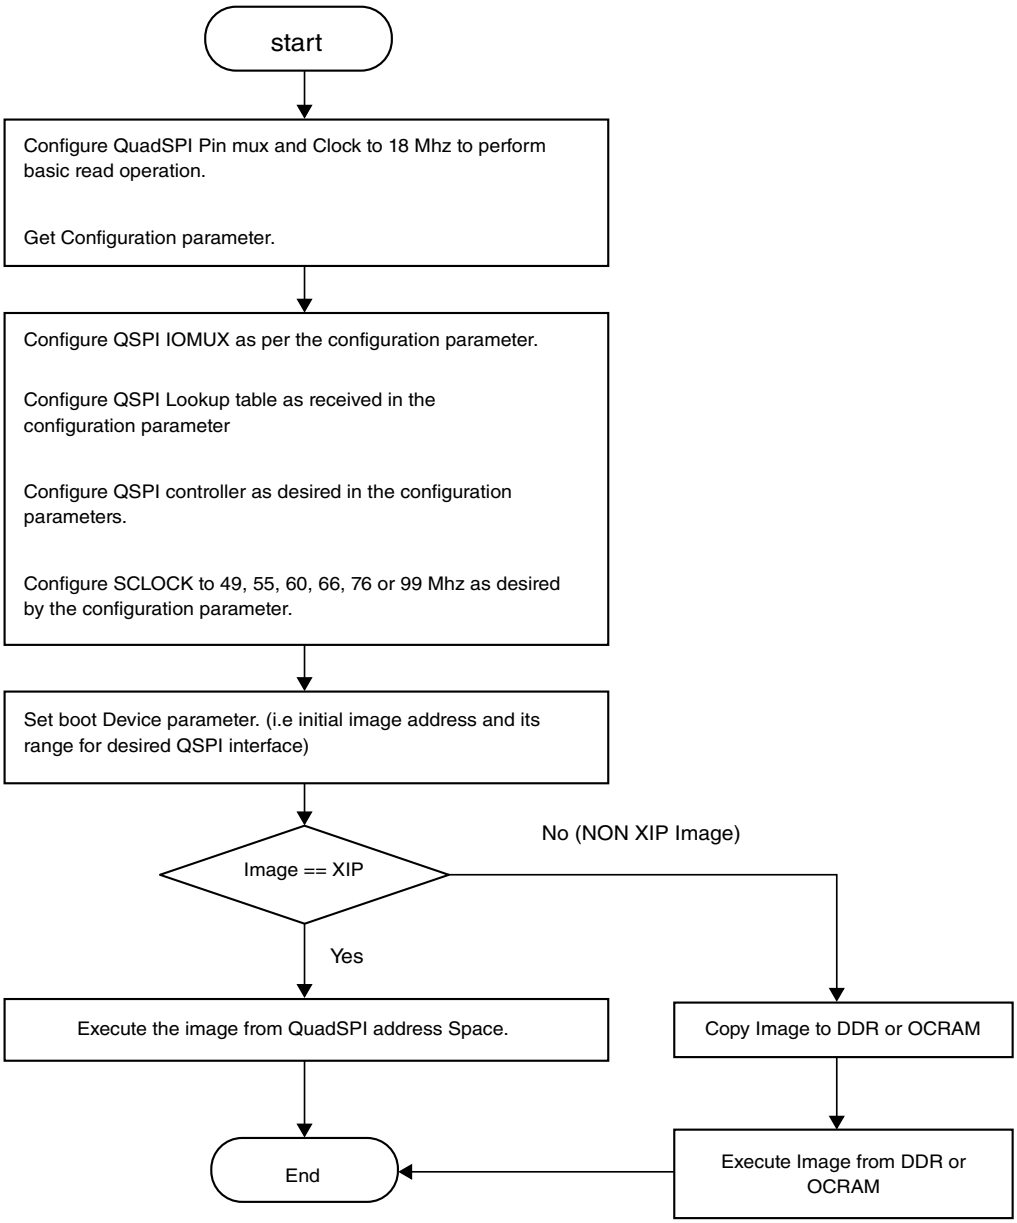

Figure 8-20. QuadSPI boot flow chart

NOTE

If flash is configured for "High performance mode (where command is generated only once)" in LUT program sequence. then external reset should be routed to flash reset to allow rebooting in case of any device reset other than Power On Reset. Also this high performance mode must be exited by application before any Low power mode entry where the device

is supposed to reboot from QSPI flash on Low power mode exit. In general, any preserved configuration in external flash will not be understood by device after reset.

8.7 Program image

This section describes the data structures that are required to be included in a user's program image. A program image consists of:

- Image vector table—A list of pointers located at a fixed address that the ROM examines to determine where other components of the program image are located
- Boot data—A table indicating the program image location, program image size in bytes, and the plugin flag
- Device configuration data—IC configuration data
- User code and data

8.7.1 Image Vector Table and Boot Data

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process.The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address and initial load region size for each boot device type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder or the image memory map is flexible and is determined by the contents of the IVT.

Table 8-25. Image Vector Table Offset and Initial Load Region Size

Boot Device Type	Image Vector Table Offset	Initial Load Region Size
NOR	4 Kbyte = 0x1000 bytes	Entire Image Size
OneNAND	256 bytes = 0x100 bytes	1 Kbyte
SD/MMC/eSD/eMMC/SDXC	1 Kbyte = 0x400 bytes	4 Kbyte
SPI EEPROM	1 Kbyte = 0x400 bytes	4 Kbyte

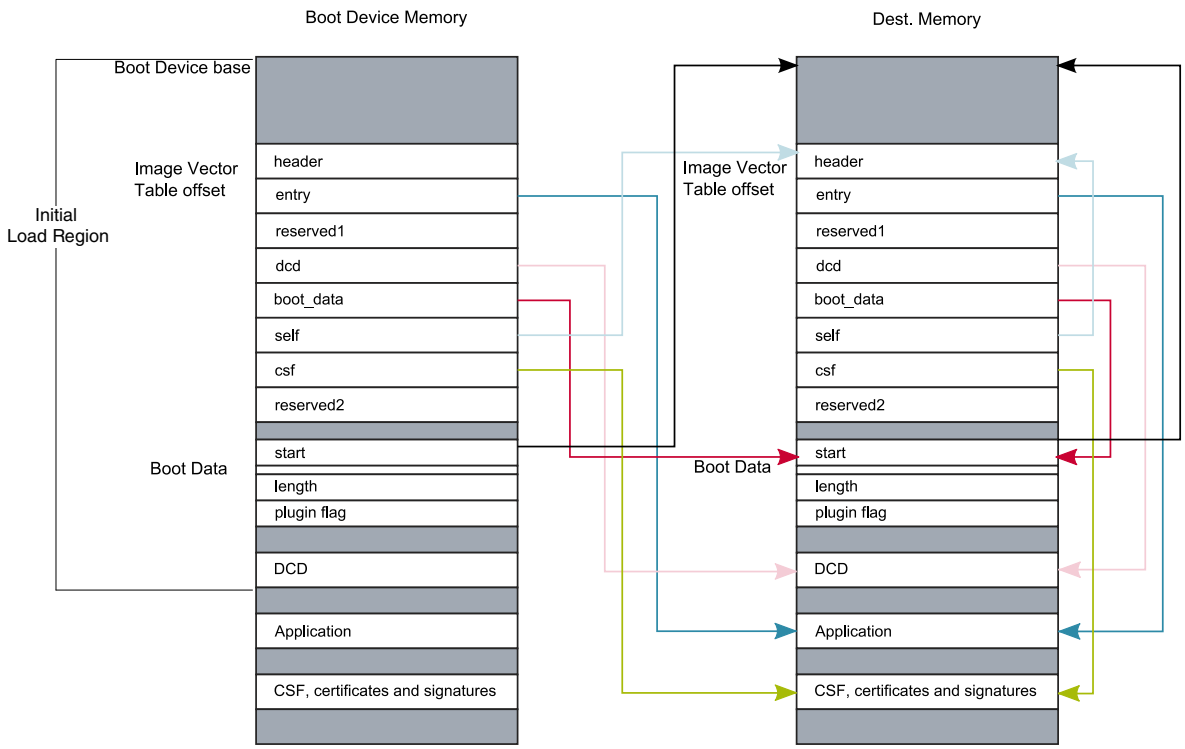

Figure 8-21. Image Vector Table

8.7.1.1 Image Vector Table Structure

The IVT has the following format where each entry is a 32 bit word:

Table 8-26. IVT Format

header
entry: Absolute address of the first instruction to execute from the image
reserved1: Reserved and should be zero
dcd: Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See Device Configuration Data (DCD) for further details on DCD.
boot data: Absolute address of the Boot Data
self: Absolute address of the IVT. Used internally by the ROM
csf: Absolute address of Command Sequence File (CSF) used by the HAB library. See High Assurance Boot (HAB) for details on secure boot using HAB. This field must be set to NULL when not performing a secure boot
reserved2: Reserved and should be zero

Figure 8-22 shows the IVT header format:

Figure 8-22. IVT Header Format

where:

```
Tag: A single byte field set to 0xD1
Length: a two byte field in big endian format containing the overall length of the IVT,
in bytes, including the header. (the length is fixed and must have a value of
32 bytes)
Version: A single byte field set to 0x40 or 0x41
```

8.7.1.2 Boot Data Structure

The Boot Data must follow the format defined in the table found here, each entry is a 32-bit word.

Table 8-27. Boot Data Format

start	Absolute address of the image
length	Size of the program image
plugin	Plugin flag (see Plugin Image)

8.7.2 Device Configuration Data (DCD)

Upon reset, the Chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving optimal system performance and there are even some peripherals that must be configured before they can be used.

The DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various peripherals on the Chip.

For example, the EIM default settings allow the core to interface to a NOR flash device immediately out of reset. This allows the Chip to interface with any NOR flash device, but has the cost of slow performance. Additionally, some components such as DDR require some sequence of register programming as part of configuration before it is ready to be used. The DCD feature can be used to program the EIM registers and MMDC registers to the optimal settings.

The ROM determines the location of the DCD table based on information located in the Image Vector Table (IVT). See Image Vector Table and Boot Data for more details. The DCD table shown below is a big endian byte array of the allowable DCD commands. The maximum size of the DCD limited to 1768 bytes.

Figure 8-23. DCD Data Format

The DCD header is 4 bytes with the following format:

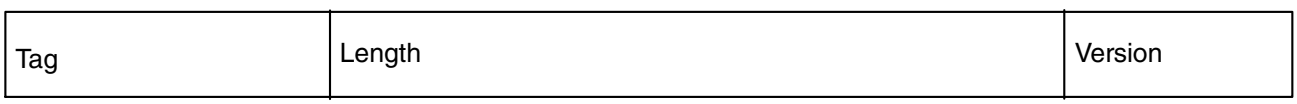

Figure 8-24. DCD Header Format

where:

```
Tag: A single byte field set to 0xD2
Length: a two byte field in big endian format containing the overall length of the DCD,
in bytes, including the header
Version: A single byte field set to 0x41
```

8.7.2.1 Write Data Command

The Write Data Command is used to write a list of given 1-, 2- or 4-byte values or bitmasks to a corresponding list of target addresses.

The format of Write Data Command, again a big endian byte array, is shown in the table below.

Table 8-28. Write Data Command Format

Tag	Length	Parameter
Address		

Table continues on the next page...

Table 8-28. Write Data Command Format (continued)

Value/Mask
[Address]
[Value/Mask]
...
[Address]
[Value/Mask]

where:

```
Tag: A single byte field set to 0xCC
Length: A two byte field in big endian format containing the length of the Write Data
Command, in bytes, including the header
Address: target address to which data should be written
Value/Mask: data value or bitmask to be written to preceding address
```

The Parameter field is a single byte divided into bitfields as follows:

Table 8-29. Write Data Command Parameter field

7	6	5	4	3	2	1	0
flags					bytes		

where

```
bytes: width of target locations in bytes. Either 1, 2 or 4
flags: control flags for command behavior.
Data Mask = bit 3: if set, only specific bits may be overwritten at target address
(otherwise all bits may be overwritten)
Data Set = bit 4: if set, bits at the target address overwritten with this flag
(otherwise it is ignored)
```

One or more target address and value/bitmask pairs can be specified. The same bytes and flags parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

Table 8-30. Interpretation of Write Data Command Flags

"Mask"	"Set"	Action	Interpretation
0	0	*address = val_msk	Write value
0	1	*address = val_msk	Write value
1	0	*address &= ~val_msk	Clear bitmask
1	1	*address |= val_msk	Set bitmask

NOTE

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values is larger or any of the bitmasks is wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within an allowed region, none of the values are written. The list of allowable blocks and target addresses for the Chip are given below.

Table 8-31. Valid DCD Address Ranges

Address range	Start address	Last Address
IOMUX Control (IOMUXC) registers	0x020E0000	0x020E3FFF
IOMUXC GPR	0x020E4000	0x020E7FFF
CCM register set	0x020C4000	0x020C7FFF
ANADIG registers	0x020C8000	0x020C8FFF
MMDC register set	0x021B0000	0x021B3FFF
OCRAM free space	0x00907000	0x00937FF0
EIM registers	0x021B8000	0x021BBFFF
DDR	0x10000000	0xFFFF7FFF
EPIT	EPIT1: 0x020D0000	EPIT1: 0x020D3FFF

8.7.2.2 Check Data Command

The Check Data Command is used to test for a given -1, 2- or 4-byte bitmasks from a source address.

The Check Data Command is a big endian byte array with format shown in the table below.

Table 8-32. Check Data Command Format

Tag	Length	Parameter
Address		
Mask		
[Count]		

where:

```
Tag: A single byte field set to 0xCF
Length: A two byte field in big endian format containing the length of the Check Data
Command, in bytes, including the header
Address: source address to test
Mask: bit mask to test
Count: optional poll count. If count is not specified this command will poll indefinitely
until the exit condition is met. If count = 0, this command behaves as for NOP.
```

The Parameter field is a single byte divided into bitfields as follows:

Table 8-33. Check Data Command Parameter field

7	6	5	4	3	2	1	0
flags					bytes		

where

```
bytes: width of target locations in bytes. Either 1, 2 or 4
flags: control flags for command behavior.
Data Mask = bit 3: if set, only specific bits may be overwritten at target address
(otherwise all bits may be overwritten)
Data Set = bit 4: if set, bits at the target address overwritten with this flag
(otherwise it is ignored)
```

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

Table 8-34. Interpretation of Check Data Command Flags

"Mask"	"Set"	Action	Interpretation
0	0	(*address & mask) == 0	All bits clear
0	1	(*address & mask) == mask	All bits set
1	0	(*address & mask)!= mask	Any bit clear
1	1	(*address & mask)!= 0	Any bit set

NOTE

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

8.7.2.3 NOP Command

This command has no effect.

The format of NOP Command is a big endian four byte array as shown in the table below.

Table 8-35. NOP Command Format

Tag	Length	Undefined

where:

```
Tag: A single byte field set to 0xC0
Length: A two byte field in big endian containing the length of the NOP Command in bytes.
Fixed to a
value of 4.
Undefined: This byte is ignored and can be set to any value.
```

8.7.2.4 Unlock Command

The Unlock Command is used to prevent specific engine features being locked when exiting ROM.

The format of Unlock Command, again a big endian byte array, is shown in the table below.

Table 8-36. Unlock Command Format

Tag	Length	Eng
Value		
Value		
...		
Value		

where:

```
Tag: A single byte field set to 0xB2
Eng: Engine to be left unlocked.
Values: [optional] unlock values required by engine.
```

NOTE

This command may not be used in DCD structure if the SEC_CONFIG is configured as closed.

8.8 Plugin Image

The ROM supports a limited number of boot devices. For using other devices as boot source (for example, Ethernet, CDROM, or USB), the supported boot device must be used (typically serial ROM) for firmware with the missing boot drivers. >Additionally plugin can customize supported boot drivers. It is more flexible when doing device initialization, such as condition judging, delay assertion, applying custom settings to boot device and memory system.

>In addition to standard images, the chip also supports plugin images. Plugin images return execution to the ROM whereas a standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see Boot Data Structure). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end the plugin function must return with the program image parameters. (See High level boot sequence for details about boot flow).

The boot ROM authenticates the plugin image prior to running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

typedef BOOLEAN (*plugin_download_f)(void **start, size_t *bytes, UINT32 *ivt_offset);

ARGUMENTS PASSED:

- start - Image load address on exit.
- bytes - Image size on exit.
- ivt_offset - Offset in bytes of the IVT from the image start address on exit.

RETURN VALUE:

- 1 - on success
- 0 - on failure

8.9 Serial Downloader

The Serial Downloader provides a means to download a Program Image to the chip over USB and UART serial connection.

In this mode the ROM programs WDOG1 for a time-out specified by fuse WDOG Time-out Select (See fusemap for details) if WDOG_ENABLE eFuse is 1 and continuously polls for USB and UART connection. If no activity is found on USB OTG1, UART 1/2 and the watchdog timer expires, the ARM core is reset.

NOTE

After being loaded, the downloaded image is responsible to manage the watchdog resets properly.

Figure 8-2 shows USB and UART boot flow.

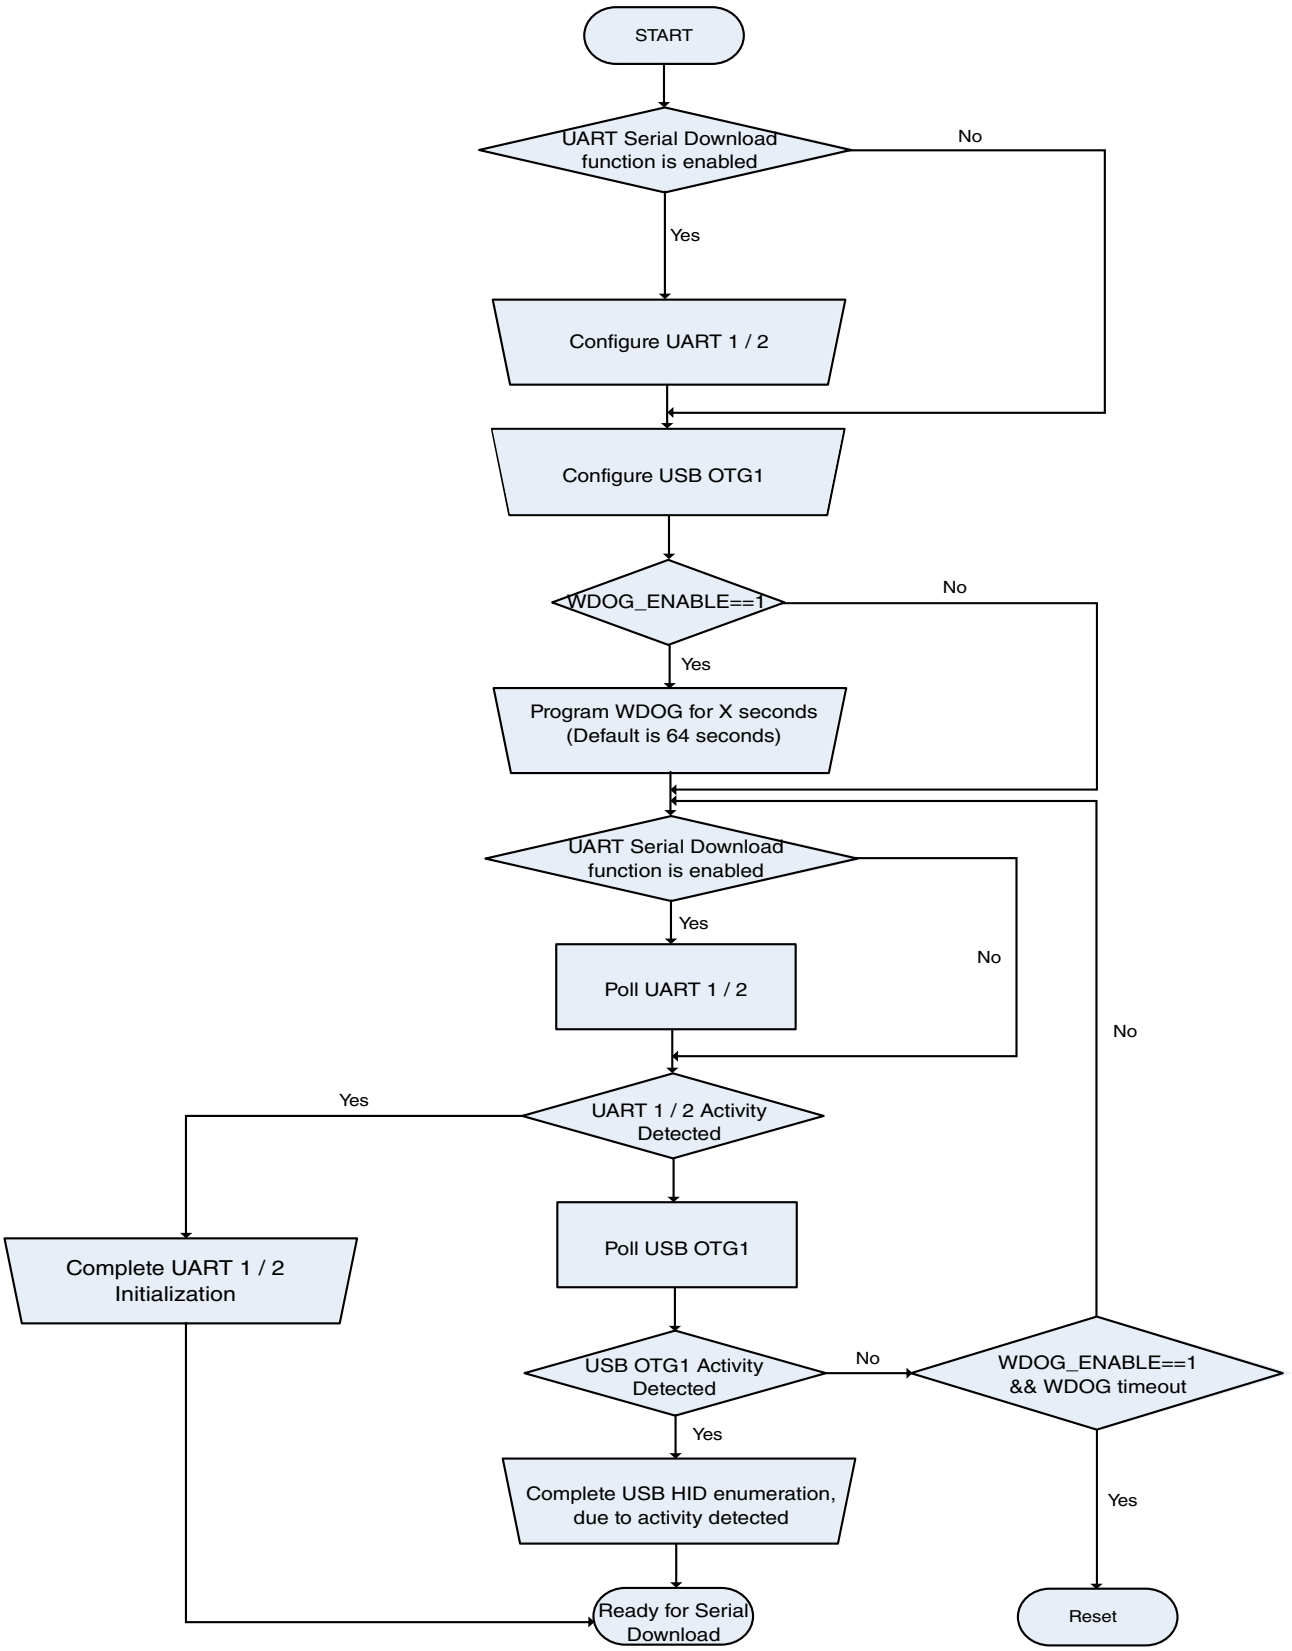

Figure 8-25. Serial Download Boot Flow

8.9.1 USB

USB support is composed of the USBO2 (USB OTG core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB OTG port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of 4 HID reports are used to implement SDP protocol for data transfers as described in Table 8-37.

Table 8-37. USB HID Reports

Report ID (first byte)	Transfer Endpoint	Direction	Length	Description
1	control OUT	Host to device	17 bytes	SDP command from host to device
2	control OUT	Host to device	Up to 1025 bytes	Data associated with report 1 SDP command
3	interrupt	Device to host	5 bytes	HAB security configuration. Device sends 0x12343412 in closed mode and 0x56787856 in open mode.
4	interrupt	Device to host	Up to 65 bytes	Data in response to SDP command in report 1

8.9.1.1 USB Configuration Details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for USB device driver are listed in the table below.

Table 8-38. VID/PID and Strings for USB Device Driver

Descriptor	Value
VID	0x15A2 (Freescale vendor ID)
PID[1]	0x007D
String Descriptor1 (manufacturer)	Freescale Semiconductor, Inc.
String Descriptor2 (product)	S Blank SE Blank

Table continues on the next page...

Table 8-38. VID/PID and Strings for USB Device Driver (continued)

Descriptor	Value
	NS Blank
String Descriptor4	Freescale Flash
String Descriptor5	Freescale Flash

1. Allocation based on BPN (Before Part Number)

8.9.1.2 IOMUX Configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX. The UTMI PHY interface uses dedicated contacts on the IC. See the Chip data sheet for details.

8.9.2 UART

ROM supports UART1 and UART2 port for boot purpose, others UART ports on the chip are not supported for boot purpose.

If the event of data ready in UART FIFO is detected, ROM will enter UART serial download boot mode, and start to read data from the UART port which reports data ready event. The noise on UART RX data pad may cause a “data ready” event reported by UART controller, and further cause ROM entering UART serial download mode. Hardware designer should take care to avoid such exception.

8.9.2.1 UART Configuration Details

Table 8-39. UART Configuration Details

Transmission Protocol	RS232
Start bit	1 bit
Stop bit	1 bit
Parity bit	No needed
Flow control	No needed
Baud Rate	115200 bps

8.9.2.2 UART eFUSE Configuration

Table 8-40. UART eFUSE Configuration

Fuse	Config	Definition	GPIO	Shipped Value	Settings
0x470[4]	OEM	UART Serial Download Disabled Selection	Yes	0	0 - UART serial download enabled 1 - disabled

8.9.2.3 IOMUX Configuration for UART

Table 8-41. IOMUX Configuration for UART

Signal	UART1	UART2
TXD	UART1_TX_DATA.alt0	UART2_TX_DATA.alt0
RXD	UART1_RX_DATA.alt0	UART2_RX_DATA.alt0

8.9.3 Serial Download protocol

The 16 byte SDP command from host to device is sent using HID report 1.

The table below describes 16 byte SDP command data structure:

Table 8-42. 16 Byte SDP Command Data Structure

BYTE Offset	Size	Name	Description
0	2	COMMAND TYPE	The following commands are supported for ROM: • 0x0101 READ_REGISTER • 0x0202 WRITE_REGISTER • 0x0404 WRITE_FILE • 0x0505 ERROR_STATUS • 0x0A0A DCD_WRITE • 0x0B0B JUMP_ADDRESS • 0x0C0C SKIP_DCD_HEADER
2	4	ADDRESS	Only relevant for following commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS. For READ_REGISTER and WRITE_REGISTER commands, this field is address to a register. For WRITE_FILE and JUMP_ADDRESS commands, this field is an address to internal or external memory address.

Table continues on the next page...

Table 8-42. 16 Byte SDP Command Data Structure (continued)

BYTE Offset	Size	Name	Description
6	1	FORMAT	Format of access, 0x8 for 8-bit access, 0x10 for 16-bit and 0x20 for 32-bit access. Only relevant for READ_REGISTER and WRITE_REGISTER commands.
7	4	DATA COUNT	Size of data to read or write. Only relevant for WRITE_FILE, READ_REGISTER, WRITE_REGISTER and DCD_WRITE commands. For WRITE_FILE and DCD_WRITE commands DATA COUNT is in byte units.
11	4	DATA	Value to write. Only relevant for WRITE_REGISTER command.
15	1	RESERVED	Reserved

8.9.3.1 SDP Command

SDP commands are decribed in the following sections.

8.9.3.1.1 READ REGISTER

The transaction for command READ_REGISTER consists of following reports: Report1 for command, Report3 for security configuration and Report4 for response or register value.

The register to read is specified in ADDRESS field of SDP command. First device sends Report3 with security configuration followed by Report4 with bytes read at given address. If count is greater than 64 then multiple reports with report id 4 are sent until entire data requested by host is sent. The STATUS is either 0x12343412 for closed parts and 0x56787856 for open or field return parts.

Report1, Command, Host to Device:

1	Valid values for READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration

ID 4 bytes status

Report4, Response, Device to Host: first response report

4	Register Value

ID 4 bytes of data containing register value. If number of bytes requested is less than 4 then remaining bytes should be ignored by host.

Multiple reports of report id 4 are sent until entire data requested is sent

Report4, Response, Device to Host: Last response report

4	Register Value

ID 64 bytes of data containing register value. If number of bytes requested is less than 64 then remaining bytes should be ignored by host.

8.9.3.1.2 WRITE REGISTER

The transaction for command WRITE_REGISTER consists of the following reports: Report1 for command, Report3 for security configuration and Report4 for write status.

Host sends Report1 with WRITE_REGISTER command. The register to write is specified in ADDRESS field of SDP command of Report1, with FORMAT field set to data type (number of bits to write 8, 16 or 32) and value to write in DATA field of SDP command. Device writes the DATA to register address and returns WRITE_COMPLETE code using Report4 and security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

1	Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status

ID 64 bytes data with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

8.9.3.1.3 WRITE_FILE

The transaction for command WRITE_FILE consists of following reports: Report1 for command-phase, Report2 for data-phase, Report3 for hab mode and Report4 to indicate data received in full.

The size of each Report2 is limited to 1024 bytes (limitation of USB HID protocol) hence multiple Report2 packets will be sent by host in data phase until entire data is transferred to device. Once entire data (DATA_COUNT bytes) is received then device sends report 3 with hab mode and report 4 with 0x88888888, indicating file download completed.

Report1, Host to Device:

1	Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT

ID 16 byte SDP Command

==========Optional Begin==========

Host sends ERROR_STATUS command to query if HAB rejected the address

========== Optional End==========

Report2, Host to Device:

2	File data

ID Max 1024 bytes data per report

Report2, Host to Device:

2	File data

ID Max 1024 bytes data per report

Report3, Device to Host:

3	4 bytes indicating security configuration

ID 4 bytes status

Report4, Response, Device to Host:

4	COMPLETE (0x88888888) status

ID 64 bytes data with first 4 bytes to indicate file download has completed with code 0x88888888. On failure device will report HAB error status.

8.9.3.1.4 ERROR_STATUS

The transaction for SDP command ERROR_STATUS consists of three reports.

Report1 is used by host to send the command; device sends global error status in 4 bytes of Report4 after returning security configuration in Report3. When device receives ERROR_STATUS command it will return global error status that is updated for each command. This command is useful to find out if last command resulted in device error or succeeded.

Report1, Command, Host to Device:

1	ERROR_STATUS COMMAND

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration

ID 4 bytes status

Report4, Response, Device to Host:

4	4 bytes Error status

ID first 4 bytes status in 64 bytes report 4

8.9.3.1.5 DCD WRITE

The SDP command DCD_WRITE is used by host to send multiple register writes in one shot. This command is provided to speed up the process of programming register writes such as to configure external RAM device.

The command goes with Report1 from host with COMMAND TYPE set to DCD_WRITE, ADDRESS which is used for temporary location of DCD data and DATA_COUNT to number of bytes sent in data out phase. In data phase host sends data

for number of registers using Report2. Device completes the transaction with Report3 indicating security configuration and report 4 with WRITE_COMPLETE code 0x12828212.

Report1, Command, Host to Device:

1	DCD_WRITE COMMAND, ADDRESS, DATA_COUNT

ID 16 byte SDP Command

Report2, Data, Host to Device:

2	DCD binary data

ID Max 1024 bytes per report

Report3, Response, Device to Host:

3	4 bytes indicating security configuration

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status

ID 64 bytes report with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

See Device Configuration Data (DCD) for DCD format description.

8.9.3.1.6 SKIP_DCD_HEADER

The SDP command SKIP_DCD_HEADER is used by host to inform device skip the DCD configuration within download image.

Normally, if the download image should be run on DDR, the DCD configuration data should be built-in the image. In case that host has issued DCD_WRITE to push DCD configuration data to device for DDR initialization, the image with DCD information will cause ROM initializes DDR twice and may cause initialization processing hung.

The SKIP_DCD_HEADER command inform device to skip the DCD configuration with the download image, and avoid this issue.

This command should typically be sent after JUMP_ADDRESS. The command is sent by host in command-phase of transaction using Report1, there is no data phase for this command. Device completes the transaction with Report3 indicating security configuration and report 4 with OK_ACK code 0x900DD009.

Report1, Command, Host to Device:

1	SKIP_DCD_HEADER

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration

ID 4 bytes status

Report4, Response, Device to Host:

4	OK_ACK (0x900DD009)

8.9.3.1.7 JUMP ADDRESS

The SDP command JUMP_ADDRESS will be the last command host can send to the device, after this command device will jump to the address specified in the ADDRESS field of SDP command and start executing.

This command should typically follow after WRITE_FILE command. The command is sent by host in command-phase of transaction using Report1, there is no data phase for this command but device send status report3 to complete the transaction. And if HAB authentication fails then it will also send report 4 with HAB error status.

Report1, Command, Host to Device:

1	JUMP_ADDRESS COMMAND, ADDRESS

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration

ID 4 bytes status

This report is sent by device only in case of an error jumping to the given address, device reports error in Report4, Response, Device to Host:

4	4 bytes HAB error status

ID 4 bytes status, 64 bytes report length

8.10 Recovery Devices

The Chip supports recovery devices. If primary boot device fails, boot ROM will try to boot from recovery device using one of ECSPI ports.

For enabling recovery device BOOT_CFG4[6] fuse must be set. Additionally Serial EEPROM fuses must be set as described in Serial ROM through SPI.

8.11 USB Low Power Boot

ROM supports USB Low Power Boot. This feature enables a device with dead or weak battery to power up and boot if the device is connected to a USB upstream port, no matter the upstream port is a USB charger or USB host/hub.

If a USB dedicated charger or host/hub charger are connected, as soon as the device is connected to the upstream port, a stable current (Max.1.5A) can be supplied by charger. If USB host/hub are connected, the maximal 1 00mA current is supplied to the device, the device should be able to power up to boot the image with less than 100mA.

If LPB_BOOT fuses are blown, the Chip will check if there is low power condition via UART3_CTS (as GPIO1_26) pad. If there is low power boot condition USB charger detection will be activated. If there is no USB charger, ROM will initialize USB as device and apply division factors on ARM, DDR, AXI and AHB root clocks based on LPB_BOOT fuses value (see the table below). Polarity of low power boot condition on UART3_CTS (as GPIO1_26) pad is set by BT _LPB_POLARITY fuse (see the figure below).

Table 8-43. USB Low Power Bus Boot Frequencies

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1
0	MMDC_CLK_ROOT = 396 MHz FABRIC_CLK_ROOT = 198 MHz AHB_CLK_ROOT = 132 MHz	MMDC_CLK_ROOT = 307 MHz FABRIC_CLK_ROOT = 153 MHz AHB_CLK_ROOT = 102 MHz

Table continues on the next page...

Table 8-43. USB Low Power Bus Boot Frequencies (continued)

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1
1	MMDC_CLK_ROOT = 396 MHz FABRIC_CLK_ROOT = 198 MHz AHB_CLK_ROOT = 132 MHz	MMDC_CLK_ROOT = 307 MHz FABRIC_CLK_ROOT = 153 MHz AHB_CLK_ROOT = 102 MHz
10	MMDC_CLK_ROOT = 198 MHz FABRIC_CLK_ROOT = 99 MHz AHB_CLK_ROOT = 66 MHz	MMDC_CLK_ROOT = 153 MHz FABRIC_CLK_ROOT = 76 MHz AHB_CLK_ROOT = 51 MHz
11	Reserved	Reserved

Table 8-44. USB Low Power CPU Boot Frequencies

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1
0	ARM_CLK_ROOT = 396 MHz	ARM_CLK_ROOT = 198 MHz
1	ARM_CLK_ROOT = 396 MHz	ARM_CLK_ROOT = 198 MHz
10	ARM_CLK_ROOT = 198 MHz	ARM_CLK_ROOT = 99 MHz
11	Reserved	Reserved

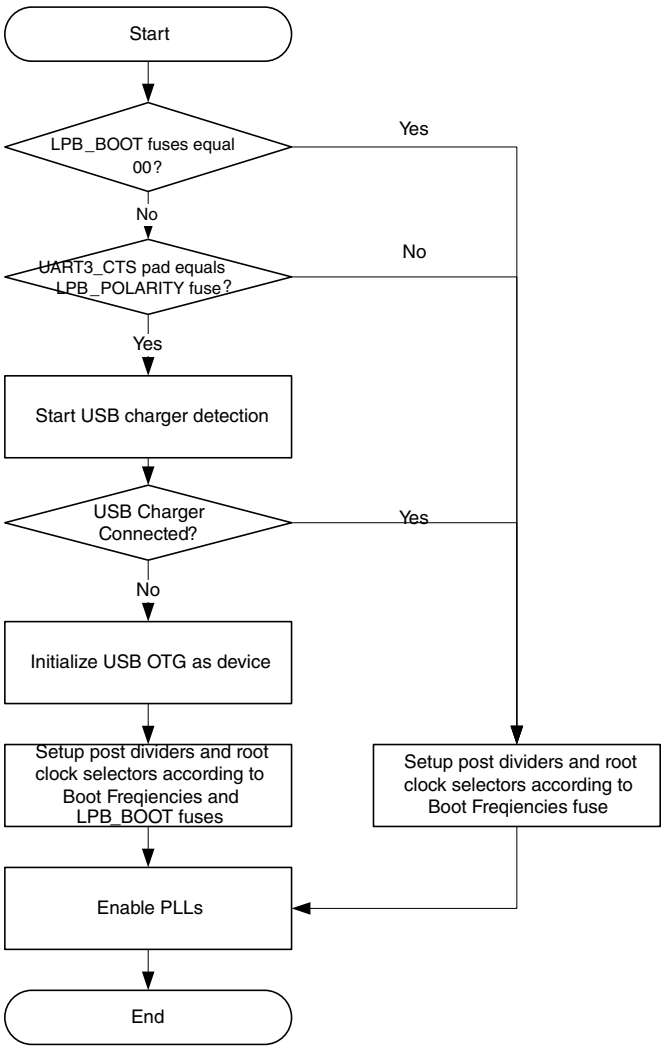

Figure 8-26. USB Low Power Boot Flow

8.12 SD/MMC Manufacture Mode

When internal boot and recover boot (if enabled) failed, SDMMC_MFG_DISABLE fuse bit isn't set, and EEPROM Recovery fuse bit is set, boot will go to SD/MMC manufacture mode before serial download mode. In manufacture mode, one bit bus width is used despite of the fuse setting.

In manufacture mode, SD or MMC card will be scanned on uSDHC1. If card is detected and valid boot image is found in card, then boot image will be loaded then executed. Pad of SD1_CD is used to detect whether card is inserted.

By default, SD/MMC manufacture mode is enabled, blow the fuse of DISABLE_SDMMC_MFG to disable it.

NOTE

Secondary boot is not supported on SD/MMC manufacture mode.

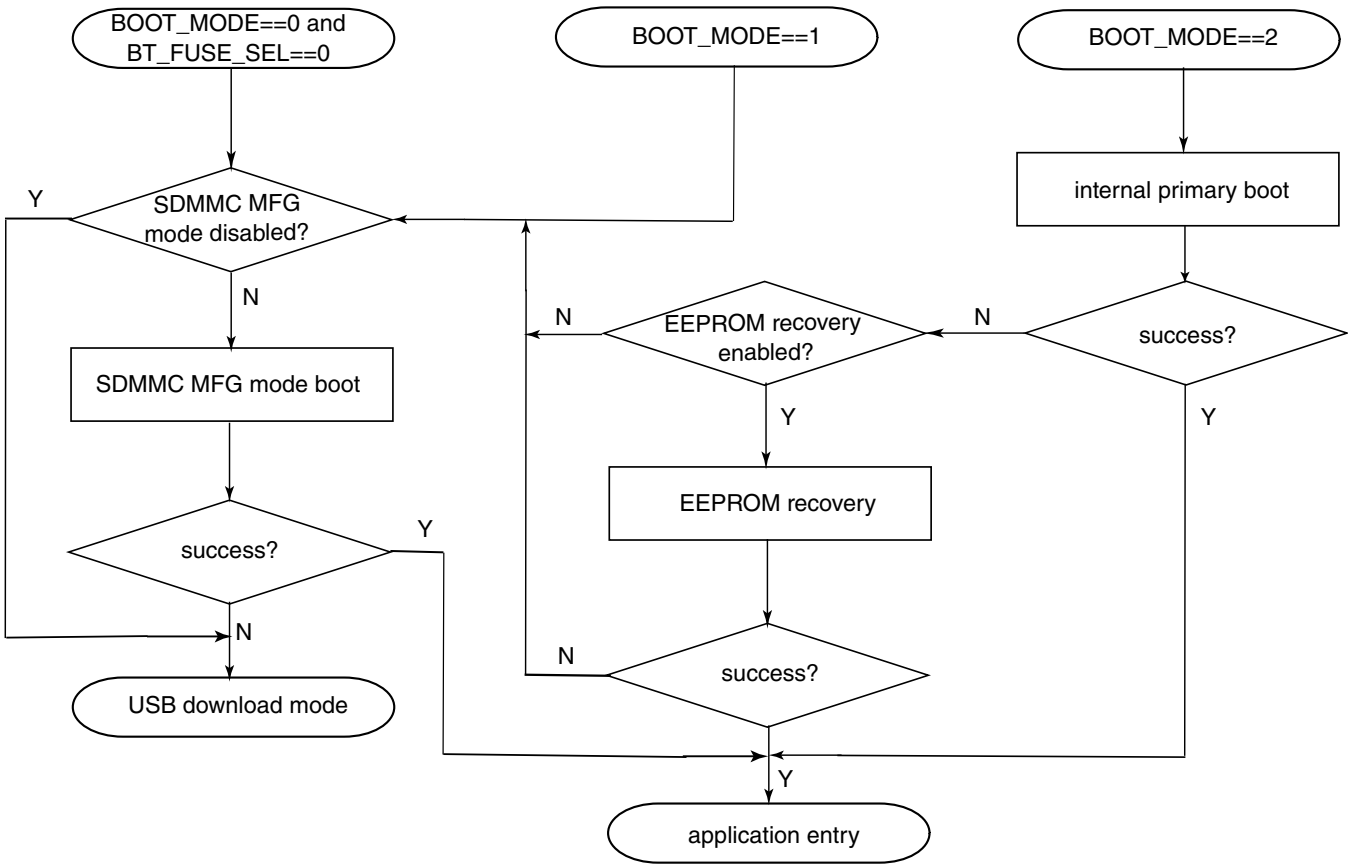

Figure 8-27. SD/MMC Manufacture boot flow

8.13 High Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying areas of code or data in programmable memory to make it behave in an incorrect manner. The HAB also prevents attempts to gain access to features which should not be available.

The integration of the HAB feature with the ROM code ensures that Chip does not enter an operational state if the existing hardware security blocks have detected a condition that may be a security threat or areas of memory deemed to be important have been modified. The HAB uses RSA digital signatures to enforce these policies.

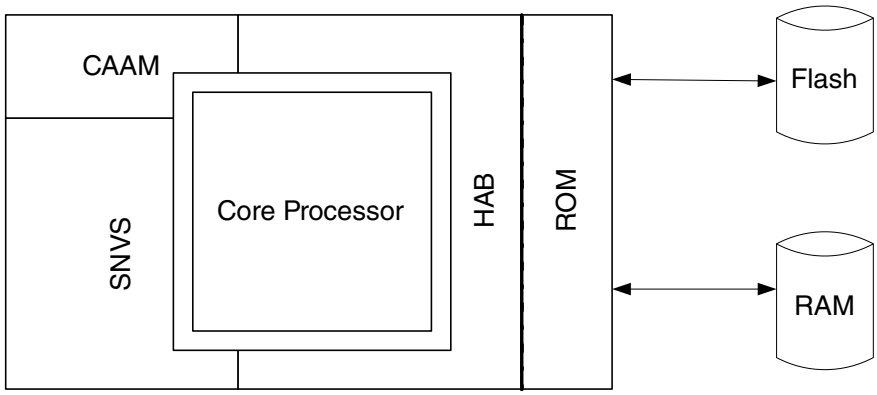

Figure 8-28. Secure Boot Components

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to ensure the system security state is as expected. The HAB also makes use of CAAM hardware block to accelerate SHA-256 message digest operations performed during signature verifications and AES-128 operations for encrypted boot operations. The HAB also includes a software implementation of SHA-256 for cases where a hardware accelerator cannot be used. The RSA key sizes supported are 1024, 2048 and 3072 bits. The RSA signature verification operations are performed by a software implementation contained in the HAB library. The main features supported by HAB are:

- X.509 Public key certificate support
- CMS signature format support
- Proprietary encrypted boot support. Note that encrypted boot depends on the CAAM HW module. When CAAM is disabled (i.e. when the EXPORT_CONTROL fuse is blown) then encrypted boot is not available.

NOTE

Freescale provides a reference Code Signing Tool (CST) for key generation, certificate generation and code signing for use with the HAB library. The CST can be found by searching for "IMX_CST_TOOL" at http://www.freescale.com.

NOTE

For further details on making use of the secure boot feature using HAB contact your local Freescale representative.

8.13.1 HAB API Vector Table Addresses

For devices that perform a secure boot, the HAB library may be called by boot stages that execute after ROM code.

The RVT table contains the pointers to the HAB API functions and is located at 0x00000100.

NOTE

For additional information on secure boot including the HAB API, contact your local Freescale representative.

Chapter 9
Multimedia

9.1 Display and graphics subsystem

The chip display and graphics subsystem consists of the dedicated modules found here.

- LCD Interface (LCDIF): 24-bit parallel RGB LCD interface
- PXP pixel pipeline: pixel/image processing engine for LCD display
- CSI (camera sensor interface): up to 24-bit parallel interface for image sensor

The following figure shows the high-level integration scheme of the chip display and graphics system.

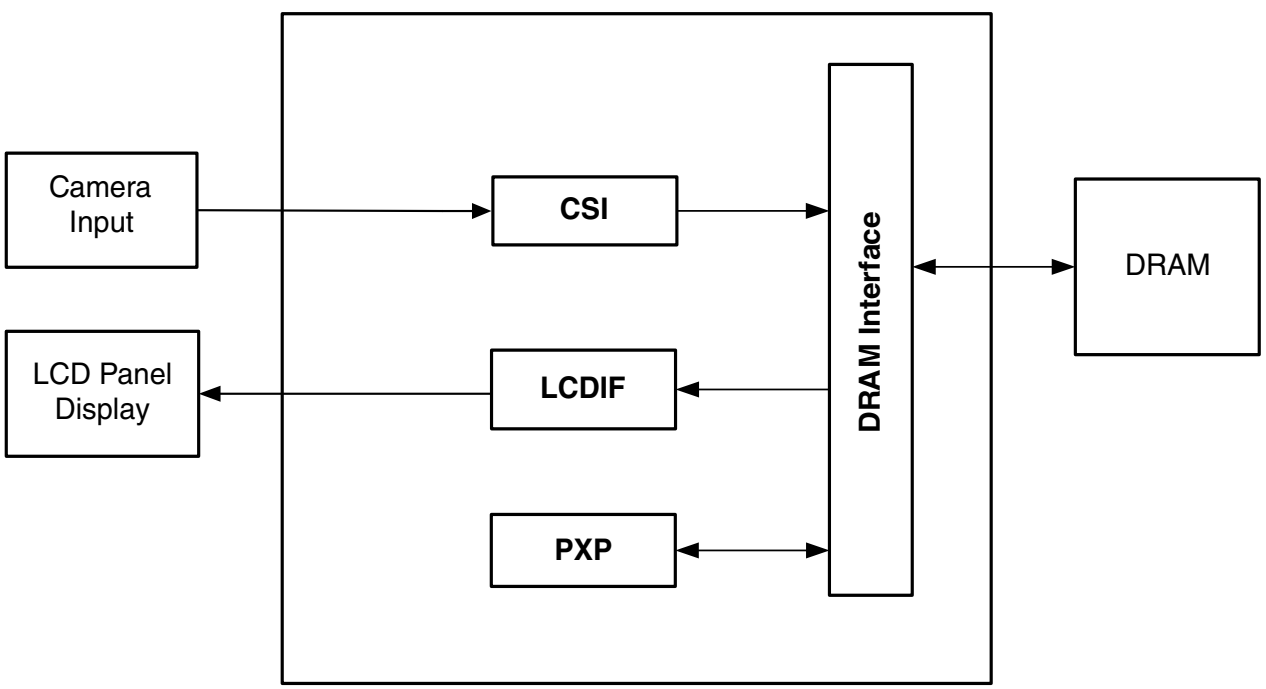

Figure 9-1. Chip display and graphics subsystem

9.1.1 PiXel Processing Pipeline

The pixel processing pipeline is used to perform image processing on image/video buffers before sending to an LCD display.

The main features of PXP include:

- Multiple input/output format support, including YUV/RGB/Grayscale
- Supports both RGB/YUV scaling
- Supports overlay with Alpha blending

9.1.2 LCD Interface

The LCDIF is a general purpose display controller that is used to drive a wide range of display devices. These displays can vary in size and capability. Many of these displays have had an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer. There are other popular displays that support moving pictures and require the RGB interface mode (called DOTCLK interface in this document) or the VSYNC mode for high-speed data transfers. In addition to these displays, it is also common to provide support for digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals. The LCDIF block supports these different interfaces by providing fully programmable functionality.

The block has several major features:

- Bus master interface to source frame buffer data for display refresh and a DMA interface to manage input data transfers from the LCD requiring minimal CPU overhead.
- 8/16/18/24 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation.

9.1.3 Parallel CMOS Sensor Interface

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit data port for YCC, YUV, or RGB data input.
- 8-bit/10-bit/16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit/pixel data format to 64-bit receive FIFO packing.
- 256 × 64 FIFO to store received image pixel data. Receive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support for 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support for double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources:
  - Start of Frame
  - End of Frame
  - Change of Field
  - FIFO full
  - FIFO overrun
  - DMA transfer done
  - CCIR error
  - AHB bus response error
- Configurable master clock frequency output to sensor.
- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).

9.2 Audio subsystem

Audio Subsystem Module Overview provides an overview of each of the audio subsystem component modules, followed by a module-specific section.

9.2.1 Audio Subsystem Module Overview

The following figure shows a high level block diagram of the audio subsystem.

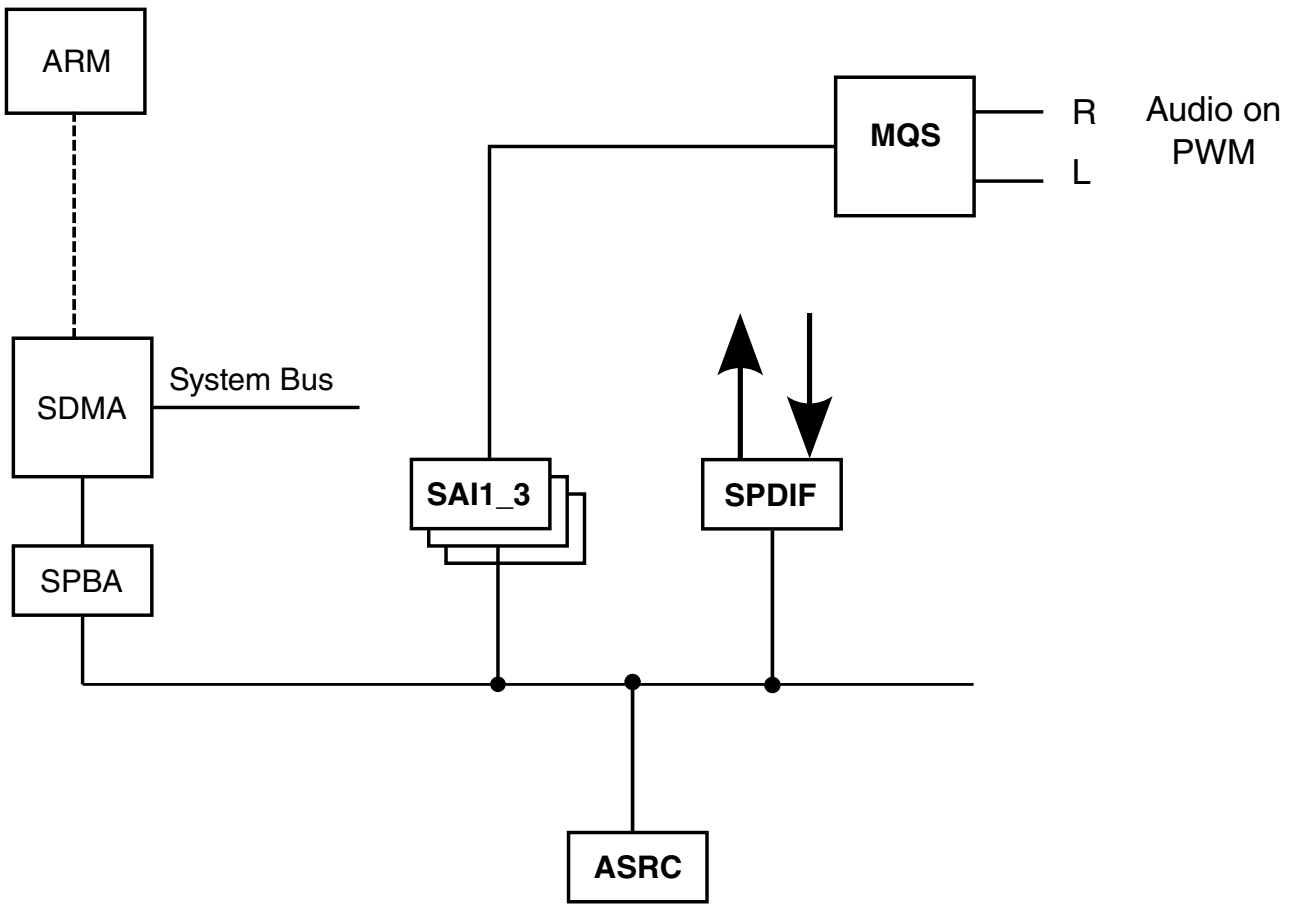

Figure 9-2. Audio subsystem block diagram

The SPDIF (Sony/Philips digital interface) audio module is a stereo transceiver that allows the processor to receive and transmit digital audio over it. The SPDIF receiver section includes a frequency measurement block that allows the precise measurement of an incoming sampling frequency. A recovered clock is provided by the SPDIF receiver section and may be used to drive both internal and external components in the system. SPDIF is connected to the shared peripheral bus.

ASRC (asynchronous sample rate converter) converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. ASRC supports concurrent sample rate conversion of up to 10 channels of over 120dB THD+N.

The sample rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. ASRC supports up to 3 sampling rate pairs. ASRC is connected to the shared peripheral bus.

9.2.2 Medium Quality Sound (MQS)

MQS is used to generate medium quality audio via a standard GPIO in the pinmux. The user can connect stereo speakers or headphones to a power amplifier without an additional DAC chip.

- 2-channel, MSB-valid 16 bit, MSB first
- Frame sync aligned with the left channel data
- 44.1 kHZ or 48 kHZ I2S signals from SAI1
- SNR target as no more than 20 dB for the signals below 10 kHZ
- Signals Over 10 kHZ have worse THD + N values

9.2.3 Synchronous Audio Interface (SAI)

- Transmitter with independent Bit Clock and Frame Sync supporting 1 data line
- Receiver with independent Bit Clock and Frame Sync supporting 1 data line
- Maximum Frame Size of 32 Words
- Word size programmable from 8-bits to 32-bits
- Word size configured separately for first word and remaining words in frame.
- Asynchronous FIFO for each Transmit and Receive data line
- Graceful restart after FIFO Error

9.2.4 Sony/Philips Digital Interface (SPDIF)

The Sony/Philips Digital Interface (SPDIF) module is a stereo that allows the processor transmit digital audio over it using the IEC60958 standard, consumer format. The chip provides one SPDIF transmitter with one output and one SPDIF receiver with four inputs.

The SPDIF allows the handling of both SPDIF channel status (CS) and User (U) data.

For the SPDIF transmitter, the audio data is provided by the processor via the SPDIFTxLeft and SPDIFTxRight registers, and the data is stored in two 16-word-deep FIFOs, one for the right channel, the other for the left channel. The FIFOs support programmable watermark levels so that FIFO Empty service request can be triggered when the combined number of empty data words locations in both FIFOs is 8, 16, 24 or

32 words. It is recommended to program the watermark level to trigger a FIFO Empty service request when 16 word locations are empty. For optimal performance when servicing the FIFO Empty service request, the FIFOs should be written alternately, starting with the left channel FIFO. The Channel Status bits are also provided via the corresponding registers. The SPDIF transmitter generates an SPDIF output bitstream in the biphase mark format (IEC 60958), which consists of audio data, channel status and user bits.

The data handled by the SPDIF module is 24-bit wide. The 24-bit SPDIF data is aligned in the 24 least significant bits of the 32-bit shared peripheral bus data word. The 8 most significant bits of the 32-bit word are ignored by the SPDIF Transmitter when data is being stored in the Transmit FIFOs from the peripheral bus. The 8 most significant bits of the 32-bit word are zeroed by the SPDIF Receiver module when the data is being read from the Receiver FIFOs to the peripheral bus.

Note that 16-bit data is left-aligned in the 24-bit word format of the SPDIF. When 16-bit data is to be transmitted, the 32-bit word to be written to the SPDIF Transmit FIFOs should be created as follows: the 16-bit data should be located in the middle two bytes of the 32-bit data word and the 8 bits of the LSB must be set to zero, while the 8 bits of the MSB will be ignored.

The SPDIF Transmit clock is generated by the SPDIF internal clock generator module and the clock sources are from outside of the SPDIF block. The clock sources should provide a clock that is at least 64 x Fs, where Fs is the sampling frequency. The external clock source should provide at least 128 x Fs. Clocks of higher frequency may be provided as long as the multiplication factor is a power of 2 (for example, 128x, 256x or 512x). Also, clock frequency precision of 100ppm or better should be provided.

Figure 9-3. SPDIF Transceiver Clock Diagram

9.2.5 Asynchronous Sample Rate Converter (ASRC)

The incoming audio data may be received from various sources at different sampling rates. The outgoing audio data may have different sampling rates, and it can also be associated to output clocks that are asynchronous to the input clocks.

ASRC converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The sampling rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. ASRC supports up to 3 sampling rate pairs.

In the real-time audio use case, both input/output sampling rate clocks are activated. Both sampling rate clocks are directly connected to ASRC, and the ratio estimation of the input clocks to output clocks is used to perform the sample rate conversion in ASRC hardware.

The SAI1, SAI2, SAI3, and SPDIF audio modules can act as either a clock master or a clock slave. Multiplexors are provided on a chip level to select which of the module's clock signal, input or output, will be connected to ASRC input in dependence of the module's operational mode as it is shown in Figure 9-4 and Table 9-1. Figure 9-4 presents the multiplexor cell used for all ASRC input clocks. Table 9-1 shows the detailed clocks, multiplexor control and data bits for each ASRC input clock. For the audio blocks clocks that are directly conected to ASRC (without the multiplexor scheme) see Table 9-2.

In the non-real time streaming audio use case, the input sampling rate clock does not need to be provided. Instead the ideal-ratio value conversion is set in the ASRC interface registers. In this case only the output sampling rate clock must be provided, and the fixed ratio of the input to the output in the register is used to perform the sample rate conversion.

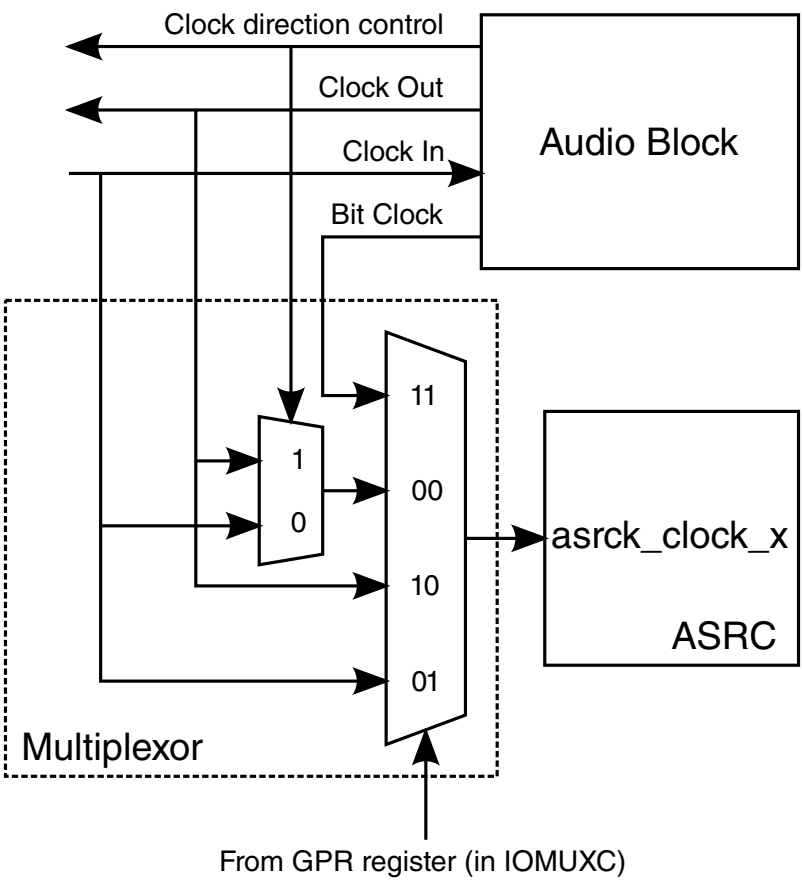

Figure 9-4. Muxing scheme template for ASRC input clocks

Table 9-1. ASRC Muxed Input Clocks

ASRC Clock Input	Audio block source	MUX2:1 Control	MUX2:1 Input 0	MUX2:1 Input 1	MUX4:1 Control	MUX4:1 Input 00	MUX4:1 Input 01	MUX4:1 Input 10	MUX4:1 Input 11

1. Not in used, the clock value is "0".

Chapter 10
Clock and Power Management

10.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The chip targets applications where low power consumption, long battery life, always-on and instant-on capabilities are paramount, and where there is no need for active cooling. To achieve these capabilities, the primary focus of the chip's design is reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the chip architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility.

This chapter contains information about:

- Structural components of the power and clock management systems of the chip
- Power, clock and thermal management techniques supported by the chip

All given numerical values are typical or examples. For accurate values one should refer to the datasheet.

10.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, clocks, and power rails are managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of the clock, power and thermal management system of the chip is presented in the figure below.

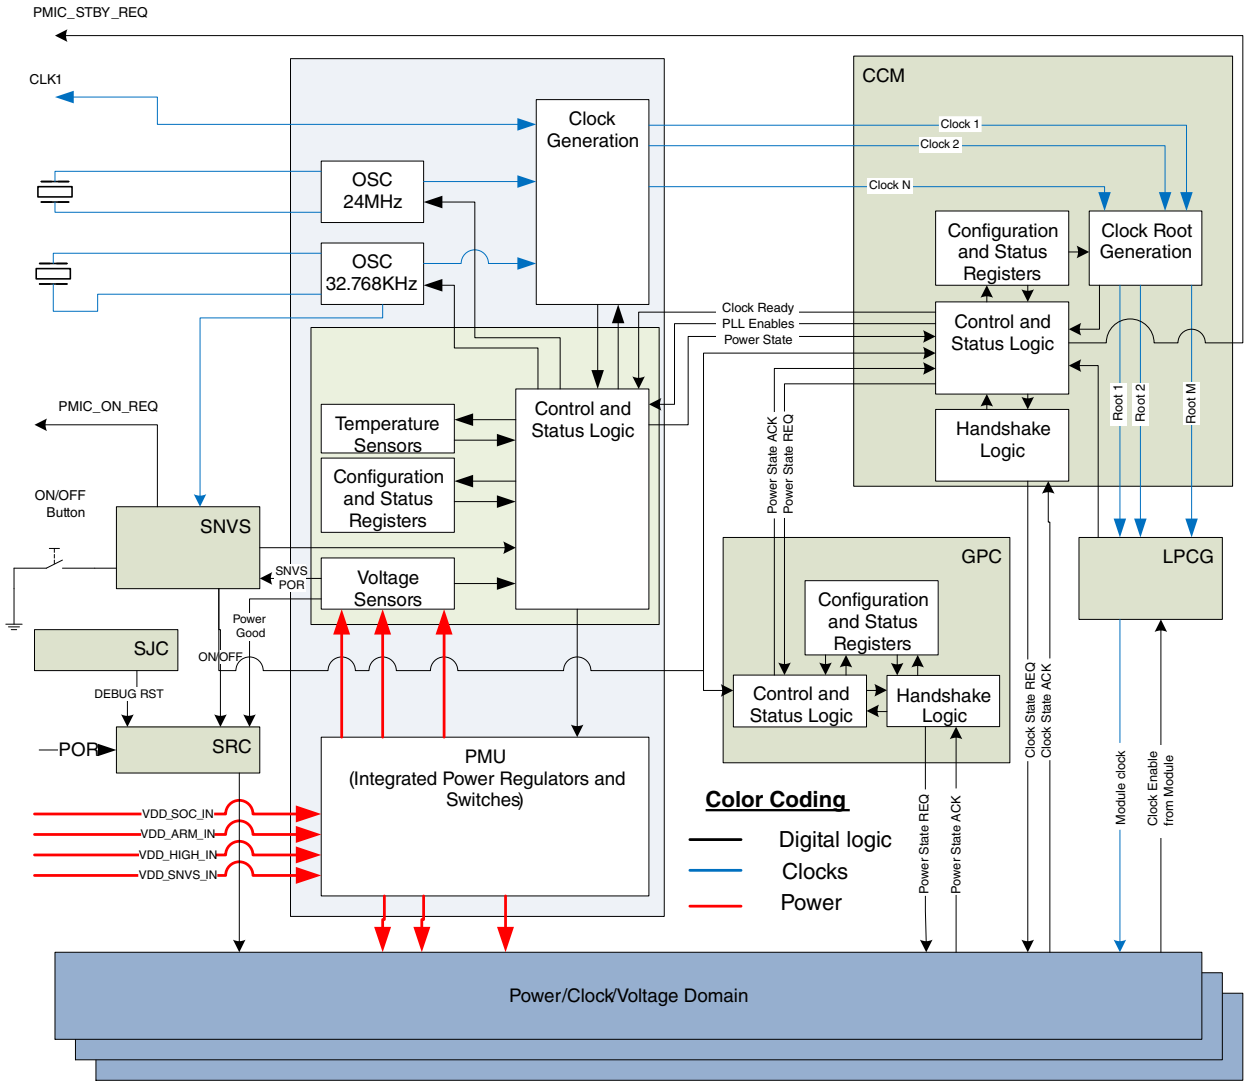

Figure 10-1. Power and clock management framework

10.2.1 Centralized components of clock generation and management

Centralized components of the clock generation and management sub-system are implemented in the following blocks:

- CCM (Clock Control Module): The CCM module provides control for primary (source level) and secondary (root level) clock generation, division, distribution, synchronization, and coarse-level gating. See Clock Controller Module (CCM)) for

information on the CCM architecture, functional description and programming model.
- LPCG (Low Power Clock Gating): This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See Clock Controller Module (CCM) for information on the LPCG architecture and functional description.

10.2.2 Centralized components of power generation, distribution and management

Centralized components of the power generation, distribution and management sub-system are implemented in the following blocks:

- Power Management Unit (PMU). See Power Management Unit (PMU) for information on the PMU architecture, functional description and programming model.
- General Power Controller (GPC). See General Power Controller (GPC) for information on the GPC architecture, functional description and programming model.

10.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented by the System Reset Controller (SRC). See General Power Controller (GPC) for information on the GPC architecture, functional description and programming model.

10.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management framework defines the managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The software component managing shared resources should take

into account the joint constraints of all the modules belonging to that resource domain.

10.3 Clock Management

10.3.1 Centralized components of clock management system

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in the following figure.

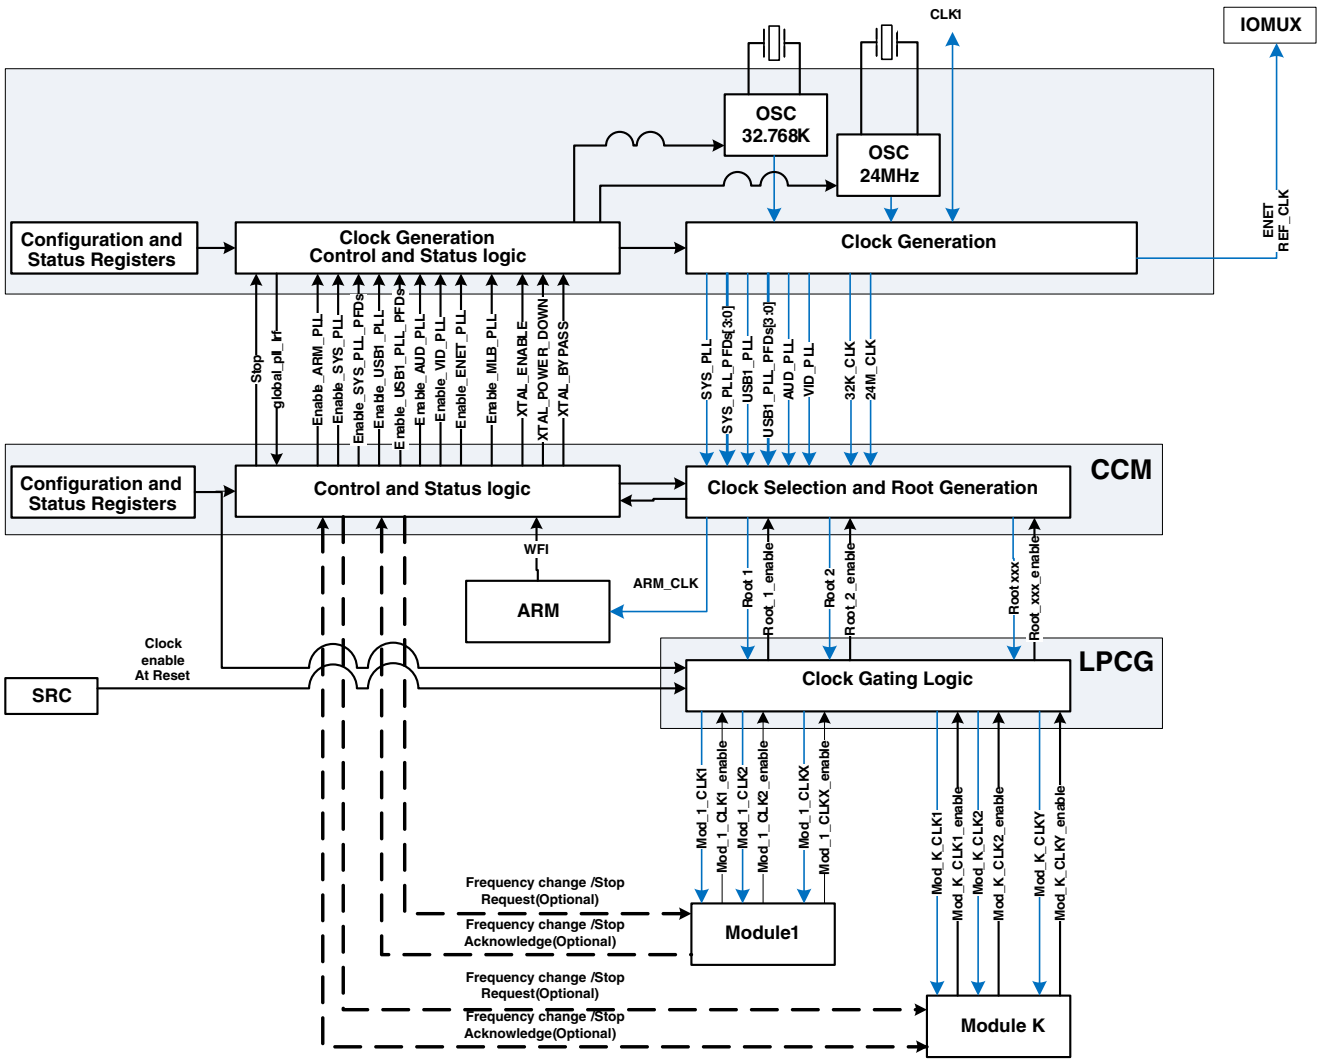

Figure 10-2. Clock Management System

A high level block diagram of the clock generation is shown in the figure below.

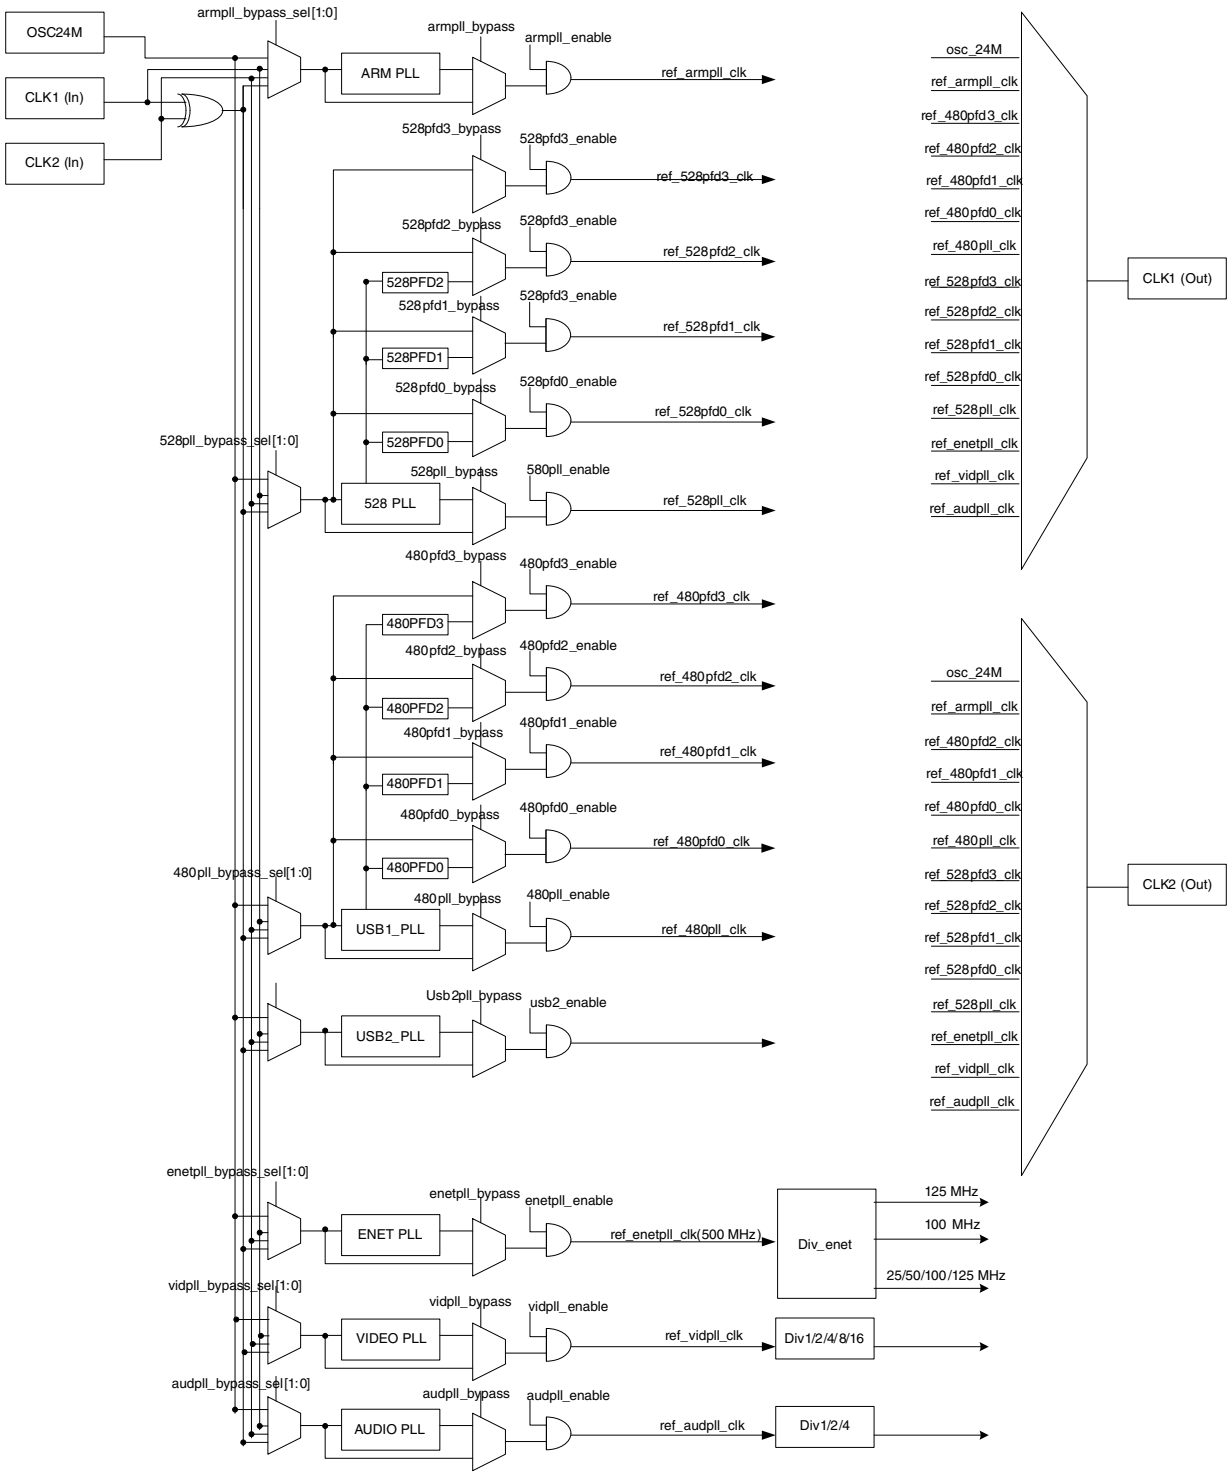

Figure 10-3. Primary Clock Generation

10.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

10.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. See Crystal Oscillator (XTALOSC) for details of the XTALOSC block.

10.3.2.2 Low Voltage Differential Signaling (LVDS) I/O ports

There is one LVDS I/O port used for clock generation. The low jitter differential I/O port is provided to input and output clocks. It can take input clocks from outside of the SoC and provide them to the PLLs or to the other modules, or it can take the outputs of the PLLs and provide them outside of the SoC as a functional or reference clock.

10.3.2.3 PLLs

Seven PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces 18/N x Fvco at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-fly" without going through the output clock disabling/enabling process.

The seven PLLs are listed below:

- PLL1 (also referred to as ARM_PLL) - This is the PLL clocking the ARM core complex. It is a programmable integer frequency multiplier capable of output

frequency of up to 1.3 GHz. Note that this frequency is higher than the maximum chip supported frequency 1.0 GHz.

- PLL2 (also referred tp as System_PLL or 528_PLL) - PLL2 runs at a fixed multiplier of 22, producing 528 MHz output frequency with 24 MHz reference from XTALOSC. Besides the main output, this PLL drives four PFDs (PLL2_PFD0...PLL2_PFD3). The main PLL output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure. Typically, this PLL or its PFDs are a clock source for internal system buses, internal processing logic, DDR interface, NAND/NOR interface modules, etc.
- PLL3 (also referred to as USB1_PLL) - PLL3 is used in conjunction with the first instance of USB PHY (USBPHY1, also known as OTG PHY). This PLL drives four PFDs (PLL3_PFD0...PLL3_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480 MHz with a 24 MHz oscillator. The main PLL output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART and other serial interfaces, audio interfaces, etc.
- PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
- PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or16 from the PLL VCO frequency
- PLL6 (also referred to as ENET_PLL) - This PLL implements a fixed 20+(5/6) multiplier. With a 24 MHz input, it has a VCO frequency of 500 MHz. This PLL is used to generate:
  - 50 or 25 MHz for the external ethernet interface.
  - 125 MHz for reduced gigabit ethernet interface.
  - 100 MHz for general purposes.
- PLL7 (also referred to as USB2_PLL) - This PLL provides clock exclusively to USB2 PHY (USBPHY2, also known as OTG PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480 MHz with a 24 MHz oscillator.

10.3.2.3.1 General PLL Control and Status Functions

Each PLLs configuration and control functions are accessible individually through its PFDs and global configuration and status registers.

Reference input clock for any of the PLLs could be selected individually by the BYPASS_CLK_SRC field of the PLL control register. See CCM Analog Memory Map/ Register Definition for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the BYPASS bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (ENABLE=0), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the ENABLE bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx_CLKGATE bit in CCM_ANALOG_PFD_480n or CCM_ANALOG_PFD_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at www.freescale.com for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

CCM Memory Map/Register Definition and CCM Analog Memory Map/Register Definition contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

10.3.2.4 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the Power modes, namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- ARM core clock - "on the fly" without clock interruption, by either shifting between PLL sources PLL clock change or by changing the divider ratio.
- Graceful changing of the DDR memory controller clock. See MMDC handshake and Self refresh and Frequency change entry/exit for more details.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

NOTE

On-the-fly frequency changing for synchronous interfaces like serial audio interfaces (SAI), Audio Sample Rate Converter (ASRC), or general purpose serial interfaces (UART, CAN) in general causes synchronization loss and should not be done.

10.3.2.5 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from three sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.
- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

10.3.3 Peripheral components of clock management system

10.3.3.1 Interface and functional clock

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).
- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory

clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity.
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

10.3.3.2 Block level clock management

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

10.3.3.2.1 Master clock protocol

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of module supporting master clock protocol USDHC. Please see details in chapters describing these modules and in the CCM enable override register (CCM_CMEOR).

10.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are CAN, EPIT and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Overide Register (CCM_CMEOR). See CCM Memory Map/Register Definition for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

10.3.3.3 Clock Domain(s)

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

10.3.3.4 Domain level clock management

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

10.3.3.5 Domain dependencies

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

10.4 Power management

10.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks.

A high level block diagram of the power management system in the SoC environment is shown in the figure below.

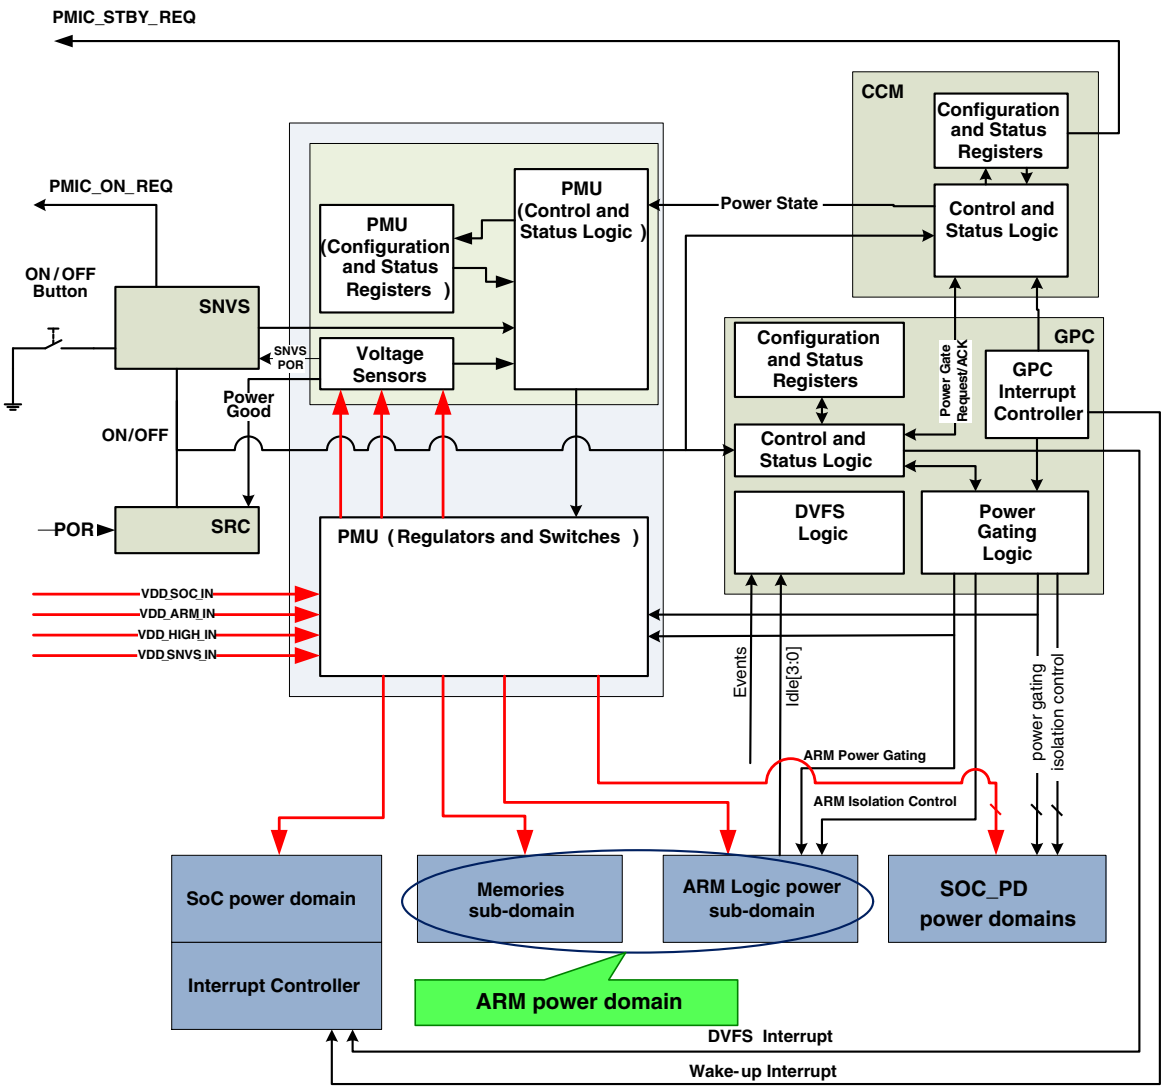

Figure 10-4. Power Management System

10.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

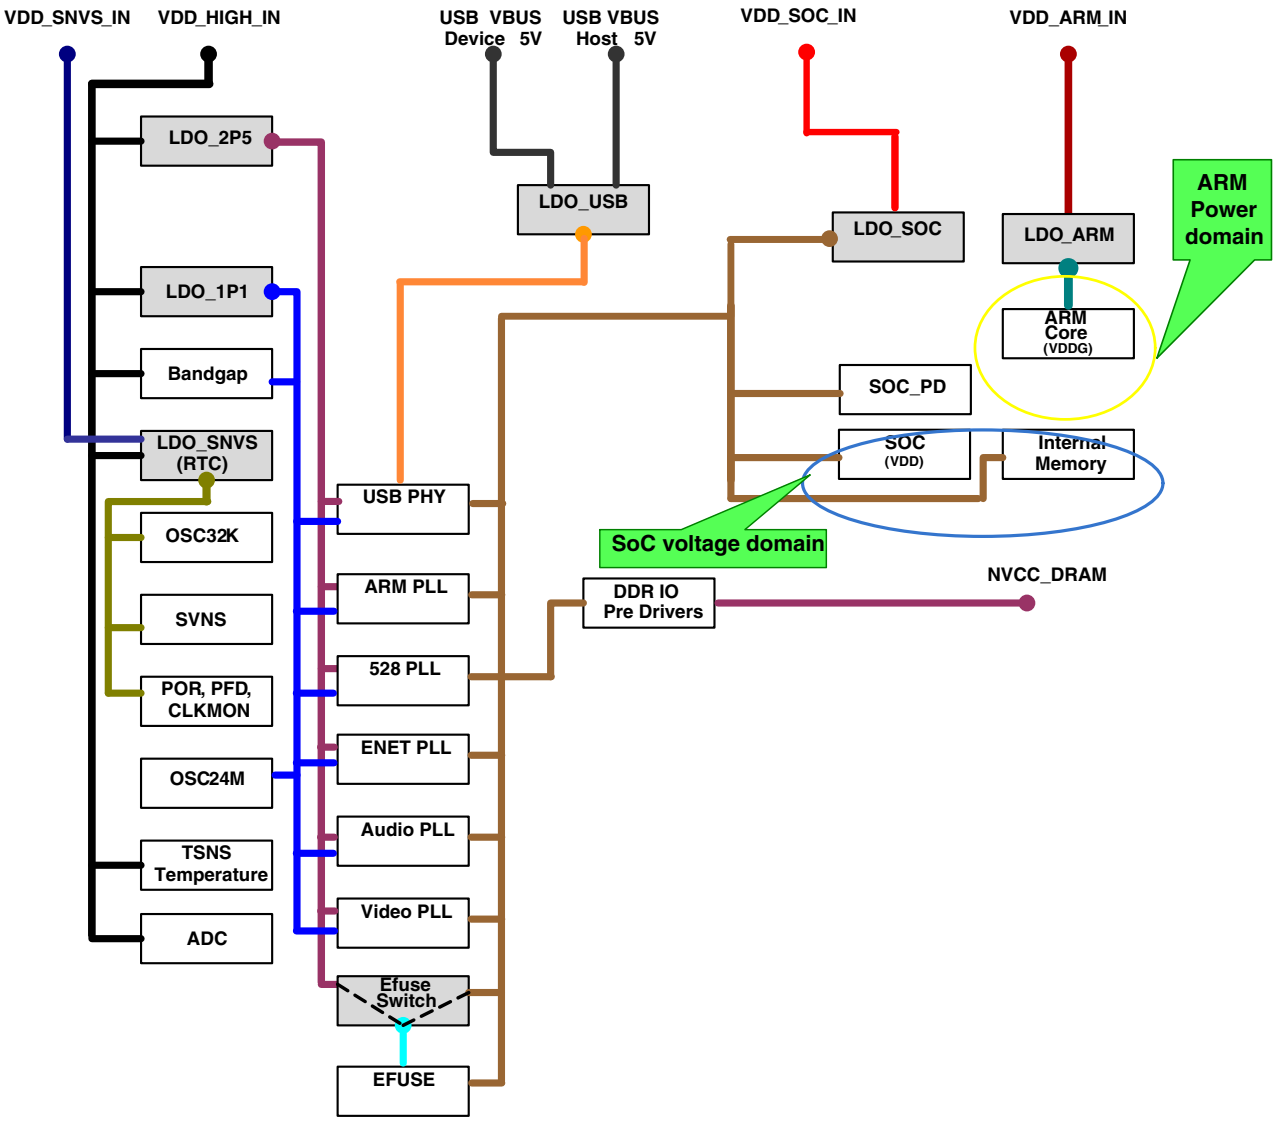

Figure 10-5. i.MX 6UltraLite Power Tree

The integrated PMU includes the following components:

- Two Digital LDO regulators
- Two Analog LDO regulators
- USB LDO
- SNVS regulator

See Power Management Unit (PMU) for further details on integrated PMU functional description and programmability.

10.4.1.1.1 Digital LDO Regulators

The integrated PMU includes three digital LDO regulators: LDO_ARM(VDD_ARM_IN, VDD_ARM_CAP), and LDO_SOC(VDD_SOC_IN, VDD_SOC_CAP). LDO_ARM and LDO_SOC regulators provide power to the ARM core power domain. LDO_SOC provides power to the SOC_PD and SOC power domains(except always-ON SNVS domain).

NOTE

The name "digital" only refers to the type of load. It is not related to the LDO design or feature set.

The digital LDO regulators can operate in the following modes:

- Internal Bypass - The regulation pass device (FET) is switched fully on, passing the external input voltage to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and the FET. Be aware that a period of time (see datasheet) is required to switch from the internal digital bypass mode to the analog regulation mode. Typically it takes less than 100us. Please refer to PMU for further details on bypass and power gate configuration.
- Power Gate - The regulation FET is switched fully off, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage will fall to a level where the residual leakage of the power FET balances with the leakage of the load.
- Analog regulation mode - The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

These digital regulators also feature brownout detection, which is helpful to sense when supplies are starting to collapse. Note that the core will be interrupted on a brownout. Please see details in Miscellaneous Control Register (PMU_MISC2*n*).

For further details of LDO programming and configuration please refer to Digital Regulator Core Register (PMU_REG_CORE).

The power management system is built under assumption that in typical applications the single (and simple) shared power supply will be used for ARM core domain and SoC domain. The combined load gains some efficiency, especially in low power modes and saves BoM significantly.

The DVFS in a typical cost/complexity optimized application is considered by mean of internal LDO. In"full speed" modes LDO bypass is considered in both domains. The dynamic voltage scaling to low load workpoints for ARM domain is implemented by programming associated LDO.

10.4.1.1.2 Analog LDO regulators

There are two analog LDO regulators used for general system purposes:

- LDO_1P1 - The LDO_1P1 (VDD_HIGH_IN, NVCC_PLL) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24 MHz oscillator.
- LDO_2P5 - The LDO_2P5 (VDD_HIGH_IN, VDD_HIGH_CAP) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage. The regular 2.5V LDO is combined with an alternate self-biased low-precision weak regulator which can be enabled for applications that need to keep the 2.5V output voltage alive during low power modes, where the main regulator and its associated global bandgap reference module are disabled to save power. The output of this weak-regulator is not programmable and is a function of its input power supply as well as its load current. Typically with a 3V input power supply, the weak-regulator output is 2.525V and its output impedance is approximately 40Ohm. Special procedure is recommended to move load back and forth between the main and low power regulators. This regulator supplies most of the analog circuitry of the integrated PHYs, special I/Os (DDR I/O), and other analog and mix signal components integrated into the SoC.

10.4.1.1.3 USB LDO

The USB_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

10.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS_IN supply and generates the SNVS_CAP supply, which in turn powers the real time clock and low power section of the SNVS blocks. If VDDHIGH_IN is present, then the SNVS_IN supply is internally shorted to the VDDHIGH_IN supply to allow coin cell recharging if necessary.

10.4.1.2 GPC - General Power Controller

The GPC block provides hardware assistance to Dynamic Voltage Frequency Scaling (DVFS) and power gating, and includes the sub-blocks listed here.

- DVFS load tracking block - This block allows hardware tracking on the core load and generates an interrupt when a frequency change is requested. It does not generate any request for voltage and/or frequency changes made by a hardware signal. The frequency/voltage changing process requires interaction with the CCM block, as well as either the integrated PMU modules or the external programmable regulator. This process should be completed by either the CPU interrupt routine or a DMA transaction.
- Power Gating Controller (PGC) - This sub-block of GPC has the following functions:
  - Provides the user with the ability to switch off power to a target subsystem.
  - Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.
  - Provides programmable registers that adjust the timing of the power control signals.
  - Controls the CPU power domain and SOC_PD power domain.
- Wake-up interrupt controller - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals. Additional features are as follows:
  - Supports up to 128 interrupts
  - Provides an option to mask/unmask each interrupt
  - Detects interrupts and generates the wake up signal

See General Power Controller (GPC) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

10.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR, WARM, and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See System Reset Controller (SRC) for further details on SRC functional description and programmability.

10.4.1.4 Power domain(s)

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

Figure below shows the power domain interface in the system

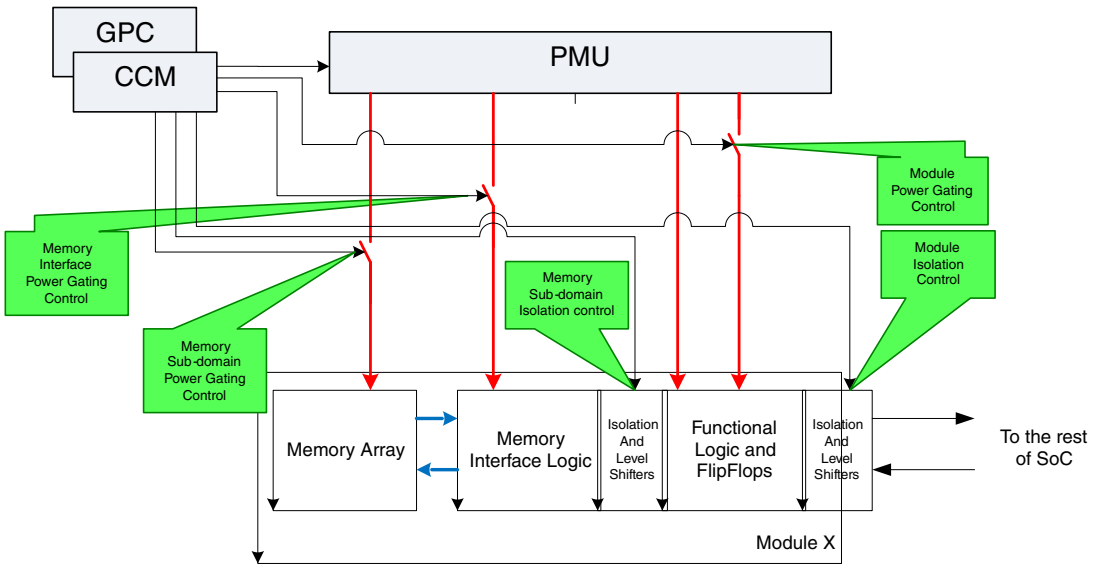

Figure 10-6. Power domain interface in system

10.4.1.4.1 Power distribution

The power distribution tree is comprised of multiple power domains. The main power domains are:

- ARM - The ARM domain contains the ARM Core platform (except for memory arrays and interface logic). This domain can be supplied either from an integrated power supply or from an external controllable regulator, preferably high efficiency DCDC converter.
- ARM Memory array - Memory arrays are connected to a separate and dedicated power domain (separated from the Main logic and ARM domain). In normal operation mode (functional, non-DVFS mode), the memory arrays domain voltage level should be kept equal to (same as) the rest of the core logic domains (Main, ARM). Please refer to the Datasheet for further information about voltage level difference between domains allowed in different power modes.
- SOC_PD domain -- The SOC_PD domain contains MMDC, APBHDMA, CSI, ENET, LCDIF, PXP, RawNAND, SDMA, uSDHC and USB. It is supplied by external regulator.
- SNVS/RTC low power domain - The SRTC domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply.
- Analog domain - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal

regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.
- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC. It is supplied by an internal regulator.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- Cortex-A7 Core Platform - DVFS and power gating.
- ARM Cortex-A7 memories - Power gating only.
- SOC_PD - Power gating only.

See table below for details of the system power domains layout and dependencies.

10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating

The following is the list of relevant memories and logic domains with the description of their state-retention support:

- Cortex-A7 Core Platform is sub-divided into three sub-domains listed below:
- Cortex-A7 Core Platform logic: The software state retention for all logic is implemented in this domain. That means that the content of relevant registers should be be stored in some memory retaining its state (L2 cache for example) while the logic domain is power-gated. Details on how to implement the software retention can be found in the Cortex-A7 Core Platform TRM.
- Cortex-A7 Core L1 memories - No retention. The L1 memories have a dedicated supply on the package (VDD_CACHE_CAP) which should be connected to the Cortex-A7 Core Platform supply. The L1 cache should be flushed prior to power gating in order to allow powering up of the CPU at the same state as before power gating.
- Cortex-A7 Core L2 memories - hardware state-retention since its supplies are driven by the SoC supplies. When Cortex-A7 core is power gated, L2 Cache can be either leaved on with its content retained or power gated together with the core.

- SOC_PD: This module can be powered gated (together) independently of Cortex-A7 power gating. SOC_PD is not allowed power down when Cortex-A7 is on. SOC_PD will be powered on automatically together with Cortex-A7.
- SoC - hardware state-retention in Standby mode.
- SNVS_LP - hardware state-retention even when SoC supplies are removed.

10.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

10.4.1.4.3.1 Cortex-A7 Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in PGC Memory Map/Register Definition as follows to power-down the core on the next "WFI" instruction:
   - Configure the GPC/PGC PGC_CPU_PDNSCR Register ISO and ISO2SW bits. These bits determine the delay between the power-down request to enabling the platform isolation and the platform isolation to the actual power-off switch to the supplies accordingly.
   - Configure the GPC/PGC PGC_CPU_PUPSCR Register SW and SW2ISO bits. These bits determine the delay between the power-up request to the actual power-up of the supplies and the last to the platform isolation disabling.
   - Configure the GPC PGC PGC_CPU_CTRL PCR bit to allow the power down of the platform
   - Cortex-A7 Core Platform should execute a "WFI" instruction.

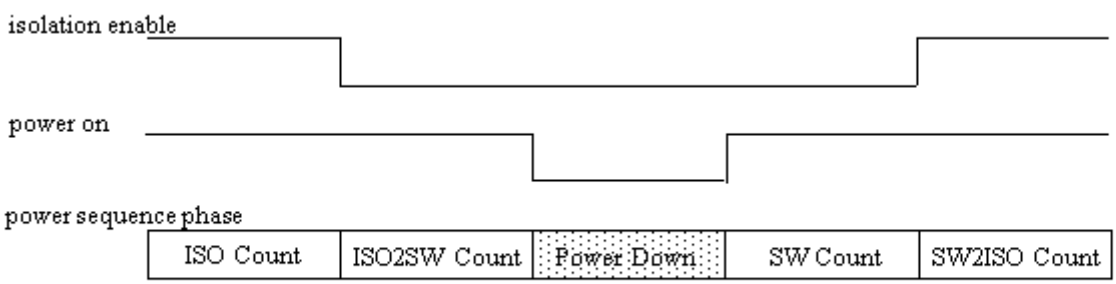

Figure 10-7. Cortex-A7 Core Platform isolation and power on switch flow

10.4.1.4.3.2 SOC_PD

1. Configure the CCM CGR bits (CCM Memory Map/Register Definition) to disable the SOC_PD clocks.
2. Configure the GPC/PGC Registers (GPC Memory Map/Register Definition) as follows to power-down isolate the SOC_PD logic from the rest of the SoC logic:

Configure the GPC/PGC PDNSCR Register ISO bits. These bits determine the delay between the power-down request to enabling the LDO domain isolation.

Configure the GPC/PGC PUPSCR Register SW2ISO bits. These bits determine the power-up request to the LDO domain isolation disabling.

Configure the GPC/PGC CTRL[PCR] bit to allow the power down of the block.

Configure the GPC/PGC GPC_CNTR to power down SOC_PD

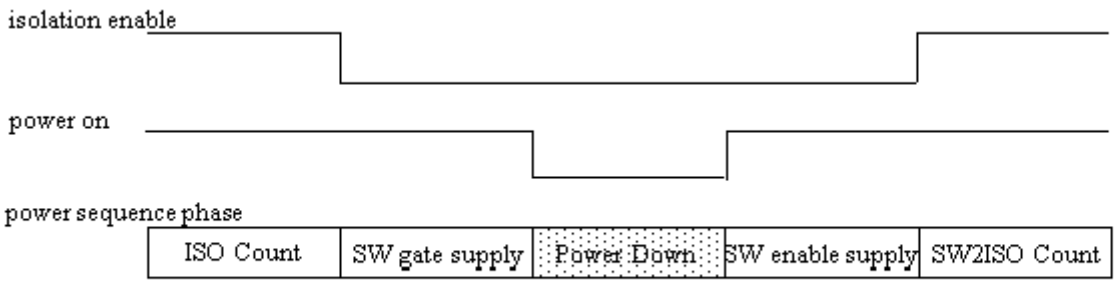

Figure 10-8. SOC_PD isolation and power on switch flow

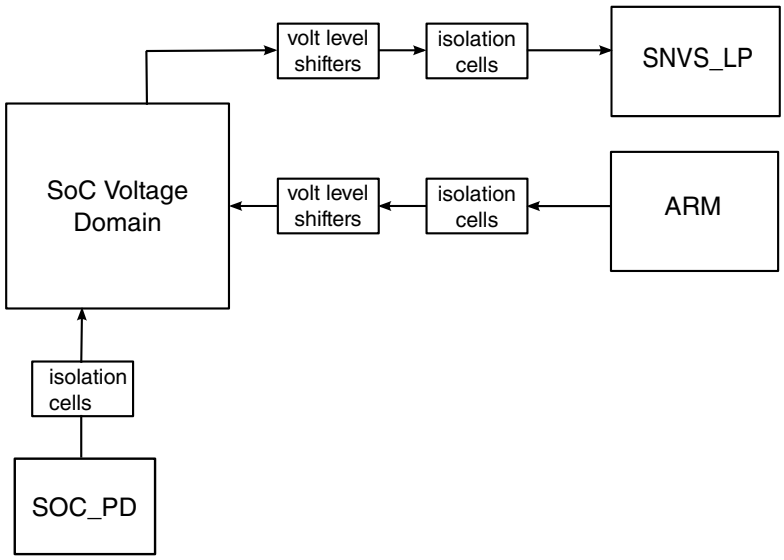
10.4.1.4.3.3 SoC



For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM_CCR[COSC_EN] (CCM Memory Map/Register Definition). This can be done only in case there is no dependency on 24 MHz XTAL for wake-up.
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS_LP is powered through an "always on" supply, configuring the SNVS_LP DP_EN to "1" allows changing the PMIC_ON_REQ pad (SoC on/off supply indication to the PMIC) through the ONOFF pad.

10.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- Cortex-A7 Core Platform and SOC_PD - Isolation needs to be enabled before power-down. This is taken care of automatically once CCM and PGC are configured and the Cortex-A7 Core Platform executes the "WFI" instruction.
- SNVS_LP - Different from the 2 cases above the SNVS_LP isolation isolates the signals coming from the SoC to the SNVS_LP. This is required for saving the contents of the SNVS_LP. (such as the real-time clock) The isolation is activated in 2 ways:
- Automatically through the power-fail detector in the PMU
- Through software configuration

Note: The arrows refer to the signal directions for the voltage level shifters and isolation cells

Figure 10-9. Isolation cells and Voltage level shifters placing

10.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- ARM - Cortex-A7 Core Platform including L1 and L2 cache - Scalable voltage in both dynamic and static scenarios
- SoC Domains - Scalable voltage only in static scenarios
- ANALOG components including PLLs - Fixed voltage
- I/O - Fixed voltage
- SNVS_LP - Fixed voltage

10.4.1.6 Voltage domain management

10.4.1.6.1 Dynamic

10.4.1.6.1.1 DVFS

Dynamic Voltage and Frequency Scaling (DVFS) is a well-known technique to reduce power consumption in mobile devices. In order to improve power saving efficiency, DVFS is applied on the ARM core voltage domain.

In this scenario the Dynamic Voltage and Frequency Scaling (DVFS) block is used. More details can be found in DVFS-CORE (DVFS). The DVFS block can monitor separately the IDLE indication of each of the Cortex-A7 Cores. The DVFS performs the following:

- Simple, non-overlapping averaging providing a level-based average index of the tracked CPU load
- Sums the CPU load and the load detected from additional load indicators weighted according to software configurations
- Calculates an exponential moving average of the tracked load
- Provides up, down and "panic" threshold comparators and counters for generating interrupts to the Cortex-A7 Core Platform
- Frequency pattern generator is able to manage the frequency update requests periodically

The DVFS interrupts are then forwarded to the Cortex-A7 Core Platform. The Cortex-A7 Core Platform reacts according to the DVFS interrupt types. The following are 2 examples for handling different DVFS interrupt types:

- Upper threshold is reached, meaning that the Core is heavily loaded and the core frequency needs to be increased according to the following flow:
  - Configure PMU to raise the core voltage
  - Wait until the voltage is stable
  - Configure CCM to raise the frequency.
- Lower threshold is reached, meaning that the Core is "IDLE" most of the time and the core frequency can be decreased according to the following flow:
  - Configure CCM to reduce the frequency.
  - Configure PMU to lower the core voltage.

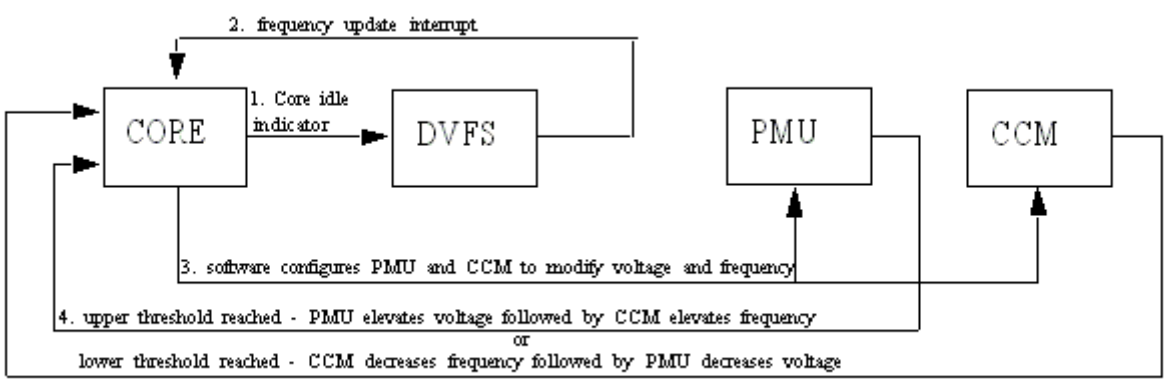


Figure 10-10. High Level DVFS working flow

NOTE

PMU cannot be used to change the voltage in case the LDO is bypassed.

10.4.1.6.1.2 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the ARM, SoC and LDOs voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

10.4.1.6.2 Static

10.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM_CCR), CCM Low Power Control Register (CCM_CLPCR) and PMU Miscellaneous Register 0 (PMU_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage:

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM_CCR[RBC_EN] bits to bypass and disable PMU regulators in the next ARM "WFI" execution.
- Configure CCM_CCR[REG_BYP_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.
- Cortex-A7 Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode

10.4.1.6.2.2 ANALOG PHYs IPs -

Details on how to put the IPs in low power mode can be found in each of the IP documentation. Further reduction can be achieved by settings the ENABLE_WEAK_LINREG in the PMU PMU_REG_2P5 register.

10.4.1.6.3 Voltage domain dependencies

When applying voltage changes for power saving the following voltage domain limitations should be taken into account:

- In dynamic scenario's the ARM supply should not be higher than the SoC supply by more the 50mV.

The above limitationsare also mentioned in datasheet.

10.4.1.6.4 IO voltage

10.4.1.7 System domains layout

The following table describes the different power modes.

Table 10-1. Low Power Mode Definition (LDO Enabled Mode)

	System IDLE	Low Power IDLE	SUSPEND
CCM LPM Mode	WAIT	WAIT	STOP
ARM Core	Low Voltage	Power Down	Power Down
L1 Cache	ON	Power Down	Power Down
L2 Cache	ON	ON	Power Down
SOC	Nominal Voltage	Nominal Voltage	Standby Voltage
SOC_PD	ON	ON	ON/Power Down
PLL	ON/Power Down	Power Down	Power Down
XTAL	ON	OFF	OFF
RC OSC	OFF	ON	OFF
DRAM	Self_Refresh[1]	Self-Refresh[2]	Self-Refresh[2]
DRAM IO Low Power	No	Yes	Yes
LDO ARM	ON	Power Gate	Power Gate
LDO SOC	ON	ON	Digital Bypass
LDO2P5	ON	OFF	OFF
LDO1P1	ON	OFF	OFF
WEAK2P5	OFF	ON	OFF
WEAK1P1	OFF	ON	OFF
Bandgap	ON	ON	OFF
Low Power Bandgap	ON	ON	OFF
MMDC Clock	24 MHz	OFF	OFF
AHB clock	24 MHz	3 MHz	OFF
IPG clock	12 MHz	1.5 MHz	OFF
PER clock	24 MHz	1 MHz	OFF
Module clocks	ON as needed	ON as needed	OFF

Table continues on the next page...

Table 10-1. Low Power Mode Definition (LDO Enabled Mode) (continued)

	System IDLE	Low Power IDLE	SUSPEND
GPIO wakeup	yes	Yes	Yes
RTC wakeup	Yes	Yes	Yes
USB remote wakeup	Yes	Yes[3]	Yes[3]
Other wakeup source	Yes	Yes[4]	No

1. Automatic enter self-refresh when there is no DRAM access;
2. Put into self-refresh mode by SW before entering low power mode;
3. Need SOC_PD power on to support USB remote wakeup;
4. When a module is inside SOC_PD domain, need SOC_PD power on to support wakeup from it.

Table 10-2. Low Power Mode Definition (LDO Bypass Mode)

	System IDLE	Low Power IDLE	SUSPEND
CCM LPM Mode	WAIT	WAIT	STOP
ARM Core	Low Voltage	Power Down	Power Down
L1 Cache	ON	Power Down	Power Down
L2 Cache	ON	ON	Power Down
SOC	Nominal Voltage	Nominal Voltage	Standby Voltage
SOC_PD	ON	ON	ON/Power Down
PLL	ON/Power Down	Power Down	Power Down
XTAL	ON	OFF	OFF
RC OSC	OFF	ON	OFF
DRAM	Self_Refresh[1]	Self-Refresh[2]	Self-Refresh[2]
DRAM IO Low Power	No	Yes	Yes
LDO ARM	Digital Bypass	Power Gate	Power Gate
LDO SOC	Digital Bypass	Digital Bypass	Digital Bypass
LDO2P5	ON	OFF	OFF
LDO1P1	ON	OFF	OFF
WEAK2P5	OFF	ON	OFF
WEAK1P1	OFF	ON	OFF
Bandgap	ON	OFF	OFF
Low Power Bandgap	OFF	ON	OFF
MMDC Clock	24 MHz	OFF	OFF
AHB clock	24 MHz	3 MHz	OFF
IPG clock	12 MHz	1.5 MHz	OFF
PER clock	24 MHz	1 MHz	OFF
Module clocks	ON as needed	ON as needed	OFF
GPIO wakeup	Yes	Yes	Yes
RTC wakeup	Yes	Yes	Yes
USB remote wakeup	Yes	Yes[3]	Yes[3]
Other wakeup source	Yes	Yes[4]	No

1. Automatic enter self-refresh when there is no DRAM access;

2. Put into self-refresh mode by SW before entering low power mode;
3. Need SOC_PD power on to support USB remote wakeup;
4. When a module is inside SOC_PD domain, need SOC_PD power on to support wakeup from it.

There is a single hardware signal coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is implemented is controlled by the PMU_MISC0[STOP_MODE_CONFIG] bit (See PMU Memory Map/Register Definition). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop_mode signal. Blocks not described in the section below are unaffected by stop_mode.

If the stop_mode_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop_mode_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

Table 10-3. STOP mode configuration

Block	STOP_MODE_CONFIG=0	STOP_MODE_CONFIG=1
reg1p1	off	on
reg2p5	off	on
reg3p0	off/on depending on vbus. Uses crude local reference if vbus is present	off/on depending on vbus . Uses analog central bandgap if VBUS is present.
reg_core	bypassed if not power gated.	bypassed if not power gated
reg_soc	bypassed	bypassed
bandgap	off	functional
temp_sensor	off	off
well_bias	hardware controlled	hardware controlled
All PLLs	off	off
OSC24M	off	Controlled by CCM configuration

10.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses

- Memory retention and state retention capability (Software State Retention for ARM A7) for preserving memory contents and device state in low-power modes
- Dynamic Voltage and Frequency Scaling (DVFS) support for the ARM A7 processor cluster
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

10.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

Table 10-4. Power saving design/architecture and power saving techniques

Techniques	Active SoC Power	Standby SoC Power	System Power
Temperature Monitoring, and active frequency throttling	√		
Cortex-A7 Core Platform DVFS	√		
Cortex-A7 Core Platform SRPG (Software)		√	
Cortex-A7 Core Platform Power Gating		√	
Clock gating (automatic dynamic and forced)	√		
Integrated PMU (IR drop, efficiency, accuracy)	√		√
C4 package (IR drop, thermal)	√		
Display Backlight optimization (SW)			√
Architecture: L2 cache	√		
Architecture: USB integration			√
Low Power DDR: LPDDR2, LV-DDR3			√

10.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the ARM domain as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See Temperature Monitor (TEMPMON) for further details on temperature monitor functions and programmability options.

10.4.2.3 Peripheral Power management

10.4.2.3.1 Main memory power management

Main system memory, DDR3, and LPDDR2 are some of the most power-hungry system components, but the SoC provides several options to manage DDR power.

Automated power saving modes are supported by the MMDC hardware. This feature allows the DDR memory to automatically enter self-refresh mode when there are no DDR accesses for a configurable time. The default setting is 1024 clock cycles which can be optimized based on the customer use case and application.

See Power Saving and Clock Frequency Change modes for further details on MMDC power saving features and programmability options.

Software may support DDR frequency scaling. Automated frequency changing procedure is supported by MMDC and CCM modules.

NOTE

DDR frequency changes cost extra time and power. Slowing requestors while keeping DDR at full speed may increase total system power. Software may also implement Cooperative Dynamic Frequency Scaling in order to keep the system balanced, (that is, keep the system in balance when DDR throughput is equal or slightly higher than total amount of requests generated by all requestors).

Reducing the DDR frequency while in DLL-ON mode may be not efficient because:

- Reduction in DDR frequency will cause bus duty cycle to increase and thus reduces chance of automatic MMDC power saving (place memory into SR).
- Total amount of read/write operation does not change (power is per-operation).
- The termination is active longer, though, lowering frequency below 396 MHz may enable lowering drive strengths and termination.

When possible at lower performance use cases, software may switch DDR3 to DLL-off mode. This allows it to greatly reduce DDR3 frequency and thus disable or reduce termination and drive strength, which significantly reduces the power consumption of the DDR3 interface.

A good strategy for many types of workloads is to combine most activity in bursts (natively possible, for example, for typical multimedia applications, communication, etc.) and run this segment at maximal speed, then switch to DLL-OFF mode to support background activity (communication, display refresh, housekeeping).

The DRAM Interface power dissipation depends on many variables, however, proper termination and drive strength is key for power and thermal performance. Memory and controllers provide a host of programmable options for the drive strength of the output buffers and for the on-die termination impedance.

The ideal settings for drive strength and ODT also depend on the clock frequency to ensure that inter-symbol interference (ISI) effects are not introduced.

DDR PHY power is proportional to the amount and type of bus activity.

In cases where the DDR is placed into self-refresh, software can configure DDR I/O to be floated or lowered to the minimum drive allowed by JEDEC.

Modifying the DDR drive strength must be done by code that is executing from a memory region other than DDR (for example, IRAM). No access to DDR (including page table walks, cache misses, alternate bus master accesses, etc.) is allowed while the DDR I/O pads are being re-configured.

10.4.2.3.2 Video-Graphics system power management

10.4.2.3.3 IO power reduction

SW configures IO to low power modes:

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs
- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)
- Set DDR type IO to CMOS mode if possible

10.4.3 Examples of External Power Supply Interface

This section presents the example of external power supply interfacing to the chip.

The scenario based on integrated PMU system is presented below. This scenario minimizes BoM and board design complexity.

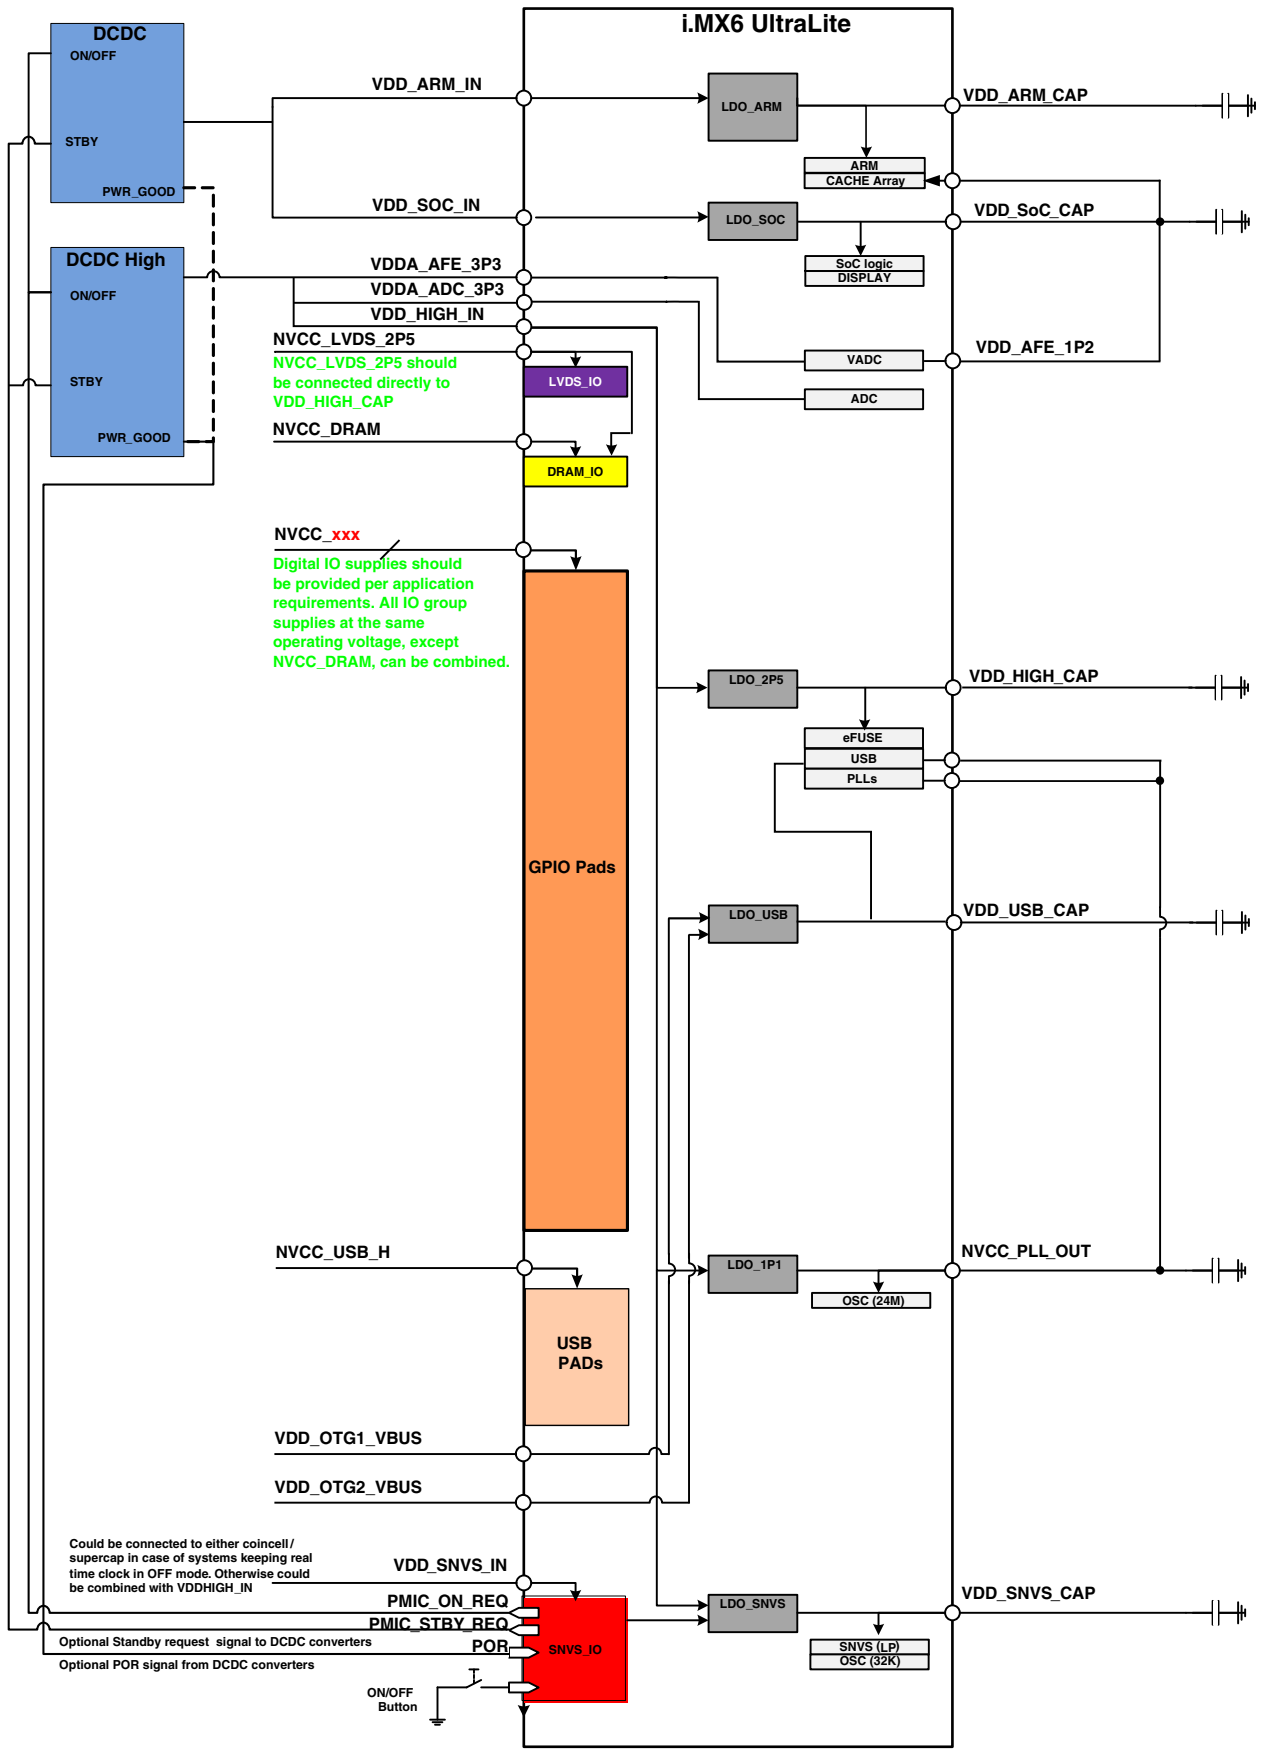

Figure 10-11. Supplying i.MX 6UltraLite power using integrated PMU

10.5 ONOFF (Button)

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The ONOFF logic inside of SNVS_LP allows for connecting directly to a PMIC or other voltage regulator device. The logic takes a button input signal and then outputs a pmic_en_b and set_pwr_off_irq signal. PMIC logic also supports the SNVS_LP tamper logic which will allow waking the system up when a tamper event has happened while in the OFF state. The logic has two different modes of operation (Dumb and Smart mode).

The Dumb PMIC Mode uses pmic_en_b to issue a level signal for on and off. Dumb pmic mode has many different configuration options which include (debounce, off to on time, and max time out).

- Debounce: The debounce configuration supports 0 msec, 50 msec, 100 msec and 500 msec. The debounce is used to generate the set_pwr_off_irq interrupt. While in the ON state and the button is pressed longer than the debounce time the set_pwr_off_irq is generated.
- Off to On Time: The Off to On configuration supports 0 msec, 50 msec, 100 msec, and 500 msec. This configuration supports the time it takes to request power on after the configured button press time has been reached. Once the button is pressed longer than the configuration time, the state machine will transition from the OFF to the ON state.
- Max Timeout: The max timeout configuration supports 5 secs, 10 secs, 15 secs and disable. This configuration supports the time it takes to request power down after the button has been pressed for the defined time.

The Dumb PMIC mode uses a 2 state state machine, as shown below. The output of the pmic_en_b is generated by the state of the state machine.

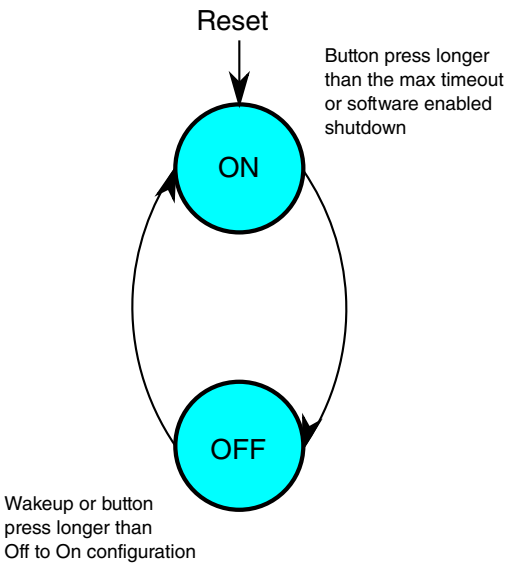

Figure 10-12. Dumb PMIC Mode State Machine

The Smart PMIC mode is meant to connect to another PMIC. The pmic_en_b signal issues a pulse instead of a level signal. The only configuration option available for this mode is the Debounce configuration that is used for the set_pwr_off_irq.

Chapter 11
System Security

11.1 Overview

Security is a common requirement for platforms built using the chip, although the specific needs vary greatly depending on the platform and market. The type and cost of assets to be protected on a portable consumer device are very different from those to be protected on automotive or industrial platforms, and the same applies to the kind of attacks and level of resources threatening those assets. The platform designer must select an appropriate set of counter measures to meet the relevant platform security needs.

For the platform designer to meet the requirements for each market, the chip incorporates a range of security features which can be used individually or in concert to underpin the platform security architecture. Most of the chip security features provide protection against particular kinds of attack and can be configured at various levels according to the required degree of protection. These features are designed to work together and can be integrated with appropriate software to create defensive layers. In addition to protection features, the chip includes a general purpose accelerator to enhance the performance of selected industry standard cryptographic algorithms.

The following is an introduction to the chip security components.

- High Assurance Boot (HAB) feature in the System Boot up to RSA-4096 signature verification
- Secure Non Volatile Storage (SNVS)
- TrustZone (TZ) Architecture in the ARM Cortex A7 Platform, TrustZone aware Interrupt Controller (GIC) and TrustZone Watchdog Timer (WDOG-2)
- TrustZone Address Space Controller (TZC-380) - providing security address region control functions on DDR memory space.
- On-chip RAM (OCRAM) with TrustZone protection using OCRAM controller.
- 64 Kbyte of on-chip Secure RAM
- On chip OTP (OCOTP) with on-chip electrical fuses
- Central Security Unit (CSU)

- Secure JTAG Controller (SJC)
- Locked mode in the Smart Direct Memory Access (SDMA) controller
- DryICE (real-time monitors for frequency, temperature and voltage)
- 10 tamper pins with 5 active tamper detection sources support
- Hardware Cryptographic Accelerators
  - Symmetric: AES-128, AES-192, AES-256, DES, 3DES, and ARC4
  - Hash Message Digest and HMAC: SHA-1, SHA-224, SHA-256, SHA-384, SHA-512, and MD-5
  - Public Key RSA (up to 4096 bit) and ECC (up to 1023 bit)
- DPA protection for 3DES engine
- True and Pseudo Random Number Generator
- Bus Encryption Engine (BEE)

11.2 Central Security Unit (CSU)

11.2.1 CSU Overview

The CSU manages the system security policy for peripheral access on the SoC. The CSU allows trusted code to set individual security access privilges on each of the peripherals, using one of eight security access privilege levels. Also, according to programmed policy, the CSU may assign bus master security privileges during bus transactions.

11.2.2 CSU Features

The Central Security Unit (CSU) sets access control policies between bus masters and bus slaves, allowing peripherals to be separated into distinct security domains. This protects against unauthorized access to data e.g. when software programs a DMA bus master to access addresses that the software itself is prohibited from accessing directly. Configuring DMA bus master privileges in the CSU consistent with software privileges defends against such attempted accesses.

CSU has the following security related features:

- Peripheral access policy - Appropriate bus master privileges and identity are required to access each peripheral.
- Masters privilege policy - CSU overrides bus master privilege signals, i.e. user/supervisor secure/non-secure, according to access control policy.

11.2.3 CSU Functional Description

The CSU enables secure software to set bus privilege security policy within the platform.

Security policies may be set, and optionally locked in the CSU registers. These privilege values may originate in the command sequence file (CSF) which is processed by the High Assurance Boot (HAB) itself or by an HAB authenticated image which executes after the initial boot ROM phase.

11.2.3.1 CSU Peripheral Access Policy

According to its programmed policy, the CSU determines the bus master privileges and the masters that are allowed to access each of the slave peripherals.

There are four security modes of operation (i.e. bus privileges) in the system distinguished by security (TrustZone/non-TrustZone) and privilege (Supervisor/User) setting of the module. Below is the list of these security modes from the highest security level to the lowest:

- TrustZone (Secure) Privilege (Supervisor) Mode - Highest Security Level
- TrustZone (Secure) non-Privilege (User) Mode - Medium Security Level
- non-TrustZone (Regular) Privilege (Supervisor) Mode - Medium Security Level
- non-TrustZone (Regular) non-Privilege (User) Mode - Lowest Security Level

This functionality is implemented as follows:

The Configure Slave Level (CSL) Register value for a specified peripheral resource defines the output signal -- csu_sec_level for that peripheral. The value of this signal determines by what master privileges a peripheral is accessible. The relationship between the value of the csu_sec_level signal and security operation mode is shown in the table below. The CSL registers reside in the CSU module. Details, describing CSL register fields and how they are programmed to control access privileges for specific peripherals, can be found in the Security Reference Manual.

Table 11-1. Permission Access Table

CSU_SEC_LEVEL[2:0]	Non-Secure User Mode	Non-Secure Spvr Mode	Secure (TZ) User Mode	Secure (TZ) Spvr Mode	CSL register value
(0) 000	RD+WR	RD+WR	RD+WR	RD+WR	8'b1111_1111
(1) 001	None	RD+WR	RD+WR	RD+WR	8'b1011_1011
(2) 010	RD	RD	RD+WR	RD+WR	8'b0011_1111
(3) 011	None	RD	RD+WR	RD+WR	8'b0011_1011

Table continues on the next page...

Table 11-1. Permission Access Table (continued)

CSU_SEC_LEVEL[2:0]	Non-Secure User Mode	Non-Secure Spvr Mode	Secure (TZ) User Mode	Secure (TZ) Spvr Mode	CSL register value
(4) 100	None	None	RD+WR	RD+WR	8'b0011_0011
(5) 101	None	None	None	RD+WR	8'b0010_0010
(6) 110	None	None	RD	RD	8'b0000_0011
(7) 111	None	None	None	None	Any other value

11.3 Cryptographic Acceleration and Assurance Module (CAAM)

11.3.1 CAAM Overview

CAAM is a cryptographic acceleration device that accelerates block encryption algorithms, stream cipher algorithms, hashing algorithms, and random number generation. It has an integral DMA engine that allows CAAM to fetch its command programs, read input data and write the resulting output.

CAAM works with the SNVS to provide platform assurance features, including support for High Assurance Boot, detection of and response to potential tamper events, and shortterm and long-term protection of secret data such as public keypairs, Digital Rights Management keys and proprietary software.

CAAM provides the following features:

- Cryptographic acceleration of hashing, encryption and decryption
- Offloading of cryptographic functions via programmable command descriptor language
- Two independent queues for commands and results
- Register Bus Interface used for configuration, control and status
- DMA, including scatter/gather support for data
- Automatic short-term encryption/decryption of cryptographic keys
- Long-term protection of secret data via device-specific encryption keys
- Secure Memory for access-controlled protection of critical data, and automatic zeroization in the case of tampering
- Random Number Generation using a true random number generator and a NISTcompliant pseudo random number generator

11.4 Secure Non-Volatile Storage (SNVS)

11.4.1 SNVS Overview

SNVS is a hardware device that includes a security state machine and security violation detection circuits that, together with High Assurance Boot software, determine whether the chip is currently in a secure state.

When the security state machine indicates a secure state, the SNVS allows use of special cryptographic keys to decrypt long-term secrets such as public/private keypairs, Digital Rights Management keys and proprietary software. When the SNVS detects a potential security violation, such as a tamper alert, the SNVS sends an interrupt to alert the Operating System of the event. The SNVS also includes a general purpose real-time counter.

The SNVS includes the following features:

- Security State Machine driven by High Assurance Boot software and tamper detection circuits
- Master Key Control that protects the integrity and secrecy of the Master Key (OTPMK) stored in fuses
- Tamper detection circuits that detect JTAG events, power glitches, Master Key ECC check failure, and software-reported and hardware-reported security violations
- 256-bit Zeroizable Master Key that can be automatically erased in the event of a security breach
- Tamper-protected Secure Realtime Counter that continues running when the chip is powered off
- Non-volatile Monotonic Counter used to protect against “roll-back” attacks
- Non-volatile General Purpose Register can be used to store a 32-bit value across power cycles
- Non-Secure Real Time Counter with programmable alarm and periodic interrupt
- Controls the access to the OTP master secret key used by CAAM to protect confidential data in off-chip storage
- Smart button input in the SNVS_LP logic of the SoC.
- Pulse mode output signal to request power state changes to a ‘Smart’ external PMIC.

11.4.2 Tamper Detection

There are 2 types of tamper detection's supported, external and internal. The internal tamper detection supports voltage, temperature and clock monitors. Voltage Monitor, monitors the Out of Range Battery Voltage. The allowed battery voltage is from 2.5V (low-trip point) to 3.5V (high-trip point). hysteresis is 100mV for each trip-point. Temperature Monitor has the temp low trip-point spec at -30°C and high trip-point spec at 115°C. Hysteresis is 5°C for each trip-point.

External Tamper Detection is a special mechanism provided through a chip pin to signal when the device encounters unauthorized opening or tampering. Inside the chip, the received signal is compared with the desired signal level, once unequal, tamper event is found. When the desired signal is fixed, it is a passive tamper; when the desired signal level is also toggling with time, it is an active tamper. The chip supports at most 10 passive tamper detection pins, or 5 active tamper pairs alternatively. The use of each active tamper pair will reduce the available number of passive tamper pins at most by 2.

An always-ON power supply (coincell battery) should be present in the system. If the tamper detection feature is enabled by software then opening of the tamper contact:

- Switches system power ON with a Tamper Detection alarm interrupt asserted (for software reaction)
- Activate security related hardware (e.g. automatic and immediate erasure of the Zeroizable Master Key and deny access and erase secure memory contents)

11.5 High Assurance Boot (HAB)

HAB, which is the high assurance boot feature in the system boot ROM, detects and prevents execution of unauthorized software (malware) during the boot sequence.

When unauthorized software is permitted to gain control of the boot sequence, it can be exploited for a variety of goals, such as exposing stored secrets; circumventing access controls to sensitive data, services, or networks; or repurposing the platform. Unauthorized software can enter the platform during upgrades or reprovisioning, or when booting from USB connections or removable devices.

HAB protects against unauthorized software by:

- Using digital signatures to recognize authentic software. This allows the user to boot the device to a known initial state, running software signed by the device manufacturer.

11.6 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the ARM processor and the system bus. This allows program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution. System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary scan) testing.

SJC provides the following security levels:

- JTAG Disabled-JTAG use is permanently blocked.
- No-Debug-All security sensitive JTAG features are permanently blocked.
- Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- JTAG Enabled-JTAG use is unrestricted.

Security levels are selected via e-fuse configuration.

11.7 Bus Encryption Engine (BEE)

The BEE is implemented as an on-the-fly encryption or decryption engine. The main features are following:

- Standard AXI interconnection
- On-the-fly AES-128 encryption/decryption, supporting ECB and CTR mode
- Aliased memory space support and address remapping for up to two individual regions
- Bus access pattern optimization with the aid of local store and forward buffer
- Non-secured access filtering based on security label of the access
- Illegal acess check and filtering

Chapter 12
ARM Cortex A7 Platform (CA7)

12.1 Overview

The Cortex-A7 MPCore platform is a high-performance, low-power processor compliant with the ARMv7-A architecture. The Cortex-A7 MPCore platform has a single ARM®Cortex®-A7 core with a L1 cache subsystem and integrated Generic Interrupt Controller (GIC).

Each Cortex-A7 MPCore includes the following:

- 32 KB L1 Instruction Cache
- 32 KB L1 Data Cache
- Media Processing Engine (MPE) with NEON technology supporting the Advanced Single Instruction Multiple Data version 2 (SIMDv2) architecture
- Floating Point Unit (FPU) with support of the VFPv4-D32 architecture

NOTE

This is a superset of VFPv4-D16

- Support of ARMv7A architecture including:
  - Security extensions for enhanced security
  - Virtualization extensions
  - Large Physical Address (LPA) extension (LPA only supported within Cortex-A7 MPCore platform)

The Cortex-A7 MPCore platform includes the following:

- Integrated Global Interrupt Controller (GIC) configured to support 128 shared peripheral interrupts
- Generic timer
- Snoop control unit (SCU)
- 128 KB unified L2 cache
- Interconnect using a single 128-bit wide bus AMBA AXI bus
- ARMv7.1 ARM debug architecture that complies with the Coresight debug/trace architecture

12.2 External Signals

The following table describes the external signals of ARM:

12.3 Clocks

This section will discuss the Cortex-A7 clocks. For the specification of the maximum Cortex-A7 core frequency, please see the product datasheet. The following table describes the clock sources for ARM. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 12-1. ARM Clocks

Clock name	Clock Root	Description
clk_ahb	ahb_clk_root	AHB Clock
clk_apb_dbg	ahb_clk_root	APB Debug Clock
clk_atb	ahb_clk_root	ATB Clock
ipg_clk	ipg_clk_root	Peripheral Clock
trace_clk_in	ahb_clk_root	Trace Clock

Bus Clocks: The AXI master port of the Cortex-A7 MPCore platform is designed to run at half the speed (1:2 ratio) of the Cortex-A7 core.

Debug Clocks: The APB debug interface is designed to run at half the speed (1:2 ratio) of the Cortex-A7 core.

12.4 Platform Configuration

The revision and configuration of components the Cortex-A7 MPCore platform are detailed below.

Table 12-2. Component Revision

Component	Revision
Cortex-A7 MPCore	MP020-BU-50000-r0p5-00rel0 MP020-BU-50000-r0p5-50rel0
ETM-A7	TM956-BU-50000-r0p0-00rel0

Table 12-3. Cortex-A7 MPCore Global Configuration

Option	Selected Value	Comments
Instruction cache size	32 KB	L1 instruction cache size per core
Data cache size	32 KB	L1 data cache size per core
L2 cache controller	Present	Integrated L2 cache controller
L2 data RAM cycle latency	2 cycles	
Shared Peripheral Interrupts	128	128 shared peripheral interrupts
Number of processors	1	Single Cortex-A7 MPCore
Integrated GIC	True	GIC included

Table 12-4. Cortex-A7 Core-Level Configuration

Option	Selected Value	Comments
NEON and/or FPU	FPU and NEON	FPU and NEON are both included in each processor

12.5 Low-Power and Performance

This section will discuss the low-power and performance features of the Cortex-A7 Core Platform.

The Cortex-A7 MPCore includes the following low-power features:

- Power-efficient processing provided by Cortex-A7 CPU
- 40nm LP process technology
- Flexible power domain partitioning with separate domains for the following blocks:
  - CPU and respective L1 caches
  - SCU and L2 cache controller
  - L2 cache memory
  - Debug including ETM
- Power-efficient timer events using combination of local generic timers and the global system counter
- DVFS to support overdrive and non-overdrive modes of operation

Chapter 13
Analog-to-Digital Converter (ADC)

13.1 Overview

The analog-to-digital converter (ADC) is a successive approximation ADC designed for operation within an integrated microcontroller system-on-chip.

13.1.1 Features

The features of the ADC are as follows:

- Configuration registers
  - 32-bit, word aligned, byte enabled registers. (byte and halfword access is not supported)
- Linear successive approximation algorithm with up to 12-bit resolution with 10/11 bit accuracy.
- Up to 10 ENOB (dedicated single ended channels)
- Up to 1MS/s sampling rate
- Up to 16 single-ended external analog inputs
- Single or continuous conversion (automatic return to idle after single conversion)
- Output Modes: (in right-justified unsigned format)
  - 12-bit
  - 10-bit
  - 8-bit
- Configurable sample time and conversion speed/power
- Conversion complete and hardware average complete flag and interrupt
- Input clock selectable from up to four sources
- Asynchronous clock source for lower noise operation with option to output the clock
- Selectable asynchronous hardware conversion trigger with hardware channel select
- Selectable voltage reference, internal, external, or alternate
- Automatic compare with interrupt for less-than, greater-than or equal-to, within range, or out-of-range, programmable value

- Operation in low power modes for lower noise operation
- Hardware average function
- Self-calibration mode

13.1.2 ADC I/F block diagram

Below is a diagram of the ADC I/F block.

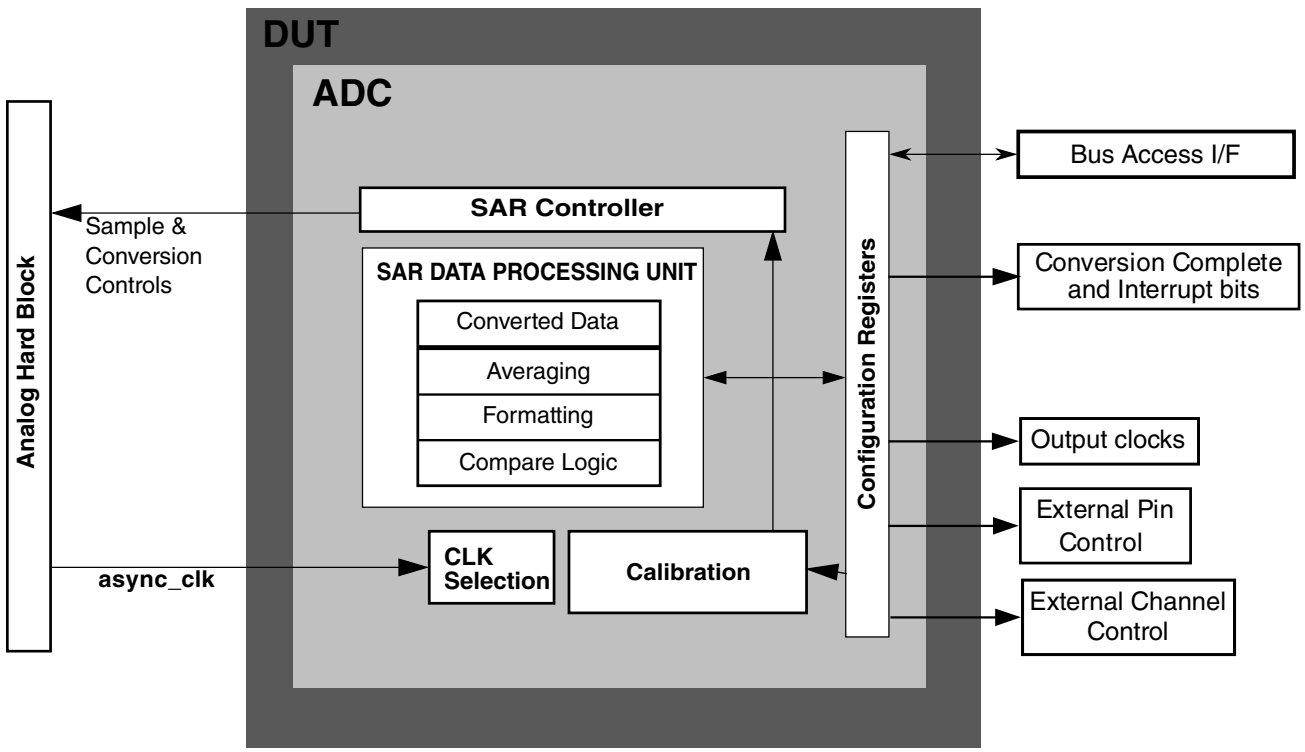

Figure 13-1. ADC-Digital I/F block diagram

13.1.3 ADC block diagram

The following figure shows a top-level block diagram of the ADC.

Figure 13-2. ADC block diagram

NOTE

ADC_VREFL is shorted to ground internally, no dedicate ball for this signal.

13.1.4 ADC module interface

The ADC is connected to many interfaces such as the clocks and reset, access bus, voltage references, interrupt controller, hardware triggers, ADC pin control, and analog I/F as shown in the following figure.

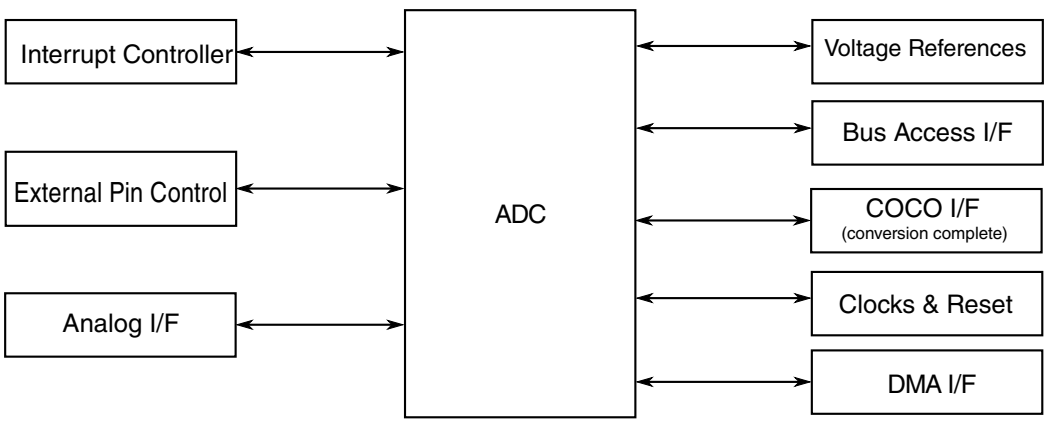

Figure 13-3. ADC module interface

13.1.5 Modes of Operation

By default, the ADC is in disabled mode. In this state, no conversion or other actions occur. All of the ADC control registers are accessible in this state through an access bus interface.To enable the ADC, required configurations should be done by programming the ADC configuration registers.

13.2 External Signals

The following table describes the external signals of ADC:

Table 13-1. ADC External Signals

Signal	Description	Pad	Mode	Direction
ADC_VREFH	Voltage reference high	ADC_VREFH	-	I
ADC1_IN0	Analog channel 1 input 0	GPIO1_IO00	-	I
ADC1_IN1	Analog channel 1 input 1	GPIO1_IO01	-	I

Table continues on the next page...

Table 13-1. ADC External Signals (continued)

Signal	Description	Pad	Mode	Direction
ADC1_IN2	Analog channel 1 input 2	GPIO1_IO02	-	I
ADC1_IN3	Analog channel 1 input 3	GPIO1_IO03	-	I
ADC1_IN4	Analog channel 1 input 4	GPIO1_IO04	-	I
ADC1_IN5	Analog channel 1 input 5	GPIO1_IO05	-	I
ADC1_IN6	Analog channel 1 input 6	GPIO1_IO06	-	I
ADC1_IN7	Analog channel 1 input 7	GPIO1_IO07	-	I
ADC1_IN8	Analog channel 1 input 8	GPIO1_IO08	-	I
ADC1_IN9	Analog channel 1 input 9	GPIO1_IO09	-	I
ADC2_IN0	Analog channel 2 input 0	GPIO1_IO00	-	I
ADC2_IN1	Analog channel 2 input 1	GPIO1_IO01	-	I
ADC2_IN2	Analog channel 2 input 2	GPIO1_IO02	-	I
ADC2_IN3	Analog channel 2 input 3	GPIO1_IO03	-	I
ADC2_IN4	Analog channel 2 input 4	GPIO1_IO04	-	I
ADC2_IN5	Analog channel 2 input 5	GPIO1_IO05	-	I
ADC2_IN6	Analog channel 2 input 6	GPIO1_IO06	-	I
ADC2_IN7	Analog channel 2 input 7	GPIO1_IO07	-	I
ADC2_IN8	Analog channel 2 input 8	GPIO1_IO08	-	I
ADC2_IN9	Analog channel 2 input 9	GPIO1_IO09	-	I

NOTE

The ADC input signals connect to GPIO[0:9]. The GPIO default configuration is enabled for keeper. The keeper causes an undesired jump behavior in ADC. To avoid the problem, disable keeper before starting ADC. For detailed information about keeper, refer to the GPIO block.

13.3 Functional Description

There are three possible states which ADC module can be in:

1. Disabled State
2. Idle state
3. Performing conversions

Disabled State:

The ADC module is disabled during reset, stop mode (if internal clock is not selected as source of clock), or when the ADCH bits of the hardware control (ADC_HC*n*) registers are all high.

Idle State:

The module is idle when a conversion has completed and another conversion has not been initiated. When idle and the asynchronous clock output enable is disabled (ADACKEN = 0), the module is in its lowest power state.

Conversion State:

The ADC can perform an analog-to-digital conversion on any of the software selectable channels. All modes perform conversion by a successive approximation algorithm.

To meet accuracy specifications the ADC module must be calibrated using the on chip calibration function. Calibration is recommended to be done after any reset.

When the conversion is completed, the result is placed in the data result registers (ADC_R*n*). The conversion complete flag (COCO*n*) field in the Hardware Status register is/are then set and an interrupt is generated, if the respective conversion complete interrupt has been enabled (ADC_HC*n*[AIEN]=1).

The ADC module has the capability of automatically comparing the result of a conversion with the contents of the compare value registers. The compare function is enabled by setting ACFE (ADC Compare Function Enable) in the ADC general control register.

The ADC module has the capability of automatically averaging the result of multiple conversions. The hardware average function is enabled by setting AVGE in the ADC general control register.

13.3.1 Clock Select and Divide Control

The ADC digital module has three clock sources:

- IPG clock
- Alternate Clock (ALTCLK) is connected to the signal as described in the chip-specific ADC information.
- Internal clock (ADACK) is a dedicated clock used only by the ADC.

ADC digital block generates IPG clock/2 by internally dividing the IPG clock. The final clock is chosen from the following clocks.

- IPG clock
- IPG clock divided by 2
- ALTCLK
- ADACK

Out of the above four clocks one is chosen depending on the configuration of ADCLK[1:0] bits of ADC_CFG. This chosen clock is divided depending on the configuration of ADIV[1:0] bits of ADC_CFG. The final generated clock is used as conversion clock for ADC.

ADICLK	Selected Clock Source
00	IPG clock
01	IPG clock divided by 2
10	Alternate clock (ALTCLK)
11	Asynchronous clock (ADACK)

- The IPG clock. This is the default selection following reset.
- The IPG clock divided by two. For higher IPG clock rates, this allows a maximum divide by 16 of the IPG clock with using the ADIV bits.
- ALTCLK, as defined for this chip.
- The asynchronous clock (ADACK). This clock is generated from a clock source within the ADC module. Conversions are possible using ADACK as the input clock source while the MCU is in stop mode.

Whichever clock is selected, its frequency must fall within the specified frequency range for ADCK. If the available clocks are too slow, the ADC may not perform according to specifications. If the available clocks are too fast, the clock must be divided to the appropriate frequency. This divider is specified by the ADIV bits and can be divide-by 1, 2, 4, or 8.

13.3.2 Voltage Reference Selection

The ADC can be configured to use reference pairs as the reference voltages used for conversions (V_{REFSH} and V_{REFSL}). Each pair contains a positive reference which must be between the minimum Ref Voltage High and V_{DDAD}, and a ground reference which must be at the same potential as V_{SSAD}. The pairs can be as follows:

- External (V_{REFH} and V_{REFL})

These voltage references are selected by configuring ADC_CFG[REFSEL].

13.3.3 Hardware Triggering and Channel Selection

The ADC module has a trigger input (known as Alternate Trigger) which provides asynchronous hardware conversion trigger when the ADTRG bit in ADC configuration register (ADC_CFG) is set and any of the external hardware trigger select is high.

To be reliably captured, the Alternate Trigger pulse must be high for sufficient time to satisfy clocking requirement of capturing Flop and the external hardware trigger select event must be set for sufficient time before and after the positive edge of Alternate trigger pulse to meet the setup / hold requirement of capturing flop.

If an external hardware trigger select event gets asserted during a conversion it must stay asserted until end of current conversion and remain set until the receipt of the an Alternate Trigger to initiate a new conversion.

When the Alternate Trigger source is available and hardware triggering is enabled (ADC_CFG[ADTRG]=1), a conversion is initiated on the rising edge of the Alternate Trigger after a external hardware trigger select event has occurred.

If a conversion is in progress when a rising edge of a trigger occurs, the rising edge is ignored. In continuous convertion configuration, only the initial rising edge to launch continuous conversions is observed and until conversion gets aborted the ADC will continue to do conversions on the same ADC Hardware Trigger Control register that initiated the conversion. The hardware trigger function operates in conjunction with any of the conversion modes and configurations.

The channel selected for the conversion will depend on the settings of active Hardware Trigger register field ADC_HCn[ADCH] of enabled external hardware trigger.

NOTE

Asserting more than one external hardware trigger select signal at the same time will result in unknown results. To avoid this, only select one external hardware trigger select signal prior to the next intended conversion.

When the conversion is completed, the result is placed in the data registers associated with the external hardware trigger received (active trigger selects ADC_Rn). The conversion complete flag associated with the external hardware trigger received (ADC_HS[COCOn]) is then set and an interrupt is generated if the respective conversion complete interrupt has been enabled (ADC_HCn[AIEN]=1).

13.3.4 Conversion Control

Conversions are performed as determined by ADC_CFG[MODE] field.

Conversions can be initiated by either software or hardware triggers. In addition, the ADC can be configured for low power operation, long sample time, continuous conversion, hardware average, and automatic comparison of conversion results with predetermined values.

13.3.4.1 Initiating Conversions

A conversion is initiated:

- Following a write to ADC_HC0 (with ADCHn bits not all 1's) and if software triggered operation is selected (ADTRG=0).
- Following a hardware trigger event if hardware triggered operation is selected (ADTRG=1) and a external hardware trigger select event has occurred. The channel selected will depend on the active trigger select signal active selects ADC_HC1; if neither is active the off condition is selected).

Note

Selecting more than one external hardware trigger select signal (ext_hwts[n]) prior to a conversion completion will generate unknown results. To avoid this, only select one hardware trigger select signal (ext_hwts[n]) prior to a conversion completion.

- Following the transfer of the result to the data registers when continuous conversion is enabled (ADCO=1 in ADC_GC register).

If continuous conversion is enabled, a new conversion is automatically initiated after the completion of the current conversion. In software triggered operation (ADTRG=0), continuous conversions begin after ADC_HC0 is written and continue until aborted. In hardware triggered operation(ADTRG=1 and one external hardware trigger select event has occurred), continuous conversions begin after a hardware trigger event and continue until aborted.

If hardware averaging is enabled, a new conversion is automatically initiated after the completion of the current conversion until the correct number of conversions is completed. In software triggered operation, conversions begin after ADC_HC0 is written. In hardware triggered operation, conversions begin after a hardware trigger. If continuous conversions is also enabled, a new set of conversions to be averaged are initiated following the last of the selected number of conversions.

13.3.4.2 Completing Conversions

A conversion is completed when the result of the conversion is transferred into the data result registers. (provided the compare function & hardware averaging is disabled), this is indicated by the setting of COCOn. If hardware averaging is enabled, COCOn sets only, if the last of the selected number of conversions is complete. If the compare function is enabled, COCOn sets and conversion result data is transferred only if the compare condition is true. If both hardware averaging and compare functions are enabled, then COCOn sets only if the last of the selected number of conversions is complete and the compare condition is true. An interrupt is generated, if ADC_HCn[AIEN] is high at the time that COCOn is set and if DMAEN is set, DMA request is asserted, if COCOn is set. Both the requests get deasserted when COCOn is low, cleared, which happens when data is read.

In all modes a blocking mechanism prevents a new result from overwriting previous data in ADC_Rn, if the previous data is in the process of being read. When blocking is active (OVWREN=0 in ADC_CFG), the conversion result data transfer is blocked, COCOn is not set, and the new result is lost. In all other cases of operation, when a conversion result data transfer is blocked, another conversion is initiated regardless of the state of ADCO (single or continuous conversions enabled).

Note

If continuous conversions are enabled, the blocking mechanism could result in the loss of data occurring at specific timepoints. To avoid this issue, the data must be read in fewer cycles than an ADC conversion time, accounting for interrupt or software polling loop latency.

If single conversions are enabled, the blocking mechanism could result in several discarded conversions and excess power consumption. To avoid this issue, the data registers must not be read after initiating a single conversion until the conversion completes.

13.3.4.3 Aborting Conversions

Any conversion in progress is aborted when:

- The MCU enters stop mode with ADACK not enabled.
- In software trigger mode, write to ADC_HC0 register, while ADC_HC0 is actively (already) controlling a conversion, aborts the current conversion. Since, any of the ADC_HC1 - ADC_HCn registers are not used for software trigger operation therefore, write to any of them neither initiate a new conversion nor abort the software triggered active conversion.
- In hardware trigger mode, write to any one of the ADC_HC0 - ADC_HCn register, while that specific ADC_HC0 - ADC_HCn register is actively controlling a conversion, aborts the current conversion.
- A write to any ADC register besides the ADC_HC0: ADC_HCn registers occurs . This indicates a mode of operation change has occurred and the current conversion is therefore invalid.

Note

When a conversion is aborted, the contents of the data result registers, ADCRn are not altered. The data result registers continue to hold the values, transferred after the completion of the last successful conversion. If the conversion is aborted by a reset or stop (not operated with internal ADACK), ADCRn (data result register) return to their reset states.

13.3.4.4 Power Control

The ADC module remains in its idle state until a conversion is initiated. If ADACK is selected as the conversion clock source but the asynchronous clock output is disabled (ADACKEN=0), the ADACK clock generator will also remain in its idle state (disabled) until a conversion is initiated. If the asynchronous clock output is enabled (ADACKEN=1), it will remain active regardless of the state of the ADC or the MCU power mode.

Power consumption when the ADC is active can be reduced by setting ADLPC..

13.3.4.5 Sample Time and Total Conversion Time

The total conversion time depends upon the following:

- the sample phase time (as determined by ADLSMP and ADSTS bits in ADC_CFG register),
- the compare phase time (determined by MODE bits)
- the frequency of the conversion clock (fADCK).
- the MCU bus frequency (for Handshaking and selection of clock)

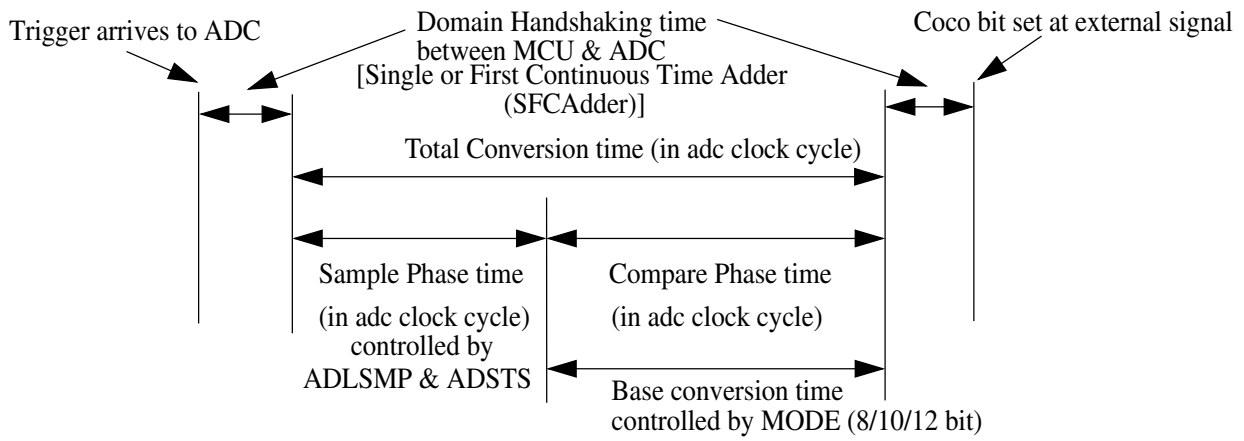

Figure 13-4. ADC conversion time details

After the module becomes active, sampling of the input begins. ADLSMP and ADSTS decide the sample time duration. When sampling is complete, the converter is isolated from the input channel and a successive approximation algorithm is performed to determine the digital value of the analog signal. The result of the conversion is transferred to ADC_Rn upon completion of the conversion algorithm.

If the bus frequency is less than the f_{ADCK} frequency, precise sample time for continuous conversions cannot be guaranteed .

The maximum total conversion time is determined by the clock source chosen and the divide ratio selected. The clock source is selectable by the ADICLK bits in ADC_CFG register, and the divide ratio is specified by the ADIV bits.

The maximum total conversion time for all configurations is summarized in Equation 1 on page 392. Refer to Table 13-2 through Table 13-5 for the variables referenced in the equation.

$$\text{ConversionTime} = \text{SFCAdder} + \text{AverageNum} \times (\text{BCT} + \text{LSTAdder})$$

Equation 1

Table 13-2. Single or First Continuous Time Adder (SFCAdder)

ADACKEN	ADICLK	Single or First Continuous Time Adder (SFCAdder)
x	0x, 10	3 ADCK cycles (before starting of conversion) + 1ADCK (after end of conversion) + 2 bus clock cycles
1	11	3 ADCK cycles (before starting of conversion) + 1 ADCK (after end of conversion) +

Table continues on the next page...

Table 13-2. Single or First Continuous Time Adder (SFCAdder) (continued)

ADACKEN	ADICLK	Single or First Continuous Time Adder (SFCAdder)
		2 bus clock cycles
0	11	1.5µs + 3 ADCK cycles (before starting of conversion) + 1 ADCK (after end of conversion) + 2 bus clock cycles

Table 13-3. Average Number Factor (AverageNum)

AVGE	AVGS[1:0]	Average Number Factor (AverageNum)
0	xx	1
1	00	4
1	01	8
1	10	16
1	11	32

Table 13-4. Base Conversion Time (BCT) (compare phase duration)

Mode	Base Conversion Time (BCT) (compare phase duration)
8 bit	17 ADCK cycles
10 bit	21 ADCK cycles
12 bit	25 ADCK cycles

Table 13-5. Long Sample Time

ADLSMP	ADSTS	Long Sample Time Adder (LSTAdder)
0	00	3 ADCK cycles
0	01	5 ADCK cycles
0	10	7 ADCK cycles (default)
0	11	9 ADCK cycles
1	00	13 ADCK cycles
1	01	17 ADCK cycles
1	10	21 ADCK cycles
1	11	25 ADCK cycles

Note

The ADCK frequency must be between f_{ADCK} minimum and f_{ADCK} maximum to meet ADC specifications.

13.3.4.6 Conversion Time Examples

The following examples uses Equation 1 on page 392 and the information provided in tables Table 13-2 through Table 13-5.

13.3.4.6.1 Typical conversion time configuration

A typical configuration for ADC conversion is: 10-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-1 ratio selected, and a bus frequency of 40 MHz, ADLSMP=0,ADLSTS=10 and high speed conversion disabled. The conversion time for a single conversion is calculated by using Equation 1 on page 392 and the information provided in Table 13-6 through Table 13-8. The table below list the variables of Equation 1 on page 392.

Table 13-6. Typical Conversion Time

Variable	Time
SFCAdder	5 ADCK cycles + 5 bus clock cycles
AverageNum	1
BCT	21 ADCK cycles
LSTAdder	7

The resulting conversion time is generated using the parameters listed in Table 13-6. So for Bus clock equal to 40 Mhz and ADCK equal to 40 Mhz the resulting conversion time is 0.95 us.

13.3.4.6.2 Long conversion time configuration

A configuration for long ADC conversion is: 12-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-8 ratio selected, and a bus frequency of 40 MHz, long sample time enabled (ADLSMP=1, ADSTS=11) and configured for longest adder and high speed conversion disabled. Average enabled for 32 conversions (AVGE=1, AVGS=11). The conversion time for this conversion is calculated by using equation on Sample Time and Total Conversion Time and the information provided in Table 13-2 through Table 13-5. The table below lists the variables of equation.

Table 13-7. Typical Conversion Time

Variable	Time
SFCAdder	3 ADCK cycles + 5 bus clock cycles
AverageNum	32
BCT	25 ADCK cycles
LSTAdder	25 ADCK cycles

The resulting conversion time is generated using the parameters listed in Table 13-7. So for Bus clock equal to 40 Mhz and ADCK equal to 5 Mhz the resulting conversion time is 10.0226 us (AverageNum). This results in a total conversion time of 320.725 us.

13.3.4.6.3 Short conversion time configuration

A configuration for short ADC conversion is: 8-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-1 ratio selected, and a bus frequency of 40 MHz, long sample time disabled(ADLSMP=0, ADSTS=00) and high speed conversion enabled. The conversion time for this conversion is calculated by using the equation and the information provided in Table 13-2 to Table 13-5. The table below list the variables of equation.

Table 13-8. Typical Conversion Time

Variable	Time
SFCAdder	3 ADCK cycles + 5 bus clock cycles
AverageNum	1
BCT	17 ADCK cycles
LSTAdder	3 ADCK cycles

The resulting conversion time is generated using the parameters listed in Table 13-8. So for Bus clock equal to 40Mhz and ADCK equal to 40Mhz the resulting conversion time is 700 ns.

13.3.4.7 Hardware Average Function

The hardware average function can be enabled (AVGE=1) to perform a hardware average of multiple conversions. The number of conversions is determined by the AVGS[1:0] bits, which select 4, 8, 16 or 32 conversions to be averaged. While the hardware average function is in progress the ADACT bit will be set.

After the selected input is sampled and converted, the result is placed in an accumulator from which an average is calculated once the selected number of conversions has been completed. When hardware averaging is selected the completion of a single conversion will not set the COCOn bit.

If the compare function is either disabled or evaluates true, after the selected number of conversions are completed, the average conversion result is transferred into the data result registers, ADC_Rn , and the COCOn bit is set. An ADC interrupt is generated upon the setting of COCOn if the respective ADC interrupt is enabled (AIENn=1).

13.3.5 Automatic Compare Function

The compare function can be configured to check if the result is less than or greater-than-or-equal-to a single compare value, or if the result falls within or outside a range determined by two compare values. The compare mode is determined by ACFGT, ACREN and the values in the compare value register (ADC_CV). After the input is sampled and converted, the compare values (CV1 and CV2) are used as described in the table below. There are six compare modes as shown in the table below.

Table 13-9. Compare Modes

ACFGT	ACREN	CV1 relative to CV2	Function	Compare Mode Description
0	0	-	Less than threshold	Compare true if the result is less than the CV1 registers.
1	0	-	Greater than or equal to threshold	Compare true if the result is greater than or equal to CV1 registers.
0	1	Less than or equal	Outside range, not inclusive	Compare true if the result is less than CV1 **Or** the result is Greater than CV2
0	1	Greater than	Inside range, not inclusive	Compare true if the result is less than CV1 **And** the result is greater than CV2
1	1	Less Than or equal	Inside range, inclusive	Compare true if the result is greater than or equal to CV1 **And** the result is less than or equal to CV2
1	1	Greater than	Outside range, inclusive	Compare true if the result is greater than or equal to CV1 **Or** the result is less than or equal to CV2

With the ADC range enable bit set, ADCREN =1, if compare value 1(CV1 value) is less than or equal to the compare value 2 (CV2 value), setting ACFGT will select a trigger-if-inside-compare-range, inclusive-of-endpoints function. Clearing ACFGT will select a trigger-if-outside-compare-range, not-inclusive-of-endpoints function.

If CV1 is greater than the CV2, setting ACFGT will select a trigger-if-outside-compare-range, inclusive-of-endpoints function. Clearing ACFGT will select a trigger-if-inside-compare-range, not-inclusive-of-endpoints function.

If the condition selected evaluates true, COCOn is set.

Upon completion of a conversion while the compare function is enabled, if the compare condition is not true, COCOn is not set and the conversion result data will not be transferred to the result register. If the hardware averaging function is enabled, the compare function compares the averaged result to the compare values. The same compare function definitions apply. An ADC interrupt is generated upon the setting of COCOn if the respective ADC interrupt is enabled (ADC_HCn[AIEN]=1).

Note

The compare function can monitor the voltage on a channel while the MCU is in wait or stop3 mode. The ADC interrupt wakes the MCU when the compare condition is met.

13.3.6 Calibration Function

The ADC contains a self-calibration function that is required to achieve the specified accuracy. Calibration should be run or valid calibration values should be written after power up and system reset (as the calibration register will be reset on reset assertion) with specified settings before any conversion is initiated. The calibration function sets the calibration value at the end of running the full calibration sequence in ADC_CAL register. The user must configure the ADC correctly prior to starting the calibration process, and must allow the process to run the full calibration sequence by checking the status of ADC_GC[CAL] and ADC_GS[CALF] so that the generated calibration value can be loaded.

Prior to calibration, the user must configure the ADC's clock source and frequency, low power configuration, voltage reference selection, sample time, averaging, and the high speed configuration according to the application's clock source availability and needs. If the application uses the ADC in a wide variety of configurations, the configuration for which the highest accuracy is required should be selected, or multiple calibrations can be done for the different configurations. The input channel, conversion mode, continuous function and compare function are all ignored during the calibration process.

To initiate calibration, the user sets the CAL bit and the calibration will automatically begin if the ADTRG bit = 0. If ADTRG = 1, the CAL bit will not get set and the calibration fail flag (CALF) will be set. While calibration is active, no ADC register can be written and no stop mode may be entered or the calibration routine will be aborted causing the CAL bit to clear and the CALF bit to set.

At the end of a calibration sequence the COCO[0] bit of the ADC_HS register will be set. The ADC_HCn[AIEN] bit can be used to allow an interrupt to occur at the end of a calibration sequence. If, at the end of calibration routine, the CALF bit is not set, the automatic calibration routine completed successfully.

To complete calibration, the user must follow the below procedure :

- Configure ADC_CFG with actual operating values for maximum accuracy.
- Configure the ADC_GC values along with CAL bit
- Check the status of CALF bit in ADC_GS and the CAL bit in ADC_GC
- When CAL bit becomes '0' then check the CALF status and COCO[0] bit status

When complete the user may reconfigure and use the ADC as desired.

A second calibration may also be performed if desired by clearing and again setting the CAL bit

Overall the calibration routine may take as many as 14000 ADCK cycles and 100 bus cycles, depending on the results and the clock source chosen.

13.3.7 User Defined Offset Function

The ADC Offset Correction Register (ADC_OFS) contains the user configured offset value. This register is 13 bit wide. The value in MSB (13th bit) is the operation bit, if this bit is ‘0’ then the value in rest 12 bit is added with the converted result value to generate final result to be loaded into ADC_Rn and if this bit is ‘1’ then this field is subtracted from converted value to generate final Result (ADC_Rn). If the Final result is above the maximum or below the minimum result value, it is forced to the appropriate limit for the current mode of operation. Forced to 0x0FFF if over and 0x0000 if lower for 12 bit mode.

The offset value has no effect during calibration and BIST test on final result.

The formatting of the ADC Offset Register is different from the Data Result Registers (ADC_Rn) to preserve the resolution of the value regardless of the conversion mode selected. Lower order bits are ignored in lower resolution modes. For example, in 8b single-ended mode, the bits OFS[11:4] are subtracted from D[7:0] when bit OFS[12] (sign bit) is ‘1’ ; indicates subtraction and bits OFS[4:0] are ignored. For 12b single-ended mode, bits OFS[11:0] are directly subtracted from the conversion result data CDATA[11:0] when OFS[12] (sign bit) is ‘1’. The similar is the addition operation when OFS[12](sign bit) is 0.

ADC_OFS is manually set according to user requirements once the self calibration sequence is done (CAL is cleared). The user have to write ADC_OFS with desired value.

NOTE

There is an effective limit to the values of Offset that can be set by the user. If the magnitude of the offset is too great the results of the conversions will cap off at the limits.

The offset function may be employed by the user to remove application offsets or DC bias values. An offset correction that results in an out-of-range value will be forced to the minimum or maximum value.

For applications which may change the offset repeatedly during operation, it is recommended to store the initial offset value in flash so that it can be recovered and added to any user offset adjustment value and the sum stored in the ADC_OFS registers.

13.3.8 Temperature Sensor

The ADC module includes a temperature sensor whose output is connected to one of the ADC analog channel inputs (ADC_HC*n*[AIEN] = 010000b = 16d). This channel can be selected through configuring the ADCH*n* bits of any ADC_HC*n* register. Any trigger on this will give a temperature value converted for further processings.

13.3.9 MCU Wait Mode Operation

Wait mode is a **lower power-consumption standby mode** from which **recovery is fast** because **the clock sources remain active**. If a conversion is in progress when the MCU enters wait mode, it continues until completion. Conversions can be initiated while the MCU is in wait mode by means of the hardware trigger or if continuous conversions are enabled.

The bus clock, bus clock divided by two, and ADACK are available as conversion clock sources while in wait mode. The use of ALTCLK as the conversion clock source in wait is dependent on the definition of ALTCLK for the specific MCU.

A conversion complete event sets the COCOn and generates an ADC interrupt to wake the MCU from wait mode.

If the compare and hardware averaging functions are disabled, a conversion complete event sets the COCOn and generates an ADC interrupt to wake the MCU from wait mode if the respective ADC interrupt is enabled (ADC_HCn[AIEN]=1).

If the hardware averaging function is enabled the COCOn will set (and generate an interrupt if enabled) when the selected number of conversions are complete.

If the compare function is enabled the COCOn will set (and generate an interrupt if enabled) only if the compare conditions are met.

If a single conversion is selected and the compare trigger is not met, the ADC will return to its idle state and cannot wake the MCU from wait mode unless a new conversion is initiated by the hardware trigger.

13.3.10 MCU Stop Mode Operation

Stop mode is a low power-consumption standby mode during which most or all clock sources on the MCU are disabled. Stop mode entered when stop indication comes from the MCU.

13.3.10.1 Stop Mode With ADACK Disabled

If the asynchronous clock, ADACK, is not selected as the conversion clock, executing a stop instruction aborts the current conversion and places the ADC in its idle state. The contents of the ADC registers, including ADC_Rn are unaffected by stop mode. After exiting from stop mode, a software or hardware trigger is required to resume conversions.

13.3.10.2 Stop Mode With ADACK Enabled

If ADACK is selected as the conversion clock, the ADC continues operation during stop mode. For guaranteed ADC operation, the MCU's voltage regulator must remain active during stop mode.

If a conversion is in progress when the MCU enters stop mode, it continues until completion. Conversions can be initiated while the MCU is in stop mode by means of the hardware trigger or if continuous conversions are enabled.

A conversion complete event sets the COCOn and generates an ADC interrupt to wake the MCU from stop mode :

Note

The ADC module can wake the system from low-power stop and cause the MCU to begin consuming run-level currents without generating a system level interrupt. To prevent this scenario, software should ensure the conversion result data

transfer blocking mechanism (discussed in Completing Conversions) is cleared when entering stop and continuing ADC conversions.

13.4 Initialization Information

This section gives an example that provides some basic direction on how to initialize and configure the ADC module. User can configure the module for 8, 10, 12 bit resolution, single or continuous conversion, and a polled or interrupt approach, among many other options.

13.4.1 ADC Module Initialization Example

This section describes the initialization sequence along with pseudo-code.

13.4.1.1 Initialization Sequence

Before the ADC module can be used to complete conversions, an initialization procedure must be performed. A typical sequence is as follows:

- Calibrate the ADC by following the calibration instructions in Calibration Function
- Update the configuration register (ADC_CFG) to select the input clock source and the divide ratio used to generate the internal clock, ADCK. This register is also used for selecting sample time and low-power configuration.
- Update Genral control register (ADC_GC) to select whether conversions will be continuous or completed only once (ADCO) and to select whether to perform hardware averaging, etc.
- Update Trigger control register (ADC_HCn) to select the conversion trigger (hardware or software, i.e. configure ADTRG bit) and compare function options, if enabled.

13.4.1.2 Pseudo-Code Example

In this example, the ADC module is set up with interrupts enabled to perform a single 10-bit conversion at low power with a long sample time on input channel 1, where the internal ADCK clock is derived from the bus clock divided by 1.

ADC_CFG

```
Bit 7    ADLPC   1      Configures for low power (lowers maximum clock speed.
Bit 6:5  ADIV    00     Sets the ADCK to the input clock  ÷  1.
Bit 4    ADLSMP  1      Configures for long sample time.
Bit 3:2  MODE    10     Sets mode at 10-bit conversions.
Bit 1:0  ADICLK  00     Selects bus clock as input clock source.
```

ADC_GC

```
Bit 7    CAL     0      Flag indicates if a conversion is in progress.
Bit 6    ADCO    0      Software trigger selected.
Bit 5    AVGE    0      Compare function disabled.
Bit 4    ACFE    0      Compare function disabled.
Bit 3    ACFGT   0      Not used in this example.
Bit 2    ACREN   0      Not used in this example.
Bit 1    DMAEN   0      Not used in this example.
Bit 0    ADACKEN 0      Not used in this example.
```

ADC_HC0

```
   Bit 7    AIEN   1      Conversion complete interrupt enabled.
Bit 4:0  ADCH   00001  Input channel 1 selected as ADC input channel.
```

ADC_R0

Holds results of conversion. Read high byte (ADCRHA) before low byte (ADCRLA) so that conversion data cannot be overwritten with data from the next conversion.

ADC_CV

Holds compare values when compare function enabled.

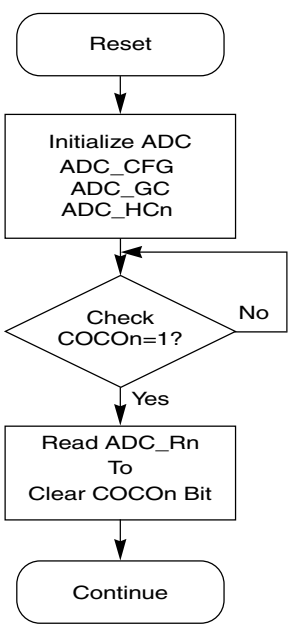

Figure 13-5. Initialization Flowchart for Example

13.5 Application Information

This section contains information for using the ADC module in applications. The ADC has been designed to be integrated into a microcontroller for use in embedded control applications requiring an A/D converter.

13.5.1 Sources of Error

Several sources of error exist for A/D conversions. These are discussed in the following sections.

13.5.1.1 Sampling Error

For proper conversions, the input must be sampled long enough to achieve the proper accuracy. Given the maximum input resistance of approximately 7kΩ and input capacitance of approximately 1.3 pF, sampling to within 1/4LSB (at 12-bit resolution) can be achieved within the nominal sample window (6 cycles @ 40 MHz maximum ADCK frequency) provided the resistance of the external analog source (R_{AS}) is kept below 4 kΩ.

Higher source resistances or higher-accuracy sampling is possible by setting ADLSMP and changing the ADSTS bits (to increase the sample window) or decreasing ADCK frequency to increase sample time.

13.5.1.2 Pin Leakage Error

Leakage on the I/O pins can cause conversion error if the external analog source resistance (R_{AS}) is high. If this error cannot be tolerated by the application, keep R_{AS} lower than $V_{DDAD} / (2^N * I_{LEAK})$ for less than 1/4LSB leakage error (N = 8 in 8-bit, 10 in 10-bit or 12 in 12-bit mode).

13.5.1.3 Noise-Induced Errors

System noise that occurs during the sample or conversion process can affect the accuracy of the conversion. The ADC accuracy numbers are guaranteed as specified only if the following conditions are met:

- There is a 0.1 µF low-ESR capacitor from V_{REFH} to V_{REFL}.
- There is a 0.1 µF low-ESR capacitor from V_{DDAD} to V_{SSAD}.
- If inductive isolation is used from the primary supply, an additional 1 µF capacitor is placed from V_{DDAD} to V_{SSAD}.
- V_{SSAD} (and V_{REFL}, if connected) is connected to V_{SS} at a quiet point in the ground plane.
- Operate the MCU in wait or stop mode before initiating (hardware triggered conversions) or immediately after initiating (hardware or software triggered conversions) the ADC conversion.
    - For software triggered conversions, immediately follow the write to ADCSC1 with a wait instruction or stop instruction.
    - For stop mode operation, select ADACK as the clock source. Operation in stop reduces V_{DD} noise but increases effective conversion time due to stop recovery.
- There is no I/O switching, input or output, on the MCU during the conversion.

There are some situations where external system activity causes radiated or conducted noise emissions or excessive V_{DD} noise is coupled into the ADC. In these situations, or when the MCU cannot be placed in wait or stop or I/O activity cannot be halted, these recommended actions may reduce the effect of noise on the accuracy:

- Place a 0.01 µF capacitor (CAS) on the selected input channel to V_{REFL} or V_{SSAD} (this improves noise issues, but affects the sample rate based on the external analog source resistance).
- Average the result by converting the analog input many times in succession and dividing the sum of the results. Four samples are required to eliminate the effect of a 1LSB, one-time error.
- Reduce the effect of synchronous noise by operating off the asynchronous clock (ADACK) and averaging. Noise that is synchronous to ADCK cannot be averaged out.

13.5.1.4 Code Width and Quantization Error

Note

This will remain the same as long as the result is rounded for 8 and 10-bit modes. If the result is truncated in 8/10b modes then they will match 12b mode where the quantization error is -1 to 0

The ADC quantizes the ideal straight-line transfer function into 4096 steps (in 12-bit mode). Each step ideally has the same height (1 code) and width. The width is defined as the delta between the transition points to one code and the next. The ideal code width for an N bit converter (in this case N can be 8, 10 or 12), defined as 1LSB, is:

$$1\text{lsb} = (V_{\text{REFH}} - V_{\text{REFL}}) / 2^N$$

There is an inherent quantization error due to the digitization of the result. For 8-bit or 10-bit conversions the code transitions when the voltage is at the midpoint between the points where the straight line transfer function is exactly represented by the actual transfer function. Therefore, the quantization error will be ± 1/2 lsb in 8- or 10-bit mode. As a consequence, however, the code width of the first (0x000) conversion is only 1/2 lsb and the code width of the last (0xFF or 0x3FF) is 1.5 lsb.

For 12-bit conversions the code transitions only after the full code width is present, so the quantization error is -1 lsb to 0 lsb and the code width of each step is 1 lsb.

13.5.1.5 Linearity Errors

The ADC may also exhibit non-linearity of several forms. Every effort has been made to reduce these errors but the system should be aware of them because they affect overall accuracy. These errors are:

- Zero-scale error (E_{ZS}) (sometimes called offset) — This error is defined as the difference between the actual code width of the first conversion and the ideal code width (1/2 lsb in 8-bit or 10-bit modes and 1 lsb in 12-bit mode). If the first conversion is 0x001, the difference between the actual 0x001 code width and its ideal (1 lsb) is used.
- Full-scale error (E_{FS}) — This error is defined as the difference between the actual code width of the last conversion and the ideal code width (1.5 lsb in 8-bit or 10-bit modes and 1LSB in 12-bit mode). If the last conversion is 0x3FE, the difference between the actual 0x3FE code width and its ideal (1LSB) is used.

- Differential non-linearity (DNL) — This error is defined as the worst-case difference between the actual code width and the ideal code width for all conversions.
- Integral non-linearity (INL) — This error is defined as the highest-value the (absolute value of the) running sum of DNL achieves. More simply, this is the worst-case difference of the actual transition voltage to a given code and its corresponding ideal transition voltage, for all codes.
- Total unadjusted error (TUE) — This error is defined as the difference between the actual transfer function and the ideal straight-line transfer function and includes all forms of error.

13.5.1.6 Code Jitter, Non-Monotonicity, and Missing Codes

Analog-to-digital converters are susceptible to three special forms of error. These are code jitter, non-monotonicity, and missing codes.

Code jitter is when, at certain points, a given input voltage converts to one of two values when sampled repeatedly. Ideally, when the input voltage is infinitesimally smaller than the transition voltage, the converter yields the lower code (and vice-versa). However, even small amounts of system noise can cause the converter to be indeterminate (between two codes) for a range of input voltages around the transition voltage. This range is normally around ±1/2 lsb in 8-bit or 10-bit mode, or around 2 lsb in 12-bit mode, and increases with noise.

This error may be reduced by repeatedly sampling the input and averaging the result. Additionally the techniques discussed in Noise-Induced Errors reduces this error.

Non-monotonicity is defined as when, except for code jitter, the converter converts to a lower code for a higher input voltage. Missing codes are those values never converted for any input value.

In 8-bit or 10-bit mode, the ADC is guaranteed to be monotonic and have no missing codes.

13.6 Memory map and register definition

The ADC-Digital contains 32-bit, word aligned, byte enables registers; byte or half word access are not supported. All configuration registers are accessible via 32-bit access bus Interface. Write access to reserved locations have no impact while read access to reserved locations always return 0.

NOTE

No protection or indication mechanism is available (for example, 32-bit access starting with address offset value 0x01 or 0x02 or 0x03). The ADC does not check for correctness of the programmed values in the registers and the programmer must ensure that correct values are being written.

13.6.1 Control register for hardware triggers (ADCx_HC0)

ADC_HC0 can be used for both software and hardware trigger mode. Other ADC_HC*n* (*n* = 1...) are for use only in hardware trigger mode. The ADC_HC0 to ADC_HC*n* (*n* = 0,1) registers have identical fields, and are used to control ADC operation. At any one point in time, only one of the ADC_HC0 to ADC_HC*n* (*n* = 0,1) registers is actively controlling ADC conversions. Updating ADC_HC0 while ADC_HC*n* (*n* = 0,1) is actively controlling a conversion is allowed (and vice-versa for any of the ADC_HC*n* (*n* = 0,1) registers). Writing ADC_HC0 while ADC_HC0 is actively controlling a conversion aborts the current conversion. In software trigger mode (ADTRG=0), writes to ADC_HC0 subsequently initiates a new conversion (if the ADCH bits are equal to a value other than all 1s). Similarly, writing any of the ADC_HC*n* (*n* = 0,1) registers while that specific ADC_HC register is actively controlling a conversion aborts the current conversion. ADC_HC1 register is not used for software trigger operation and therefore writes to any of them do not initiate a new conversion.

6–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
ADCH	Input Channel Select This 5-bit field selects one of the input channels. The successive approximation converter subsystem is turned off when the channel select bits are all set (ADCH =11111b). This feature allows for explicit disabling of the ADC and isolation of the input channel from all sources. Terminating continuous conversions this way prevents an additional single conversion from being performed. 00000-01111 External channels 0 to 15. 10000-10111 Reserved 11000 Reserved. 11001 VREFSH = internal channel, for ADC self-test, hard connected to VRH internally 11010 Reserved. 11011 Reserved. 11100-11110 Reserved. 11111 Conversion Disabled. Hardware Triggers will not initiate any conversion.

13.6.3 Status register for HW triggers (ADCx_HS)

Bit 0 is used for both software and hardware trigger modes of operation. Bit 1 to bit (n-1) indicate the rest of the HW triggers' statuses similar to bit 0, potentially corresponding to multiple ADC_HC registers (for use only in hardware trigger mode).

Address: Base address + 8h offset

ADCx_HS field descriptions

Field	Description
31–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 COCO1	See description for COCO0.
0 COCO0	Conversion Complete Flag The COCOn flag is a read-only bit that is set each time a conversion is completed when the compare function is disabled (ADC_GC[ACFE]=0) and the hardware average function is disabled (ADC_GC[AVGE]=0). When the compare function is enabled (ADC_GC[ACFE]=1), the COCOn flag is set upon completion of a conversion only if the compare result is true. When the hardware average function is enabled (ADC_GC[AVGE]=1), the COCOn flag is set upon completion of the selected number of conversions (determined by the ADC_CFG[AVGS] field). The COCO0 flag will also set at the completion of a Calibration and Test sequence. A COCOn bit is cleared when the respective ADC_HCn is written or when the respective ADC_Rn is read.

13.6.4 Data result register for HW triggers (ADCx_R0)

Contains the result of an ADC conversion of the channel selected by the respective hardware trigger and channel control register (ADC_HC0:ADC_HCn). For every ADC_HC0:ADC_HCn status and channel control register, there is a respective ADC_R0:ADC_Rn data result register. Unused bits in the ADC_Rn register are cleared in unsigned right justified modes. For example when configured for 10-bit single-ended mode, D[31:10] are cleared. The table below describes the behavior of the data result registers in the different modes of operation.

Table 13-10. Data Result Register Description

Field	Description
31–12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
CDATA	Data (result of an ADC conversion)

13.6.6 Configuration register (ADCx_CFG)

Selects the mode of operation, clock source, clock divide, configure for low power, long sample time, high speed configuration and selects the sample time duration.

Address: Base address + 14h offset

ADCx_CFG field descriptions

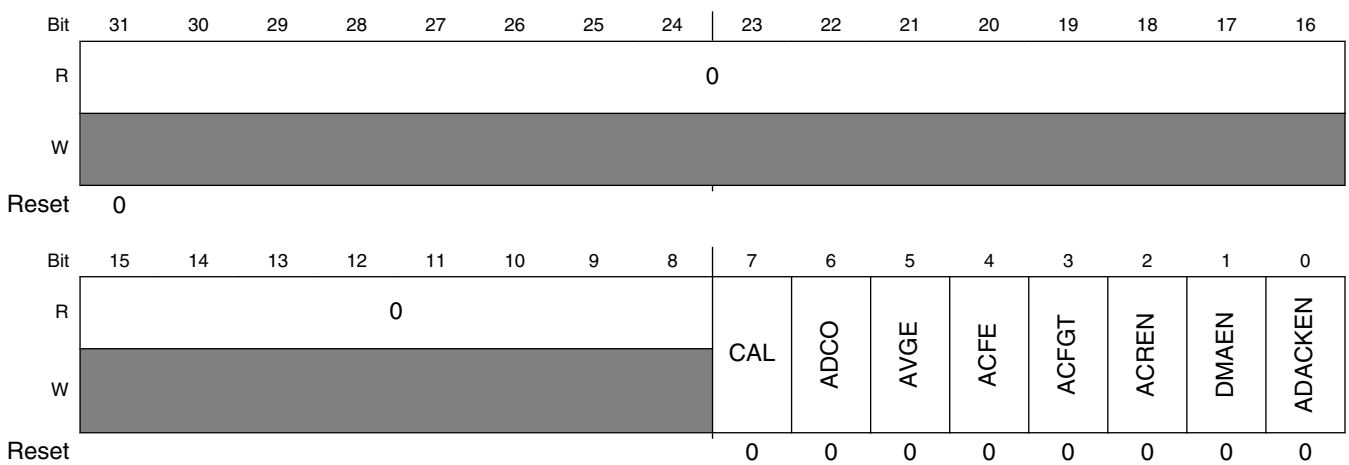
Field	Description
31–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 OVWREN	Data Overwrite Enable Controls the overwriting of the next converted Data onto the existing (previous) unread data into the Data result register. 1 Enable the overwriting. 0 Disable the overwriting. Existing Data in Data result register will not be overwritten by subsequent converted data.
15–14 AVGS	Hardware Average select Determines how many ADC conversions will be averaged to create the ADC average result. This functionality is activated when ADC_GC[AVGE] = 1. 00 4 samples averaged 01 8 samples averaged 10 16 samples averaged 11 32 samples averaged
13 ADTRG	Conversion Trigger Select Selects the type of trigger used for initiating a conversion. Two types of trigger are selectable: software trigger and hardware trigger. When software trigger is selected, a conversion is initiated following a write to ADC_HC0. When hardware trigger is selected, a conversion is initiated following the assertion of a pulse on Alternate Hardware trigger input along with the assertion of the enable of respective the hardware Triggers input .

Table continues on the next page...

ADCx_CFG field descriptions (continued)

Field	Description
	0 Software trigger selected 1 Hardware trigger selected
12–11 REFSEL	Voltage Reference Selection Selects the voltage reference source used for conversions (see the chip-specific SARADC information for details). 00 Selects VREFH/VREFL as reference voltage. 01 Reserved 10 Reserved 11 Reserved
10 ADHSC	High Speed Configuration This bit configures the ADC for high speed operation. The internal ADC clock is higher than normal. 0 Normal conversion selected. 1 High speed conversion selected.
9–8 ADSTS	Defines the sample time duration. This has two modes, short and long. When long sample time is selected (ADLSMP=1) this works for long sample time otherwise this works for short sample. This allows higher impedance inputs to be accurately sampled or to maximize conversion speed for lower impedance inputs. Longer sample times can also be used to lower overall power consumption when continuous conversions are enabled if high conversion rates are not required. 00 Sample period (ADC clocks) = 2 if ADLSMP=0b Sample period (ADC clocks) = 12 if ADLSMP=1b 01 Sample period (ADC clocks) = 4 if ADLSMP=0b Sample period (ADC clocks) = 16 if ADLSMP=1b 10 Sample period (ADC clocks) = 6 if ADLSMP=0b Sample period (ADC clocks) = 20 if ADLSMP=1b 11 Sample period (ADC clocks) = 8 if ADLSMP=0b Sample period (ADC clocks) = 24 if ADLSMP=1b
7 ADLPC	Low-Power Configuration Puts the ADC hard block into low power mode and reduces the comparator enable period by controlling its timing in the SAR controller block towards the anlong hard block. The signal indicating low power mode to the Analog block is asserted when this bit is set. 0 ADC hard block not in low power mode. 1 ADC hard block in low power mode.
6–5 ADIV	Clock Divide Select Selects the divide ratio used by the ADC to generate the internal clock ADCK. 00 Input clock 01 Input clock / 2 10 Input clock / 4 11 Input clock / 8

Table continues on the next page...



ADCx_CFG field descriptions (continued)

Field	Description
4 ADLSMP	Long Sample Time Configuration Selects between different sample times based on the ADC_CFG[ADSTS] field. This bit adjusts the sample period to allow higher impedance inputs to be accurately sampled or to maximize conversion speed for lower impedance inputs. If high conversion rates are not required, longer sample times can also be used to lower overall power consumption when continuous conversions are enabled. When ADLSMP=1, the Long Sample Time mode is selected and the time is defined by ADSTS[1:0] of the ADC_CFG register. 0 Short sample mode. 1 Long sample mode.
3–2 MODE	Conversion Mode Selection Used to set the ADC resolution mode. 00 8-bit conversion 01 10-bit conversion 10 12-bit conversion 11 Reserved
ADICLK	Input Clock Select Selects the input clock source to generate the internal clock ADCK. 00 IPG clock 01 IPG clock divided by 2 10 Alternate clock (ALTCLK) 11 Asynchronous clock (ADACK)

13.6.7 General control register (ADCx_GC)

Controls the calibration, continuous convert, hardware averaging functions, conversion active, hardware/software trigger select, compare function and voltage reference select of the ADC module.

Address: Base address + 18h offset

ADCx_GC field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 CAL	Calibration CAL begins the calibration sequence when set. This bit stays set while the calibration is in progress and is cleared when the calibration sequence is complete. The ADC_GS[CALF] bit must be checked to determine the result of the calibration sequence. Once started, the calibration routine cannot be interrupted by writes to the ADC registers or the results will be invalid and the ADC_GS[CALF] bit will set. Setting the CAL bit will abort any current conversion.
6 ADCO	Continuous Conversion Enable Enables continuous conversions. 0 One conversion or one set of conversions if the hardware average function is enabled (AVGE=1) after initiating a conversion. 1 Continuous conversions or sets of conversions if the hardware average function is enabled (AVGE=1) after initiating a conversion.
5 AVGE	Hardware average enable Enables the hardware average function of the ADC. 0 Hardware average function disabled 1 Hardware average function enabled
4 ACFE	Compare Function Enable Enables the compare function. 0 Compare function disabled 1 Compare function enabled
3 ACFGT	Compare Function Greater Than Enable Configures the compare function to check the conversion result relative to the compare value register (ADC_CV) based upon the value of ACREN (bit 2 in ADC_GC register). The ACFE bit must be set for ACFGT to have any effect. 0 Configures "Less Than Threshold, Outside Range Not Inclusive and Inside Range Not Inclusive" functionality based on the values placed in the ADC_CV register. 1 Configures "Greater Than Or Equal To Threshold, Outside Range Inclusive and Inside Range Inclusive" functionality based on the values placed in the ADC_CV registers.
2 ACREN	Compare Function Range Enable Configures the compare function to check the conversion result of the input being monitored is either between or outside the range formed by the compare values in register (ADC_CV) determined by the value of ACFGT. The ACFE bit must be set for ACFGT to have any effect. 0 Range function disabled. Only the compare value 1 of ADC_CV register (CV1) is compared. 1 Range function enabled. Both compare values of ADC_CV registers (CV1 and CV2) are compared.
1 DMAEN	DMA Enable Enables the DMA logic.

Table continues on the next page...

ADCx_GC field descriptions (continued)

Field	Description
	0 DMA disabled (default) 1 DMA enabled
0 ADACKEN	Asynchronous clock output enable Enables the ADC's asynchronous clock source and the clock source output regardless of the conversion and input clock select (ADC_CFG[ADICLK]) settings of the ADC. Based on MCU configuration, the asynchronous clock may be used by other modules (see module introduction section). Setting this bit allows the clock to be used even while the ADC is idle or operating from a different clock source. Also, latency of initiating a single or first-continuous conversion with the asynchronous clock selected is reduced since the ADACK clock is already operational. 0 Asynchronous clock output disabled; Asynchronous clock only enabled if selected by ADICLK and a conversion is active. 1 Asynchronous clock and clock output enabled regardless of the state of the ADC

13.6.8 General status register (ADCx_GS)

Controls the calibration, continuous convert, hardware averaging functions, conversion active, hardware/software trigger select, compare function and voltage reference select of the ADC module.

Address: Base address + 1Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W														w1c	w1c	
Reset														0	0	0

ADCx_GS field descriptions

Field	Description
31–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 AWKST	Asynchronous wakeup interrupt status Holds the status of asynchronous interrupt status that occured during stop mode. This bit is set when ipg_stop is deasserted and ipg_clk has started. It is cleared by writing '1' to it. Clearing this bit also deasserts the Asynchronous interrupt to CPU. 1 Asynnchronous wake up interrupt occured in stop mode. 0 No asynchronous interrupt.
1 CALF	Calibration Failed Flag Displays the result of the calibration sequence. The calibration sequence will fail if Hardware Trigger is selected (i.e. ADC_CFG[ADTRG] = 1), or any ADC register is written, or any stop mode is entered before the calibration sequence completes. The CALF bit is cleared by writing a 1 to it. 0 Calibration completed normally. 1 Calibration failed. ADC accuracy specifications are not guaranteed.
0 ADACT	Conversion Active Indicates that a conversion or hardware averaging is in progress. ADACT is set when a conversion is initiated and cleared when a conversion is completed or aborted. 0 Conversion not in progress. 1 Conversion in progress.

13.6.9 Compare value register (ADCx_CV)

Contains compare values used to compare with the conversion result when the compare function is enabled (ADC_GC[ACFE]=1). The compare values are right justified as shown Figure . Therfore, the compare function only uses the compare value register bits that are related to the ADC mode of operation. (e.g. in 8 bit mode, CV1 = ADC_CV[7:0] and CV2 = ADC_CV[23:16], similarly in 10 bit mode, CV1 = ADC_CV[9:0] and CV2 = ADC_CV[25:16] etc.) The compare value 2 in this register is utilized only when the compare range function is enabled (ADC_GC[ACREN]=1).

Address: Base address + 20h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

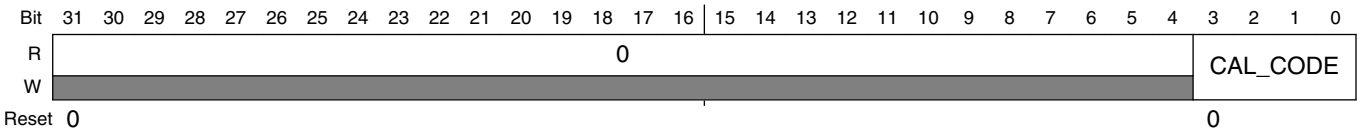
ADCx_CV field descriptions

Field	Description
31–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–16 CV2	Compare Value 2 Contains a compare value used to compare with the conversion result when the compare function and compare range function are enabled (ADC_GC[ACFE]=1, ADC_GC[ACREN]=1).
15–12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
CV1	Compare Value 1 Contains a compare value used to compare with the conversion result when the compare function ais enabled (ADC_GC[ACFE]=1).

13.6.10 Offset correction value register (ADCx_OFS)

Contains the user-defined offset error correction value. This register is 13 bits wide. The value in the most significant bit (13th bit) is the operation bit. If this bit is ‘0’ then the value in the other 12 bits is added with the converted result value to generate final result to be loaded into ADC_Rn; if this bit is ‘1’ then this field is subtracted from converted value to generate final result (ADC_Rn).

Address: Base address + 24h offset



ADCx_OFS field descriptions

Field	Description
31–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12 SIGN	Sign bit 0 The offset value is added with the raw result 1 The offset value is subtracted from the raw converted value
OFS	Offset value User configurable offset value.

13.6.11 Calibration value register (ADCx_CAL)

Contains calibration information that is generated by the calibration function. This register contains a calibration value of four bits(CAL[3:0]); this is automatically set once the self calibration sequence is done (ADC_SC[CAL] bit is cleared). If this register is written to by the user after calibration, the linearity error specifications may not be met.

Address: Base address + 28h offset

ADCx_CAL field descriptions

Field	Description
31–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
CAL_CODE	Calibration Result Value This value is automatically loaded and updated at the end of calibration.

Chapter 14
AHB to IP Bridge (AIPSTZ)

14.1 Overview

This section provides an overview of the AHB to IP Bridge (AIPSTZ). This particular peripheral is designed as the bridge between AHB bus and peripherals with the lower bandwidth IP Slave (IPS) buses.

14.1.1 Features

The following list summarizes the key features of the bridge:

- The bridge supports the IPS slave bus signals. This interface is only meant for slave peripherals.
- The bridge supports 8-, 16-, and 32-bit IPS peripherals. (Accesses larger than the size of a peripheral are not supported, except to 32-bit memory.)
- The bridge supports a pair of IPS accesses for 64-bit and certain misaligned AHB transfers to 32-bit memory in 64-bit platforms.
- The bridge directly supports up to 32 16-Kbyte external IPS peripherals, and 2 global external IPS peripheral spaces. The bridge occupies 1 MBytes of total address space.
- The bridge provides configurable per-block and per-master access protections. Access permissions are based on bus master (e.g. DMA or core) privilege levels and resource domain. More details on the protection features and configuration can be found in the Security Reference Manual
- Peripheral read transactions require a minimum of 2 hclk clocks, and unbuffered write transactions require a minimum of 3 hclk clocks.
- The bridge uses one single asynchronous reset and one global clock.

14.2 Clocks

The following table describes the clock sources for AIPSTZ. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 14-1. AIPSTZ Clocks

Clock name	Clock Root	Description
hclk	ahb_clk_root	Module clock

14.3 Functional Description

The AIPS bridge serves as a protocol translator between the AHB system bus and the IP bus.

Support is provided for generating a pair of 32-bit IP bus accesses when targeted by a 64-bit system bus access, or a misaligned access which crosses a 32-bit boundary. No other bus-sizing access support is provided.

The AHB to IP bridge is the interface between the AHB and on-chip IPS peripherals, which are sub-blocks containing readable/writable control and status registers.

The AHB master reads and writes these registers through the AIPSTZ. The bridge generates block enables, the block address, transfer attributes, byte enables and write data as inputs to the IPS peripherals. The bridge captures read data from the IPS interface and drives it on the AHB.

Each bridge that connects to the IPS (or peripherals) are referred as AIPS. The chip has three separate AIPS modules, and peripherals are grouped and assigned under each AIPS block. The list of peripherals are indicated as n-1, n-2, and n-3 for AIPS-1, AIPS-2, and AIPS-3 respectively.

AIPS occupies a 1-Mbyte portion of the address space. The register maps of the IPS peripherals are located on 16-Kbyte boundaries. Each IPS peripheral is allocated one 16-Kbyte block of the memory map, and is activated by one of the block enables from the bridge. Up to thirty-two 16-Kbyte external IPS peripherals may be implemented, occupying contiguous blocks of 16-Kbytes. Two global external IPS block enables are available for the remaining address space to allow for customization and expansion of addressed peripheral devices. In addition, a single "non-global" block enable is also asserted whenever any of the thirty-two non-global block enables is asserted.

The bridge is responsible for indicating to IPS peripherals if an access is in supervisor or user mode. It may block user mode accesses to certain IPS peripherals or it may allow the individual IPS peripherals to determine if user mode accesses are allowed. In addition, peripherals may be designated as write-protected.

The bridge supports the notion of "trusted" masters for security purposes. Masters may be individually designated as trusted for reads, trusted for writes, or trusted for both reads and writes, as well as being forced to look as though all accesses from a master are in user-mode privilege level. Refer to AIPSTZ Memory Map/Register Definition for more information.

The AIPSTZ prevents access to a peripheral if the transaction originated from a source from a resource domain that has been explicitly omitted. Resource domains are assigned in the RDC submodule. Please refer to the RDC chapter for programming details.

All peripheral devices are expected to only require aligned accesses equal to or smaller in size than the peripheral size. An exception to this rule is supported for 32-bit peripherals to allow memory to be placed on the IPS.

14.4 Access Protections

The AIPSTZ bridge provides programmable access protections for both masters and peripherals. It allows the privilege level of a master to be overridden, forcing it to user-mode privilege, and allows masters to be designated as trusted or untrusted.

Peripherals may require supervisor privilege level for access, may restrict access to a trusted master only, and may be write-protected. IP bus peripherals are subject to access control policies set in both CSU registers and AIPSTZ registers. An access is blocked if it is denied by either policy.

Masters and peripherals are assigned to one or more resource domains in the RDC submodule (see the RDC chapter for details). Depending on RDC programming, masters transactions through the AIPSTZ may or may not be allowed access to peripherals in different resource domains.

14.5 Access Support

Aligned 64-bit accesses, aligned and misaligned word and half word accesses, as well as byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the IPS.

Peripheral registers must not be misaligned, although no explicit checking is performed by the AIPS bridge. The bridge will perform two IPS transfers for 64-bit accesses, word accesses with byte offsets of 1, 2, or 3, and for half word accesses with a byte offset of 3. All other accesses will be performed with a single IPS transfer.

Only aligned half word and byte accesses are supported for 16-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

Only byte accesses are supported for 8-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

14.6 Initialization Information

The AIPS bridge should be programmed before use.

The following registers should be initialized: The Master Privilege Registers (AIPSTZ_MPRs), the Peripheral Access Control registers (AIPSTZ_PACRs), and the Off-platform Peripheral Access Control registers (AIPSTZ_OPACRs) described in AIPSTZ Memory Map/Register Definition.

14.6.1 Security Block

The AIPSTZ contains a security block that is connected to each off-platform peripheral. This block filters accesses based on write/read, non-secure, and supervisor signals.

Each peripheral can be individually configured to allow or deny each of the following transactions as described in the table below:

Table 14-2. Peripheral Access Configuration options

Config Bit	Write	Non-Secure	Supervisor	Meaning
0	0	0	0	Secure User Read
1	0	0	1	Secure Supervisor Read
2	0	1	0	Non-Secure User Read
3	0	1	1	Non-Secure Supervisor Read
4	1	0	0	Secure User Write
5	1	0	1	Secure Supervisor Write
6	1	1	0	Non-Secure User Write
7	1	1	1	Non-Secure Supervisor Write

Each peripheral has a security configuration (sec_config_X) input for determining whether to allow or deny a given access type. These are 8-bit vectors, with each bit corresponding to one of the transactions above as listed in the Config Bit column of Table 14-2. If the bit is asserted (1'b1), the transaction is allowed. If the bit is negated (1'b0), the transaction is not allowed.

For example, if peripheral 0 is configured as follows:

sec_config_0 [7:0] = 8'b0011_0011

This peripheral can only be accessed by secure transactions. Bits 0, 1, 4, and 5 are asserted and these bits refer to the four types of secure transactions. If an insecure transaction is attempted to this peripheral, it will result in an error.

Eight bits per peripheral across an entire system can result in a large number of configuration bits that must be assigned and controlled, most likely in a series of registers in another block. To reduce the number of register bits required predefined sets of security profiles can be defined and encapsulated in an external security translation block. The table below describes one set of security profiles that has been proposed for use with the AIPSTZ.

Table 14-3. Security Levels

CSU_SEC_LEVEL	Non-Secure User	Non-Secure Supervisor	Secure User	Secure Supervisor
0	RD+WR	RD+WR	RD+WR	RD+WR
1	NOT ALLOWED	RD+WR	RD+WR	RD+WR
2	Read Only	Read Only	RD+WR	RD+WR
3	NOT ALLOWED	Read Only	RD+WR	RD+WR
4	NOT ALLOWED	NOT ALLOWED	RD+WR	RD+WR
5	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	RD+WR
6	NOT ALLOWED	NOT ALLOWED	Read Only	Read Only
7	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED

Information regarding CSU is provided in the Security Reference Manual. Contact your Freescale representative for information about obtaining this document.

A 3-bit input, 8-bit output translation block can be used such that only three register bits are required to set the security profile and the translation block will drive the correct 8-bit configuration vector. Each peripheral connected to the AIPSTZ would require this translation block. The top level AIPSTZ has this three bit input line `csu_sec_level[2:0]' corresponding to each peripheral X.

14.7 AIPSTZ Memory Map/Register Definition

The memory map for the AIPS SW-visible registers is shown in the table below.

The MPROT and OPACR fields are 4 bits in width. Some bits may be reserved depending on device.

AIPSTZ memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
0	Master Priviledge Registers (AIPSTZ_MPR)	32	R/W	7700_0000h	14.7.1/428
40	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR)	32	R/W	4444_4444h	14.7.2/431
44	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR1)	32	R/W	4444_4444h	14.7.3/434
48	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR2)	32	R/W	4444_4444h	14.7.4/437
4C	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR3)	32	R/W	4444_4444h	14.7.5/440
50	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR4)	32	R/W	4444_4444h	14.7.6/443

14.7.1 Master Priviledge Registers (AIPSTZ_MPR)

Each AIPSTZ_MPR specifies 16 4-bit fields defining the access privilege level associated with a bus master in the platform, as well as specifying whether write accesses from this master are bufferable shown in Table 14-4

The registers provide one field per bus master, where field 15 corresponds to master 15, field 14 to master 14,... field 0 to master 0 (typically the processor core). The master index allocation is shown in Table 14-5.

Table 14-4. MPROT Field

Bit	Field	Description
3	MBW	**Master Buffer Writes** - This bit determines whether the AIPSTZ is enabled to buffer writes from this master.
2	MTR	**Master Trusted for Reads** - This bit determines whether the master is trusted for read accesses.
1	MTW	**Master Trusted for Writes** - This bit determines whether the master is trusted for write accesses.
0	MPL	**Master Privilege Level** - This bit determines how the privilege level of the master is determined.

NOTE

The reset value is set to 0000_0000_7700_0000, which makes master 0 and master 1 (ARM CORE) the trusted masters. Trusted software can change the settings after reset.

Table 14-5. Master Index Allocation

Master Index	Master Name	Comments
Master 0	All masters excluding ARM core, SDMA and CAAM	Share the same number allocation.
Master 1	ARM A7 CORE	
Master 2	CAAM	
Master 3	SDMA	
Master 4	Reserved	
Master 5	ARM M4 Core	
Master 6-15	Reserved

14.7.2 Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ_OPACR has the following format shown in Table 14-6

Table 14-6. OPAC Field

Bit	Field	Description
3	BW	**Buffer Writes** - This bit determines whether write accesses to this peripheral are allowed to be buffered.[1]
2	SP	**Supervisor Protect** - This bit determines whether the peripheral requires supervisor privilege level for access.
1	WP	**Write Protect** - This bit determines whether the peripheral allows write accesses.
0	TP	**Trusted Protect** - This bit determines whether the peripheral allows accesses from an untrusted master.

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

Chapter 15
AHB-to-APBH Bridge with DMA (APBH-Bridge-DMA)

15.1 Overview

The AHB-to-APBH bridge provides the chip with an inexpensive peripheral attachment bus running on the AHB's HCLK.

(The H in APBH denotes that the APB*H* is synchronous to HCLK.)

As shown in the figure below, the AHB-to-APBH bridge includes the AHB-to-APB PIO bridge for a memory-mapped I/O to the APB devices, as well as a central DMA facility for devices on this bus and a vectored interrupt controller for the ARM core. Each one of the APB peripherals, including the vectored interrupt controller, is documented in their respective chapters.

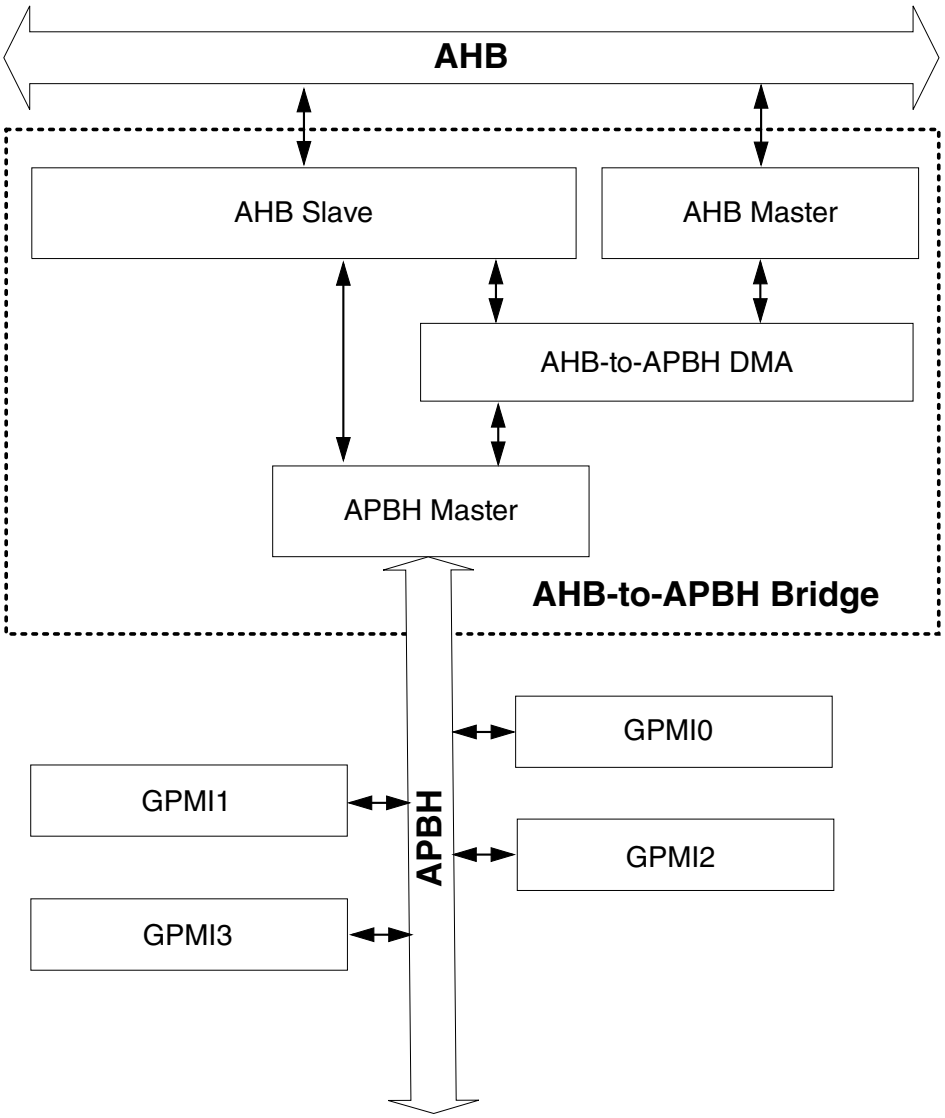

Figure 15-1. AHB-to-APBH Bridge DMA Block Diagram

There is no separate DMA bus for these devices. Contention between the DMA's use of the APBH bus and the AHB-to-APB bridge functions' use of the APBH is mediated by an internal arbitration logic. For contention between these two units, the DMA is favored and the AHB slave will report "not ready" through its HREADY output until the bridge transfer can complete. The arbiter tracks repeated lockouts and inverts the priority, guaranteeing the ARM platform every fourth transfer on the APB.

15.2 Clocks

The table found here describes the clock sources for APBH.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 15-1. APBH Clocks

Clock name	Clock Root	Description
hclk	bch_clk_root	Module clock

15.3 APBH DMA

The DMA supports four channels of DMA services, as shown in the following table. The shared DMA resource allows each independent channel to follow a simple chained command list.

Command chains are built up using the general structure, as shown in Figure 15-2.

Table 15-2. APBH DMA channel assignments

APBH DMA Channel #	Usage
0	GPMI0
1	GPMI1
2	GPMI2
3	GPMI3

A single command structure or channel command word specifies a number of operations to be performed by the DMA in support of a given device. Thus, the ARM platform can set up large units of work, chaining together many DMA channel command words, pass them off to the DMA, and have no further concern for the device until the DMA completion interrupt occurs. The goal is to have enough intelligence in the DMA and the devices to keep the interrupt frequency from any device below 1 KHz (arrival intervals longer than 1 ms).

A single command structure can issue 32-bit PIO write operations to key registers in the associated device using the same APB bus and controls that it uses to write DMA data bytes to the device. For example, this allows a chain of operations to be issued to the GPMI controller to send NAND command bytes, address bytes, and data transfers where the command and the address structure is completely under software control, but the administration of that transfer is handled autonomously by the DMA. Each DMA structure can have 0–15 PIO words appended to it. The CMDPIOWORDS field, if non-zero, instructs the DMA engine to copy these words to the APB, beginning at the first register address offset for the peripheral and and incrementing the register offset each cycle.

The DMA master generates only normal read/write transfers to the APBH. It does *not* generate set, clear, or toggle (SCT) transfers.

After any requested PIO words have been transferred to the peripheral, the DMA examines the two-bit command field in the channel command structure. Table 15-3 shows the four commands implemented by the DMA.

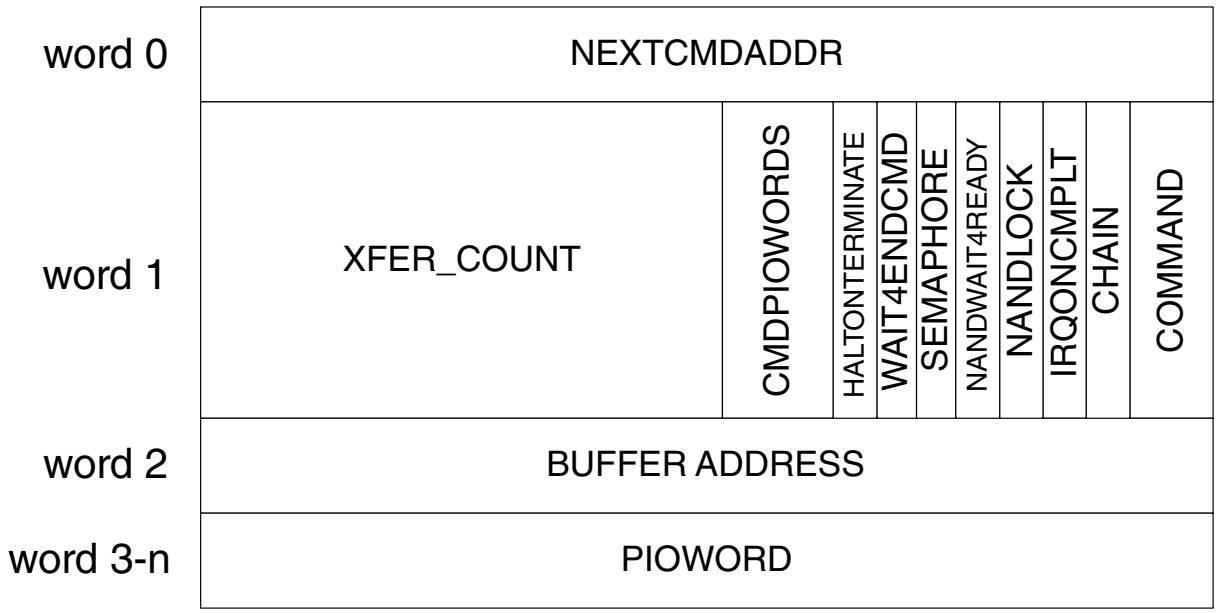

Figure 15-2. AHB-to-APBH Bridge DMA channel command structure

Table 15-3. APBH DMA commands

DMA Command	Usage
00	NO_DMA_XFER. Perform any requested PIO word transfers, but terminate the command before any DMA transfer.
01	DMA_WRITE. Perform any requested PIO word transfers, then perform a DMA transfer from the peripheral for the specified number of bytes.
10	DMA_READ. Perform any requested PIO word transfers and then perform a DMA transfer to the peripheral for the specified number of bytes.
11	DMA_SENSE. Perform any requested PIO word transfers, then perform a conditional branch to the next chained device. Follow the NEXTCMD_ADDR pointer if the peripheral sense is false. Follow the BUFFER_ADDRESS as a chain pointer if the peripheral sense line is true. This command becomes a no-operation for any channel other than a GPMI channel.

DMA_WRITE operations copy data bytes to the system memory (on-chip RAM or SDRAM) from the associated peripheral.

DMA_READ operations copy data bytes to the APB peripheral from the system memory. The DMA engine contains a shared byte aligner that aligns bytes from system memory to or from the peripherals. Peripherals always assume little-endian-aligned data arrives or

departs on their 32-bit APB. The DMA_READ transfer uses the BUFFER_ADDRESS word in the command structure to point to the DMA data buffer to be read by the DMA_READ command.

The NO_DMA_XFER command is used to write PIO words to a device without performing any DMA data byte transfers. This command is useful in such applications as activating the NAND devices CHECKSTATUS operation. The check status command reads a status byte from the NAND device, performs an XOR and MASK against an expected value supplied as part of the PIO transfer. Once the read check completes (see NAND Read Status Polling Example), the NO_DMA_XFER command completes. The result in the peripheral is that its sense line is driven by the results of the comparison. The sense flip-flop is only updated by CHECKSTATUS for the device that is executed. At some future point, the chain contains a DMA command structure with the fourth and final command value, that is, the DMA_SENSE command.

As each DMA command completes, it triggers the DMA to load the next DMA command structure in the chain. The normal flow list of DMA commands is found by following the NEXTCMD_ADDR pointer in the DMA command structure. The DMA_SENSE command uses the DMA buffer pointer word of the command structure to point to an alternate DMA command structure chain or list. The DMA_SENSE command examines the sense line of the associated peripheral. If the sense line is false, then the DMA follows the standard list found whose next command is found from the pointer in the NEXTCMD_ADDR word of the command structure. If the sense line is true, then the DMA follows the alternate list whose next command is found from the pointer in the DMA Buffer Pointer word of the DMA_SENSE command structure (see Figure 15-2). The sense command ignores the CHAIN bit, so that both pointers must be valid when the DMA comes to a sense command.

If the wait-for-end-command bit (WAIT4ENDCMD) is set in a command structure, the DMA channel waits for the device to signal completion of a command by toggling the endcmd signal before proceeding to load and execute the next command structure. Then, if DECREMENT_SEMAPHORE is set, the semaphore is decremented after the end command is seen.

A detailed bit-field view of the DMA command structure is shown in the following table, which shows a field that specifies the number of bytes to be transferred by this DMA command. The transfer-count mechanism is duplicated in the associated peripheral, either as an implied or as a specified count in the peripheral.

Table 15-4. DMA channel command word in system memory

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00

Table continues on the next page...

Table 15-4. DMA channel command word in system memory (continued)

Number DMA Bytes to Transfer	Number PIO Words to Write				HALTONTERMINATE	WAIT4ENDCMD	DECREMENT SEMAPHORE	NANDwAIT4READY	NANDLOCK	IRQ_COMPLETE	CHAIN	COMMAND
DMA Buffer or Alternate CCW												
Zero or More PIO Words to Write to the Associated Peripheral Starting at its Base Address on the APBH Bus												

Figure 15-2 also shows the CHAIN bit in bit 2 of the second word of the command structure. This bit is set to 1, if the NEXT_COMMAND_ADDRESS contains a pointer to another DMA command structure. If a null pointer (0) is loaded into the NEXT_COMMAND_ADDRESS, it is not detected by the DMA hardware. Only the CHAIN bit indicates whether a valid list exists beyond the current structure.

If the IRQ_COMPLETE bit is set in the command structure, then the last act of the DMA before loading the next command is to set the interrupt-status bit corresponding to the current channel. The sticky interrupt request bit in the DMA CSR remains set until cleared by the software. It can be used to interrupt the ARM platform.

The NAND_LOCK bit is monitored by the DMA channel arbiter. succeeds in the arbiter with its NAND_LOCK bit set, then the arbiter ignores the other NAND channels until a command is completed in which the NAND_LOCK is not set. Notice that the semantic here is that the NAND_LOCK state is to limit scheduling of a non-locked DMA. A DMA channel can go from unlocked to locked in the arbiter at the beginning of a command when the NAND_LOCK bit is set. When the last DMA command of an atomic sequence is completed, the lock should be removed. To accomplish this, the last command does not have the NAND_LOCK bit. It is still locked in the atomic state within the arbiter when the command starts, so that it is the only NAND command that can be executed. At the end, it drops from the atomic state within the arbiter.

The NAND_WAIT4READY bit also has a special use for GPMI channels (from channel to channel), i.e., the NAND device channels. The GPMI peripheral supplies a sample of the ready line from the NAND device. This ready value is used to hold off of a command with this bit set until the ready line is asserted to 1. Once the arbiter sees a command with a wait-for-ready set, it holds off that channel until ready is asserted.

Receiving an IRQ for HALTONTERMINATE (HOT) is a feature in the APBH DMA descriptor that allows GPMI to signal to the DMA engine that an error has occurred. If a commmand is stalled due to an error, a HOT signal is sent from the peripheral to the DMA engine and causes an IRQ after terminating the DMA descriptor being executed.

Therefore, it is recommended that software use this signal as follows:

- Always set HALTONTERMINATE to 1 in a DMA descriptor. That way, if a peripheral signals HOT, the transfer will end, leaving the peripheral block and the DMA engine synchronized (but at the end of a command).
- When an IRQ from an APBH channel is received, and the IRQ is determined to be due to an error (as opposed to an IRQONCOMPLETE interrupt) the software should:
  - Reset the channel.
  - Determine the error from error reporting in the peripheral block, then manage the error in the peripheral that is attached to that channel in whatever appropriate way exists for that device (software recovery, device reset, block reset, etc).

Each channel has an eight-bit counting semaphore that controls whether it is in the idle state. When the semaphore is non-zero, the channel is ready to run, process commands and perform DMA transfers. Whenever a command finishes its DMA transfer, it checks the DECREMENT_SEMAPHORE bit. If set, it decrements the counting semaphore. If the semaphore goes to 0 as a result, then the channel enters the idle state and remains there until the semaphore is incremented by the software. When the semaphore goes to non-zero and the channel is in its idle state, then it uses the value in the APBH_CHn_NXTCMDAR register (next command address register) to fetch a pointer to the next command to process.

NOTE

This is a double indirect case. This method allows the software to append to a running command list under the protection of the counting semaphore.

To start processing the first time, software creates the command list to be processed. It writes the address of the first command into the APBH_CHn_NXTCMDAR register, and then writes 1 to the counting semaphore in APBH_CHn_SEMA. The DMA channel loads APBH_CHn_CURCMDAR register and then enters the normal state machine processing for the next command. When the software writes a value to the counting semaphore, it is added to the semaphore count by hardware, protecting the case where both hardware and software are trying to change the semaphore on the same clock edge.

Software can examine the value of APBH_CHn_CURCMDAR at any time to determine the location of the command structure currently being processed.

15.4 NAND Read Status Polling Example

The following figure shows a more complicated scenario.

This subset of a NAND device workload shows that the first two command structures are used during the data-write phase of an NAND device write operation (CLE and ALE transfers omitted for clarity).

- After writing the data, one must wait until the NAND device status register indicates that the write charge has been transferred. This is built into the workload using a check status command in the NAND in a loop created from the next two DMA command structures.
- The NO_DMA_TRANSFER command is shown here performing the read check, followed by a DMA_SENSE command to branch the DMA command structure list, based on the status of a bit in the external NAND device.

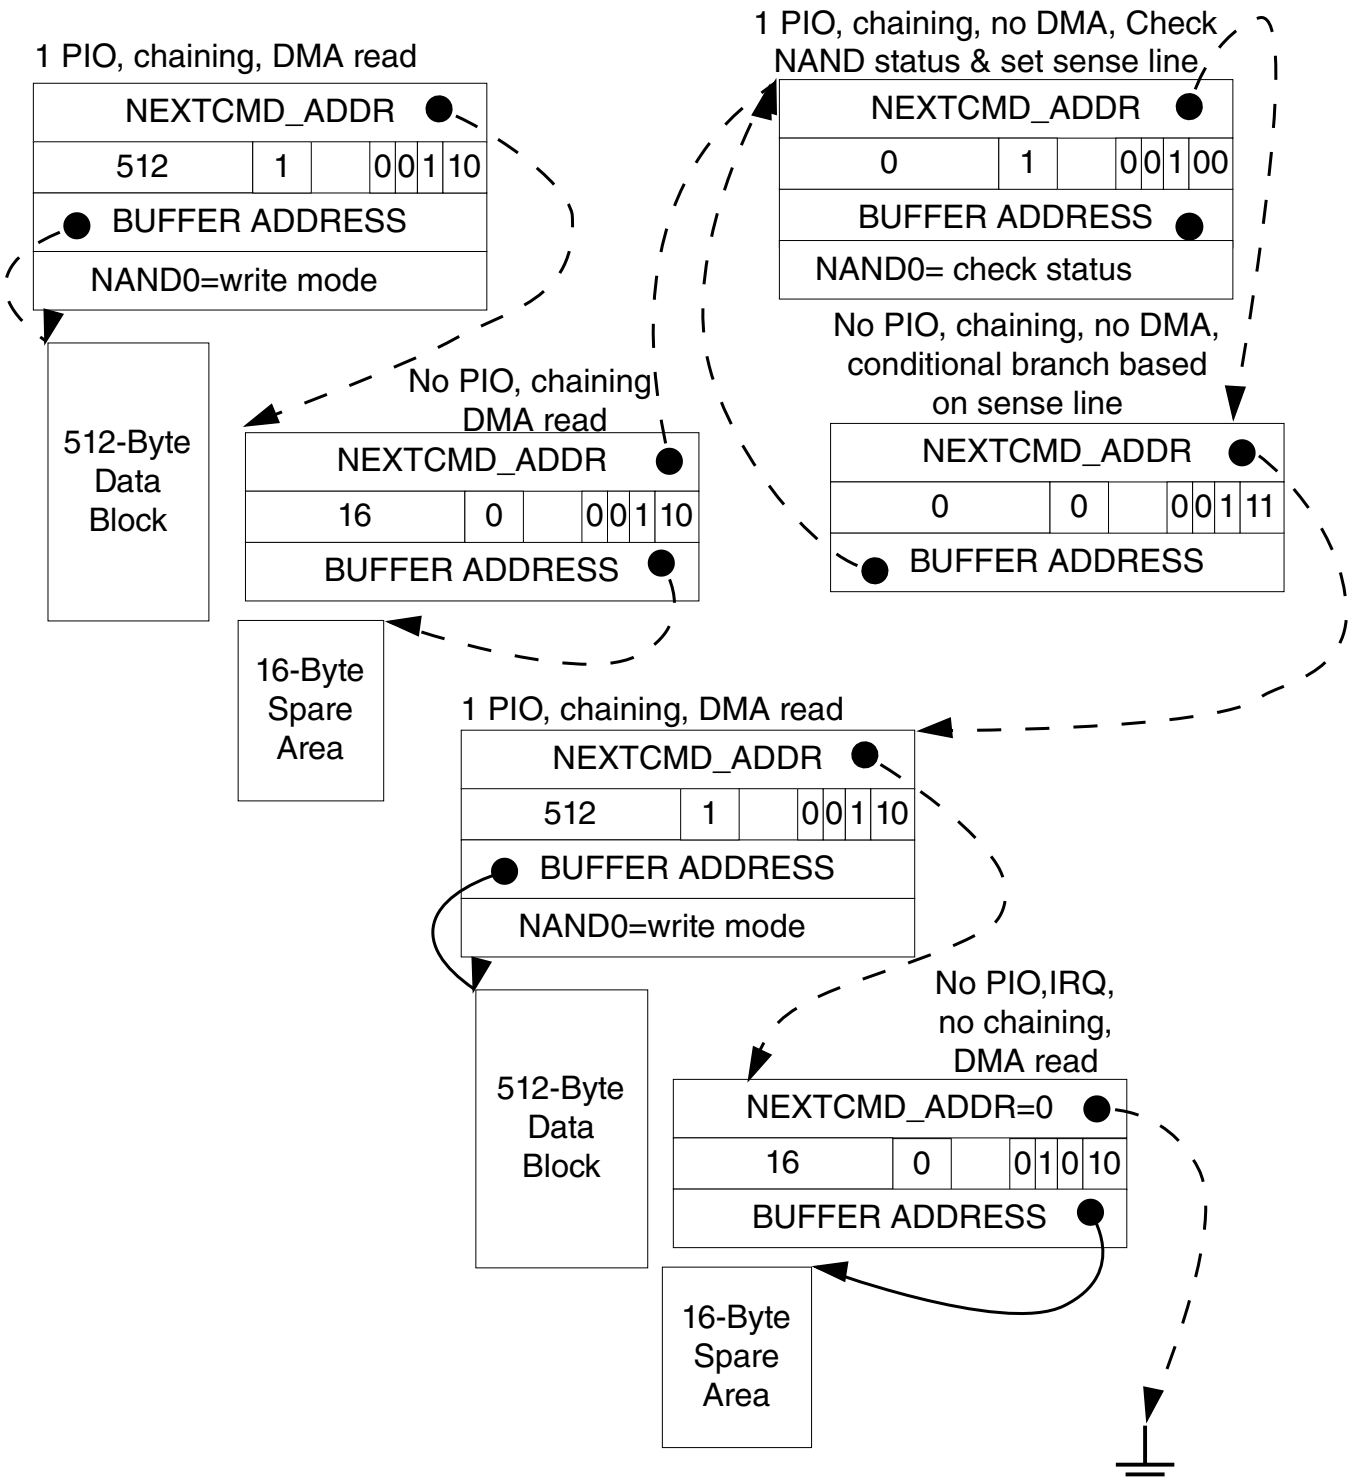

Figure 15-3. AHB-to-APBH Bridge DMA NAND Read Status Polling with DMA Sense Command

The example in the above figure shows the workload continuing immediately to the next NAND page transfer. However, one could perform a second sense operation to see if an error has occurred after the write. One could then point the sense command alternate branch at a NO_DMA_XFER command with the interrupt bit set. If the CHAIN bit is not

set on this failure branch, then the ARM platform is interrupted immediately, and the channel process is also immediately terminated in the presence of a workload-detected NAND error bit.

Note that each word of the three-word DMA command structure corresponds to a PIO register of the DMA that is accessible on the APBH bus. Normally, the DMA copies the next command structure onto these registers for processing at the start of each command by following the value of the pointer previously loaded into the NEXTCMD_ADDR register.

To start DMA processing for the first command, initialize the PIO registers of the desired channel, as follows:

- First, load the next command address register with a pointer to the first command to be loaded.
- Then, write 1 to the counting semaphore register. This causes the DMA to schedule the targeted channel for the DMA command structure load, just as if it had finished its previous command.

15.5 APBH Memory Map/Register Definition

APBH Hardware Register Format Summary

15.5.1 AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0*n*)

The APBH CTRL 0 provides overall control of the AHB to APBH bridge and DMA.

This register contains module softreset, clock gating, channel clock gating/freeze bits.

Address: 180_4000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

APBH_CTRL0*n* field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal APBH DMA operation. Set this bit to one (default) to disable clocking with the APBH DMA and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the APBH DMA block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 AHB_BURST8_EN	Set this bit to one (default) to enable AHB 8-beat burst. Set to zero to disable 8-beat burst on AHB interface.
28 APB_BURST_EN	Set this bit to one to enable apb master do a continous transfers when a device request a burst dma. Set to zero will treat a burst dma request as 4/8 individual requests.
27–16 RSVD0	This field is reserved. Reserved, always set to zero.
CLKGATE_CHANNEL	These bits must be set to zero for normal operation of each channel. When set to one they gate off the individual clocks to the channels. 0x0001 **NAND0** — 0x0002 **NAND1** — 0x0004 **NAND2** — 0x0008 **NAND3** — 0x0010 **NAND4** — 0x0020 **NAND5** — 0x0040 **NAND6** — 0x0080 **NAND7** — 0x0100 **SSP** —

15.5.2 AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1*n*)

The APBH CTRL one provides overall control of the interrupts generated by the AHB to APBH DMA. This register contains the per channel interrupt status bits and the per channel interrupt enable bits. Each channel has a dedicated interrupt vector in the vectored interrupt controller.

EXAMPLE

```
BF_WR(APBH_CTRL1, CH5_CMDCMPLT_IRQ, 0);  // use bitfield write macro
```

```
                    BF_APBH_CTRL1.CH5_CMDCMPLT_IRQ = 0;      // or, assign to register
struct's bitfield
```

Address: 180_4000h base + 10h offset + (4d × i), where i=0d to 3d

APBH_CTRL1*n* field descriptions (continued)

Field	Description
25 CH9_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 9.
24 CH8_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 8.
23 CH7_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 7.
22 CH6_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 6.
21 CH5_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 5.
20 CH4_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 4.
19 CH3_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 3.
18 CH2_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 2.
17 CH1_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 1.
16 CH0_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 0.
15 CH15_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 15. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
14 CH14_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 14. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.

Table continues on the next page...

APBH_CTRL1*n* field descriptions (continued)

Field	Description
13 CH13_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 13. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
12 CH12_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 12. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
11 CH11_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 11. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
10 CH10_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 10. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
9 CH9_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 9. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
8 CH8_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 8. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
7 CH7_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 7. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
6 CH6_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 6. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
5 CH5_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 5. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
4 CH4_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 4. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
3 CH3_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 3. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
2 CH2_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 2. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.

Table continues on the next page...

APBH_CTRL1*n* field descriptions (continued)

Field	Description
1 CH1_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 1. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
0 CH0_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 0. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.

15.5.3 AHB to APBH Bridge Control and Status Register 2 (APBH_CTRL2*n*)

The APBH CTRL 2 provides channel error interrupts generated by the AHB to APBH DMA. This register contains the per channel interrupt status bits and the per channel interrupt enable bits. Each channel has a dedicated interrupt vector in the vectored interrupt controller.

EXAMPLE

```
                    BF_WR(APBH_CTRL1, CH5_CMDCMPLT_IRQ, 0);  // use bitfield write macro
                    BF_APBH_CTRL1.CH5_CMDCMPLT_IRQ = 0;      // or, assign to register
struct's bitfield
```

15.5.4 AHB to APBH Bridge Channel Register (APBH_CHANNEL_CTRL*n*)

The APBH CHANNEL CTRL provides reset/freeze control of each DMA channel. This register contains individual channel reset/freeze bits.

Address: 180_4000h base + 30h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

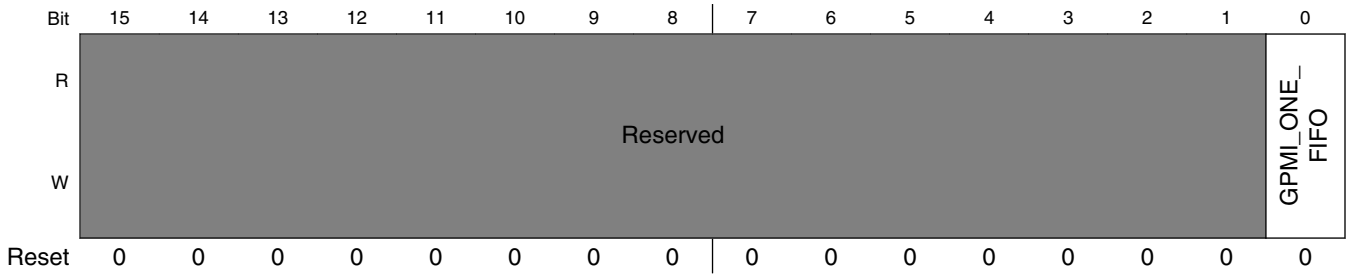
13–12 CH6	DMA burst size for GPMI channel 6. Do not change. GPMI only support burst size 4.
11–10 CH5	DMA burst size for GPMI channel 5. Do not change. GPMI only support burst size 4.
9–8 CH4	DMA burst size for GPMI channel 4. Do not change. GPMI only support burst size 4.
7–6 CH3	DMA burst size for GPMI channel 3. Do not change. GPMI only support burst size 4.
5–4 CH2	DMA burst size for GPMI channel 2. Do not change. GPMI only support burst size 4.
3–2 CH1	DMA burst size for GPMI channel 1. Do not change. GPMI only support burst size 4.
CH0	DMA burst size for GPMI channel 0. Do not change. GPMI only support burst size 4.



15.5.7 AHB to APBH DMA Debug Register (APBH_DEBUG)

This register is for debug purpose.

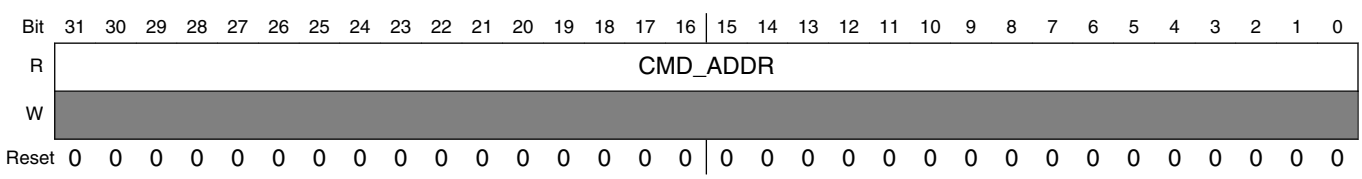
The debug register is for internal use only. Not recommend for customer useage.

Address: 180_4000h base + 60h offset = 180_4060h

APBH_DEBUG field descriptions

Field	Description
31–1 -	This field is reserved. Reserved, always set to zero.
0 GPMI_ONE_FIFO	Set to 0ne and the 8 GPMI channels will share the DMA FIFO, and when set to zero, the 8 GPMI channels will use its own DMA FIFO.

15.5.8 APBH DMA Channel n Current Command Address Register (APBH_CH*n*_CURCMDAR)



The APBH DMA channel n current command address register points to the multiword command that is currently being executed. Commands are threaded on the command address.

APBH DMA Channel n is controlled by a variable sized command structure. This register points to the command structure currently being executed.

EXAMPLE

```
pCurCmd = (apbh_chn_cmd_t *) APBH_CHn_CURCMDAR_RD(0);              // read the whole
register, since there is only one field
pCurCmd = (apbh_chn_cmd_t *) BF_RDn(APBH_CHn_CURCMDAR, 0, CMD_ADDR);  // or, use multi-
register bitfield read macro
pCurCmd = (apbh_chn_cmd_t *) APBH_CHn_CURCMDAR(0).CMD_ADDR;        // or, assign from
bitfield of indexed register's struct
```

Address: 180_4000h base + 100h offset + (112d × i), where i=0d to 15d

APBH_CH*n*_CURCMDAR field descriptions

Field	Description
CMD_ADDR	Pointer to command structure currently being processed for channel n.

15.5.9 APBH DMA Channel n Next Command Address Register (APBH_CH*n*_NXTCMDAR)

The APBH DMA Channel n Next Command Address register contains the address of the next multiword command to be executed. Commands are threaded on the command address. Set CHAIN to 1 in the DMA command word to process command lists.

APBH DMA Channel n is controlled by a variable sized command structure. Software loads this register with the address of the first command structure to process and increments the Channel n semaphore to start processing. This register points to the next command structure to be executed when the current command is completed.

EXAMPLE

```
APBH_CHn_NXTCMDAR_WR(0, (reg32_t) pCommandTwoStructure);         // write the entire
register, since there is only one field
BF_WRn(APBH_CHn_NXTCMDAR, 0, (reg32_t) pCommandTwoStructure);       // or, use multi-
register bitfield write macro
APBH_CHn_NXTCMDAR(0).CMD_ADDR = (reg32_t) pCommandTwoStructure;  // or, assign to bitfield
of indexed register's struct
```

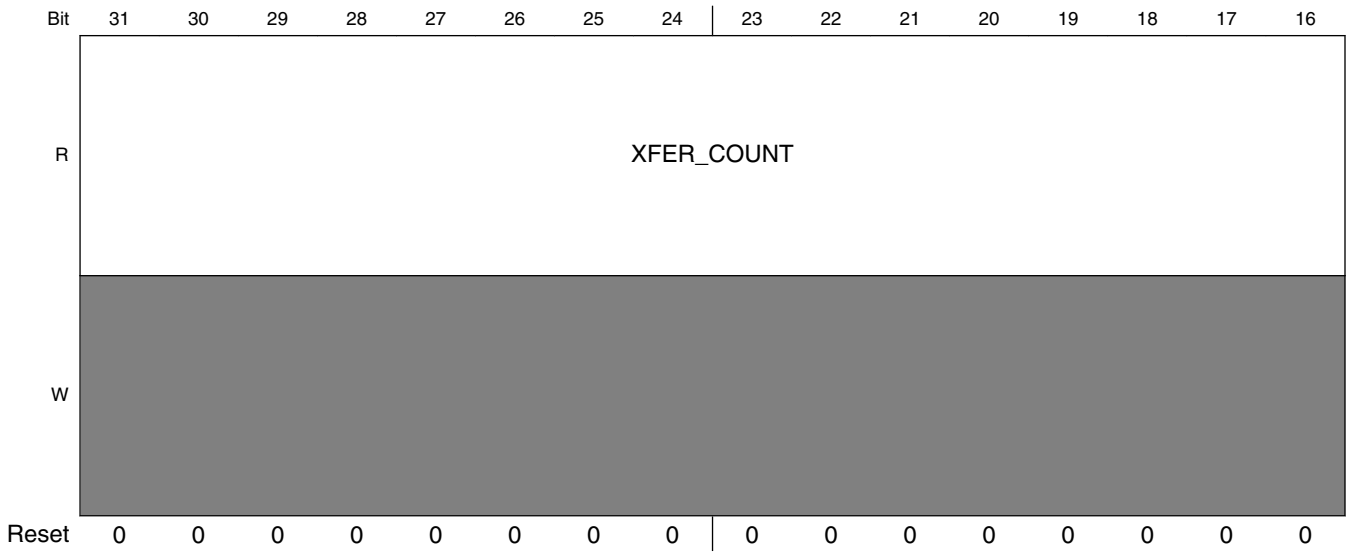
Address: 180_4000h base + 110h offset + (112d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	CMD_ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

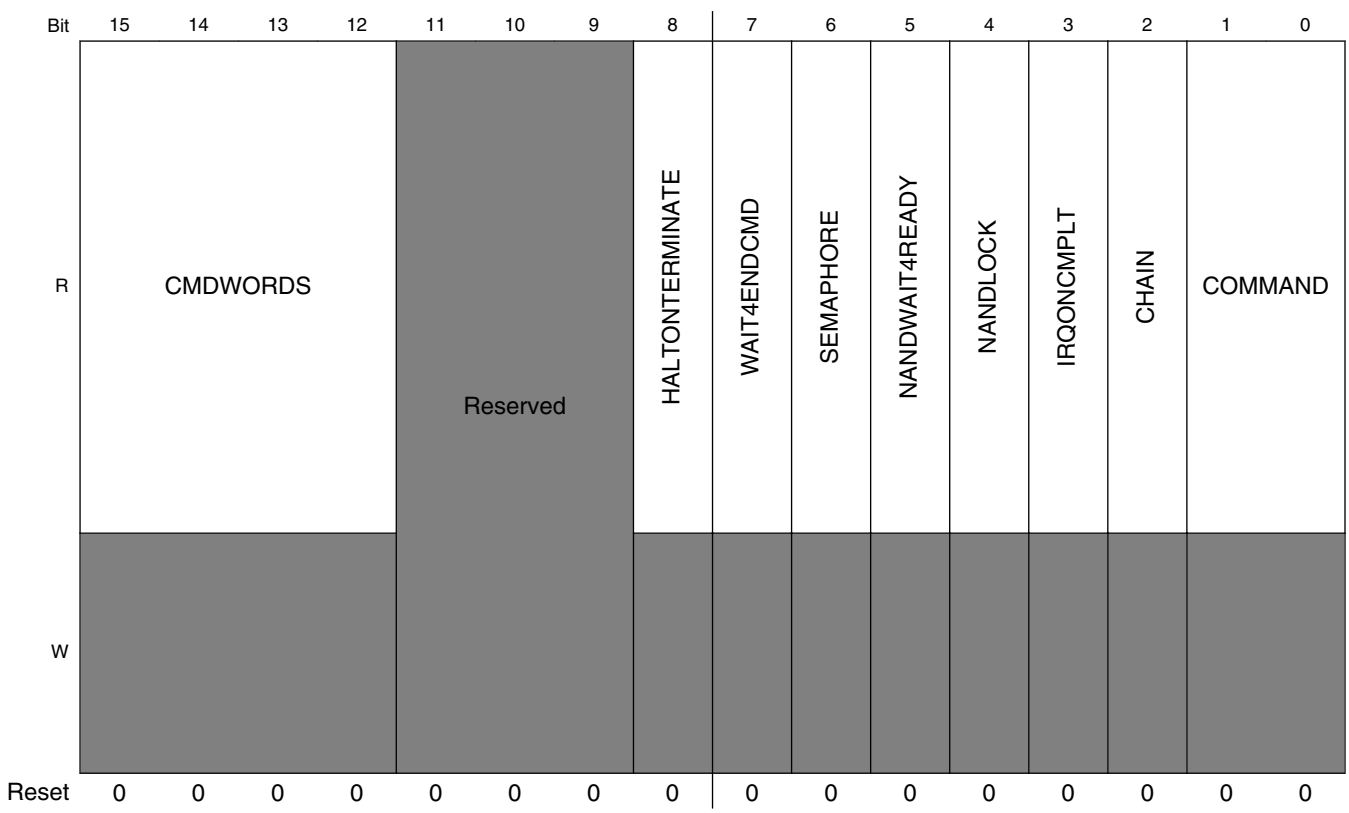
APBH_CH*n*_NXTCMDAR field descriptions

Field	Description
CMD_ADDR	Pointer to next command structure for channel n.

15.5.10 APBH DMA Channel n Command Register (APBH_CH*n*_CMD)



The APBH DMA Channel n command register specifies the DMA transaction to perform for the current command chain item.



The command register controls the overall operation of each DMA command for this channel. It includes the number of bytes to transfer to or from the device, the number of APB PIO command words included with this command structure, whether to interrupt at command completion, whether to chain an additional command to the end of this one and whether this transfer is a read or write DMA transfer.

EXAMPLE

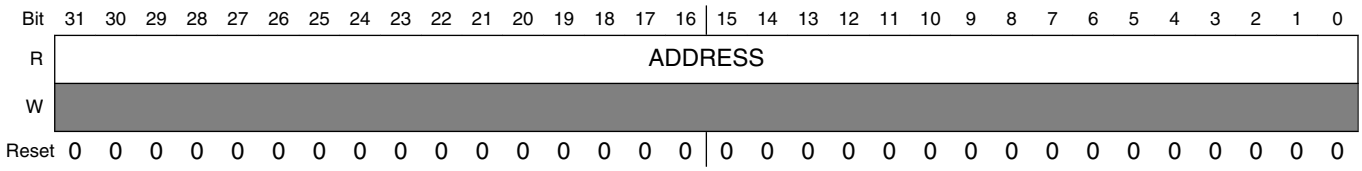
```
apbh_chn_cmd_t  dma_cmd;
dma_cmd.XFER_COUNT = 512;                                    // transfer 512 bytes
dma_cmd.COMMAND = BV_APBH_CHn_CMD_COMMAND__DMA_WRITE;  // transfer to system memory from
peripheral device
dma_cmd.CHAIN = 1;                                           // chain an additional command
structure on to the list
dma_cmd.IRQONCMPLT = 1;                                      // generate an interrupt on
completion of this command structure
```

Address: 180_4000h base + 120h offset + (112d × i), where i=0d to 15d

APBH_CH*n*_CMD field descriptions

Field	Description
31–16 XFER_COUNT	This field indicates the number of bytes to transfer to or from the appropriate PIO register in the GPMI0 device. A value of 0 indicates a 64 KBytes transfer.
15–12 CMDWORDS	This field indicates the number of command words to send to the GPMI0, starting with the base PIO address of the GPMI0 control register and incrementing from there. Zero means transfer NO command words
11–9 -	This field is reserved. Reserved, always set to zero.
8 HALTONTERMINATE	A value of one indicates that the channel will immeditately terminate the current descriptor and halt the DMA channel if a terminate signal is set. A value of 0 will still cause an immediate terminate of the channel if the terminate signal is set, but the channel will continue as if the count had been exhausted, meaning it will honor IRQONCMPLT, CHAIN, SEMAPHORE, and WAIT4ENDCMD.
7 WAIT4ENDCMD	A value of one indicates that the channel will wait for the end of command signal to be sent from the APBH device to the DMA before starting the next DMA command.
6 SEMAPHORE	A value of one indicates that the channel will decrement its semaphore at the completion of the current command structure. If the semaphore decrements to zero, then this channel stalls until software increments it again.
5 NANDWAIT4READY	A value of one indicates that the NAND DMA channel will will wait until the NAND device reports "ready" before executing the command. It is ignored for non-NAND DMA channels.
4 NANDLOCK	A value of one indicates that the NAND DMA channel will remain "locked" in the arbiter at the expense of other NAND DMA channels. It is ignored for non-NAND DMA channels.
3 IRQONCMPLT	A value of one indicates that the channel will cause the interrupt status bit to be set upon completion of the current command, i.e. after the DMA transfer is complete.
2 CHAIN	A value of one indicates that another command is chained onto the end of the current command structure. At the completion of the current command, this channel will follow the pointer in APBH_CHn_CMDAR to find the next command.
COMMAND	This bitfield indicates the type of current command: 0x0 **NO_DMA_XFER** — Perform any requested PIO word transfers but terminate command before any DMA transfer. 0x1 **DMA_WRITE** — Perform any requested PIO word transfers and then perform a DMA transfer from the peripheral for the specified number of bytes. 0x2 **DMA_READ** — Perform any requested PIO word transfers and then perform a DMA transfer to the peripheral for the specified number of bytes. 0x3 **DMA_SENSE** — Perform any requested PIO word transfers and then perform a conditional branch to the next chained device. Follow the NEXCMD_ADDR pointer if the perpheral sense is true. Follow the BUFFER_ADDRESS as a chain pointer if the peripheral sense line is false.

15.5.11 APBH DMA Channel n Buffer Address Register (APBH_CH*n*_BAR)



The APBH DMA Channel n buffer address register contains a pointer to the data buffer for the transfer. For immediate forms, the data is taken from this register. This is a byte address which means transfers can start on any byte boundary.

This register holds a pointer to the data buffer in system memory. After the command values have been read into the DMA controller and the device controlled by this channel, then the DMA transfer will begin, to or from the buffer pointed to by this register.

EXAMPLE

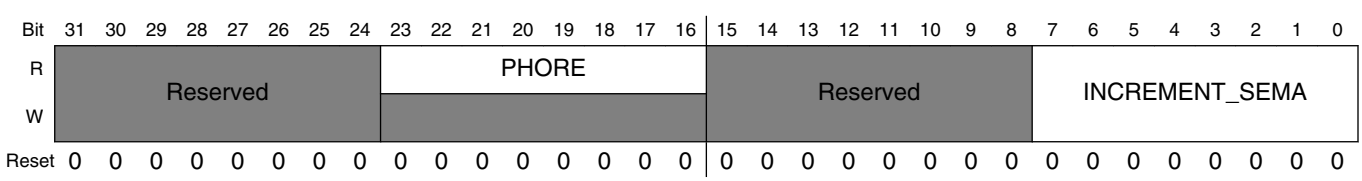
```
apbh_chn_bar_t  dma_data;
dma_data.ADDRESS = (reg32_t) pDataBuffer;
```

Address: 180_4000h base + 130h offset + (112d × i), where i=0d to 15d

APBH_CH*n*_BAR field descriptions

Field	Description
ADDRESS	Address of system memory buffer to be read or written over the AHB bus.

15.5.12 APBH DMA Channel n Semaphore Register (APBH_CH*n*_SEMA)



The APBH DMA Channel n semaphore register is used to synchronize the ARM platform instruction stream and the DMA chain processing state.

Each DMA channel has an 8 bit counting semaphore that is used to synchronize between the program stream and and the DMA chain processing. DMA processing continues until the DMA attempts to decrement a semaphore that has already reached a value of zero. When the attempt is made, the DMA channel is stalled until software increments the semaphore count.

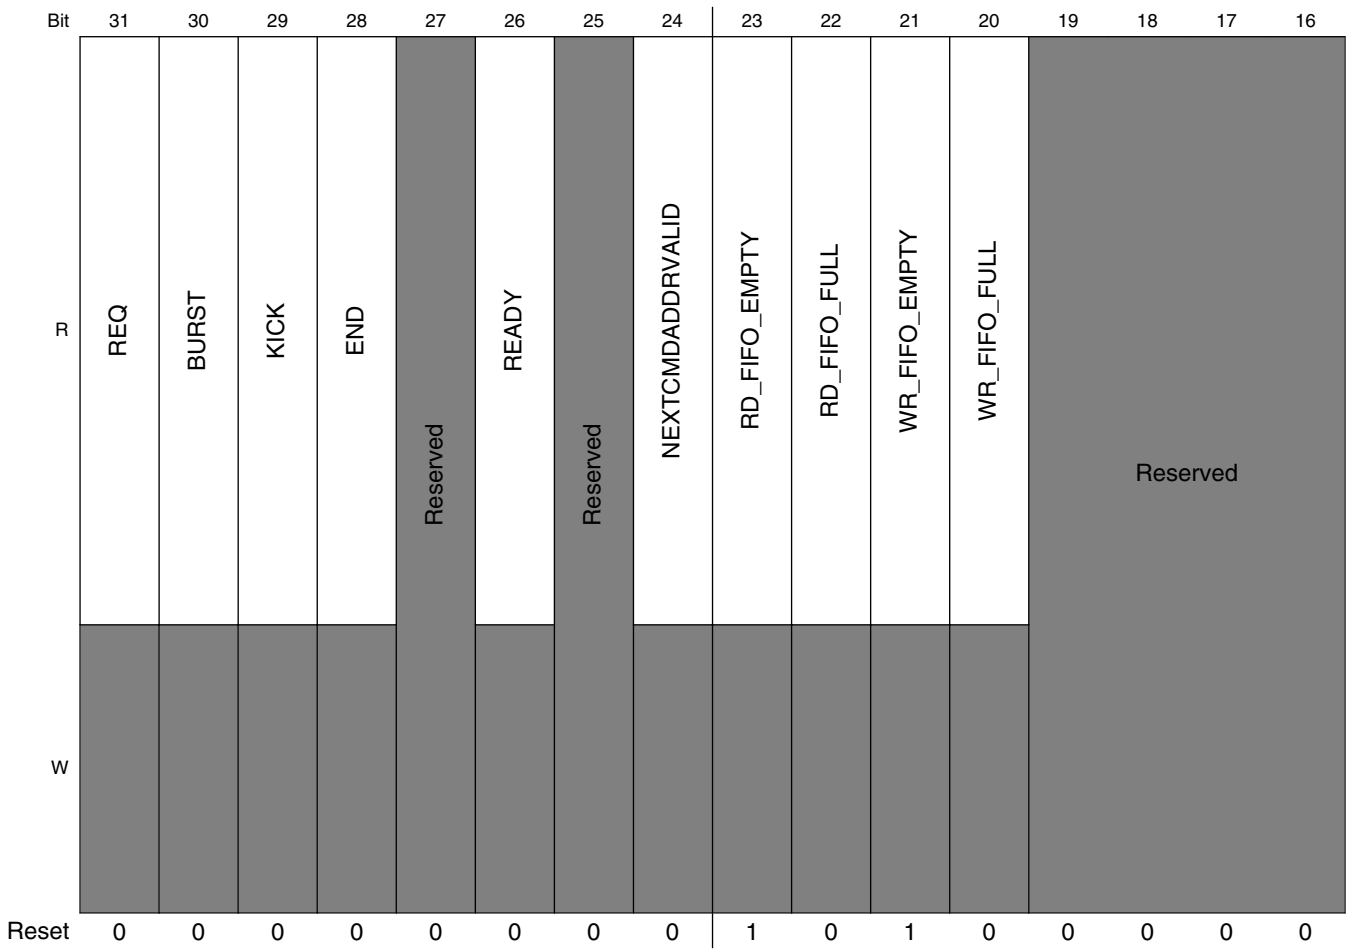
EXAMPLE

```
BF_WR(APBH_CHn_SEMA, 0, INCREMENT_SEMA, 2);     // increment semaphore by two
current_sema = BF_RD(APBH_CHn_SEMA, 0, PHORE);  // get instantaneous value
```

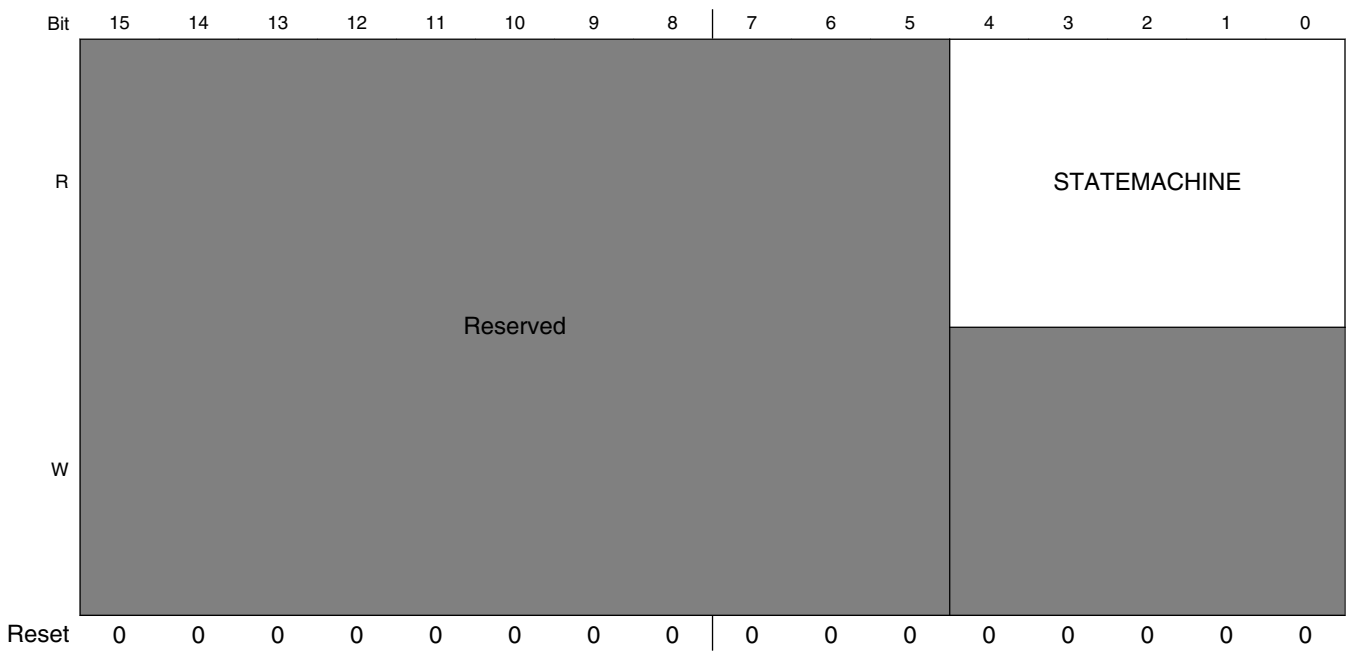
Address: 180_4000h base + 140h offset + (112d × i), where i=0d to 15d

APBH_CH*n*_SEMA field descriptions

Field	Description
31–24 -	This field is reserved. Reserved, always set to zero.
23–16 PHORE	This read-only field shows the current (instantaneous) value of the semaphore counter.
15–8 -	This field is reserved. Reserved, always set to zero.
INCREMENT_ SEMA	The value written to this field is added to the semaphore count in an atomic way such that simultaneous software adds and DMA hardware substracts happening on the same clock are protected. This bit field reads back a value of 0x00. Writing a value of 0x02 increments the semaphore count by two, unless the DMA channel decrements the count on the same clock, then the count is incremented by a net one.



15.5.13 AHB to APBH DMA Channel n Debug Information (APBH_CH*n*_DEBUG1)



This register gives debug visibility into the APBH DMA Channel n state machine and controls.

This register allows debug visibility of the APBH DMA Channel n.

APBH Memory Map/Register Definition

Address: 180_4000h base + 150h offset + (112d × i), where i=0d to 15d

APBH_CH*n*_DEBUG1 field descriptions

Field	Description
31 REQ	This bit reflects the current state of the DMA Request Signal from the APB device
30 BURST	This bit reflects the current state of the DMA Burst Signal from the APB device
29 KICK	This bit reflects the current state of the DMA Kick Signal sent to the APB Device
28 END	This bit reflects the current state of the DMA End Command Signal sent from the APB Device
27 SENSE	This field is reserved. This bit is reserved for this DMA Channel and always reads 0.
26 READY	This bit is reserved for this DMA Channel and always reads 0.
25 LOCK	This field is reserved. This bit is reserved for this Channel and always reads 0.
24 NEXTCMDADDRVALID	This bit reflects the internal bit which indicates whether the channel's next command address is valid.
23 RD_FIFO_EMPTY	This bit reflects the current state of the DMA Channel's Read FIFO Empty signal.
22 RD_FIFO_FULL	This bit reflects the current state of the DMA Channel's Read FIFO Full signal.
21 WR_FIFO_EMPTY	This bit reflects the current state of the DMA Channel's Write FIFO Empty signal.
20 WR_FIFO_FULL	This bit reflects the current state of the DMA Channel's Write FIFO Full signal.
19–5 RSVD1	This field is reserved. Reserved
STATEMACHINE	PIO Display of the DMA Channel n state machine state. 0x00 **IDLE** — This is the idle state of the DMA state machine. 0x01 **REQ_CMD1** — State in which the DMA is waiting to receive the first word of a command. 0x02 **REQ_CMD3** — State in which the DMA is waiting to receive the third word of a command. 0x03 **REQ_CMD2** — State in which the DMA is waiting to receive the second word of a command. 0x04 **XFER_DECODE** — The state machine processes the descriptor command field in this state and branches accordingly. 0x05 **REQ_WAIT** — The state machine waits in this state for the PIO APB cycles to complete. 0x06 **REQ_CMD4** — State in which the DMA is waiting to receive the fourth word of a command, or waiting to receive the PIO words when PIO count is greater than 1. 0x07 **PIO_REQ** — This state determines whether another PIO cycle needs to occur before starting DMA transfers. 0x08 **READ_FLUSH** — During a read transfers, the state machine enters this state waiting for the last bytes to be pushed out on the APB. 0x09 **READ_WAIT** — When an AHB read request occurs, the state machine waits in this state for the AHB transfer to complete. 0x0C **WRITE** — During DMA Write transfers, the state machine waits in this state until the AHB master arbiter accepts the request from this channel. 0x0D **READ_REQ** — During DMA Read transfers, the state machine waits in this state until the AHB master arbiter accepts the request from this channel.

Table continues on the next page...

APBH_CH*n*_DEBUG1 field descriptions (continued)

Field	Description
	0x0E **CHECK_CHAIN** — Upon completion of the DMA transfers, this state checks the value of the Chain bit and branches accordingly. 0x0F **XFER_COMPLETE** — The state machine goes to this state after the DMA transfers are complete, and determines what step to take next. 0x14 **TERMINATE** — When a terminate signal is set, the state machine enters this state until the current AHB transfer is completed. 0x15 **WAIT_END** — When the Wait for Command End bit is set, the state machine enters this state until the DMA device indicates that the command is complete. 0x1C **WRITE_WAIT** — During DMA Write transfers, the state machine waits in this state until the AHB master completes the write to the AHB memory space. 0x1D **HALT_AFTER_TERM** — If HALTONTERMINATE is set and a terminate signal is set, the state machine enters this state and effectively halts. A channel reset is required to exit this state 0x1E **CHECK_WAIT** — If the Chain bit is a 0, the state machine enters this state and effectively halts. 0x1F **WAIT_READY** — When the NAND Wait for Ready bit is set, the state machine enters this state until the GPMI device indicates that the external device is ready.

15.5.14 AHB to APBH DMA Channel n Debug Information (APBH_CH*n*_DEBUG2)

This register gives debug visibility for the APB and AHB byte counts for DMA Channel n.

This register allows debug visibility of the APBH DMA Channel n.

Address: 180_4000h base + 160h offset + (112d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

APBH_CH*n*_DEBUG2 field descriptions

Field	Description
31–16 APB_BYTES	This value reflects the current number of APB bytes remaining to be transfered in the current transfer.
AHB_BYTES	This value reflects the current number of AHB bytes remaining to be transfered in the current transfer.

15.5.15 APBH Bridge Version Register (APBH_VERSION)

This register always returns a known read value for debug purposes it indicates the version of the block.

This register indicates the RTL version in use.

EXAMPLE

```
if (APBH_VERSION.B.MAJOR != 3)
   Error();
```

Address: 180_4000h base + 800h offset = 180_4800h

APBH_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

Chapter 16
Asynchronous Sample Rate Converter (ASRC)

16.1 Overview

The Asynchronous Sample Rate Converter (ASRC) converts the sampling rate of a signal associated with an input clock into a signal associated with a different output clock.

The ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The ASRC supports up to three sampling rate pairs.

The incoming audio data to this chip may be received from various sources at different sampling rates. The outgoing audio data of this chip may have different sampling rates and it can also be associated with output clocks that are asynchronous to the input clocks.

The ASRC is implemented as a co-processor in hardware, with minimal ARM Platform intervention required.

Figure 16-1 is a system view of the connection between the ASRC block and other blocks.

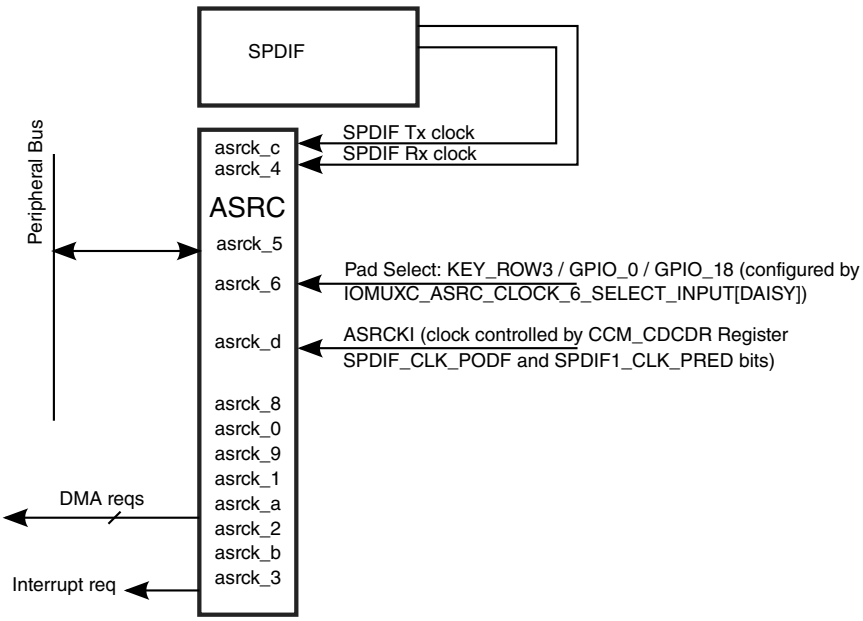

Figure 16-1. General System Overview

Figure 16-2 is the ASRC block diagram.

The red dotted line designates the ASRC block. Objects outside the dotted line represent SoC-level resources.

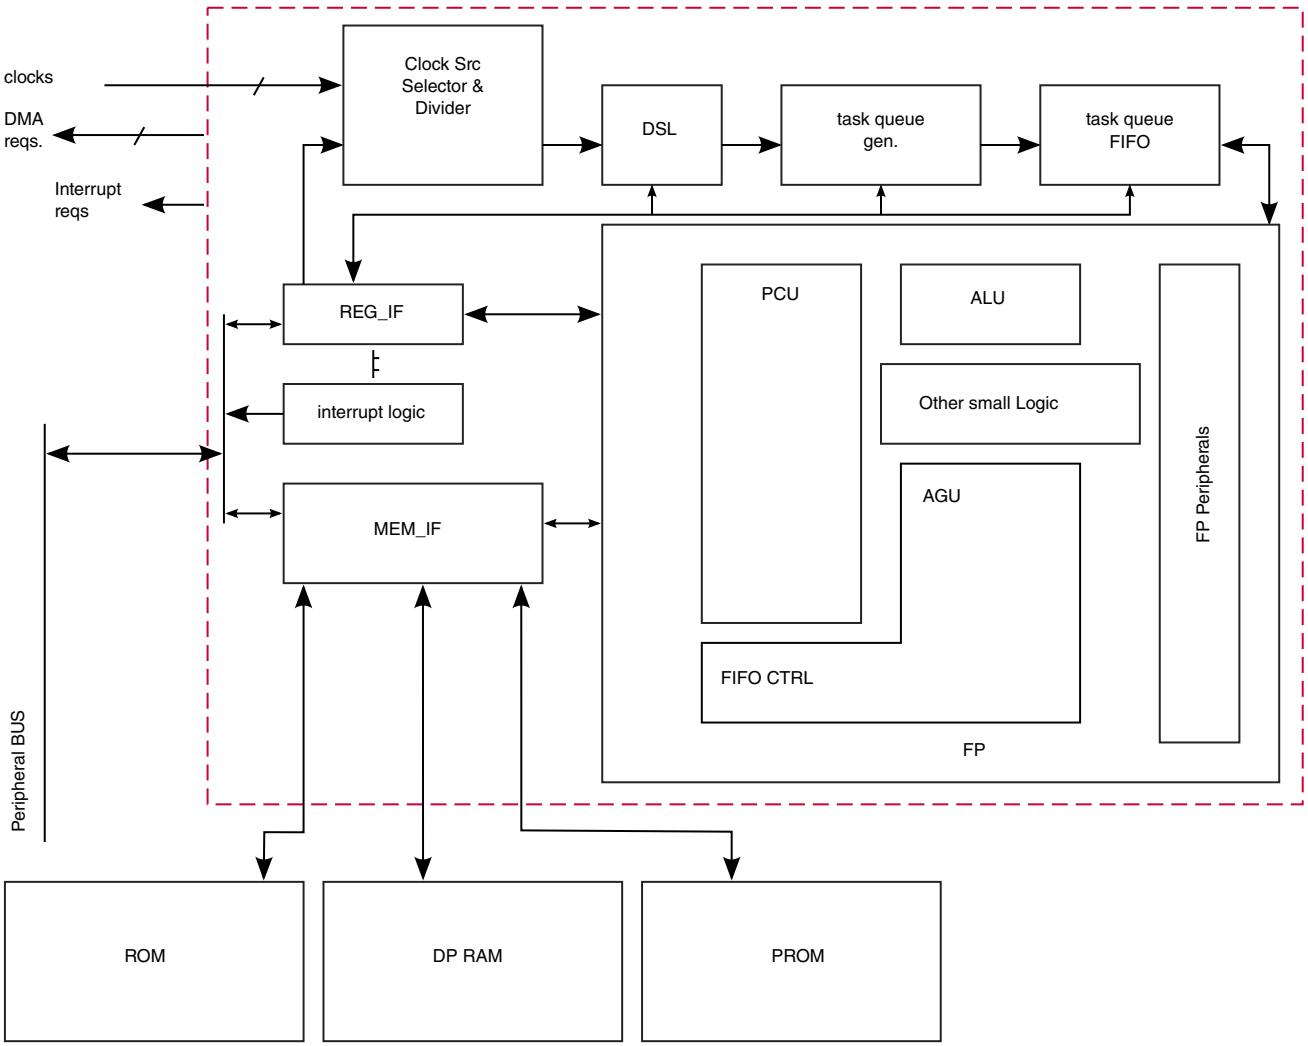

Figure 16-2. ASRC block diagram

16.1.1 Features

Table 16-1. ASRC Specifications

Parameters	Test Conditions	Minimum	Typical	Maximum	Unit
Channels Supported		0 [1]		10	
Pairs of Rate Conversion		1	-	3	
THD+N	120 MHz < Fs_{ASRC} [2] <160 MHz		-120		dB
Dynamic Range				144	dB
Settling Time			40		ms
Comment:					

1. When a pair has zero channels, the pair will be disabled, although the pair enable bit may be set in ASRCTR register.
2. Fs_{ASRC} is the processing clock of ASRC block.

Other Features:

- Support user-programmable threshold for the input/output FIFOs.
- Support flexible 8/16/24-bit width of input data, and 16/24-bit width of output data.
- Designed for rate conversion between 44.1 kHz, 32 kHz, 48 kHz, 96 kHz, and 192 kHz. The useful signal bandwidth is below 24 kHz.
- Other input sampling rates in the range of 8 kHz to 200 kHz is also supported, but possibly with less desirable bandwidth.
- Other output sampling rates in the range of 30 kHz to 200 kHz is also supported, but possibly with less desirable bandwidth.
- Automatic accommodation to slow variations in the incoming and outgoing sampling rates.
- Linear phase
- Tolerant to sample clock jitter

Clock/Data Connections

- The sampling rate clocks are directly connected to the ASRC block, the ratio estimation of the input clocks with output clocks are done in ASRC hardware.
- The clock signals come from the following blocks, for example:
  - Receiving bit clock and transmitting bit clock
  - SPDIF, receiving bit clock and transmitting bit clock
  - other audio peripherals etc.
- The exchange of audio data is done by the processor accessing ASRC block through registers defined on shared peripheral bus.

16.1.2 Modes of Operation

See ASRC Memory Map/Register Definition for a definition of the registers and parameters used in ASRC.

16.1.2.1 Data Transfer Schemes

16.1.2.1.1 Data Input Modes

The input mode for each of the three channel sets may be set independently. Three modes of supplying data to the ASRC input FIFOs are available:

- Polling
- Interrupt
- DMA

In all input-data transfer schemes, the ASRC fetches data from each enabled FIFO and processes the data sample-by-sample after each rising edge of the associated input sampling clock until the FIFO level reaches a threshold.

After the threshold is reached, the ASRC requests data. The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples.The threshold can be defined by interface registers ASRMCRx, x=A, B or C.

If the ASRC attempts to fetch data from an empty FIFO, an error is generated and the ASRSTR_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER_AOLIE bit is set), an interrupt is generated.

When writing data to an input FIFO, you must ensure that it is in a predefined sequence. For example, when writing to an input FIFO, the sequence should be: channel_0, channel_1, channel_2,..., channel_n, channel_0, channel_1, channel_2, etc. Here channel_n stands for the data intended for the n-th channel. The hardware will re-allocate each data to its corresponding channel FIFO. The channel being re-allocated is shown by ASRCCR_ACIx, x=A,B or C.

Mode 1 (Polling Mode)

Polling mode is the default mode following power-on or individual reset, and is selected by clearing the associated channel set A, B, or C data-input interrupt enable bit (ASRIER_ADIEx, where x=A, B or C). In this mode, data-input interrupts are disabled. When the FIFO level is below the threshold, the associated status bit (ASRSTR_AIDEx, where x=A, B, or C) is set. To clear the status bit, the FIFO must be written with enough data to raise the level above the threshold.

Mode 2 (Interrupt Mode)

The ASRC input FIFOs can also be serviced by interrupts. To enable interrupts, the corresponding data-input interrupt enable bits (ASRIER_ADIEx, where x=A, B, or C) should be set. An interrupt is automatically generated any time the input FIFO level is below the threshold. The interrupt is cleared when enough data is written to the FIFO to raise the level above the threshold.

Mode 3 (DMA Mode)

The ASRC input FIFOs can also be filled using DMA. In this mode, the data-input interrupt-enable bits (ASRIER_ADIEx, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

16.1.2.1.2 Data Output Modes

The output mode for each of the 3 channel sets (A, B, and C) may be set independently.

Three modes of retrieving data from the ASRC output FIFOs are available:

- Polling
- Interrupt
- DMA

In all output-data transfer schemes, the ASRC places a processed sample into the associated output FIFO. After a threshold is reached, the ASRC requests that data be transferred out of the FIFO.

The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers ASRMCRx, x=A, B or C.

If the ASRC attempts to place data into a FIFO that is already full, an error is generated and the ASRSTR_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER_AOLIE bit is set), an interrupt is generated.

Each output FIFO is organized in the same channel order in which the associated input FIFO was written.

Three transfer modes are supported by Interface Block.

Mode 1 (Polling Mode)

The ASRC output FIFOs can be serviced by polling. In this mode, ensure the associated output-data interrupt enable bit (ASRIER_ADOEx, where x=A, B, or C) is cleared. In this mode, all output-data interrupts are disabled. Any time the output FIFO exceeds the threshold the associated status bit (ASRSTR_AODFx, where x=A, B, or C) is set. To clear the status bit, enough data must be read from the associated output FIFO to lower the level below the threshold.

Mode 2 (Interrupt Mode)

The ASRC output FIFOs may also be serviced using interrupts. To enable this mode, the corresponding output-data interrupt-enable bits (ASRIER_ADOEx, where x=A, B, or C) should be set. Any time the output FIFO level exceeds the threshold, an interrupt is automatically generated. The interrupt is cleared when enough data is read from the FIFO to lower the level below the threshold.

Mode 3 (DMA Mode)

The ASRC output FIFOs can also be read using DMA. In this mode, the output-data interrupt-enable bits (ASRIER_ADOEx, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

16.1.2.2 Word Alignment Supported

16.1.2.2.1 Input Data Alignment Modes

The position and length of input data word to the input data FIFOs ASRDIA, ASRDIB, ASRDIC are programmable. The control bits are defined in ASRMCR1x {x=A, B, or C}. It supports the following modes.

Table 16-2. Input Data Alignment

Format	Bit Number																															
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

16.2 Clocks

The table found here describes the clock sources for ASRC.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 16-4. ASRC Clocks

Clock name	Clock Root	Description
asrck_clock_d	spdif1_clk_root	ASRC module clock (SPDIF clock)
ipg_clk	ahb_clk_root	Peripheral clock
mem_clk	ahb_clk_root	Peripheral access clock

16.3 Interrupts

ASRC has several interrupts events.

The priorities are shown as Table 16-5 .

Table 16-5. Interrupt Priorities/Vector

Priority	Description
lowest	ASRC Pair A input data needed
	ASRC Pair B input data needed
	ASRC Pair C input data needed
	ASRC Pair A output data ready
	ASRC Pair B output data ready
	ASRC Pair C output data ready
	ASRC Overload

16.4 DMA requests

ASRC has six DMA requests. They are directly connected to the lowest six status bits in the ASRSTR register.

Table 16-6. DMA requests

Type	Description
0	ASRC Pair A input data needed
1	ASRC Pair B input data needed
2	ASRC Pair C input data needed
3	ASRC Pair A output data ready
4	ASRC Pair B output data ready
5	ASRC Pair C output data ready

16.5 Functional Description

This section provides a complete functional description of the block.

16.5.1 Algorithm Description

16.5.1.1 Signal processing flow

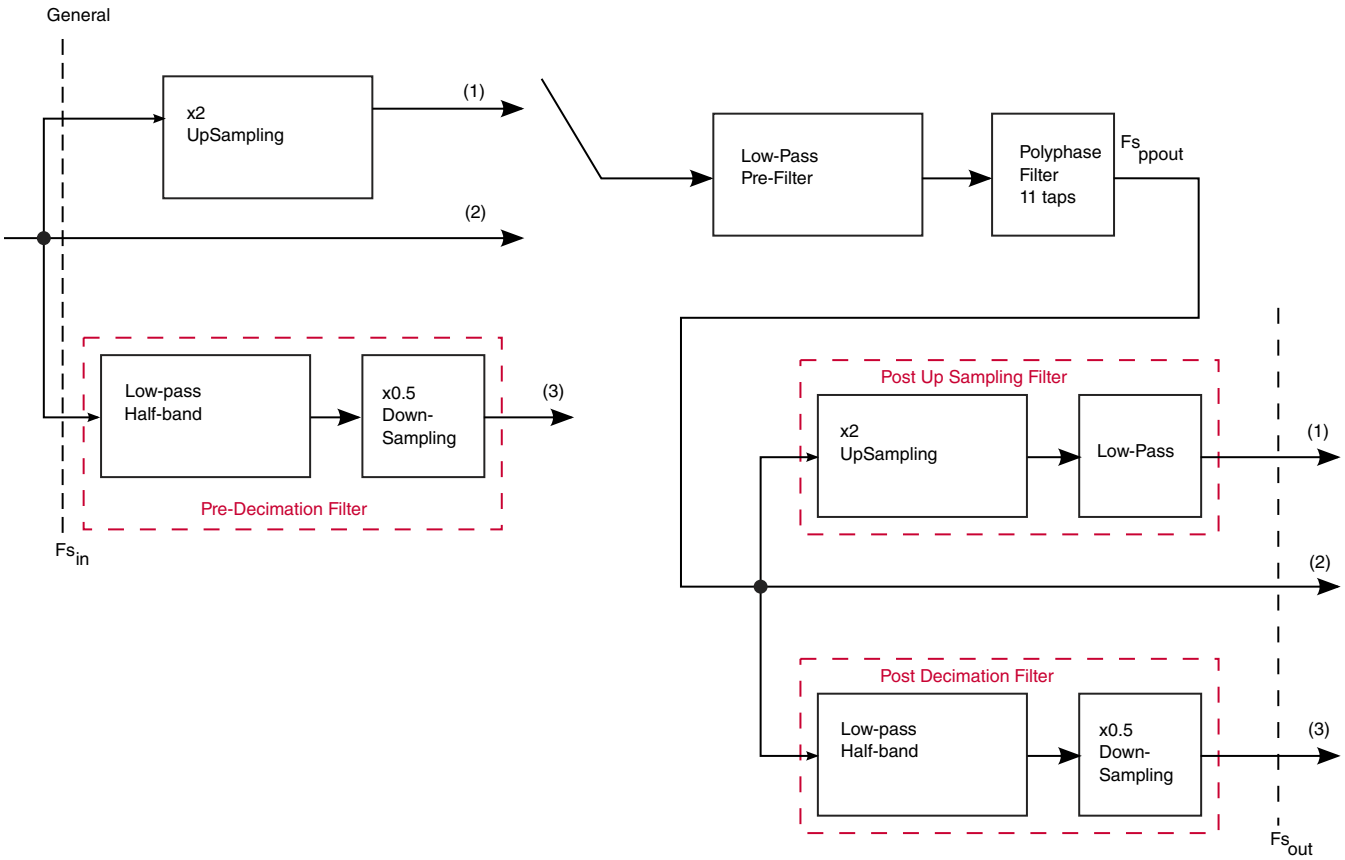

Figure 16-3. Signal processing configurations

The figure above shows the possible configurations of the ASRC. Each configuration consists of 2 to 4 stages.

- x2 up-sampling rate expander (zero insertion only) (input branch 1), direct connection (input branch 2), or low-pass pre decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (input branch 3),
- low-pass pre-filter, the low-pass bandwidth is at most 0.25 x Fs, where Fs is the sampling rate of the input signal to this low-pass pre-filter,
- polyphase filter,
- x2 post upsampling filter (consisting of a x2 up-sampling rate expander (zero insertion only) with low-pass half-band FIR filter) (output branch 1), direct connection (output branch 2), or low-pass post decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (output branch 3).

By flowing through different processing branches and different setups of the pre-filter, this ASRC scheme can be used to handle different rate conversion requirements.

- Configuration (a): Input Branch 1+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/2$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}/2$.

- Configuration (b): Input Branch 1+Output Branch 2:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/2$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}$.

- Configuration (c): Input Branch 1+Output Branch 3:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/2$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = 2Fs_{out}$.

- Configuration (d): Input Branch 2+Output Branch 1:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/4$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}/2$.

- Configuration (e): Input Branch 2+Output Branch 2:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/4$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}$.

- Configuration (f): Input Branch 2+Output Branch 3:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/4$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = 2Fs_{out}$.

- Configuration (g): Input Branch 3+Output Branch 1:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/8$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}/2$.

- Configuration (h): Input Branch 3+Output Branch 2:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/8$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}$.

- Configuration (i): Input Branch 3+Output Branch 3:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/8$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = 2Fs_{out}$.

Table 16-7. Pre-processing, post-processing options

{Pre_Proc, Post_Proc}		Fsout (KHz)											
		8	12	16	24	32	44.1	48	64	88.2	96	128	192
Fsin (KHz)	8	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}

	16	{1,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}
	24	{1,2}	{1,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}
	32	{1,2}	{1,2}	{1,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}
	44.1	{2,2}	{1,2}	{1,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}
	48	{2,2}	{1,2}	{1,2}	{1,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}
	64	{2,2}	{2,2}	{1,2}	{1,2}	{0,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}
	88.2	NA	{2,2}	{2,2}	{1,2}	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	96	NA	{2,2}	{2,2}	{1,2}	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	128	NA	NA	{2,2}	{2,2}	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	192	NA	NA	NA	{2,2}	{2,2}	{2,2}	{2,2}	{2,1}	{2,1}	{2,1}	{2,1}	{2,1}

NOTE: In the {Pre_Proc, Post_Proc} pair, the meaning of the values are:

Pre_Proc:

- 0 --- Pre-processing Branch 1 as shown in Figure 16-3
- 1 --- Pre-processing Branch 2 as shown in Figure 16-3
- 2 --- Pre-processing Branch 3 as shown in Figure 16-3, decimation-by-2

Post_Proc:

- 0 --- Post-processing Branch 1 as shown in Figure 16-3
- 1 --- Post-processing Branch 2 as shown in Figure 16-3
- 2 --- Post-processing Branch 3 as shown in Figure 16-3

The latencies of the different option can be roughly calculated as follows:

- For PreProc = 0, PostProc = 1 : min latency = constant_A / input-sample-rate + constant_B / output-sample-rate
- For PreProc = 0, PostProc = 0 : min latency = constant_A / input-sample-rate + constant_C / output-sample-rate
- For PreProc = 1, PostProc = 1 : min latency = constant_D / input-sample-rate + constant_B / output-sample-rate

The constants above (e.g., constant_A means the Constant for Preproc = 0, constant_B means the Constant for Postproc = 1, ...) are only influenced by the PreProc/PostProc and (input/output) sampling rate to which they are connected. Input latencies have no relationship with the output latencies, but both elements add together to form the total latencies.

For a rough estimation, the constants can be set as:

- Constant for Preproc = 0: 39

- Constant for Preproc = 1: 78.5
- Constant for Preproc = 2: 235
- Constant for Postproc = 0: 42.5
- Constant for Postproc = 1: 8.5
- Constant for Postproc = 2: 172

The max latency can be derived from this value by using the following formula (where 32 means the input/output FIFO depth that will arouse data transfer):

- max latency = min latency + 32 / input-sample-rate + 32 / output-sample-rate

16.5.1.2 Operation of the Filter

16.5.1.2.1 Support of Physical Clocks

This design supports physical sampling clocks. The clocks can be provided by Sony/ Phillips digital interface (SPDIF), Serial Audio Interface (SAI)media local bus controller (MLB) , Core master clock derivative as ASRCK1 .

Figure 16-4. Clock Source Selector & Divider

Software can set the ASRC Clock Source Register (ASRCSR) and the Clock Divider Register to select the desired clock source and divide it to the needed sample rate clock for use by the ASRC. The clocks have the following restriction. If the prescaler is set to 1, the clock divider can only be set to 1 and the clock source must have a 50% duty cycle.

16.6 Startup Procedure

The following example shows the normal setup procedure for the ASRC block.

```
#include "asrc_common.h"

#include "stdio.h"

#include "soc_api.h"

16.7 ASRC Memory Map/Register Definition

All useful registers are listed in the memory map below. The access of undefined registers will behave as normal registers.

All the interface registers are LSB aligned except the input FIFOs and the output FIFOs, and each register has only 24 effective bits.

The input FIFO and output FIFO word alignment can be defined using ASRMCR1{A,B,C} registers in 32-bit interface system.

ASRC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

16.7.1 ASRC Control Register (ASRC_ASRCTR)

The ASRC control register (ASRCTR) is a 24-bit read/write register that controls the ASRC operations.

Address: 203_4000h base + 0h offset = 203_4000h

ASRC_ASRCTR field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 -	This field is reserved. Reserved. Should be written as zero for compatibility.
22 ATSC	ASRC Pair C Automatic Selection For Processing Options When this bit is 1, pair C will automatic update its pre-processing and post-processing options (ASRCFG: PREMODC, ASRCFG:POSTMODC see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair C. This bit should be disabled when {USRC, IDRC}={1,1}.
21 ATSB	ASRC Pair B Automatic Selection For Processing Options When this bit is 1, pair B will automatic update its pre-processing and post-processing options (ASRCFG: PREMODB, ASRCFG:POSTMODB see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair B. This bit should be disabled when {USRB, IDRB}={1,1}.
20 ATSA	ASRC Pair A Automatic Selection For Processing Options When this bit is 1, pair A will automatic update its pre-processing and post-processing options (ASRCFG: PREMODA, ASRCFG:POSTMODA see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair A. This bit should be disabled when {USRA, IDRA}={1,1}.
19 -	This field is reserved. Reserved. Should be written as zero for compatibility.
18 USRC	Use Ratio for Pair C Use ratio as the input to ASRC. This bit is used in conjunction with IDRC control bit.
17 IDRC	Use Ideal Ratio for Pair C When USRC=0, this bit has no usage. When USRC=1 and IDRC=0, ASRC internal measured ratio will be used. When USRC=1 and IDRC=1, the idea ratio from the interface register ASRIDRHC, ASRIDRLC will be used. It is suggested to manually set ASRCFG:POSTMODC, ASRCFG:PREMODC according to Table 16-7 in this case.
16 USRB	Use Ratio for Pair B Use ratio as the input to ASRC. This bit is used in conjunction with IDRB control bit.
15 IDRB	Use Ideal Ratio for Pair B When USRB=0, this bit has no usage. When USRB=1 and IDRB=0, ASRC internal measured ratio will be used.

Table continues on the next page...

ASRC_ASRCTR field descriptions (continued)

Field	Description
	When USRB=1 and IDRB=1, the idea ratio from the interface register ASRIDRHB, ASRIDRLB will be used.It is suggested to manually set ASRCFG:POSTMODB, ASRCFG:PREMODB according to Table 16-7 in this case.
14 USRA	Use Ratio for Pair A Use ratio as the input to ASRC. This bit is used in conjunction with IDRA control bit.
13 IDRA	Use Ideal Ratio for Pair A When USRA=0, this bit has no usage. When USRA=1 and IDRA=0, ASRC internal measured ratio will be used. When USRA=1 and IDRA=1, the idea ratio from the interface register ASRIDRHA, ASRIDRLA will be used. It is suggested to manually set ASRCFG:POSTMODA, ASRCFG:PREMODA according to Table 16-7 in this case.
12–5 -	This field is reserved. Reserved. Should be written as zero for compatibility.
4 SRST	Software Reset This bit is self-clear bit. Once it is been written as 1, it will generate a software reset signal inside ASRC. After 9 cycles of the ASRC processing clock, this reset process will stop, and this bit will be cleared automatically.
3 ASREC	ASRC Enable C Enable the operation of the conversion C of ASRC. When ASREC is cleared, operation of conversion C is disabled.
2 ASREB	ASRC Enable B Enable the operation of the conversion B of ASRC. When ASREB is cleared, operation of conversion B is disabled.
1 ASREA	ASRC Enable A Enable the operation of the conversion A of ASRC. When ASREA is cleared, operation of conversion A is disabled.
0 ASRCEN	ASRC Enable Enable the operation of ASRC.

16.7.2 ASRC Interrupt Enable Register (ASRC_ASRIER)

Address: 203_4000h base + 4h offset = 203_4004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ASRC_ASRIER field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–8 -	This field is reserved. Reserved. Should be written as zero for compatibility.
7 AFPWE	FP in Wait State Interrupt Enable Enables the FP in wait state interrupt. 1 interrupt enabled 0 interrupt disabled
6 AOLIE	Overload Interrupt Enable Enables the overload interrupt. 1 interrupt enabled 0 interrupt disabled
5 ADOEC	Data Output C Interrupt Enable Enables the data output C interrupt. 1 interrupt enabled 0 interrupt disabled
4 ADOEB	Data Output B Interrupt Enable Enables the data output B interrupt.

Table continues on the next page...

ASRC_ASRIER field descriptions (continued)

Field	Description
	1 interrupt enabled 0 interrupt disabled
3 ADOEA	Data Output A Interrupt Enable Enables the data output A interrupt. 1 interrupt enabled 0 interrupt disabled
2 ADIEC	Data Input C Interrupt Enable Enables the data input C interrupt. 1 interrupt enabled 0 interrupt disabled
1 ADIEB	Data Input B Interrupt Enable Enables the data input B interrupt. 1 interrupt enabled 0 interrupt disabled
0 ADIEA	Data Input A Interrupt Enable Enables the data input A Interrupt. 1 interrupt enabled 0 interrupt disabled

16.7.3 ASRC Channel Number Configuration Register (ASRC_ASRCNCR)

The ASRC channel number configuration register (ASRCNCR) is a 24-bit read/write register that sets the number of channels used by each ASRC conversion pair.

There are 10 channels available for distribution among 3 conversion pairs, they are ordered as 0,1,...,9. The bottom [0, ANCA-1] channels are used for pair A, the top [10-ANCC, 9] channels are used for pair C, and the [ANCA, ANCA+ANCB-1] channels are allocated for pair B. In case that ANCA=0, then the [0, ANCB-1] channels are assigned for pair B.

Address: 203_4000h base + Ch offset = 203_400Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

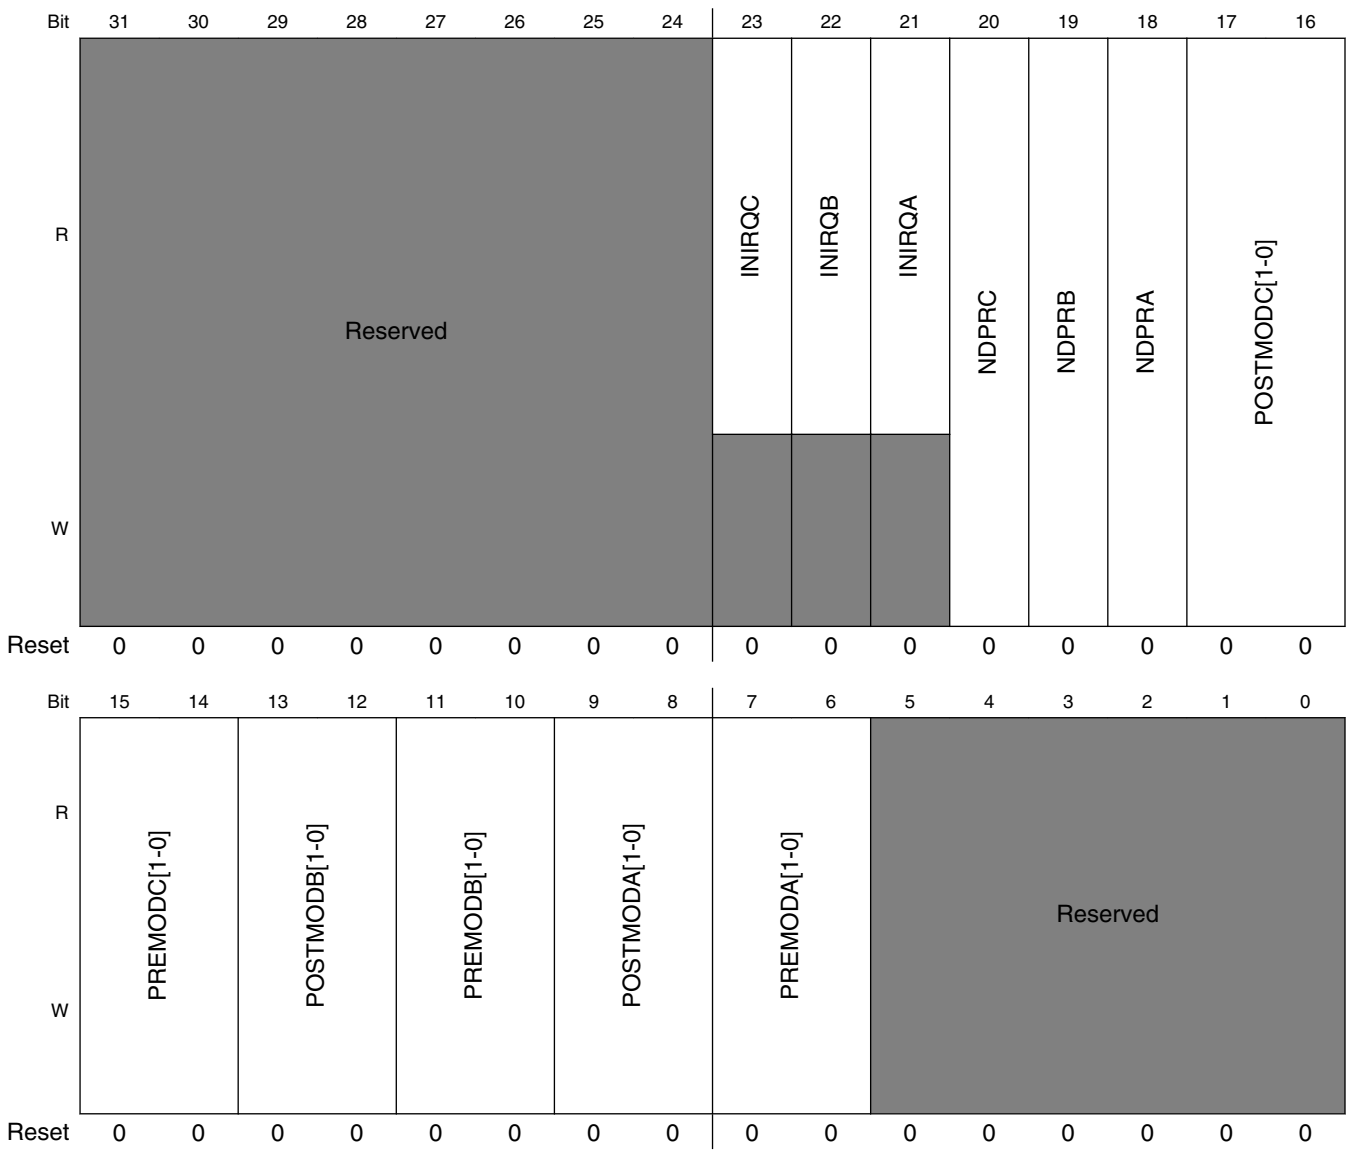
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ASRC_ASRCNCR field descriptions



Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–12 -	This field is reserved. Reserved. Should be written as zero for compatibility.
11–8 ANCC	Number of C Channels[1] 0000 0 channels in C (Pair C is disabled) 0001 1 channel in C 0010 2 channels in C 0011 3 channels in C 0100 4 channels in C 0101 5 channels in C 0110 6 channels in C 0111 7 channels in C 1000 8 channels in C 1001 9 channels in C 1010 10 channels in C 1011-1111 Should not be used.
7–4 ANCB	Number of B Channels 0000 0 channels in B (Pair B is disabled) 0001 1 channel in B 0010 2 channels in B 0011 3 channels in B 0100 4 channels in B 0101 5 channels in B 0110 6 channels in B 0111 7 channels in B 1000 8 channels in B 1001 9 channels in B 1010 10 channels in B 1011-1111 Should not be used.
ANCA	Number of A Channels 0000 0 channels in A (Pair A is disabled) 0001 1 channel in A 0010 2 channels in A 0011 3 channels in A 0100 4 channels in A 0101 5 channels in A 0110 6 channels in A 0111 7 channels in A 1000 8 channels in A 1001 9 channels in A 1010 10 channels in A 1011-1111 Should not be used.

1. ANCC+ANCB+ANCA<=10. Hardware is not checking the constraint. Programmer should take the responsibility to ensure the constraint is satisfied.

16.7.4 ASRC Filter Configuration Status Register (ASRC_ASRCFG)

The ASRC configuration status register (ASRCFG) is a 24-bit read/write register that sets and/or automatically senses the ASRC operations.

Address: 203_4000h base + 10h offset = 203_4010h

ASRC_ASRCFG field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 INIRQC	Initialization for Conversion Pair C is served When this bit is 1, it means the initialization for conversion pair C is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREC=0 or ASRCTR:ASRCEN=0).
22 INIRQB	Initialization for Conversion Pair B is served When this bit is 1, it means the initialization for conversion pair B is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREB=0 or ASRCTR:ASRCEN=0).
21 INIRQA	Initialization for Conversion Pair A is served When this bit is 1, it means the initialization for conversion pair A is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREA=0 or ASRCTR:ASRCEN=0).
20 NDPRC	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair C 0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameters. Use the parameters already stored in RAM.
19 NDPRB	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair B 0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameter. Use the parameters already stored in RAM.
18 NDPRA	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair A 0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameters. Use the parameters already stored in RAM.
17–16 POSTMODC[1-0]	Post-Processing Configuration for Conversion Pair C These bits will be read/write by user if ASRCTR:ATSC=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSC=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the post-processing configuration. 00 Select Upsampling-by-2 as defined in Signal Processing Flow. 01 Select Direct-Connection as defined in Signal Processing Flow. 10 Select Downsampling-by-2 as defined in Signal Processing Flow.
15–14 PREMODC[1-0]	Pre-Processing Configuration for Conversion Pair C These bits will be read/write by user if ASRCTR:ATSC=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSC=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the pre-processing configuration. 00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow 10 Select Downsampling-by-2 as defined in Signal processing flow 11 Select passthrough mode. In this case, POSTMODC[1-0] have no use.
13–12 POSTMODB[1-0]	Post-Processing Configuration for Conversion Pair B These bits will be read/write by user if ASRCTR:ATSB=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSB=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the post-processing configuration.

Field	Description
11–9 AOCDC	Output Clock Divider C Specify the divide ratio of the output clock divider C. The divide ratio may range from 1 to 8 (AOCDC[2:0] = 000 to 111).
8–6 AOCPC	Output Clock Prescaler C Specify the prescaling factor of the output prescaler C. The prescaling ratio may be any power of 2 from 1 to 128.
5–3 AICDC	Input Clock Divider C Specify the divide ratio of the input clock divider C. The divide ratio may range from 1 to 8 (AICDC[2:0] = 000 to 111).
AICPC	Input Clock Prescaler C Specify the prescaling factor of the input prescaler C. The prescaling ratio may be any power of 2 from 1 to 128.

16.7.8 ASRC Status Register (ASRC_ASRSTR)

The ASRC status register (ASRSTR) is a 24-bit read-write register used by the processor core to examine the status of the ASRC block and clear the overload interrupt request and AOLE flag bit. Read the status register will return the current state of ASRC.

Address: 203_4000h base + 20h offset = 203_4020h

ASRC_ASRSTR field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

Field	Description
23–22 -	This field is reserved. Reserved. Should be written as zero for compatibility.
21 DSLCNT	DSL Counter Input to FIFO ready When set, this bit indicates that new DSL counter information is stored in the internal ASRC FIFO. When clear, this bit indicates that new DSL counter information is in the process of storage into the internal ASRC FIFO. When ASRIER:AFPWE=1, the rising edge of this signal will propose an interrupt request. Writing any value with this bit set will clear the interrupt request proposed by the rising edge of this bit.
20 ATQOL	Task Queue FIFO overload When set, this bit indicates that task queue FIFO logic is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
19 AOOLC	Pair C Output Task Overload When set, this bit indicates that pair C output task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
18 AOOLB	Pair B Output Task Overload When set, this bit indicates that pair B output task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
17 AOOLA	Pair A Output Task Overload When set, this bit indicates that pair A output task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
16 AIOLC	Pair C Input Task Overload When set, this bit indicates that pair C input task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
15 AIOLB	Pair B Input Task Overload When set, this bit indicates that pair B input task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
14 AIOLA	Pair A Input Task Overload When set, this bit indicates that pair A input task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
13 AODOC	Output Data Buffer C has overflowed When set, this bit indicates that output data buffer C has overflowed. When clear, this bit indicates that output data buffer C has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1.
12 AODOB	Output Data Buffer B has overflowed

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

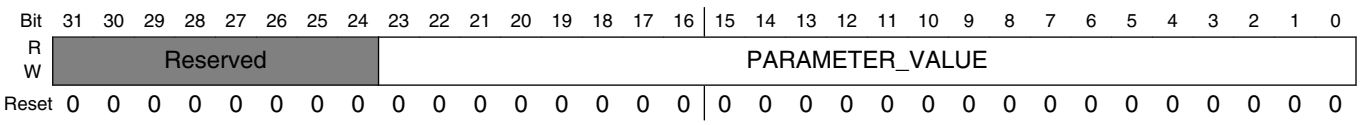
Field	Description
	When set, this bit indicates that output data buffer B has overflowed. When clear, this bit indicates that output data buffer B has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1.
11 AODOA	Output Data Buffer A has overflowed When set, this bit indicates that output data buffer A has overflowed. When clear, this bit indicates that output data buffer A has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1.
10 AIDUC	Input Data Buffer C has underflowed When set, this bit indicates that input data buffer C has underflowed. When clear, this bit indicates that input data buffer C has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1.
9 AIDUB	Input Data Buffer B has underflowed When set, this bit indicates that input data buffer B has underflowed. When clear, this bit indicates that input data buffer B has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1.
8 AIDUA	Input Data Buffer A has underflowed When set, this bit indicates that input data buffer A has underflowed. When clear, this bit indicates that input data buffer A has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1.
7 FPWT	FP is in wait states This bit is for debug only. When set, this bit indicates that ASRC is in wait states. When clear, this bit indicates that ASRC is not in wait states.
6 AOLE	Overload Error Flag When set, this bit indicates that the task rate is too high for the ASRC to handle. The reasons for overload may be: - too high input clock frequency, - too high output clock frequency, - incorrect selection of the pre-filter, - low ASRC processing clock, - too many channels, - underrun, - or any combination of the reasons above. Since the ASRC uses the same hardware resources to perform various tasks, the real reason for the overload is not straight forward, and it should be carefully analyzed by the programmer. If ASRIER:AOLIE=1, an interrupt will be proposed when this bit is set. Write any value with this bit set as one into the status register will clear this bit and the interrupt request proposed by this bit.
5 AODFC	Number of data in Output Data Buffer C is greater than threshold

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

Field	Description
	When set, this bit indicates that number of data already existing in ASRDORC is greater than threshold and the processor can read data from ASRDORC. When AODFC is set, the ASRC generates data output C interrupt request to the processor, if enabled (that is, ASRIER:ADOEC = 1). A DMA request is always generated when the AODFC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
4 AODFB	Number of data in Output Data Buffer B is greater than threshold When set, this bit indicates that number of data already existing in ASRDORB is greater than threshold and the processor can read data from ASRDORB. When AODFB is set, the ASRC generates data output B interrupt request to the processor, if enabled (that is, ASRIER:ADOEB = 1). A DMA request is always generated when the AODFB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
3 AODFA	Number of data in Output Data Buffer A is greater than threshold When set, this bit indicates that number of data already existing in ASRDORA is greater than threshold and the processor can read data from ASRDORA. When AODFA is set, the ASRC generates data output A interrupt request to the processor, if enabled (that is, ASRIER:ADOEA = 1). A DMA request is always generated when the AODFA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
2 AIDEC	Number of data in Input Data Buffer C is less than threshold When set, this bit indicates that number of data still available in ASRDIRC is less than threshold and the processor can write data to ASRDIRC. When AIDEC is set, the ASRC generates data input C interrupt request to the processor, if enabled (that is, ASRIER:ADIEC = 1). A DMA request is always generated when the AIDEC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
1 AIDEB	Number of data in Input Data Buffer B is less than threshold When set, this bit indicates that number of data still available in ASRDIRB is less than threshold and the processor can write data to ASRDIRB. When AIDEB is set, the ASRC generates data input B interrupt request to the processor, if enabled (that is, ASRIER:ADIEB = 1). A DMA request is always generated when the AIDEB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
0 AIDEA	Number of data in Input Data Buffer A is less than threshold When set, this bit indicates that number of data still available in ASRDIRA is less than threshold and the processor can write data to ASRDIRA. When AIDEA is set, the ASRC generates data input A interrupt request to the processor, if enabled (that is, ASRIER:ADIEA = 1). A DMA request is always generated when the AIDEA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.

16.7.9 ASRC Parameter Register n (ASRC_ASRPMn*n*)



Parameter registers determine the performance of ASRC.

The parameter registers must be initialized by software before ASRC is enabled. Recommended values are given in ASRC Misc Control Register 1 for Pair C below,

Table 16-8. ASRC Parameter Registers (ASRPM1~ASRPM5)

Register	Offset	Access	Reset Value	Recommend Value
asrcpm1	0x40	R/W	0x00_0000	0x7fffff
asrcpm2	0x44	R/W	0x00_0000	0x255555
asrcpm3	0x48	R/W	0x00_0000	0xff7280
asrcpm4	0x4C	R/W	0x00_0000	0xff7280
asrcpm5	0x50	R/W	0x00_0000	0xff7280

Address: 203_4000h base + 40h offset + (4d × i), where i=0d to 4d

16.7.20 ASRC 76 kHz Period in terms of ASRC processing clock (ASRC_ASR76K)

The register (ASR76K) holds the period of the 76 kHz sampling clock in terms of the ASRC processing clock with frequency Fs_{ASRC}. ASR76K = Fs_{ASRC}/Fs_{76k}. Reset value is 0x0A47 which assumes that Fs_{ASRC}=200 MHz. This register is used to help the ASRC internal logic to decide the pre-processing and the post-processing options automatically (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). In a system when Fs_{ASRC} = 133 MHz, the value should be assigned explicitly as 0x06D6 in user application code.

Address: 203_4000h base + 98h offset = 203_4098h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASR56K	Value for the period of the 56 kHz sampling clock

16.7.22 ASRC Misc Control Register for Pair A (ASRC_ASRMCRA)

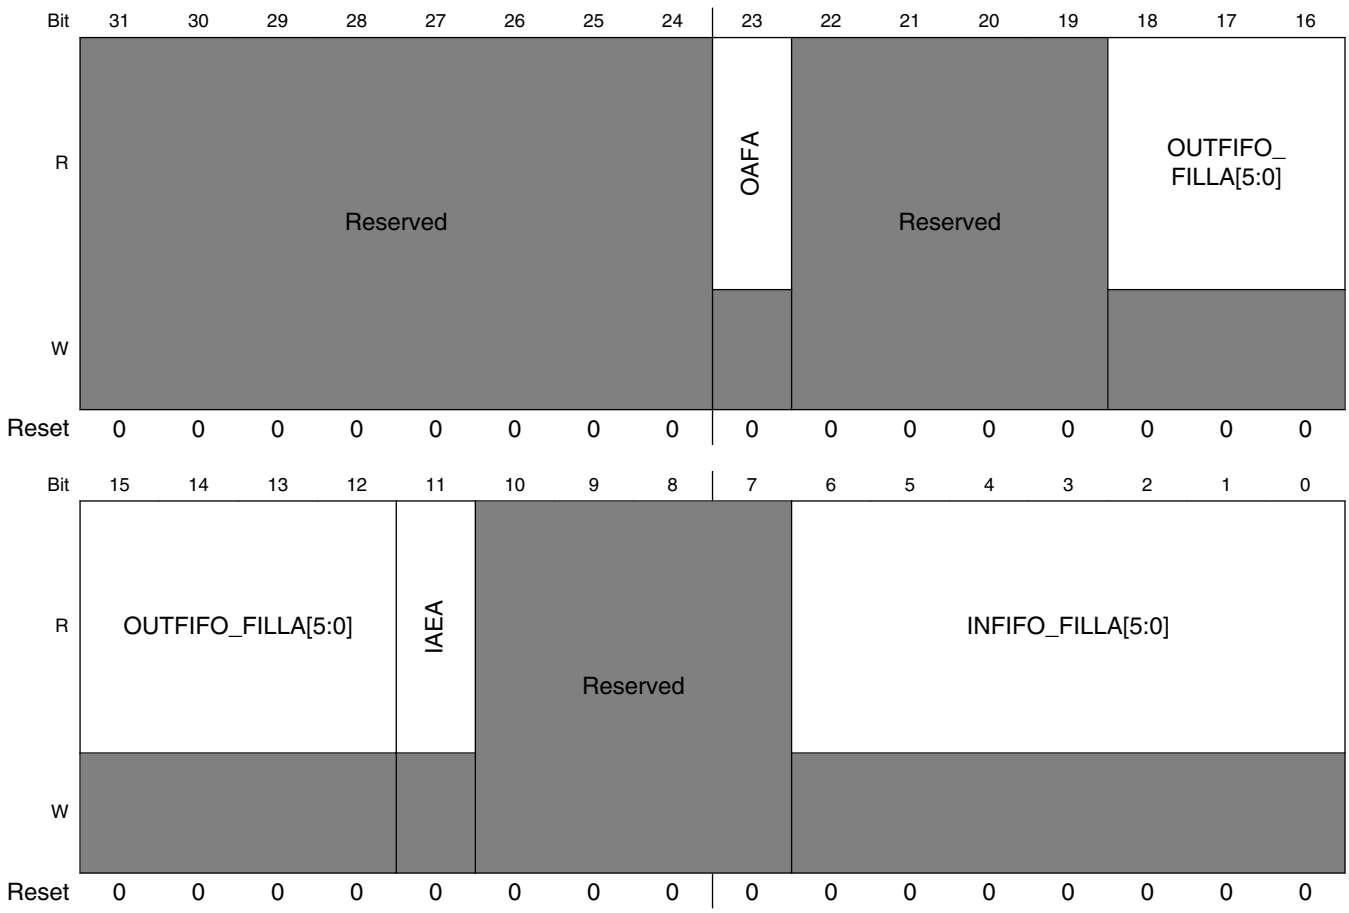
The register (ASRMCRA) is used to control Pair A internal logic.

Address: 203_4000h base + A0h offset = 203_40A0h

ASRC_ASRMCRA field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 ZEROBUFA	Initialize buf of Pair A when pair A is enabled. Always clear option. This bit is used to control whether the buffer is to be zeroized when pair A is enabled. 1 Don't zeroize the buffer 0 Zeroize the buffer
22 EXTTHRSHA	Use external thresholds for FIFO control of Pair A This bit will determine whether the FIFO thresholds externally defined in this register is used to control ASRC internal FIFO logic for pair A. 1 Use external defined thresholds. 0 Use default thresholds.
21 BUFSTALLA	Stall Pair A conversion in case of Buffer Near Empty/Full Condition This bit will determine whether the near empty/full FIFO condition will stall the rate conversion for pair A. This option can only work when external ratio is used. Near empty condition is the condition when input FIFO has less than 4 useful samples per channel. Near full condition is the condition when the output FIFO has less than 4 vacant sample words to fill per channel.

Table continues on the next page...



ASRC_ASRMCRA field descriptions (continued)

Field	Description
	1 Stall Pair A conversion in case of near empty/full FIFO conditions. 0 Don't stall Pair A conversion even in case of near empty/full FIFO conditions.
20 BYPASSPOLYA	Bypass Polyphase Filtering for Pair A This bit will determine whether the polyphase filtering part of Pair A conversion will be bypassed. 1 Bypass polyphase filtering. 0 Don't bypass polyphase filtering.
19–18 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
17–12 OUTFIFO_ THRESHOLDA[5:0]	The threshold for Pair A's output FIFO per channel These bits stand for the threshold for Pair A's output FIFO per channel. Possible range is [0,63]. When the value is n, it means that: when the number of output FIFO fillings of the pair is greater than n samples per channel, the output data ready flag is set; when the number of output FIFO fillings of the pair is less than or equal to n samples per channel, the output data ready flag is automatically cleared.
11 RSYNIFA	Re-sync Input FIFO Channel Counter If bit set, force ASRCCR:ACIA=0. If bit clear, untouch ASRCCR:ACIA.
10 RSYNOFA	Re-sync Output FIFO Channel Counter If bit set, force ASRCCR:ACOA=0. If bit clear, untouch ASRCCR:ACOA.
9–6 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
INFIFO_ THRESHOLDA[5:0]	The threshold for Pair A's input FIFO per channel These bits stand for the threshold for Pair A's input FIFO per channel. Possible range is [0,63]. When the value is n, it means that: when the number of input FIFO fillings of the pair is less than n samples per channel, the input data needed flag is set; when the number of input FIFO fillings of the pair is greater than or equal to n samples per channel, the input data needed flag is automatically cleared.

16.7.23 ASRC FIFO Status Register for Pair A (ASRC_ASRFSTA)

The register (ASRFSTA) is used to show Pair A internal FIFO conditions.

Address: 203_4000h base + A4h offset = 203_40A4h

ASRC_ASRFSTA field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 OAFA	Output FIFO is near Full for Pair A This bit is to indicate whether the output FIFO of Pair A is near full.
22–19 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
18–12 OUTFIFO_ FILLA[5:0]	The fillings for Pair A's output FIFO per channel These bits stand for the fillings for Pair A's output FIFO per channel. Possible range is [0,64].

Field	Description
	3'b001 16-bit audio data. 3'b010 8-bit audio data.
8 IMSB	Data Alignment of the input FIFO This bit will determine the data alignment of the input FIFO. 1 MSB aligned. 0 LSB aligned.
7–3 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
2 OMSB	Data Alignment of the output FIFO This bit will determine the data alignment of the output FIFO. 1 MSB aligned. 0 LSB aligned.
1 OSGN	Sign Extension Option of the output FIFO This bit will determine the sign extension option of the output FIFO. 1 Sign extension. 0 No sign extension.
0 OW16	Bit Width Option of the output FIFO This bit will determine the bit width option of the output FIFO. 1 16-bit output data 0 24-bit output data.

Chapter 17
40-BIT Correcting ECC Accelerator (BCH)

17.1 Overview

The hardware ECC accelerator provides a forward error-correction function for improving the reliability of various storage media that may be attached to the device.

For example, NAND flash devices use a spare area to store ecc codes to correct some hard bit errors in data stored within the device, allowing higher device yields and, therefore, lower NAND device costs.

The Bose, Ray-Chaudhuri, Hocquenghem (BCH) Encoder and Decoder module is capable of correcting from 2 to 40 single bit errors within a block of data no larger than about 1900 bytes (512 bytes or 1024 bytes are typical) in applications such as protecting data and resources stored on modern NAND flash devices. The correction level in the BCH block is programmable to provide flexibility for varying applications and configurations of flash page size. The design can be programmed to encode protection of 2 to 40 bit errors when writing flash and to correct the corresponding number of errors on decode. The correction level when decoding MUST be programmed to the same correction level as was used during the encode phase.

BCH-codes are a type of block-code, which implies that all error-correction is performed over a block of N-symbols. The BCH operation will be performed over GF(2^{13} = 8192) or GF(2^{14} = 16384), which is the Galois Field consisting of 8191 or 16383 one-bit symbols. BCH-encoding (or encode for any block-code) can be performed by two algorithms: systematic encoding or multiplicative encoding. Systematic encoding is the process of reading all the symbols which constitute a block, dividing continuously these symbols by the generator polynomial for the GF(8192) or GF(16384) and appending the resulting ***t*** parity symbols to the block to create a BCH codeword (where ***t*** is the number of correctable bits).

The BCH encode process creates *t**13 (or *t**14)-bit parity symbols for each data block when the data is written to the flash device. The parity symbols are written to the flash device after the corresponding data block, and together these are collectively called the codeword. The codeword can be used during the decode process to correct errors that occur in either the data or parity blocks.

The BCH decoder processes code words in a 4-step fashion:

1. Syndrome Calculation (SC): This is the process of reading in all of the symbols of the codeword and continuously dividing by the generator polynomial for the field. 2**t* syndromes must be calculated for each codeword and inspection of the syndromes determines if there are errors: a non-zero set of syndromes indicates one or more errors. This process is implemented parallel hardware to minimize processing time since it must be done every time the decode is performed.
2. Key Equation Solver (KES): The syndromes represent 2t-linear equations with 2t-unknown variables. The process of solving these equations and selecting from the numerous solutions constitutes the KES module. When the KES block completes its operations, it generates an error locator polynomial (sigma) that is used in the proceeding block to determine the locations and values of the errors.
3. Chien Search (CS): This block takes input from the KES block and uses the Chien Algorithm for finding the locations of the errors based on the error locator polynomial. The method basically involves substituting all 8191 symbols from the GF(8192) or 16383 symbols from the GF(16383) into the locator polynomial. All evaluations that produce a zero solution indicate locations of the various errors. Since each located error corresponds to a single bit, the bit in the original data may be corrected by simply flipping the polarity of the incorrect location.
4. Correction: this block has to convert the symbol index and mask information to memory byte indexes and masks.

The BCH block, shown in the figure, was designed to operate in a pipelined fashion to maximize throughput. Aside from the initial latency to fill the pipeline stages, the BCH throughput is about 7/4 cycles/byte. Thus, the bottleneck in performing NAND reads and error corrections is the BCH rate. Current GPMI read rates are approximately 1/2 cycles/byte maximally for the current generation of NAND flash. Fortunately, BCH has a different master clock from GPMI, this gives some flexibility to match the throughput rate. The CPU is not directly involved in generating parity symbols, checking for errors, or correcting them.

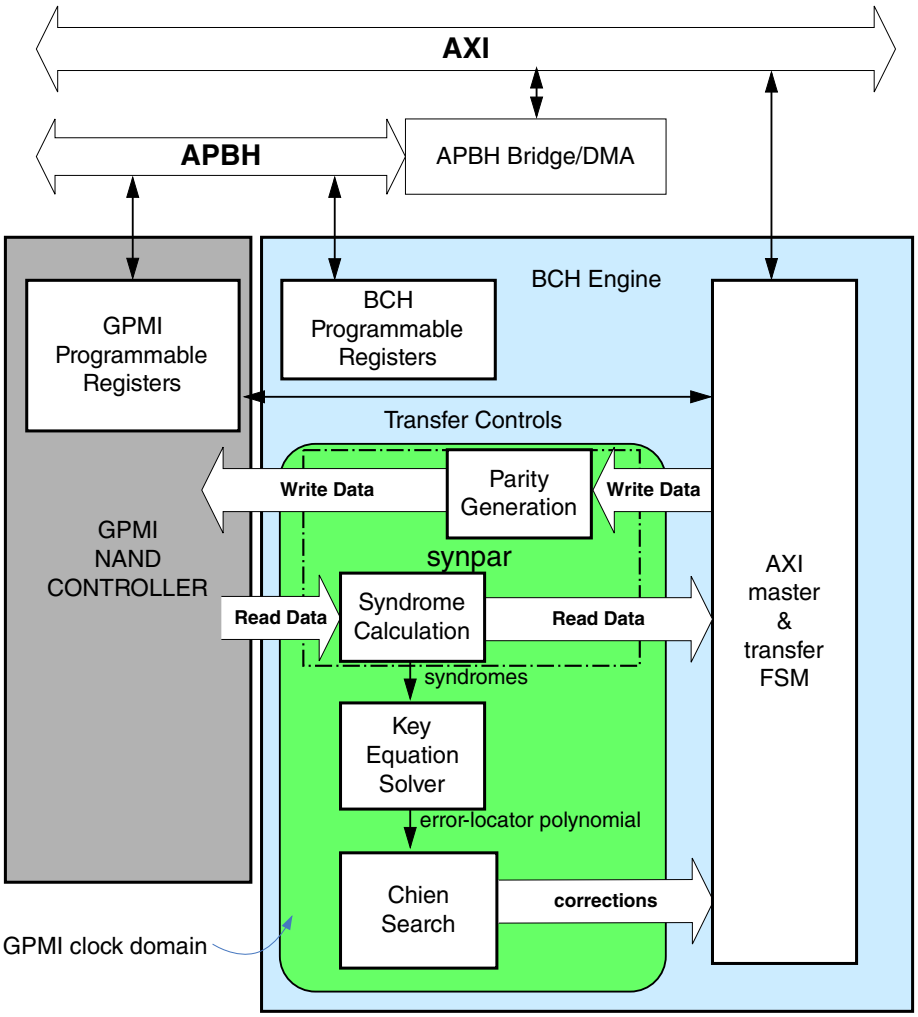

Figure 17-1. Hardware BCH Accelerator

17.2 Operation

Before performing any NAND flash read or write operations, software should first program the BCH's flash layout registers (see Flash Page Layout) to specify how data is to be formatted on the flash device.

The BCH hardware allows full programmability over the flash page layout to enable users flexibility in balancing ECC correction levels and ever-changing flash page sizes.

To initiate a NAND Flash write, software will program a GPMI DMA operation. The DMA need only program the GPMI control registers (and handle the requisite flash addressing handshakes) since the BCH will handle all data operations using its AXI bus interface. The BCH will then send the data to the GPMI controller to be written to flash

as it computes the parity symbols. At the end of each data block the BCH will insert the parity symbols into the data stream so that the GPMI sees only a continuous stream of data to be written.

NAND Flash read operations operate in a similar manner. As the GPMI controller reads the device, all data is sent to the BCH hardware for error detection/correction. The BCH controller writes all incoming read data to system memory and in parallel computes the syndromes used to detect bit errors. If errors are detected within a block, the BCH hardware activates the error correction logic to determine where bit errors have occurred and ultimately correct them in the data buffer in system memory. After an entire flash page has been read and corrected, the BCH will signal an interrupt to the CPU.

The figure below indicates how data read from the GPMI is operated on within the BCH hardware. As the BCH receives data from the GPMI (top row), it is written to memory by the BCH's Bus Interface Unit (BIU) (second row). For blocks requiring correction, the KES logic will be activated after the entire block has been received. Once the error locator polynomial has been computed, the corrections are determined by the Chien Search and fed back to the BIU, which performs a read, modify, write operation on the buffer in memory to correct the data.

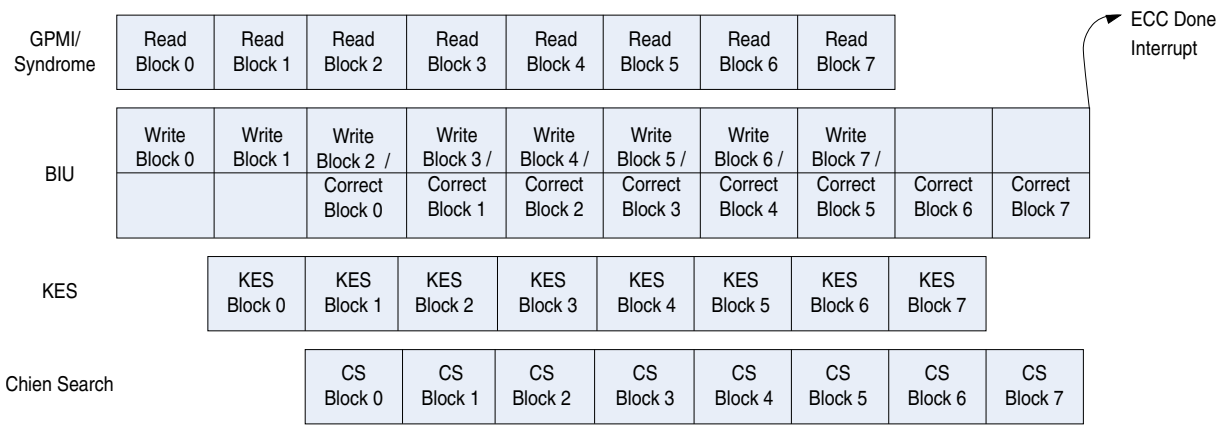

Figure 17-2. Block Pipeline while Reading Flash

17.2.1 BCH Limitations and Assumptions

- The BCH is programmable to support 2 to 40 bit error correction. ECC0 is supported as a pass-through, non-correcting mode.
- Data block sizes must be a multiple of 4 bytes and be aligned in system memory.
- The BCH supports a programmable number of metadata/auxiliary data bytes, from 0 to 255.

- Metadata will be written at the beginning of the flash page to facilitate fast access for filesystem operations.
- Metadata may be treated as an independent block for ECC purposes or combined with the first data block to conserve bits in the flash.
- The BCH does not support a partial page write (this can be accomplished by programming the BCH layout registers such that the BCH only sees a portion of the page).
- Flash read operations can read the entire page or the first block on the page.
- The BCH also supports a memory-to-memory mode of operation that does not require the use of DMA or the GPMI.

17.2.2 Flash Page Layout

The BCH supports a fully programmable flash page layout. The BCH maintains four independent layout registers that can describe four completely different NAND devices or layouts.

When the BCH initiates an operation, it selects one of the layouts by using the chip select as an index into the BCH_LAYOUTSELECT register that determines which layout should be used for the operation.

Three possible (generic) flash layout schemes are supported, as indicated in the figure below. (In each case, the metadata size may also be programmed to 0 bytes). Metadata may either be combined with the first block of data or the size of the first data block can be programmed to 0 to allow the metadata to be protected by its own ECC parity bits.

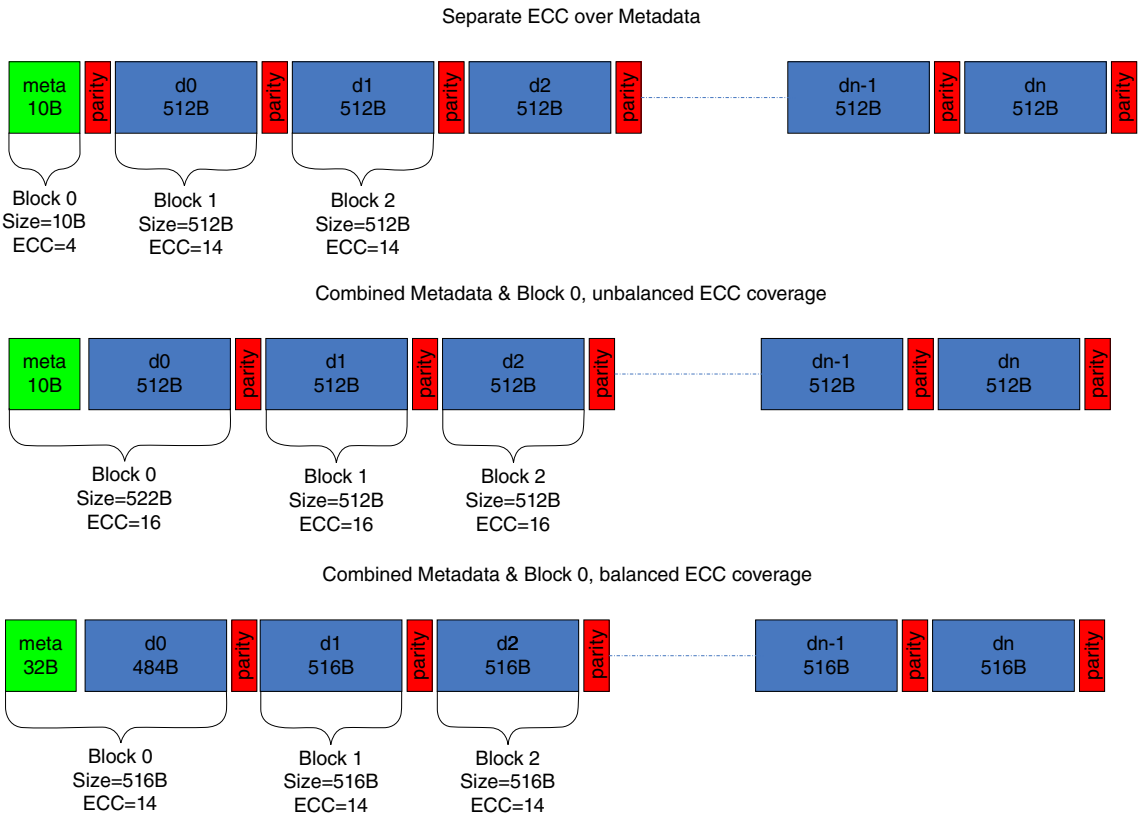

Figure 17-3. FLASH Page Layout Options

Each layout is determined by a pair of registers that define the following parameters:

- DATA0_SIZE: Indicates the number of data bytes in the first block on the page (this should not include parity or metadata bytes). This should be set to 0 when the metadata is to be covered separately with its own ECC. This must be a multiple of 4 bytes.
- ECC0: Indicates the ECC level to be used for the first block on the flash (data0+metadata).
- META_SIZE: Indicates the number of bytes (from 0-255) that are stored as metadata.
- NBLOCKS: Indicates the number of subsequent DATAN blocks on the flash, or the number of blocks following the DATA0 block.
- DATAN_SIZE: Indicates the number of data bytes in all subsequent data blocks. This MUST be a multiple of 4 bytes.
- ECCN: Indicates the ECC level to be used for the subsequent data blocks.

- GF0 or GFN: Indicates the Galois field the meta / data blocks are using
- PAGE_SIZE: Indicates the total number of bytes available per page on the physical flash device. This includes the spare area and is typically 4096+128, 4096+218, or 2048+64 bytes.

17.2.3 Determining the ECC layout for a device

Since the BCH is programmable, a system can trade off ECC levels for flash size and layout configurations.

The following examples indicate how to determine a valid layout based on the required storage space and flash size. For all cases, the size of the parity will be 13 (or 14 for GF(2^{14}))*ECC level ***bits***-- so for ECC8, 13 (or 14) bytes are required (per block).

17.2.3.1 4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(2^{13})

In this case, we have 8 data blocks each consisting of 512 bytes. Since the flash has 218 spare bytes (1744 bits), first estimate an ECC level for the data blocks by first subtracting the number of metadata bytes from the spare bytes (218 – 10 = 208 bytes = 1664 bits) then dividing the number of bits by 8 (number of blocks) and then by 13 (bits per ECC level).

(218 - 10) x 8 = 1664/13(8) = 16

Therefore all the data blocks could be covered by ECC16 if the metadata had no parity. This isn't acceptable, so assume ECC14 for all the data blocks. Now calculate the number of free bits for the metadata parity as

1664 - (14) x 13 x 8 = 208

Therefore, 208 bits remain for metadata parity. Dividing by 13 (bits/ECC) gives 16, so the metadata can be covered with ECC16. The settings for this device would then be

Table 17-1. Settings for 4K+218 FLASH

Setting	Value
PAGE_SIZE	4096+218=4314=0x10DA
META_SIZE	10=0x0A
DATA0_SIZE	0
ECC0	16=0x10

Table continues on the next page...

Table 17-1. Settings for 4K+218 FLASH (continued)

Setting	Value
GF0	GF(2^{13})
DATAN_SIZE	512=0x200 (in register interface, assigned as 0x80)
ECCN	14=0x0E
GFN	GF(2^{13})
NBLOCKS	8

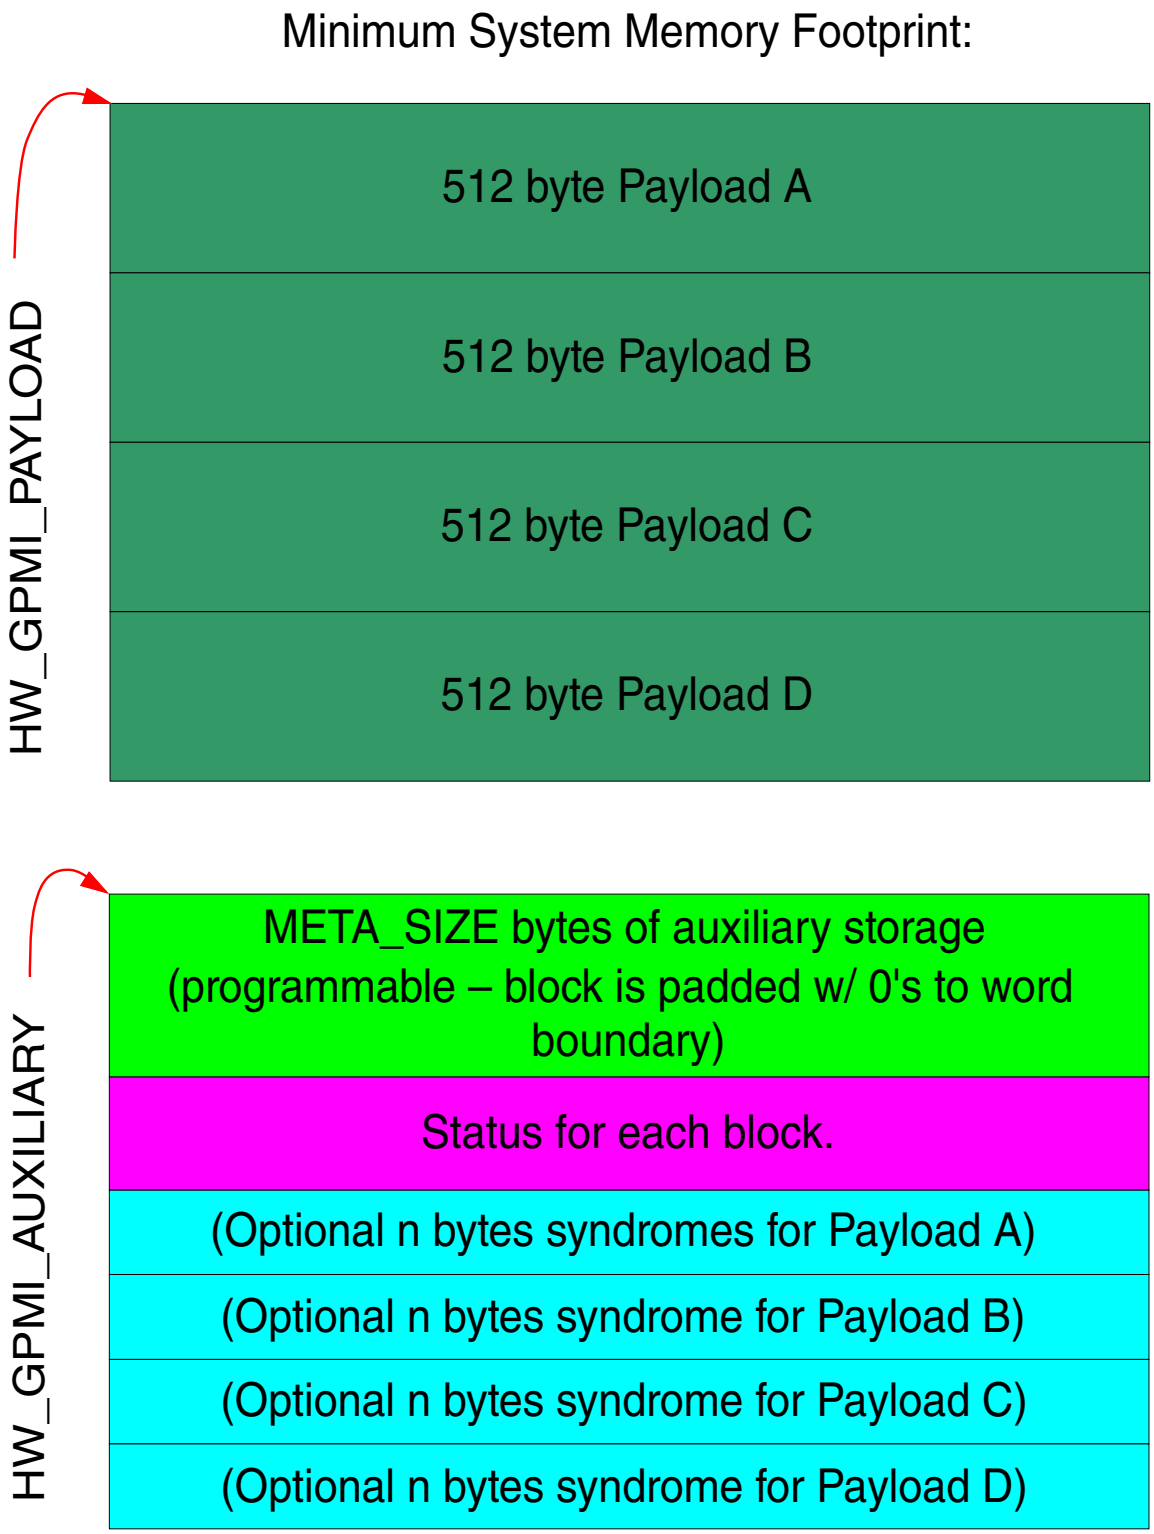
17.2.3.2 4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(2^{13}) for data and GF(2^{14}) for metadata

This flash will have 118 bytes available for ECC (after subtracting the metadata size), therefore, 994 bits.

Dividing by 4*14 (number of blocks * ECC level) we get 17.75, therefore we can support ECC16 on the data blocks. The number of free spare bits becomes 944 - 16 * 4 * 14 = 944 - 896 = 48, divided by 13 = 3.69, therefore the metadata can be also covered by ECC2.

Table 17-2. Settings for 4K+128 FLASH

Setting	Value
PAGE_SIZE	4096+128=4224=0x1080
META_SIZE	10=0x0A
DATA0_SIZE	0
ECC0	2
GF0	GF(2^{13})
DATAN_SIZE	1024=0x400 (in register interface, assigned as 0x100)
ECCN	16
GFN	GF(2^{14})
NBLOCKS	4



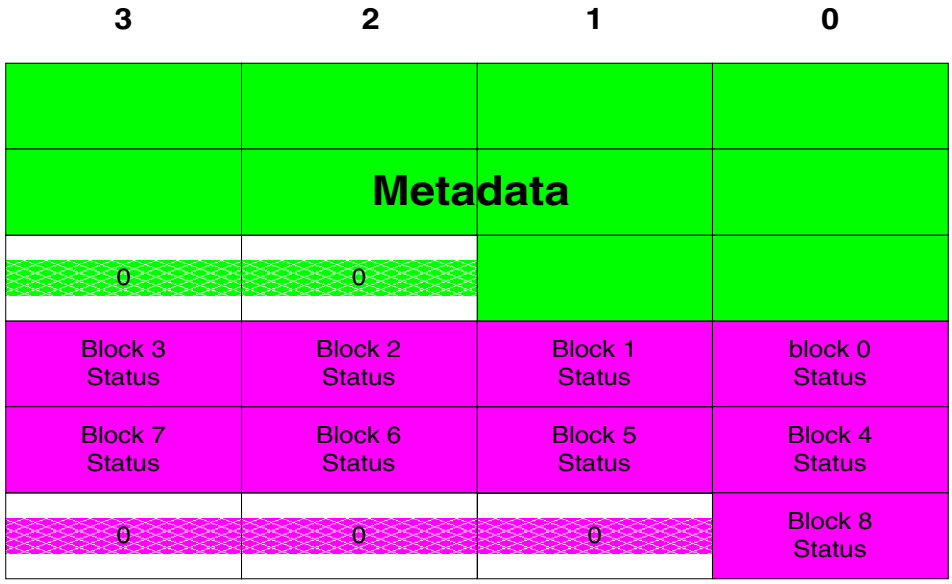
In this case, there will be additional unused spare bits, with the BCH will pad out with zeros.

17.2.4 Data Buffers in System Memory

While the data on the flash is interleaved with parity symbols, the BCH assumes that the data buffers in memory are contiguous.

Metadata read from the flash will be stored to the location pointed to by the GPMI_AUXILIARY register and data will be written to the address specified in the GPMI_PAYLOAD register as is shown in the following figure where the block length is 512 bytes for example. Since the number of blocks on a flash page is programmable, the BCH also writes individual block correction status to the auxiliary pointer at the word-aligned address following the end of the metadata. Optionally, the computed syndromes may also be written to the auxiliary area if the DEBUGSYNDROME bit is set in the control register.

As blocks complete processing, the bus master will accumulate the status for each block and write it to the auxiliary data buffer following the metadata. The metadata area will be padded with 0's until the next word boundary and the status for blocks 0-3 will be written to the next word. The status for subsequent blocks will then be written to the buffer. The status for the first block (metadata block) is also stored in the STATUS_BLK0 register in the BCH_STATUS register. The completion codes for the blocks are indicated in the Table 17-3. Note that the definition of the bytes and their ordering in the auxiliary and payload storage areas are user defined. When this data is read back from the flash and put into memory, it will resemble the original buffer that was written out to the flash.



*Computed syndrome area consists of 2*t 13 (or 14)-bit symbols written as 16-bit half word.*

Figure 17-4. BCH Data Buffers in Memory

Table 17-3. Status Block Completion Codes

Code	Description
0xFF	Block is erased
0xFE	Block is uncorrectable
0x00	No errors found
0x01-0x28	Number of errors corrected

The following figure shows the layout of the bytes within the status field.

Status bytes are allocated based on the NBLOCKS programmed into the flash format register. The number of status bytes will be computed by the NBLOCKS+1. The status area will be padded with zeros to the next word boundary.

Syndrome data written for debug purposes will follow the end of the status block.

Figure 17-5. Memory-to-Memory Operations

17.3 Memory to Memory (Loopback) Operation

The BCH supports a memory-to-memory mode of operation where both the encoded and decoded buffers reside in system memory.

This can be useful for applications where data must be protected by ECC, but the storage device does not reside on the GPMI bus.

The BCH operation in memory to memory mode is much simpler than in GPMI mode since DMAs are not required to manage the operation. Instead, software simply writes the BCH_DATAPTR and BCH_METAPTR with the addresses of the data and metadata (auxiliary) buffers and the BCH_ENCODEPTR with the address of the buffer for encoded data. To initiate the operation, software simply sets the M2M_ENCODE and M2M_ENABLE bits in the control register. The BCH can be programmed to either issue an interrupt at the end of the operation or software may poll the status bits for completion.

Memory to memory decode operations work in a similar manner. The encoded data address is written to the BCH_ENCODEPTR and the data and meta pointers are written to buffers that correspond to the desired decoded data addresses. To initiate a decode, software must set the M2M_ENCODE bit to 0 while writing the M2M_ENABLE bit. Note that the addresses written to the BCH_DATAPTR, BCH_METAPTR and BCH_ENCODEPTR registers should always be aligned on a 4 byte boundary. In other words, the 2 lower bits of the address should always be written with zeros.

17.4 Programming the BCH/GPMI Interfaces

Programming the BCH for NAND operations consists largely of disabling the soft reset and clock bits (SFTRST and CLKGATE) from the BCH_CTRL register and then programming the flash layout registers to correspond to the format of the attached NAND device(s).

The BCH_LAYOUTSELECT register should also be programmed to map the chip select of each attached device into one of the four layout registers.

The bulk of the programming is actually applied to the GPMI through PIO operations embedded in DMA command structures. The DMA will perform all the requisite handshaking with the GPMI interface to negotiate the address portion of the transfer, then the BCH will handle all the movement of data from memory to the GPMI (writes) or the GPMI to memory (reads). The BCH will direct all data blocks to the buffer pointed to by the PAYLOAD_BUFFER and the metadata will be written to the AUXILIARY_BUFFER. Both of these registers are located in the GPMI PIO data space and are communicated to the BCH hardware at the beginning of the transfer. Thus, the normal multi-NAND DMA based device interleaving is preserved, that is, four NANDs on four separate chip selects can be scheduled for read or write operations using the BCH. Whichever channel finishes its ready wait first and enters the DMA arbiter with its lock bit set owns the GPMI command interface and through it owns the BCH resources for the duration of its processing.

17.4.1 BCH Encoding for NAND Writes

The BCH encoder flowchart in Figure 17-6 shows the detailed steps involved in programming and using the BCH encoder. This flowchart shows how to use the BCH block with the GPMI.

To use the BCH encoder with the GPMI's DMA, create a DMA command chain containing ten descriptor structures, as shown in Figure 17-8 and detailed in the DMA structure code example that follows it in DMA Structure Code Example. The ten descriptors perform the following tasks:

1. Disable the BCH block (in case it was enabled) and issue NAND write setup command byte (under CLE) and address bytes (under ALE).
2. Configure and enable the BCH and GPMI blocks to perform the NAND write.
3. Disable the BCH block and issue NAND write execute command byte (under CLE).
4. Wait for the NAND device to finish writing the data by watching the ready signal.
5. Check for NAND timeout through PSENSE.
6. Issue NAND status command byte (under CLE).
7. Read the status and compare against expected.
8. If status is incorrect or incomplete, branch to error handling descriptor chain.
9. Otherwise, write is complete and emit GPMI interrupt.

```

17.4.1.2 Using the BCH Encoder

To use the BCH encoder, first turn off the module-wide soft reset bit in both the GPMI and BCH blocks before starting any DMA activity.

Turning off the soft reset must take place by itself, prior to programming the rest of the control registers. Turn off the BCH bus master soft reset bit. Turn off the clock gate bits.

Program the remainder of the GPMI, BCH and APBH DMA as follows:

```
// bring APBH out of reset
APBH_CTRL0_CLR(BM_APBH_CTRL0_SFRST);
APBH_CTRL0_CLR(BM_APBH_CTRL0_CLKGATE);

// bring BCH out of reset
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);

// bring gpmi out of reset
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_SFTRST);
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_CLKGATE);
GPMI_CTRL1_SET(BM_GPMI_CTRL1_DEV_RESET | // deassert reset
                   BM_GPMI_CTRL1_BCH_MODE  );    // enable BCH mode

// enable pinctrl
PINCTRL_CTRL_WR(0x00000000);

// enable gpmi pins
PINCTRL_MUXSEL0_CLR(0x0000ffff);    // data bits
PINCTRL_MUXSEL1_CLR(0x03ffffff);    // control bits
PINCTRL_MUXSEL8_CLR(0x0003f3ff);    // control bits
PINCTRL_MUXSEL8_SET(0x00015155);    // control bits
```

Note that for writing NANDs (ECC encoding), only GPMI DMA command complete interrupts are used. The BCH engine is used for writing to the NAND but may optionally produces an interrupt. From the sample code in DMA Structure Code Example:

- DMA descriptor 1 prepares the NAND for data write by using the GPMI to issue a write setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is disabled and not used for these commands.

- DMA descriptor 2 enables the BCH engine for encoding to begin the initial writing of the NAND data by specifying where the data and auxiliary payload are coming from in system memory.
- DMA descriptor 3 issues the write commit command byte under CLE to the NAND.
- DMA descriptor 4 waits for the NAND to complete the write commit/transfer by watching the NAND's ready line status. This descriptor relinquishes the NANDLOCK on the GPMI to enable the other DMA channels to initiate NAND transactions on different NAND CS lines.
- DMA descriptor 6 issues a NAND status command byte under "CLE" to check the status of the NAND device following the page write.
- DMA descriptor 7 reads back the NAND status and compares the status with an expected value. If there are differences, then the DMA processing engine follows an error-handling DMA descriptor path.
- DMA descriptor 8 disables the BCH engine and emits a GPMI interrupt to indicate that the NAND write has been completed.

17.4.2 BCH Decoding for NAND Reads

When a page is read from NAND flash, BCH syndromes will be computed and, if correctable errors are found, they will be corrected on a per block basis within the NAND page.

This decoding process is fully overlapped with other NAND data reads and with CPU execution. The BCH decoder flowchart in the figure below shows the steps involved in programming the decoder. The hardware flow of reading and decoding a 4096-byte page is shown in Figure 17-10.

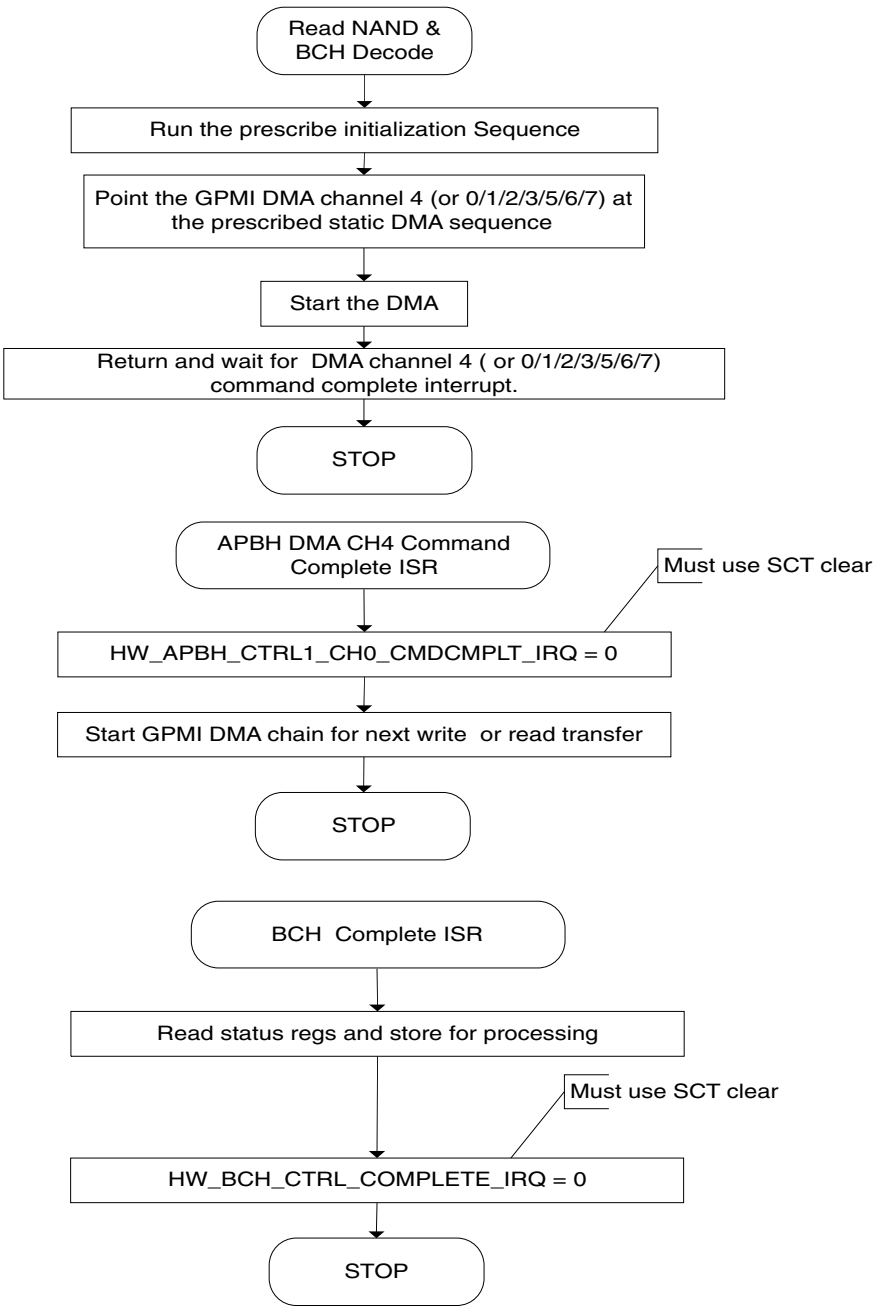

Figure 17-9. BCH Decode Flowchart

Conceptually, an APHB DMA Channel command chain with seven command structures linked together is used to perform the BCH decode operation (as shown in Figure 17-10).

Note

The GPMI's DMA command structures controls the BCH decode operation.

To use the BCH decoder with the GPMI's DMA, create a DMA command chain containing seven descriptor structures, as shown in the figure below and detailed in the DMA structure code example that follows it in DMA Structure Code Example. The seven DMA descriptors perform the following tasks:

1. Issue NAND read setup command byte (under "CLE") and address bytes (under "ALE").
2. Issue NAND read execute command byte (under "CLE").
3. Wait for the NAND device to complete accessing the block data by watching the ready signal.
4. Check for NAND timeout through "PSENSE".
5. Configure and enable the BCH block and read the NAND block data.
6. Disable the BCH block.
7. Descriptor NOP to allow NANDLOCK in the previous descriptor to the thread-safe.

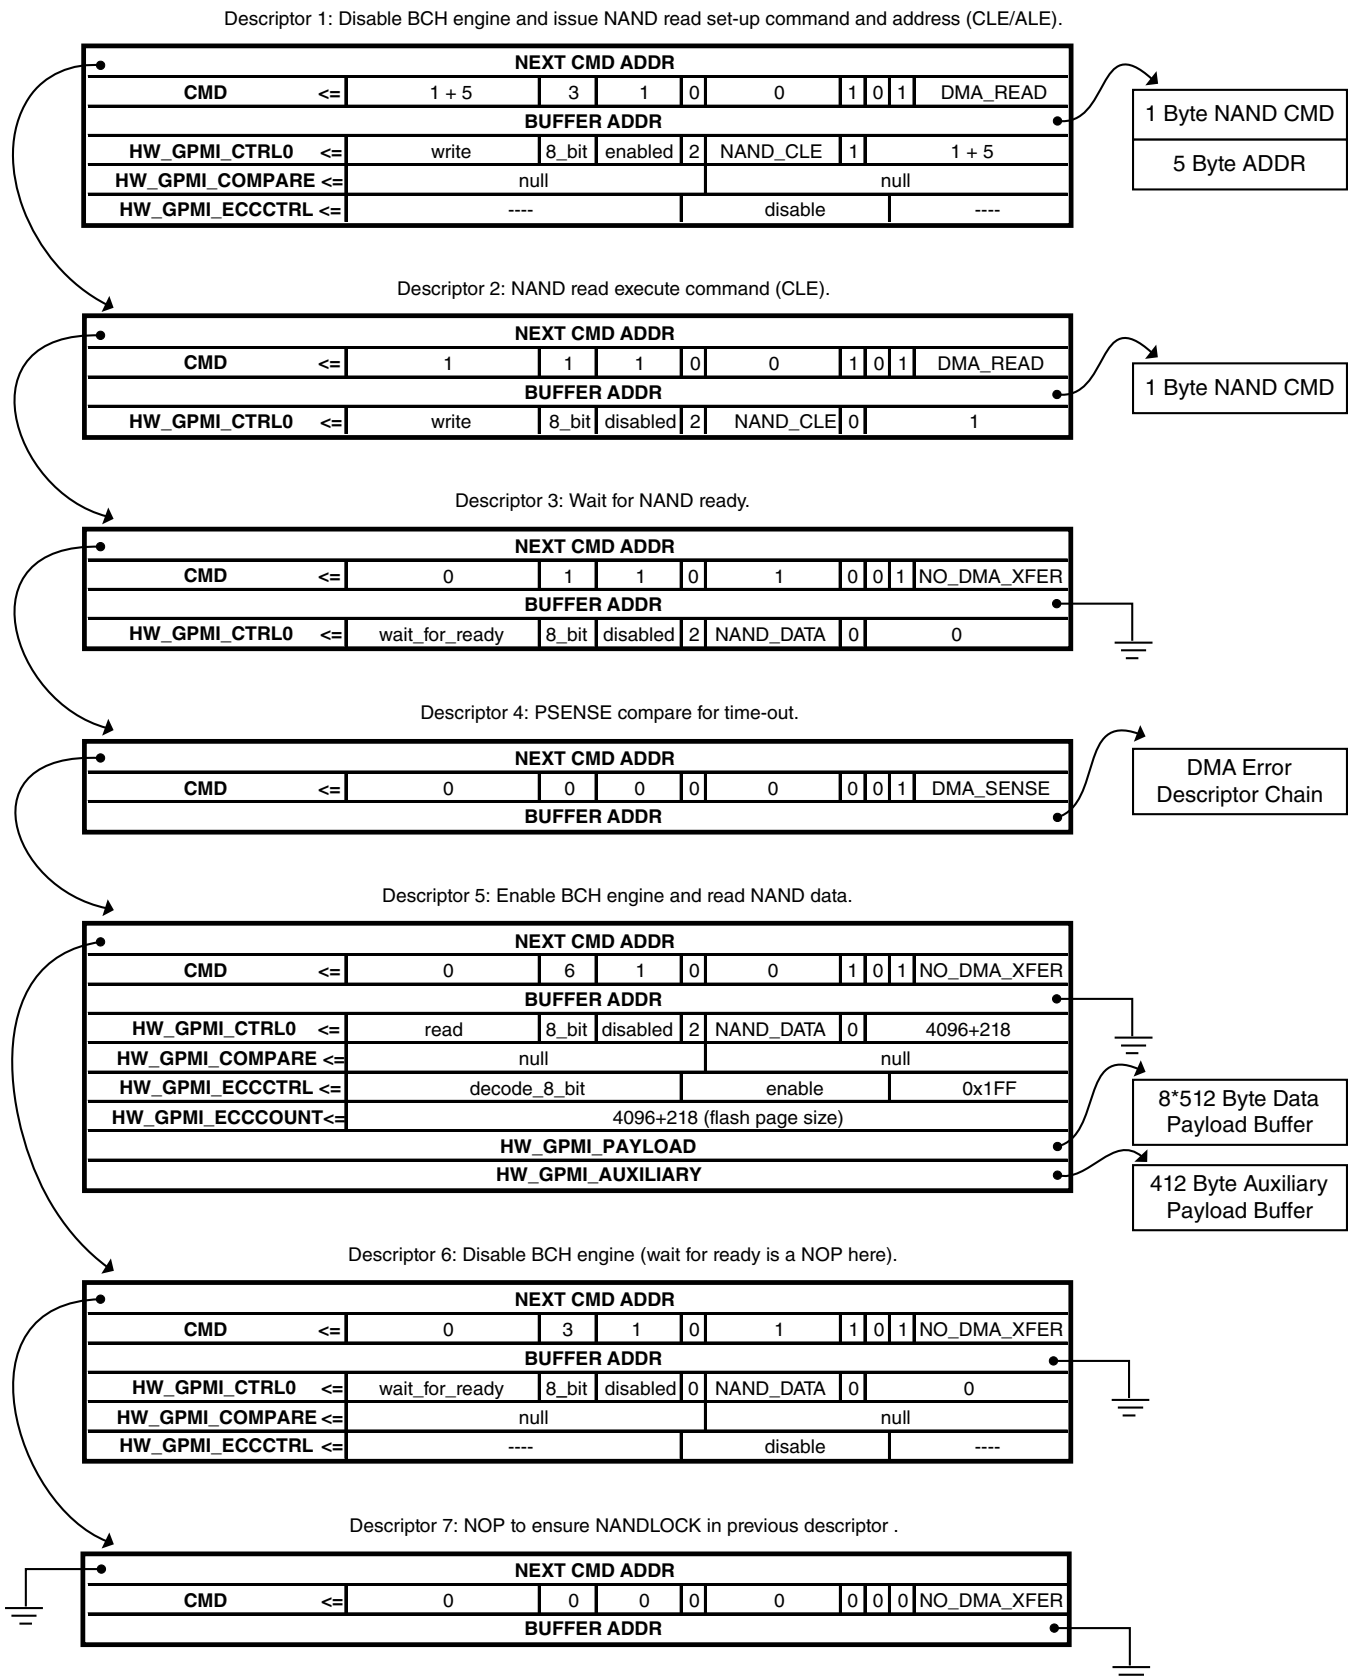

Figure 17-10. BCH Decode DMA Descriptor Chain

17.4.2.1 DMA Structure Code Example

The following sample code illustrates the coding for one read transaction, consisting of a seven DMA command structure chain for reading all 4096 bytes of payload data (eight 512-byte blocks) and 65 bytes of metadata with the associative parity bytes (8 * (18) + 9) from a 4K NAND page sitting on GPMI CS2.

17.4.2.2 Using the Decoder

As illustrated in Figure 17-10 and the sample code in DMA Structure Code Example :

- DMA descriptor 1 prepares the NAND for data read by using the GPMI to issue a NAND read setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is not used for these commands.
- DMA descriptor 2 issues a one-byte read execute command to the NAND device that triggers its read access. The NAND then goes not ready.

- DMA descriptor 3 performs a wait for ready operation allowing the DMA chain to remain dormant until the NAND device completes its read access time.
- DMA descriptor 5 handles the reading and error correction of the NAND data. This command's PIOs activate the BCH engine to write the read NAND data to system memory and to process it for any errors that need to be corrected. This DMA descriptor contains two PIO values that are system memory addresses pointing to the PAYLOAD data area and to the AUXILIARY data area. These addresses are used by the BCH engine's AHB master to move data into system memory and to correct it. While this example is reading an entire 4K page—payload plus metadata—it is equally possible to read just one 512-byte payload block or just the uniquely protected metadata block in a single 7 DMA structure transfer.
- DMA descriptor 6 disables the BCH engine with the NANDLOCK asserted. This is necessary to ensure that the GPMI resource is not arbitrated to another DMA channel when multiple DMA channels are active concurrently.
- DMA descriptor 7 deasserts the NANDLOCK to free up the GPMI resource to another channel.

As the BCH block receives data from the GPMI:

- The decoder transforms the read NAND data block into a BCH code word and computes the codeword syndrome.
- If no errors are present, then the BCH block can immediately report back to firmware. This report is passed as the BCH_CTRL_COMPLETE_IRQ interrupt status bit and the associated status registers in BCH_STATUS0/1 registers.
- If an error is present, then the BCH block corrects the necessary data block or parity block bytes, if possible (not all errors are correctable).

As the BCH decoder reads the data and parity blocks, it records a special condition, i.e., that all of the bits of a payload data block or metadata block are one, including any associated parity bytes. The all-ones case for both parity and data indicates an erased block in the NAND device.

The BCH_STATUS0 register contains a 4-bit field that indicates the final status of the auxiliary block. A value of 0x0 indicates no errors found for a block.

- A value of 1 to 20 inclusive indicates that many correctable errors were found and fixed.
- A value of 0xFE indicates uncorrectable errors detected on the block.

- A value of 0xFF indicates that the block was in the special ALL ONES state and is therefore considered to be an ERASED block.
- All other values are disallowed by the hardware design.

Recall that up to eight NAND devices can have DMA chains in-flight at once, i.e. they can all be contending for access to the GPMI data bus. It is impossible to predict which NAND device will enter the BCH engine with a transfer first, because each chain includes a wait4ready command structure. As a result, firmware should look at the BCH_STATUS0_COMPLETED_CE bit field to determine which block is being reported in the status register. There is also a 16-bit HANDLE field in the GPMI_ECCCTRL register that is passed down the pipeline with each transaction. This handle field can be used to speed firmware's detection of which transaction is being reported.

These examples of reading and writing have focused on full page transfers of 4K page NAND devices. Other device configurations can be specified by changing the ECCOUNT field in the GPMI registers and reprogramming the BCH's FLASHnLAYOUTm registers.

The BCH and GPMI blocks are designed to be very efficient at reading single 512 (or 1024)-byte pages in one transaction. With no errors, the transaction takes less than 20 HCLKs longer than the time to read the raw data from the NAND.

To summarize, the APBH DMA command chain for a BCH decode operation is shown in Figure 17-10. Seven DMA command structures must be present for each NAND read transaction decoded by the BCH. The seven DMA command structures for multiple NAND read transaction blocks can be chained together to make larger units of work for the BCH, and each will produce an appropriate error report in the BCH PIO space. Multiple NAND devices can have such multiple chains scheduled. The results can come back out of order with respect to the multiple chains.

17.4.3 Interrupts

There are two interrupt sources used in processing BCH protected NAND read and write transfers.

Since all BCH operations are initiated by GPMI DMA command structures, the DMA completion interrupt for the GPMI is an important ISR. Both of the flow charts of Figure 17-6 and Figure 17-9 show the GPMI DMA complete ISR skeleton. In both reads and writes, the GPMI DMA completion interrupt is used to schedule work ***INTO*** the error correction pipeline. As the front end processing completes, the DMA interrupt is

generated and additional work, such as DMA chains, are passed to the GPMI DMA to keep it *fed*. For write operations, this is the only interrupt that is generated for processing the NAND write transfer.

For reads, however, two interrupts are needed. Every read is started by a GPMI DMA command chain and the front end queue is fed as described above. The back end of the read pipeline is drained by monitoring the BCH completion interrupt found int HW_BCH_CTRL_COMPLETE_IRQ.

An BCH transaction consists of reading or writing all of the blocks requested in the HW_GPMI_ECCCTRL_BUFFER_MASK bit field. As every read transaction completes, it posts the status of all of the blocks to the HW_BCH_STATUS0 and HW_BCH_STATUS1 registers and sets the completion interrupt. The five stages of the BCH read pipeline completes, one in the GPMI and four in the BCH, are independently stalled as they complete and try to deliver to the next stage in the data flow. Several of these stages can be skipped if no-errors are found or once an uncorrectable error is found in a block.

In any case, the final stage will stall if the status register is busy waiting for the CPU to take status register results. The hardware monitors the state of the HW_BCH_CTRL_COMPLETE_IRQ bit. If it is still set when the last pipeline stage is ready to post data, then the stage will stall. It follows that the next previous stage will stall when it is ready to hand off work to the final stage, and so on up the pipeline.

CAUTION

It is important that firmware read the STATUS0/1 results and save them before clearing the interrupt request bit. Otherwise, a transaction and its results could be completely lost.

17.5 Behavior During Reset

A soft reset (SFTRST) can take multiple clock periods to complete, so do NOT set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically. The exemplary code is shown below.

```
// A soft reset can take multiple clocks to complete, so do NOT gate the
// clock when setting soft reset. The reset process will gate the clock
// automatically. Poll until this has happened before subsequently
// preparing soft-reset and clock gate
  BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
  BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);
// asserting soft-reset
  BCH_CTRL_SET(BM_BCH_CTRL_SFTRST);
// waiting for confirmation of soft-reset
  while (!BCH_CTRL.B.CLKGATE)
```

```
   {
// busy wait
   }
// Done.
   BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
   BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);
```

17.6 BCH Memory Map/Register Definition

BCH Hardware Register Format Summary

BCH memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
180_8000	Hardware BCH ECC Accelerator Control Register (BCH_CTRL)	32	R/W	C000_0000h	17.6.1/578
180_8004	Hardware BCH ECC Accelerator Control Register (BCH_CTRL_SET)	32	R/W	C000_0000h	17.6.1/578
180_8008	Hardware BCH ECC Accelerator Control Register (BCH_CTRL_CLR)	32	R/W	C000_0000h	17.6.1/578

17.6.1 Hardware BCH ECC Accelerator Control Register (BCH_CTRL*n*)

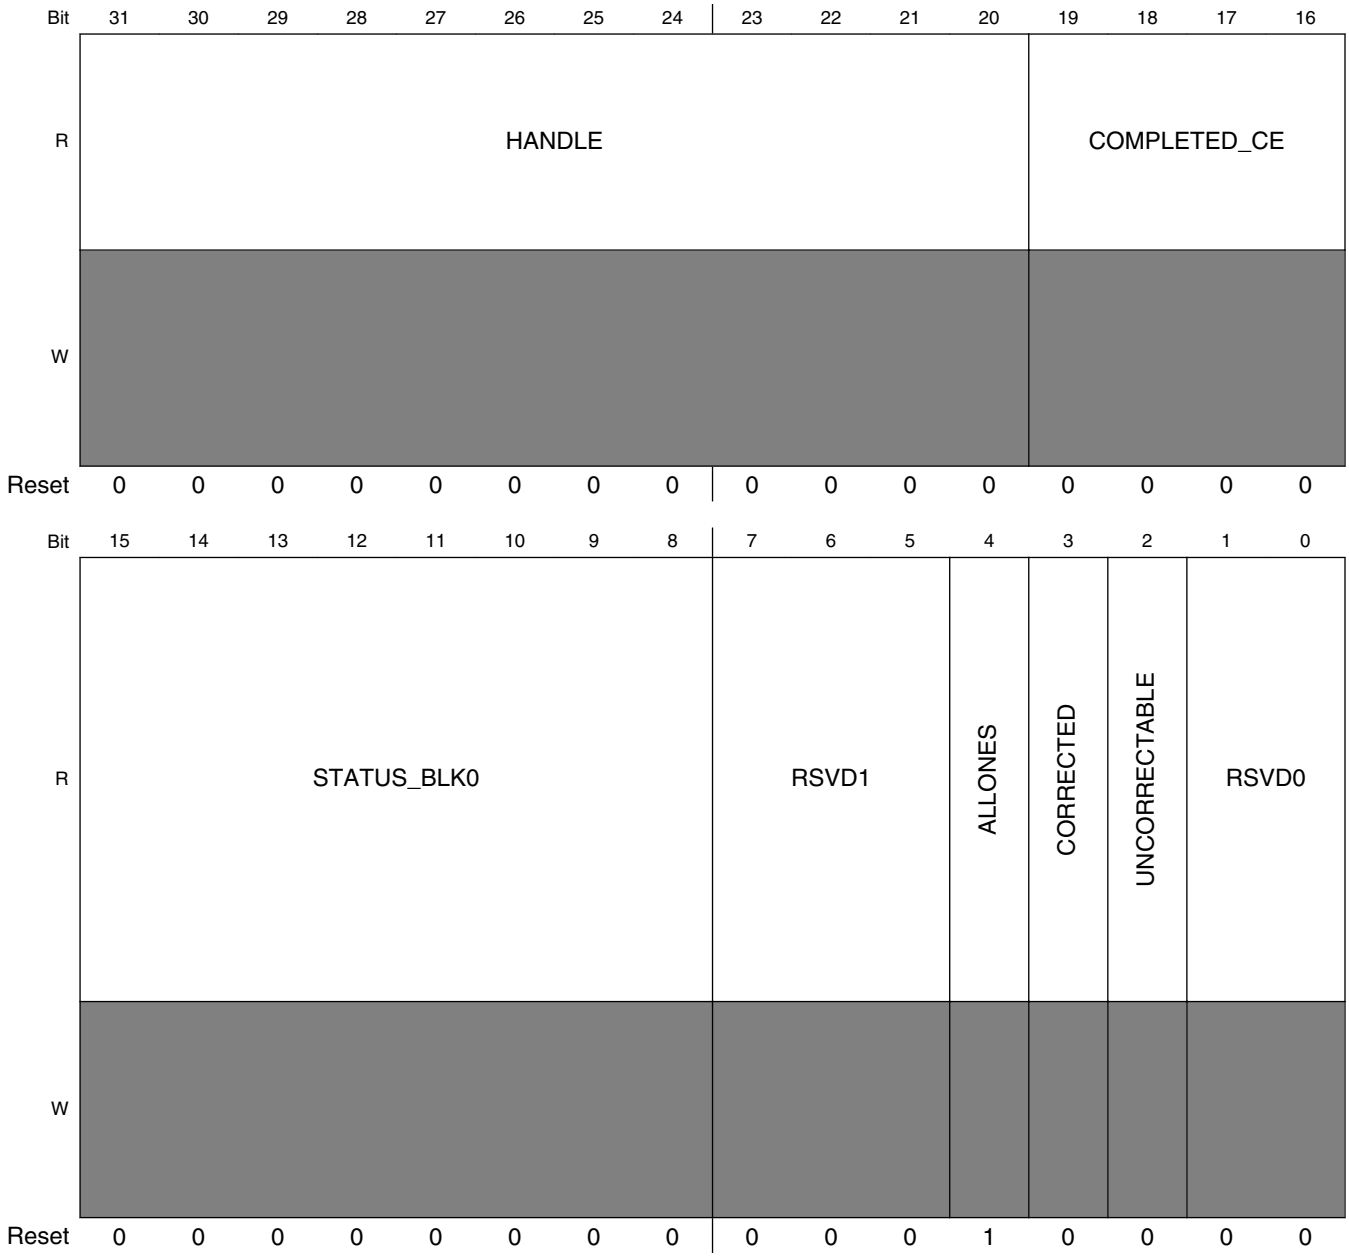
The BCH CTRL provides overall control of the hardware ECC accelerator

Address: 180_8000h base + 0h offset + (4d × i), where i=0d to 3d

BCH_CTRL*n* field descriptions

Field	Description
31 SFTRST	Set this bit to 0 to enable normal BCH operation. Set this bit to 1 (default) to disable clocking with the BCH and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the BCH block to its default state. This bit resets all state machines except for the AHB master state machine 0x0 **RUN** — Allow BCH to operate normally. 0x1 **RESET** — Hold BCH in reset.
30 CLKGATE	This bit must be set to 0 for normal operation. When set to 1 it gates off the clocks to the block. 0x0 **RUN** — Allow BCH to operate normally. 0x1 **NO_CLKS** — Do not clock BCH gates in order to minimize power consumption.
29–23 RSVD5	This field is reserved. This read-only field is reserved and always has the value 0.
22 DEBUGSYNDROME	(For debug purposes only). Enable write of computed syndromes to memory on BCH decode operations. Computed syndromes will be written to the auxiliary buffer after the status block. Syndromes will be written as padded 16-bit values.
21–20 RSVD4	This field is reserved. This read-only field is reserved and always has the value 0
19–18 M2M_LAYOUT	Selects the flash page format for memory-to-memory operations.
17 M2M_ENCODE	Selects encode (parity generation) or decode (correction) mode for memory-to-memory operations.
16 M2M_ENABLE	NOTE! WRITING THIS BIT INITIATES A MEMORY-TO-MEMORY OPERATION. The BCH module must be inactive (not processing data from the GPMI) when this bit is set. The M2M_ENCODE and

Table continues on the next page...



BCH_CTRL*n* field descriptions (continued)

Field	Description
	M2M_LAYOUT bits as well as the ENCODEPTR, DATAPTR, and METAPTR registers are used for memory-to-memory operations and must be correctly programmed before writing this bit.
15–11 RSVD3	This field is reserved. This read-only field is reserved and always has the value 0
10 DEBUG_STALL_ IRQ_EN	1 = interrupt on debug stall mode is enabled. The IRQ is raised on every block
9 RSVD2	This field is reserved. This read-only field is reserved and always has the value 0.
8 COMPLETE_IRQ_ EN	1 = interrupt on completion of correction is enabled.
7–4 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
3 BM_ERROR_IRQ	AHB Bus interface Error Interrupt Status. Write a 1 to the SCT clear address to clear the interrupt status bit.
2 DEBUG_STALL_IRQ	DEBUG STALL Interrupt Status. Write a 1 to the SCT clear address to clear the interrupt status bit.
1 RSVD0	This field is reserved. This read-only field is reserved and always has the value 0.
0 COMPLETE_IRQ	This bit indicates the state of the external interrupt line. Write a 1 to the SCT clear address to clear the interrupt status bit. NOTE: subsequent ECC completions will be held off as long as this bit is set. Be sure to read the data from BCH_STATUS0, 1 before clearing this interrupt bit.

17.6.2 Hardware ECC Accelerator Status Register 0 (BCH_STATUS0*n*)

The BCH STAT register provides visibility into the run-time status of the BCH and status information when processing is complete. It provides overall status of the hardware ECC accelerator.

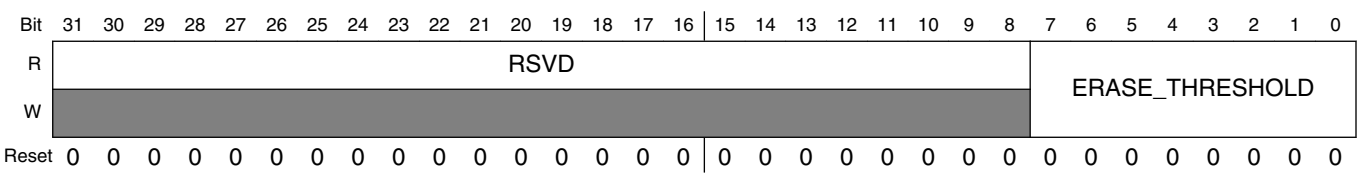
Address: 180_8000h base + 10h offset + (4d × i), where i=0d to 3d

BCH_STATUS0*n* field descriptions

Field	Description
31–20 HANDLE	Software supplies a 12 bit handle for this transfer as part of the GPMI DMA PIO operation that started the transaction. That handle passes down the pipeline and ends up here at the time the BCH interrupt is signaled.
19–16 COMPLETED_CE	This is the chip enable number corresponding to the NAND device from which this data came.
15–8 STATUS_BLK0	Count of symbols in error during processing of first block of flash (metadata block). The number of errors reported will be in the range of 0 to the ECC correction level for block 0. 0x00 **ZERO** — No errors found on block.

Table continues on the next page...

BCH_STATUS0*n* field descriptions (continued)



Field	Description
	0x01 **ERROR1** — One error found on block. 0x02 **ERROR2** — One errors found on block. 0x03 **ERROR3** — One errors found on block. 0x04 **ERROR4** — One errors found on block. 0xFE **UNCORRECTABLE** — Block exhibited uncorrectable errors. 0xFF **ERASED** — Page is erased.
7–5 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
4 ALLONES	1 = All data bits of this transaction are ONE.
3 CORRECTED	1 = At least one correctable error encountered during last processing cycle.
2 UNCORRECTABLE	1 = Uncorrectable error encountered during last processing cycle.
RSVD0	This field is reserved. This read-only field is reserved and always has the value 0.

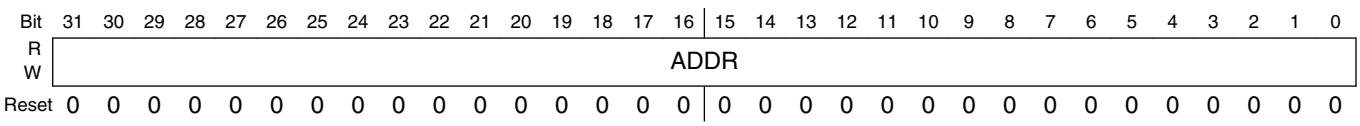
17.6.3 Hardware ECC Accelerator Mode Register (BCH_MODE*n*)

The BCH MODE register provides additional mode controls.

Contains additional global mode controls for the BCH engine.

Address: 180_8000h base + 20h offset + (4d × i), where i=0d to 3d

BCH_MODE*n* field descriptions



Field	Description
31–8 RSVD	This field is reserved. This read-only field is reserved and always has the value 0.
ERASE_ THRESHOLD	This value indicates the maximum number of zero bits on a flash subpage for it to be considered erased. For SLC NAND devices, this value should be programmed to 0 (meaning that the entire page should consist of bytes of 0xFF. For MLC NAND devices, bit errors may occur on reads (even on blank pages), so this threshold can be used to tune the erased page checking algorithm.

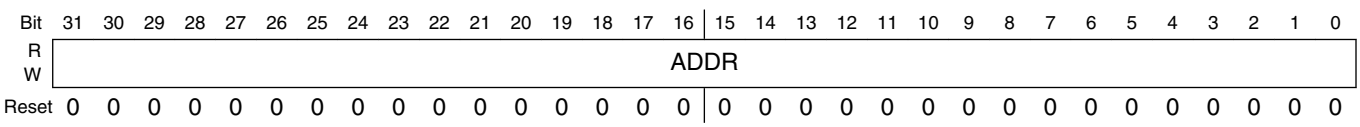
17.6.4 Hardware BCH ECC Loopback Encode Buffer Register (BCH_ENCODEPTR*n*)

When performing memory to memory operations, indicates the address of the encode buffer. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register.

For memory to memory operations, this register is used as the pointer to the encoded data, which is an output when encoding and an input while decoding.

Address: 180_8000h base + 30h offset + (4d × i), where i=0d to 3d

BCH_ENCODEPTR*n* field descriptions



Field	Description
ADDR	Address pointer to encode buffer. This is the source for decode operations and the destination for encode operations. This value must be aligned on a 4 bytes boundary.

17.6.5 Hardware BCH ECC Loopback Data Buffer Register (BCH_DATAPTR*n*)

When performing memory to memory operations, indicates the address of the data buffer.

For memory to memory operations, this register is used as the pointer to the data to encode or the destination buffer for decode operations.

Address: 180_8000h base + 40h offset + (4d × i), where i=0d to 3d

BCH_DATAPTR*n* field descriptions

Field	Description
ADDR	Address pointer to data buffer. This is the source for encode operations and the destination for decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 byte boundary.

17.6.6 Hardware BCH ECC Loopback Metadata Buffer Register (BCH_METAPTR*n*)

When performing memory to memory operations, indicates the address of the metadata buffer.

For memory to memory operations, this register is used as the pointer to the metadata to encode or the extracted metadata for decode operations.

Address: 180_8000h base + 50h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

BCH_METAPTR*n* field descriptions

Field	Description
ADDR	Address pointer to metadata buffer. This is the source for encode metadata read operations and the destination for metadata decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 bytes boundary.

17.6.7 Hardware ECC Accelerator Layout Select Register (BCH_LAYOUTSELECT*n*)

The BCH LAYOUTSELECT register provides a mapping of chip selects to layout registers.

When the BCH engine receives a request to process a data block from the GPMI interface, it will use this register to map the incoming chip select to one of the four possible flash layout registers

Address: 180_8000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

BCH_LAYOUTSELECT*n* field descriptions

Field	Description
31–30 CS15_SELECT	Selects which layout is used for chip select 15.
29–28 CS14_SELECT	Selects which layout is used for chip select 14.
27–26 CS13_SELECT	Selects which layout is used for chip select 13.
25–24 CS12_SELECT	Selects which layout is used for chip select 12.
23–22 CS11_SELECT	Selects which layout is used for chip select 11.
21–20 CS10_SELECT	Selects which layout is used for chip select 10.
19–18 CS9_SELECT	Selects which layout is used for chip select 9.
17–16 CS8_SELECT	Selects which layout is used for chip select 8.
15–14 CS7_SELECT	Selects which layout is used for chip select 7.
13–12 CS6_SELECT	Selects which layout is used for chip select 6.
11–10 CS5_SELECT	Selects which layout is used for chip select 5.
9–8 CS4_SELECT	Selects which layout is used for chip select 4.
7–6 CS3_SELECT	Selects which layout is used for chip select 3.
5–4 CS2_SELECT	Selects which layout is used for chip select 2.
3–2 CS1_SELECT	Selects which layout is used for chip select 1.
CS0_SELECT	Selects which layout is used for chip select 0.

17.6.8 Hardware BCH ECC Flash 0 Layout 0 Register (BCH_FLASH0LAYOUT0*n*)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH0LAYOUT1 register to control the format for the devices selecting layout 0 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data,

metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See the BCH programming reference manual for more information on setting up the flash layout registers.

Address: 180_8000h base + 80h offset + (4d × i), where i=0d to 3d

BCH_FLASH0LAYOUT0*n* field descriptions

Field	Description
31–24 NBLOCKS	Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that 8 subsequent blocks are present for a total of 9 blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware.
23–16 META_SIZE	Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata—if set to 0, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a 0, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and covered by a single parity block.
15–11 ECC0	Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field. 0x0 **NONE** — No ECC to be performed 0x1 **ECC2** — ECC 2 to be performed 0x2 **ECC4** — ECC 4 to be performed 0x3 **ECC6** — ECC 6 to be performed 0x4 **ECC8** — ECC 8 to be performed 0x5 **ECC10** — ECC 10 to be performed 0x6 **ECC12** — ECC 12 to be performed 0x7 **ECC14** — ECC 14 to be performed

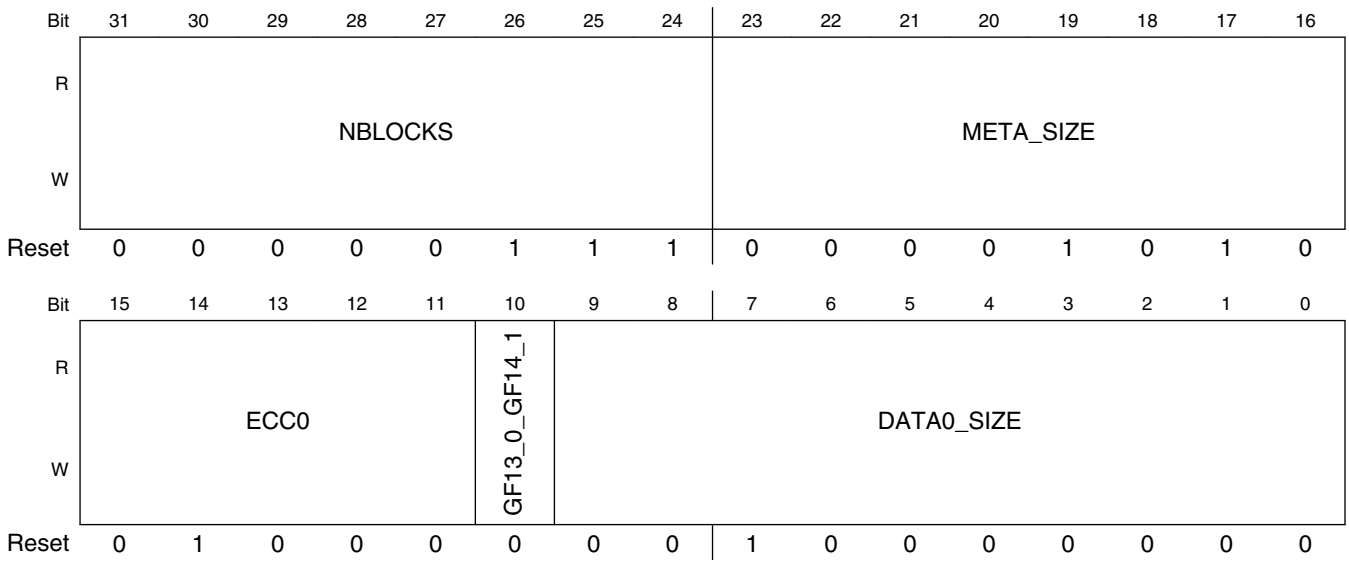
BCH_FLASH0LAYOUT1*n* field descriptions

Field	Description
31–16 PAGE_SIZE	Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accomodate different flash configurations that may be available in the future.
15–11 ECCN	Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata). 0x0 **NONE** — No ECC to be performed 0x1 **ECC2** — ECC 2 to be performed 0x2 **ECC4** — ECC 4 to be performed 0x3 **ECC6** — ECC 6 to be performed 0x4 **ECC8** — ECC 8 to be performed 0x5 **ECC10** — ECC 10 to be performed 0x6 **ECC12** — ECC 12 to be performed 0x7 **ECC14** — ECC 14 to be performed 0x8 **ECC16** — ECC 16 to be performed 0x9 **ECC18** — ECC 18 to be performed 0xA **ECC20** — ECC 20 to be performed 0xB **ECC22** — ECC 22 to be performed 0xC **ECC24** — ECC 24 to be performed 0xD **ECC26** — ECC 26 to be performed 0xE **ECC28** — ECC 28 to be performed 0xF **ECC30** — ECC 30 to be performed 0x10 **ECC32** — ECC 32 to be performed 0x11 **ECC34** — ECC 34 to be performed 0x12 **ECC36** — ECC 36 to be performed 0x13 **ECC38** — ECC 38 to be performed 0x14 **ECC40** — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.

17.6.10 Hardware BCH ECC Flash 1 Layout 0 Register (BCH_FLASH1LAYOUT0*n*)



The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH1LAYOUT1 register to control the format for the devices selecting layout 1 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data,

metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See the BCH programming reference manual for more information on setting up the flash layout registers.

Field	Description
	0x8 **ECC16** — ECC 16 to be performed 0x9 **ECC18** — ECC 18 to be performed 0xA **ECC20** — ECC 20 to be performed 0xB **ECC22** — ECC 22 to be performed 0xC **ECC24** — ECC 24 to be performed 0xD **ECC26** — ECC 26 to be performed 0xE **ECC28** — ECC 28 to be performed 0xF **ECC30** — ECC 30 to be performed 0x10 **ECC32** — ECC 32 to be performed 0x11 **ECC34** — ECC 34 to be performed 0x12 **ECC36** — ECC 36 to be performed 0x13 **ECC38** — ECC 38 to be performed 0x14 **ECC40** — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATA0_SIZE	Indicates the size of the data 0 block (in DWORDS / four bytes) to be stored on the flash page. If set to 0, the first block will only contain metadata.

17.6.15 Hardware BCH ECC Flash 3 Layout 1 Register (BCH_FLASH3LAYOUT1*n*)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH3LAYOUT0 register to control the format for the device selecting layout 3 in the LAYOUTSELECT register.

Address: 180_8000h base + F0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	PAGE_SIZE

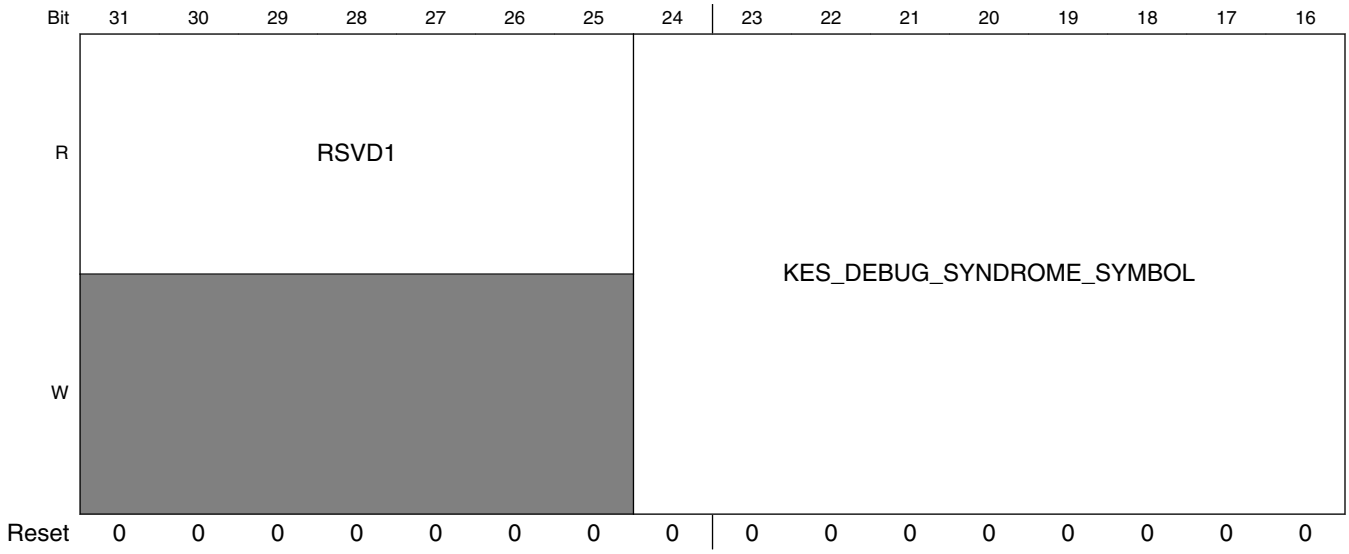
BCH_FLASH3LAYOUT1*n* field descriptions



Field	Description
31–16 PAGE_SIZE	Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accomodate different flash configurations that may be available in the future.
15–11 ECCN	Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata). 0x0 **NONE** — No ECC to be performed 0x1 **ECC2** — ECC 2 to be performed 0x2 **ECC4** — ECC 4 to be performed 0x3 **ECC6** — ECC 6 to be performed 0x4 **ECC8** — ECC 8 to be performed 0x5 **ECC10** — ECC 10 to be performed 0x6 **ECC12** — ECC 12 to be performed 0x7 **ECC14** — ECC 14 to be performed 0x8 **ECC16** — ECC 16 to be performed 0x9 **ECC18** — ECC 18 to be performed 0xA **ECC20** — ECC 20 to be performed 0xB **ECC22** — ECC 22 to be performed 0xC **ECC24** — ECC 24 to be performed 0xD **ECC26** — ECC 26 to be performed 0xE **ECC28** — ECC 28 to be performed 0xF **ECC30** — ECC 30 to be performed 0x10 **ECC32** — ECC 32 to be performed 0x11 **ECC34** — ECC 34 to be performed 0x12 **ECC36** — ECC 36 to be performed 0x13 **ECC38** — ECC 38 to be performed 0x14 **ECC40** — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.

17.6.16 Hardware BCH ECC Debug Register0 (BCH_DEBUG0*n*)

The hardware BCH accelerator internal state machines and signals can be seen in the ECC debug register.

The BCH_DEBUG0 register provides access to various internal state information which might prove useful during hardware debug and validation.

Address: 180_8000h base + 100h offset + (4d × i), where i=0d to 3d

BCH_DEBUG0*n* field descriptions

Field	Description
31–25 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
24–16 KES_DEBUG_ SYNDROME_ SYMBOL	The 9 bit value in this bit field shifts into the syndrome register array at the input of the KES engine whenever BCH_DEBUG0_KES_DEBUG_SHIFT_SYND is toggled. 0x0 **NORMAL** — Bus master address generator for SYND_GEN writes operates normally. 0x1 **TEST_MODE** — Bus master address generator always addresses last four bytes in Auxiliary block.
15 KES_DEBUG_ SHIFT_SYND	Toggling this bit causes the value in BCH_DEBUG0_KES_SYNDROME_SYMBOL to be shift into the syndrome register array at the input to the KES engine. After shifting in 16 symbols, one can kick off both KES and CF cycles by toggling BCH_DEBUG0_KES_DEBUG_KICK. Make sure that set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking.

Table continues on the next page...

BCH_DEBUG0*n* field descriptions (continued)

Field	Description
14 KES_DEBUG_ PAYLOAD_FLAG	When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input payload flag. 0x1 **DATA** — Payload is set for 512 bytes data block. 0x1 **AUX** — Payload is set for 65 or 19 bytes auxiliary block.
13 KES_DEBUG_ MODE4K	When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input mode (4K or 2K pages). 0x1 **4k** — Mode is set for 4K NAND pages. 0x1 **2k** — Mode is set for 2K NAND pages.
12 KES_DEBUG_ KICK	Toggling causes KES engine FSM to start as if kick by the Bus Master. This allows stand alone testing of the KES and Chien Search engines. Be sure to set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking.
11 KES_ STANDALONE	Set to one, cause the KES engine to suppress toggling the KES_BM_DONE signal to the bus master and suppress toggling the CF_BM_DONE signal by the CF engine. 0x0 **NORMAL** — Bus master address generator for SYND_GEN writes operates normally. 0x1 **TEST_MODE** — Bus master address generator always addresses last four bytes in Auxiliary block.
10 KES_DEBUG_ STEP	Toggling this bit causes the KES FSM to skip passed the stall state if it is in DEBUG_STALL mode and completed processing a block.
9 KES_DEBUG_ STALL	Set to one to cause KES FSM to stall after notifying Chien search engine to start processing its block but before notifying the bus master that the KES computation is complete. This allows a diagnostic to stall the FSM after each blocks key equations are solved. This also has the effect of stalling the CSFE search engine so it's state can be examined after it finishes processing the KES stalled block. 0x0 **NORMAL** — KES FSM proceeds to next block supplied by bus master. 0x1 **WAIT** — KES FSM waits after current equations are solved and the search engine is started.
8 BM_KES_TEST_ BYPASS	1 = Point all SYND_GEN writes to dummy area at the end of the AUXILLIARY block so that diagnostics can preload all payload, parity bytes and computed syndrome bytes for test the KES engine. 0x0 **NORMAL** — Bus master address generator for SYND_GEN writes operates normally. 0x1 **TEST_MODE** — Bus master address generator always addresses last four bytes in Auxiliary block.
7–6 RSVD0	This field is reserved. This read-only field is reserved and always has the value 0.
DEBUG_REG_ SELECT	The value loaded in this bit field is used to select the internal register state view of KES engine or the Chien search engine.

17.6.17 KES Debug Read Register (BCH_DBGKESREAD*n*)

The hardware BCH ECC accelerator key equation solver internal state machines and signals can be seen in the ECC debug registers.

Address: 180_8000h base + 110h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

BCH_DBGKESREAD*n* field descriptions

Field	Description
VALUES	This register returns the ROM BIST CRC value after a BIST test.

17.6.18 Chien Search Debug Read Register (BCH_DBGCSFEREAD*n*)

The hardware BCH ECC accelerator Chien Search internal state machines and signals can be seen in the ECC debug registers.

Address: 180_8000h base + 120h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

BCH_DBGAHBMREAD*n* field descriptions

Field	Description
VALUES	Reserved

17.6.21 Block Name Register (BCH_BLOCKNAME*n*)

Read only view of the block name string BCH.

Fixed pattern read only value is for test purposes. It can be read as an ASCII string with the zero termination coming from the first byte of the BLOCKVERSION register.

Address: 180_8000h base + 150h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

BCH_BLOCKNAME*n* field descriptions

Field	Description
NAME	The name is in the ASCII characters BCH (0x20, H, C, B).

17.6.22 BCH Version Register (BCH_VERSION*n*)

This register always returns a known read value for debug purposes and indicates the version of the block and RTL version in use.

Address: 180_8000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

BCH_VERSION*n* field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value indicates the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value indicates the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

17.6.23 Hardware BCH ECC Debug Register 1 (BCH_DEBUG1*n*)

The BCH_DEBUG1 register provides erased zero count information and pre-erase check.

Address: 180_8000h base + 170h offset + (4d × i), where i=0d to 3d

BCH_DEBUG1*n* field descriptions

Field	Description
31 DEBUG1_ PREERASECHK	Blank page enables pre-erase check. 0x0 Turn off pre-erase check 0x1 Turn on pre-erase check
30–9 RSVD	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

BCH_DEBUG1*n* field descriptions (continued)

Field	Description
ERASED_ ZERO_COUNT	The zero counts on one page.

Chapter 18
Clock Controller Module (CCM)

18.1 Overview

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
  - PLL1 also referenced as ARM PLL
  - PLL2 also referenced as System PLL
  - PLL3 also referenced as USB1 PLL
  - PLL4 also referenced as Audio PLL
  - PLL5 also referenced as Video PLL
  - PLL6 also referenced as ENET PLL
  - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
- Uses programmable bits to control frequencies of the clock roots.
- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of DVFS and power gating operations.

18.1.1 Features

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- ARM core root clock is generated from a dedicated source clock.

- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM_CLKO onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for ARM core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
    - PLL - Interfaces for each PLL
    - LPCG - Low Power Clock Gating unit
    - SRC - System Reset Controller
    - GPC - General Power Controller

18.1.2 CCM Block Diagram

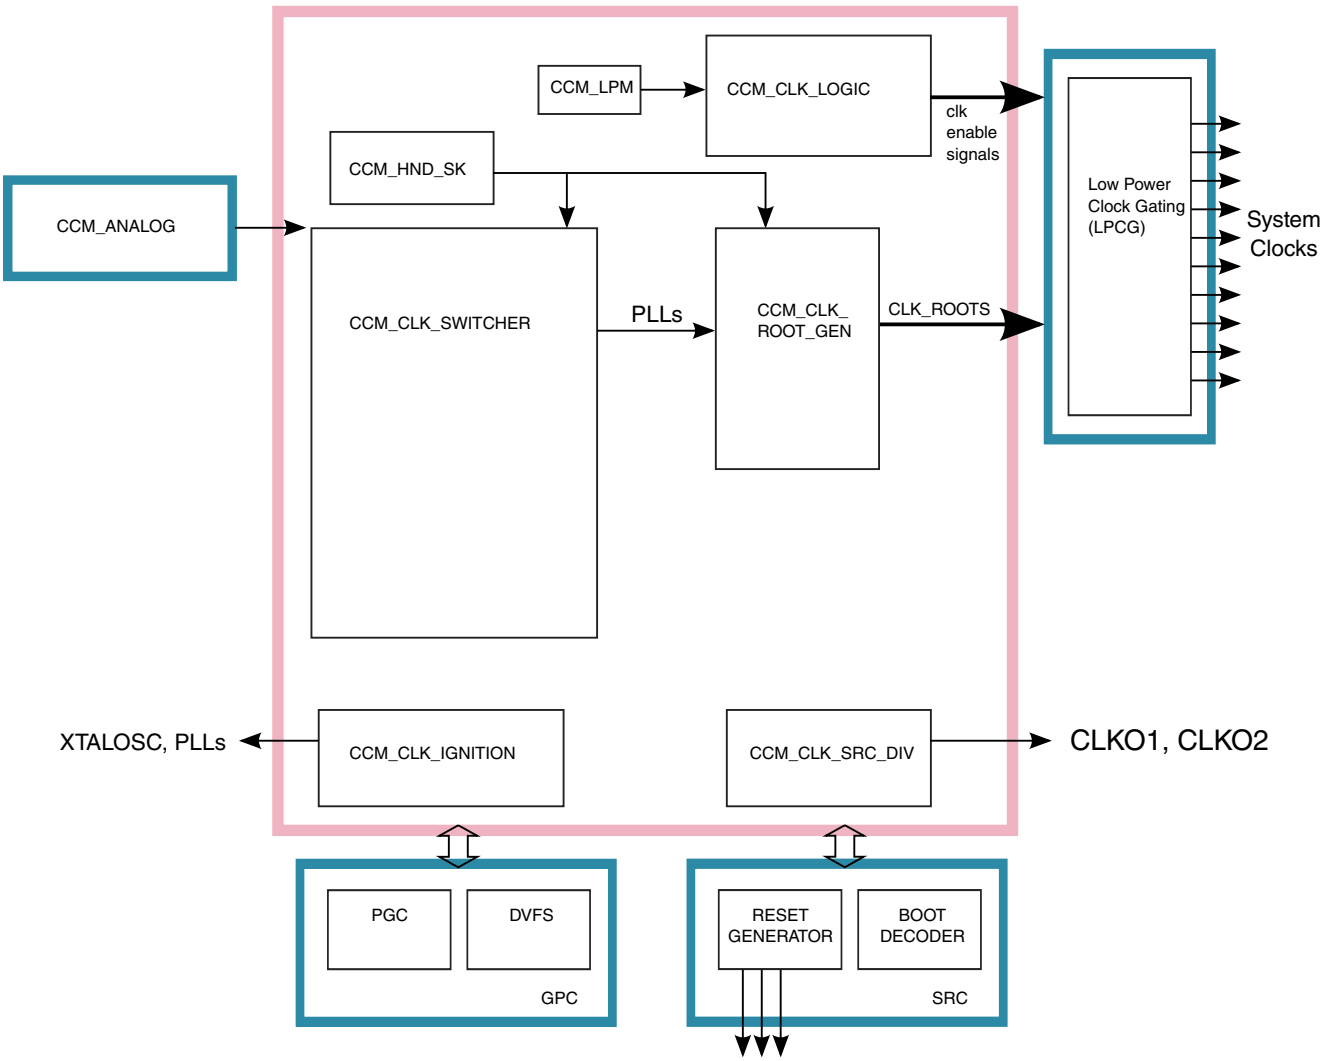

Figure 18-1. Block Diagram

CCM Contains the following sub-blocks:

Table 18-1. CCM Sub-blocks

CCM_CLK_SRC_DIV Sub-block	Description
CCM_CLK_IGNITION	Manages the ignition process. This module starts its functionality once CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset.
CCM_CLK_SWITCHER	Receives the clock outputs of the PLLs, together with the bypass clocks for the PLLs, and generates three switcher clock outputs (pll1_sw_clk, pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module.
CCM_CLK_ROOT_GEN	Receives the main clocks (PLLs / PFDs) and generates the output root clocks.
CCM_CLK_LOGIC	Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks.

Table continues on the next page...

Table 18-1. CCM Sub-blocks (continued)

CCM_CLK_SRC_DIV Sub-block	Description
CCM_LPM	Manages the low power modes of the IC.
CCM_HND_SK	Manages the handshake when changing root clock dividers that require handshake, and manages the frequency change in case of dvfs scenario.

18.2 External Signals

The following table describes the external signals of CCM:

Table 18-2. CCM External Signals

Signal	Description	Pad	Mode	Direction
CCM_CLKO1	Observability clock 1 output	JTAG_TMS	ALT3	O
		SD1_DATA2	ALT6	
CCM_CLKO2	Observability clock 2 output	JTAG_TDO	ALT3	O
		SD1_DATA3	ALT6	
CCM_REF_EN_B	Enable external reference clock (CKIH)	GPIO1_IO06	ALT7	O

18.3 CCM Clock Tree

The figure found here shows the clock tree configuration and clock roots for CCM.

For detailed sub-block information, please see:

- Clock Switcher
- Clock Root Generator
- Low Power Clock Gating module (LPCG)
- System Clocks

NOTE

The PLL and PFD control registers may be programmed according to the speed grade of the SoC, but should not exceed that maximum setting for that speed grade. The default frequency values (in MHz) for the PLLs and PFDs are shown in the Clock Tree below.

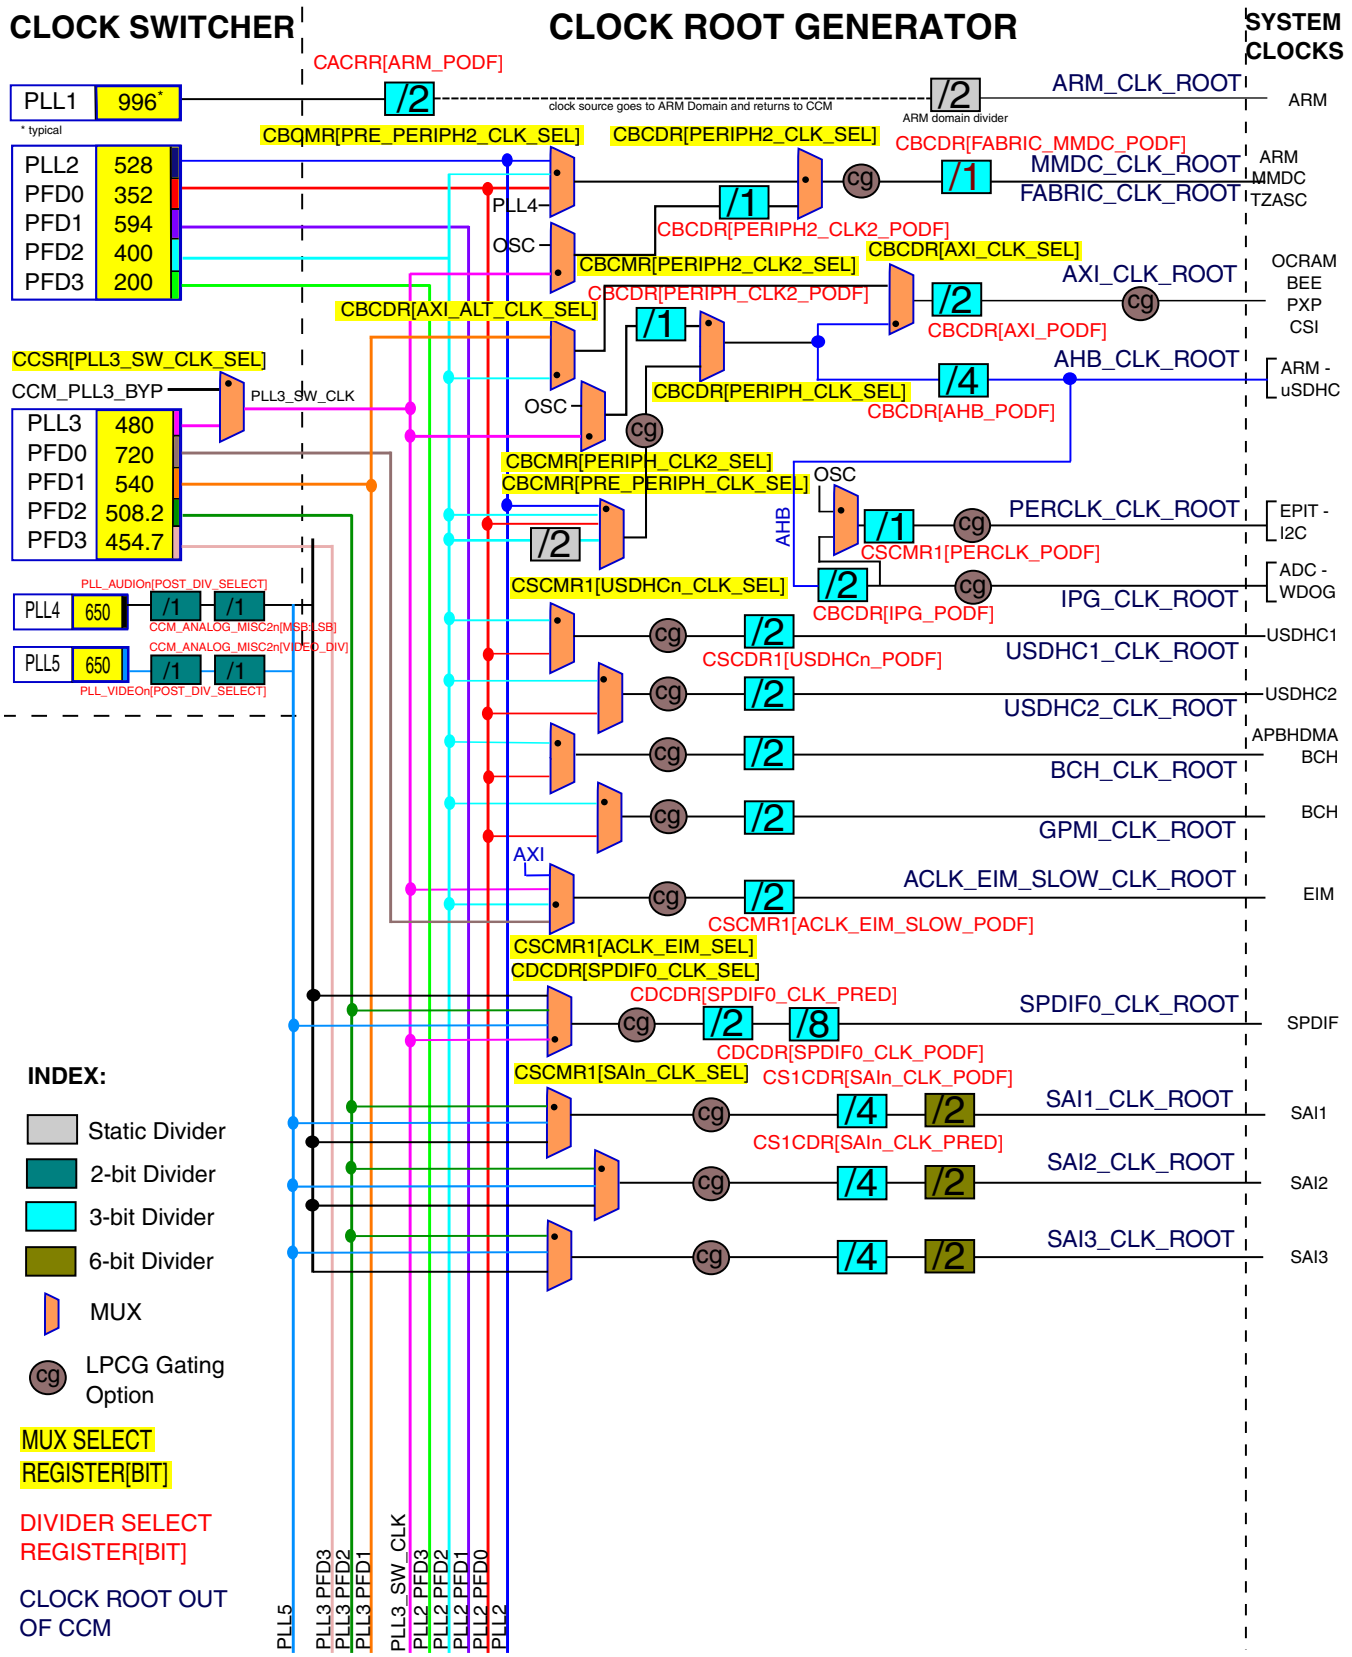

Figure 18-2. Clock Tree - Part 1

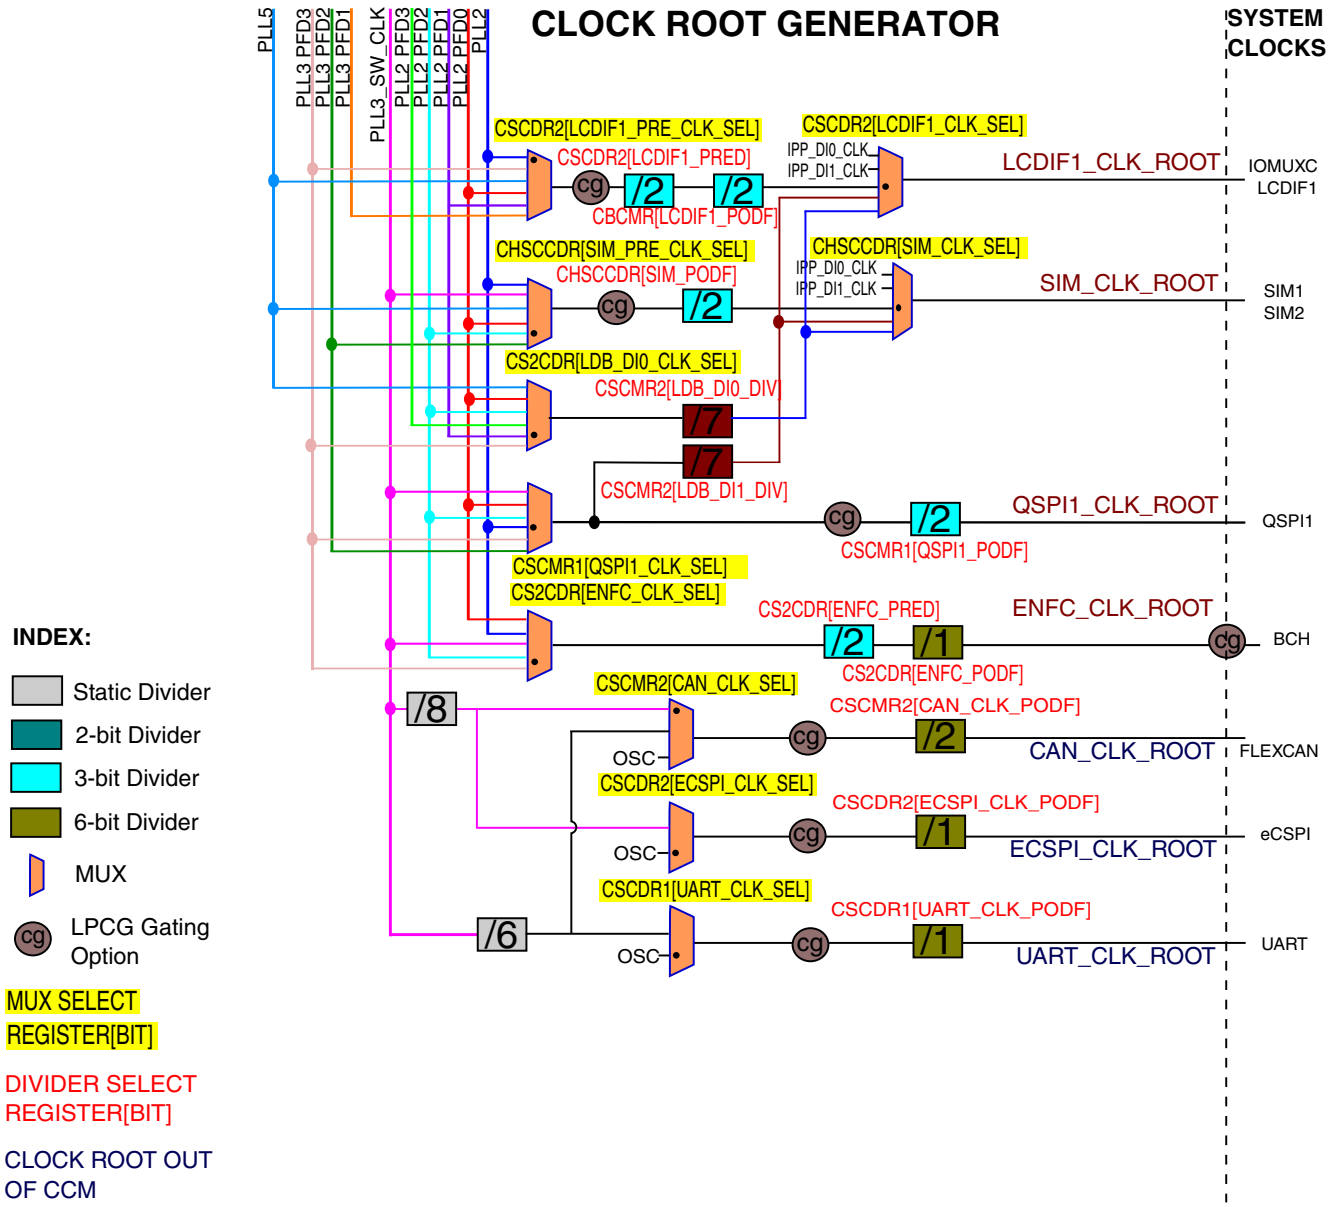

Figure 18-3. Clock Tree - Part 2

18.4 System Clocks

The table found here shows the CCM output clocks' system-level connectivity.

The gating option in the table can either be CGR bit or clock enable from the block itself. Applicable override bits are also shown.

Table 18-3. System Clocks, Gating, and Override

Module	Module Clock	Clock Root	Module Clock Gating Enable	Module Override Enable
ADC	IPG_CLK	IPG_CLK_ROOT	CCGR1[CG8] (ADC1_CLK_ENABLE) CCGR1[CG4] (ADC2_CLK_ENABLE)

Table 18-4. System Clock Frequency Values

Clock Root	Default Frequency (MHz)	Maximum Frequency (MHz)
ARM_CLK_ROOT	12	528
MMDC_CLK_ROOT FABRIC_CLK_ROOT	24	396
AXI_CLK_ROOT	12	264
AHB_CLK_ROOT	6	132
PERCLK_CLK_ROOT	3	66
IPG_CLK_ROOT	3	66
USDHCn_CLK_ROOT	12	198
ACLK_EIM_SLOW_CLK_ROOT	6	132
SPDIF0_CLK_ROOT	1.5	66.6
SAIn_CLK_ROOT	3	66.6
LCDIF_CLK_ROOT	6	150
SIM_CLK_ROOT	12	264
QSPI_CLK_ROOT	12	396
ENFC_CLK_ROOT	12	198
CAN_CLK_ROOT	1.5	80
ECSPI_CLK_ROOT	3	60
UART_CLK_ROOT	4	80

NOTE

The default frequency is reset value after system power on reset. It is different with the value initialized by ROM code, which depends on boot CFG pins/fuse setting.

18.5 Functional Description

This section provides a complete functional description of the block.

18.5.1 Clock Generation

18.5.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG_CLK and supplied to modules that need it.

18.5.1.1.1 CKIL synchronizing to IPG_CLK

CKIL is synchronized to ipg_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

18.5.1.2 External High Frequency Clock - CKIH and internal oscillator

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

18.5.1.3 PLL reference clock

There are several PLLs in this chip.

PLL1 - ARM PLL (typical functional frequency)

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

Some of the PLLs are described in the sections below. See CCM Analog Memory Map/ Register Definition for register information.

18.5.1.3.1 ARM PLL

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. The output frequency is selected by a 7-bit register field CCM_ANALOG_PLL_ARM[DIV_SELECT].

PLL output frequency = Fref * DIV_SEL/2

NOTE

The upper frequency range may exceed the maximum frequency supported. Please see the datasheet for more information.

18.5.1.3.2 USB PLLs

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV_SELECT register field, this PLL should always be set to 480 MHz in normal operation. USB2 PLL is only used by the USB UTM interface through a direct connection.

18.5.1.3.3 System PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus 4 PFD outputs. The System PLL supports spread spectrum modulation for use in applications to minimize radiated emissions. The spread spectrum PLL output clock is frequency modulated so that the energy is spread over a wider bandwidth, thereby reducing peak radiated emissions. Due to this feature support, the associated lock time of this PLL is longer than other PLLs in the SoC that do not support spread spectrum modulation.

Spread spectrum operation is controlled by configuring the CCM_ANALOG_PLL_SYS_SS register. When enabled, the PLL output frequency will decrease by the amount defined in the STEP field, until it reaches the limiting frequency in the STOP field. The frequency will then similarly return to the original nominal frequency. The following equations control the spread-spectrum operation:

$$\text{Spread spectrum range} = \text{Fref} \times \frac{\text{CCM_ANALOG_PLL_SYS_SS[STOP]}}{\text{CCM_ANALOG_PLL_SYS_DENOM[B]}}$$

$$\text{Modulation frequency} = \text{Fref} \times \frac{\text{CCM_ANALOG_PLL_SYS_SS[STEP]}}{2 \times \text{CCM_ANALOG_PLL_SYS_SS[STOP]}}$$

Although this PLL does have a DIV_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

18.5.1.3.4 Audio / Video PLL

The audio PLL and video PLL each synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL and /1, /2, /4 , /8, /16 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM_ANALOG_PLL_AUDIO, CCM_ANALOG_PLL_VIDEO, and CCM_ANALOG_MISC2 register sets according to the following equation.

PLL output frequency = Fref * (DIV_SELECT + NUM/DENOM)

18.5.1.3.5 Ethernet PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The PLL outputs a clock. The reference clocks generated by this PLL are:

- ref_enetpll0 programmable to 25, 50, 100 and 125 MHz by setting CCM_ANALOG_PLL_ENET[DIV_SELECT] bitfield
- ref_enetpll1 programmable to 25, 50, 100 and 125 MHz by setting CCM_ANALOG_PLL_ENET[DIV_SELECT] bitfield
- ref_enetpll2 fixed at 25 MHz

18.5.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to Fvco*18/N, N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See CCM Analog Memory Map/Register Definition.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL regrogramming, it is required that the related PFDx_CLKGATE bit in CCM_ANALOG_PFD_480n or CCM_ANALOG_PFD_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at www.freescale.com for procedure details.

18.5.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM_CLK_SWITCHER

CCM_CLK_ROOT_GEN

18.5.1.5.1 Clock Switcher

The Clock Switcher (CCM_CLK_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

Figure 18-4 describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

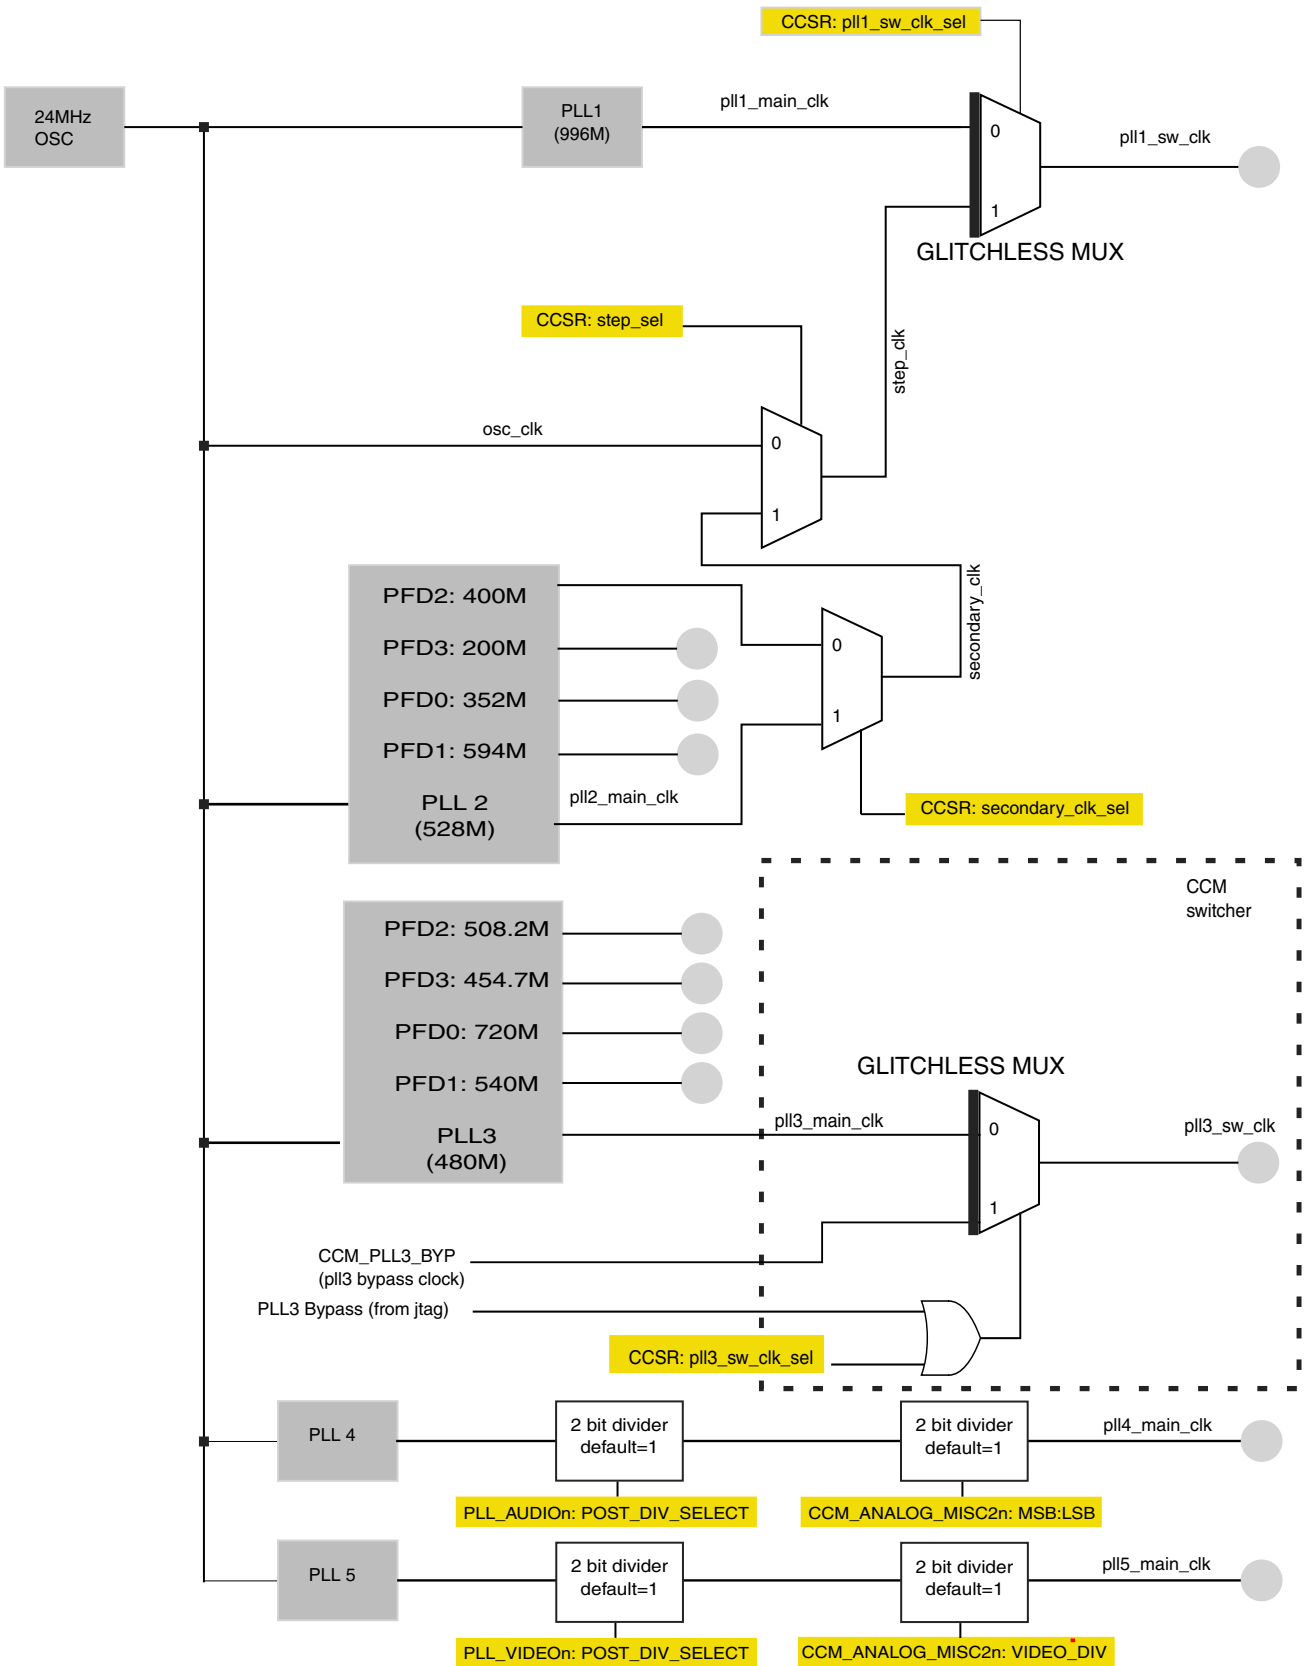

Figure 18-4. Switcher clock generation

18.5.1.5.2 PLL bypass procedure

In addition to PLL bypass options in CCM_ANALOG module, switcher and clk_root_gen sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clock.

18.5.1.5.3 PLL clock change

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See Disabling / Enabling PLLs for more information.

18.5.1.5.4 Clock Root Generator

The Clock Root Generator (CCM_CLK_ROOT_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parantheses are the default typical frequencies.

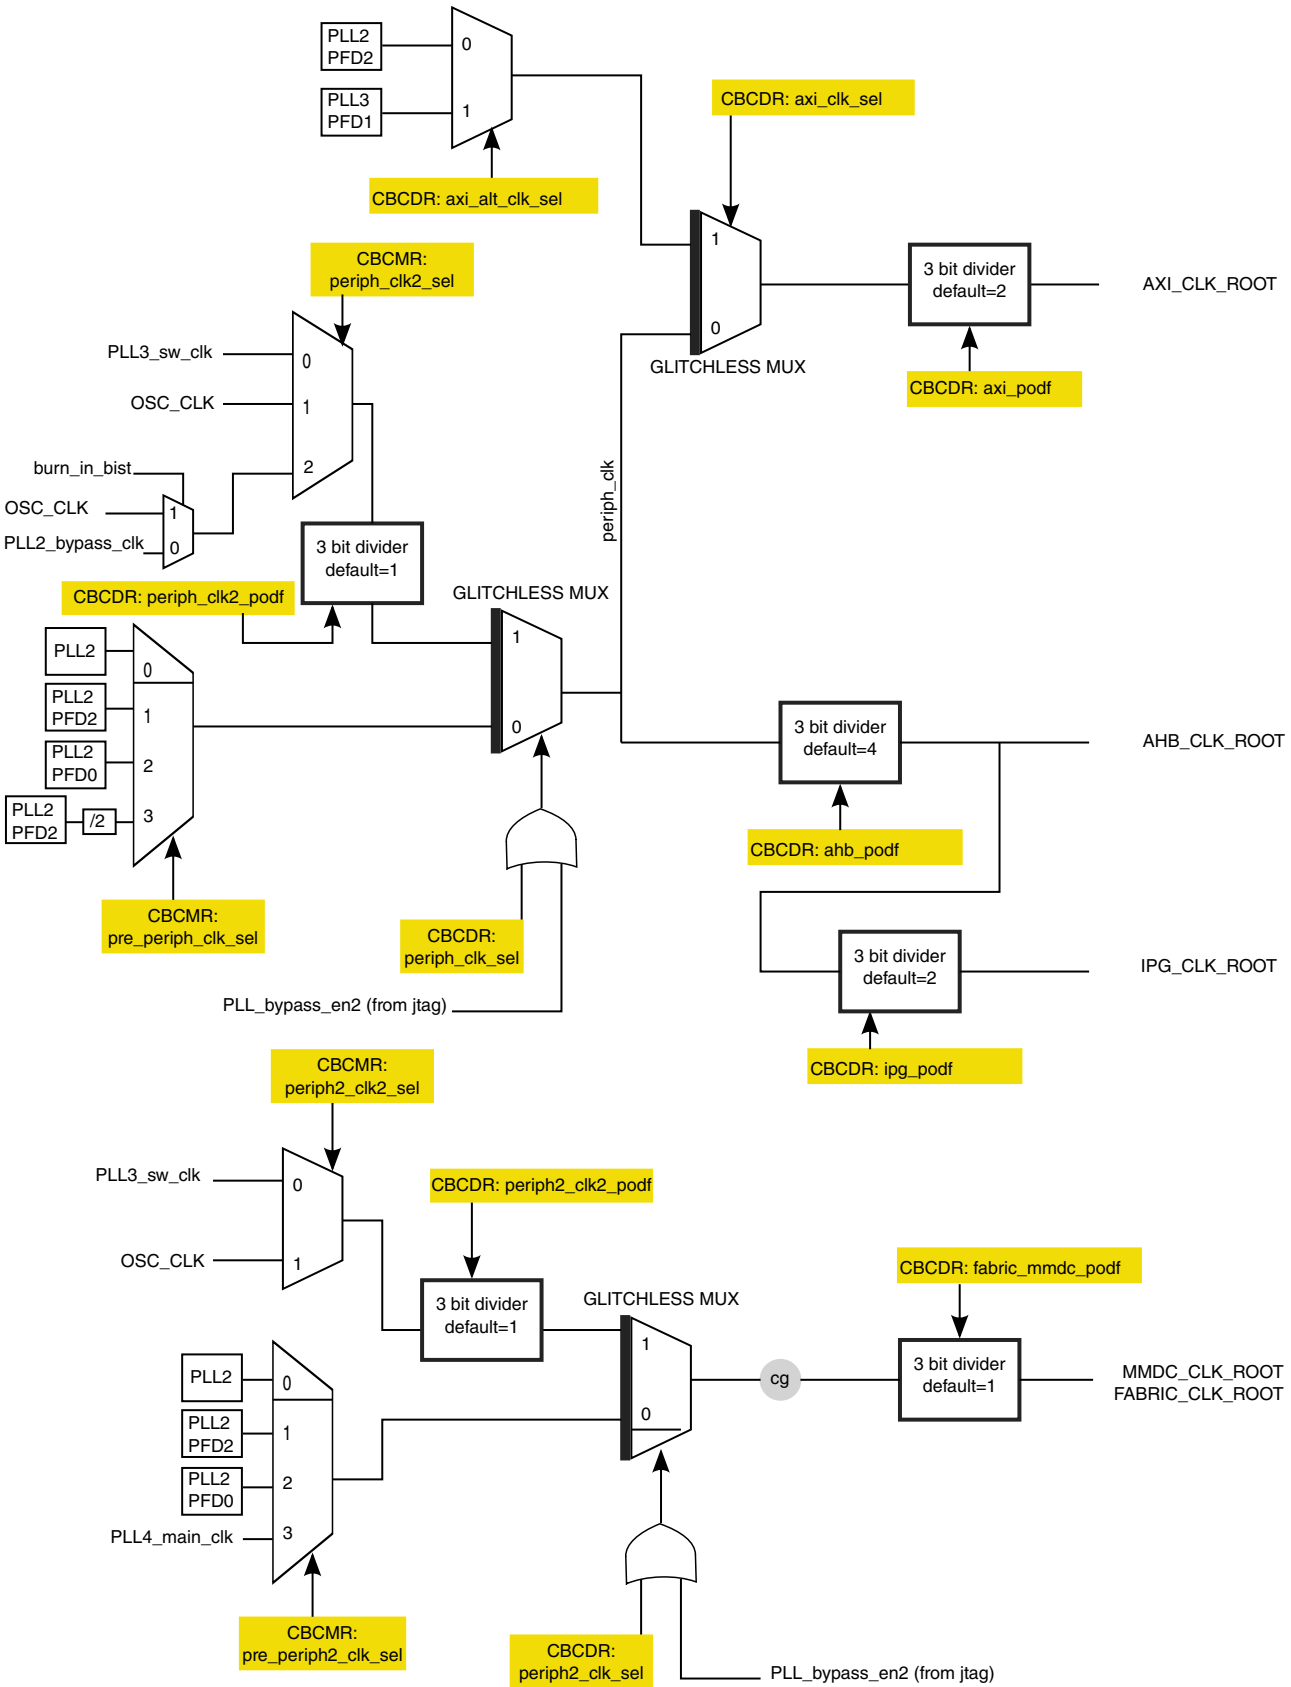

Figure 18-5. BUS clock generation

NOTE

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

18.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC).

The initial values of the following dividers and muxes can be controlled by SJC.

In regular functional mode, the SJC will drive the reset values stated in the CCM register memory map. If SJC is programmed to change those values, then the reset value for those dividers/muxes will be taken from the SJC programability.

Software can update the changed reset value after reset sequence. The control signals and the dividers/muxes are listed below:

- [2:0] init_periph2_clk2_podf
- [1:0] init_ipg_podf
- [2:0] init_ahb_podf
- [2:0] init_axi_podf
- [2:0] init_periph_clk2_podf
- init_periph_clk_sel
- init_periph2_clk_sel

18.5.1.5.6 Divider change handshake

Modifying the following dividers will start the handshake with MMDC.

- mmdc_podf
- periph_clk_sel
- periph2_clk_sel
- arm_podf
- ahb_podf

18.5.1.6 Disabling / Enabling PLLs

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24 MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL.

18.5.1.7 Clock Switching Multiplexers

There are a multitude of multiplexers available throughout the clock generation logic that provide alternate clock sources for the system clocks controlled by the CCM. The CCM utilizes several synchronous glitchless clock multiplexers as well as asynchronous glitchy clock multiplexers.

Synchronous muxes ensure there are no glitches between the transition of two asynchronous clocks and that there will be no pulses that are of a frequency higher than either input clock. In order for the synchronous multiplexer to work properly, both the current clock and the clock to be selected must remain active during the entire selection process.

There are five glitchless (synchronous) muxes used in the CCM. The table below lists the muxes and the respective control bits.

Table 18-5. Glitchless Multiplexers

Glitchless Mux	Mux Select Bit	Handshake Bit
periph_clk_mux	CBCDR[periph_clk_sel]	CDHIPR[periph_clk_sel_busy]
periph2_clk_mux	CBCDR[periph2_clk_sel]	CDHIPR[periph2_clk_sel_busy]
axi_alt_clk_mux	CBCDR[axi_sel]	
pll3_sw_clk_mux	CCSR[pll3_sw_clk_sel]	
pll1_sw_clk_mux	CCSR[pll1_sw_clk_sel]	

NOTE

Any change of the periph_clk_sel and periph2_clk_sel sync mux select will involve handshake with the MMDC. Refer to the CCDR and CDHIPR registers for the handshake bypass and busy bits.

For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in . In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the FABRIC_CLK_ROOT away from the PLL2 or one of its PFDs by programming CBCMR[PERIPH2_CLK2_SEL] and CBCDR[PERIPH2_CLK2_PODF] to provide an appropriate frequency clock, then glitchlessly switch to it by programming CBCDR[PERIPH2_CLK_SEL].

Asynchronous multiplexers or glitchy multiplexers, allow the clock to switch immediately after the multiplexer select changed. This immediate switch of two asynchronous clock domains can cause the output clock to glitch. Since both clock sources to the mux are asynchronous, switching the clocks from one source to the other can cause a glitch to be generated, regardless of the input clock source.

The input clocks to the mux are required to be gated before switching the source clock in the CCM clock mux and the output should also be gated. If the input and output clocks are not gated, clock glitches can propagate to the logic that follows the clock mux, causing the logic to behave unpredictably.

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

18.5.1.8 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

1. Clock enable signal from CCM - this signal is generated by configuring of the CGR bits in the CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC chapter for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

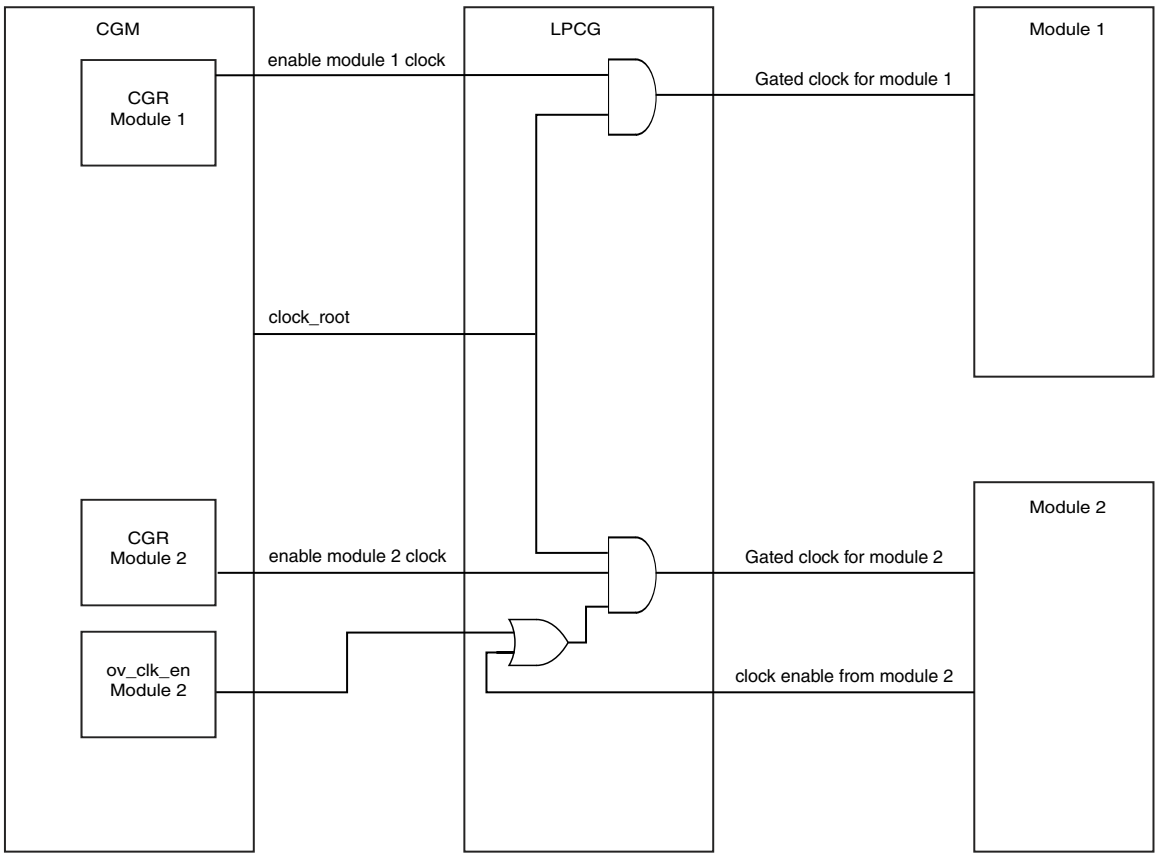

Figure 18-6. Clock split in LPCG

18.5.1.8.1 MMDC handshake

CCM will assert the mmdc_freq_change_req signal.

MMDC will assert the signals to acknowledge that the frequency change request has been received and that the frequency can now be changed safely.

CCM will commence the actual change of division ratio of mmdc dividers or apply mux change on root clocks once both of the non-masked acknowledges are asserted.

NOTE

MMDC handshakes can be masked.

18.5.2 DVFS support

When performing DVFS, the frequency shift procedure for the ARM core clock domain can be performed by software.

CPU PLL frequency and CCM ARM clock divider is controlled by CCM and CPU power domain supply voltage value is controlled by CCM_ANALOG module.

NOTE

The frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

NOTE

CCM_ANALOG will not control the voltage value in Bypass mode

18.5.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

18.5.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

18.5.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits when all ARM cores are in WFI, and L2 cache and SCU are idle.

18.5.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform.

The next actions can be programmed during WAIT mode:

1. CCM requests an acknowledge to close clocks to MMDC if its CGR bits indicate to close its clocks on WAIT mode, and if those clocks are not already closed in run mode. The request will be issued if the handshake is not bypassed by programing the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. Once CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.
3. Observability to indicate WAIT mode.

NOTE

Setting MMDC CGR bits to 01 can hang the entire system since the MMDC clock and fabric clock share the same clock root.

Any enabled interrupt assertion will start the exit from WAIT mode.

18.5.3.2.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

18.5.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating can be applied for ARM platform. External supply voltage can be reduced to decrease leakage.

18.5.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- CCM_PMIC_STBY_REQ asserted, if vstby bit is set
- osc_en signal is negated
- osc_pwrdn is asserted, if sbyos bit is set

Counter will be triggered after CCM_PMIC_STBY_REQ assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, stop_mode signal will be asserted, that will trigger disabling analog elements in anatop.

CCM's low power state machine will remain in state STOP_GPC until STOP mode is exited.

18.5.3.3.2 Exiting STOP mode

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting STOP mode.

The following will take place:

1. If vstby bit was set, deassert PMIC_STBY_REQ to notify power management IC to change voltage from standby voltage to functional voltage.
2. If sbyos was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting ref_en_b signal and deasserting cosc_pwrdown signal respectively.
3. After the number of cycles of CKILs defined in stby_count bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
4. Start osc. If oscillator was started, wait until oscnt has finished its counting to make sure that oscillator is ready.
5. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to STOP mode will be started.
6. CCM will request GPC to restore ARM power by GPC_PUP_REQ. If power was removed from the ARM platform, GPC will notify CCM by asserting signal GPC_PUP_ACK that power to ARM is back on, and its safe to exit from STOP mode. Only then will the CCM progress to the next step.
7. Once assertion of notification from src that the resets for the power gated modules has been finished, (src_power_gating_reset_done is set) negate the low power request signals to all modules and enable all module clocks including ARM clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in RUN mode will not be opened; they will continued to be gated.)

Once the system is in run mode, negate signals ccm_ipg_stop and system_in_stop_mode.

18.6 CCM Memory Map/Register Definition

NOTE

The register reset values for CCM change depending on the boot configuration. See Clocks at Boot Time for more information.

18.6.1 CCM Control Register (CCM_CCR)

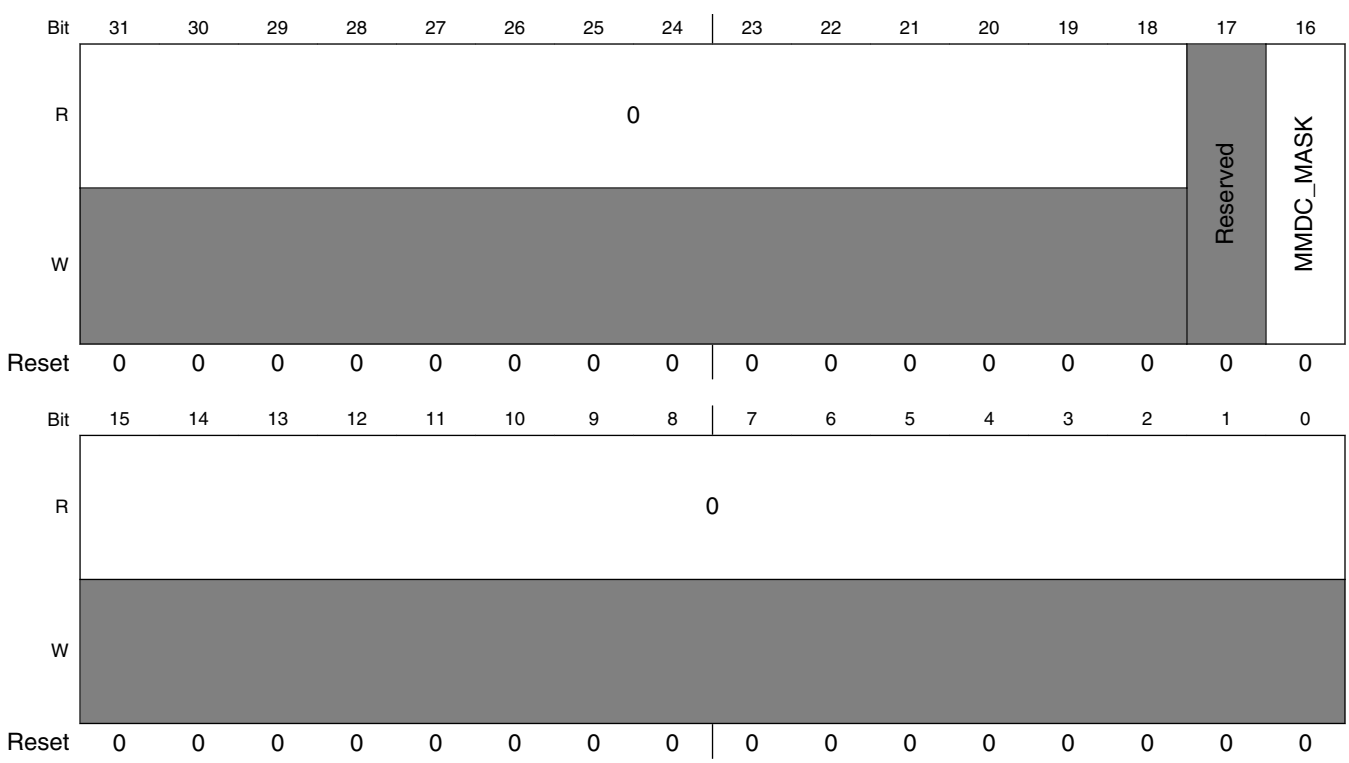
The figure below represents the CCM Control Register (CCR), which contains bits to control general operation of CCM. The table below provides its field descriptions.

Address: 20C_4000h base + 0h offset = 20C_4000h

CCM_CCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 RBC_EN	Enable for REG_BYPASS_COUNTER. If enabled, analog_reg_bypass signal will be asserted after REG_BYPASS_COUNT clocks of CKIL, after standby voltage is requested. If standby voltage is not requested analog_reg_bypass won't be asserted, event if counter is enabled. 1 REG_BYPASS_COUNTER enabled. 0 REG_BYPASS_COUNTER disabled
26–21 REG_BYPASS_ COUNT	Counter for analog_reg_bypass signal assertion after standby voltage request by PMIC_STBY_REQ. Should be zeroed and reconfigured after exit from low power mode. REG_BYPASS_COUNT can also be used for holding off interrupts when the PGC unit is sending signals to power gate the core. 000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock periods delay
20–13 Reserved	This read-only field is reserved and always has the value 0.
12 COSC_EN	On chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on chip oscillator enabled to supply source for the PLLs. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then CCM will enable the on chip oscillator and after counting oscnt ckil clock cycles it will notify that on chip

Table continues on the next page...



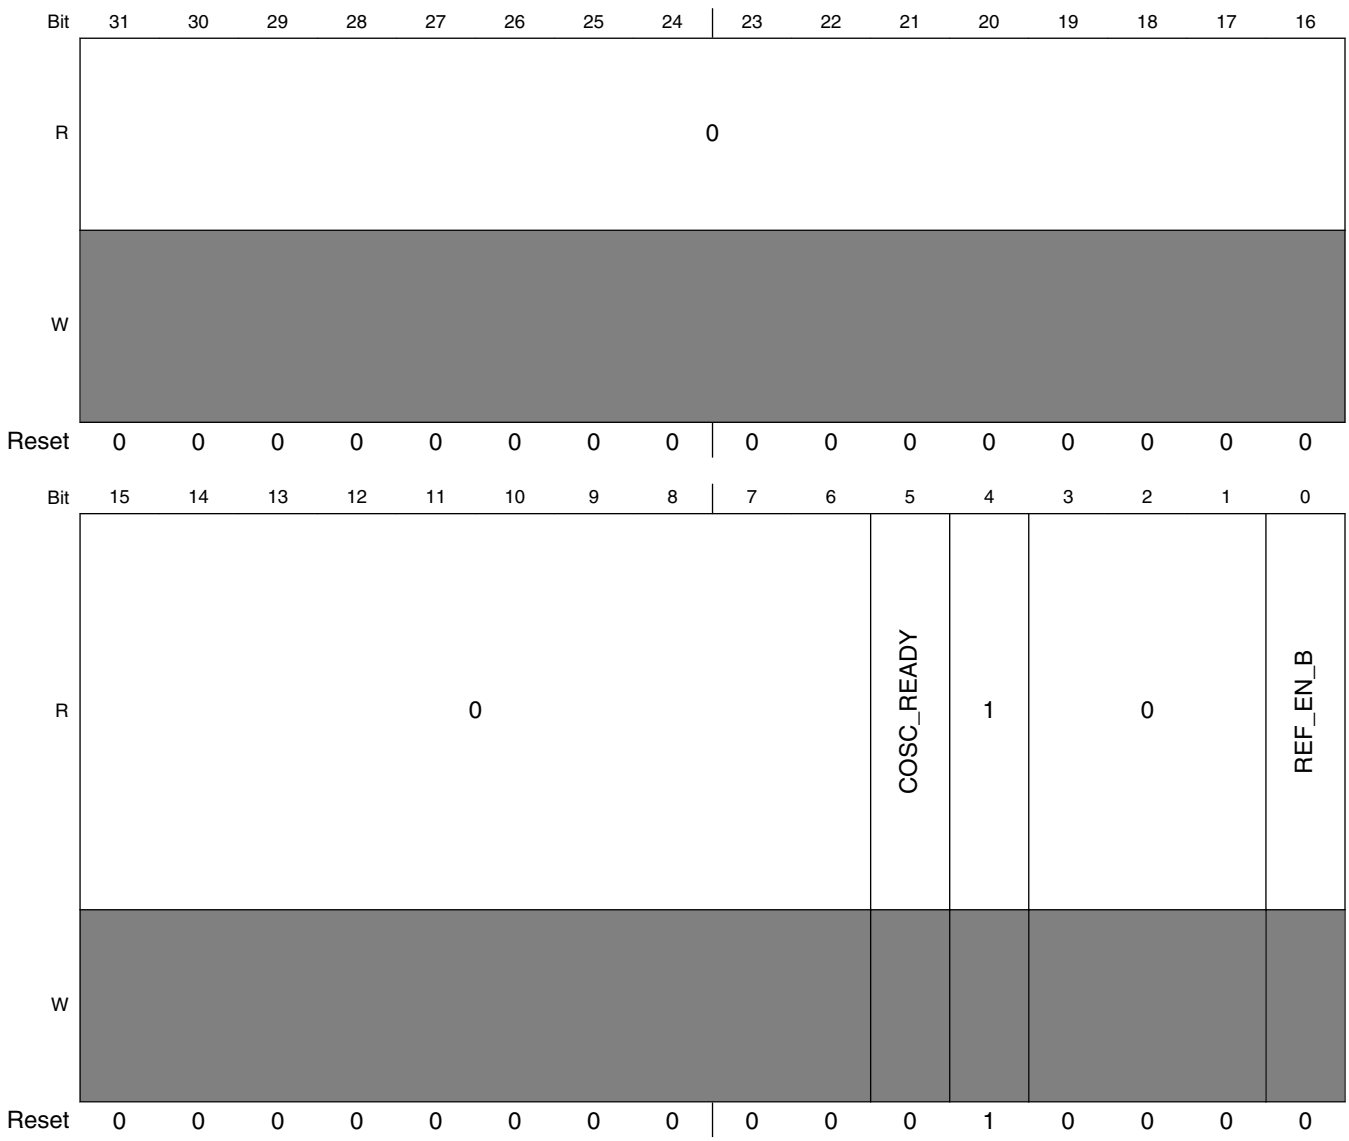
CCM_CCR field descriptions (continued)

Field	Description
	oscillator is ready by a interrupt cosc_ready and by status bit cosc_ready. The cosc_en bit should be changed only when on chip oscillator is not chosen as the clock source. 0 disable on chip oscillator 1 enable on chip oscillator
11–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
OSCNT	Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in ignition sequence and in wake from stop sequence if sbyos bit was defined, to notify that on chip oscillator output is ready for the dpll_ip to use and only then the gate in dpll_ip can be opened. 0000000 count 1 ckil 1111111 count 128 ckil's

18.6.2 CCM Control Divider Register (CCM_CCDR)

The figure below represents the CCM Control Divider Register (CCDR), which contains bits that control the loading of the dividers that need handshake with the modules they affect. The table below provides its field descriptions.

Address: 20C_4000h base + 4h offset = 20C_4004h



CCM_CCDR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 -	This field is reserved. Reserved
16 MMDC_MASK	During divider ratio mmdc_axi_podf change or sync mux periph2_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc module. 0 allow handshake with mmdc module 1 mask handshake with mmdc. Request signal will not be generated.
Reserved	This read-only field is reserved and always has the value 0.

18.6.3 CCM Status Register (CCM_CSR)

The figure below represents the CCM status Register (CSR). The status bits are read-only bits. The table below provides its field descriptions.

Address: 20C_4000h base + 8h offset = 20C_4008h

CCM_CSR field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

CCM_CSR field descriptions (continued)

Field	Description
5 COSC_READY	Status indication of on board oscillator. This bit will be asserted if on chip oscillator is enabled and on chip oscillator is not powered down, and if oscnt counter has finished counting. 0 on board oscillator is not ready. 1 on board oscillator is ready.
4 Reserved	This read-only field is reserved and always has the value 1.
3–1 Reserved	This read-only field is reserved and always has the value 0.
0 REF_EN_B	Status of the value of CCM_REF_EN_B output of ccm 0 value of CCM_REF_EN_B is '0' 1 value of CCM_REF_EN_B is '1'

18.6.4 CCM Clock Switcher Register (CCM_CCSR)

The figure below represents the CCM Clock Switcher register (CCSR). The CCSR register contains bits to control the switcher sub-module dividers and multiplexers. The table below provides its field descriptions.

Address: 20C_4000h base + Ch offset = 20C_400Ch

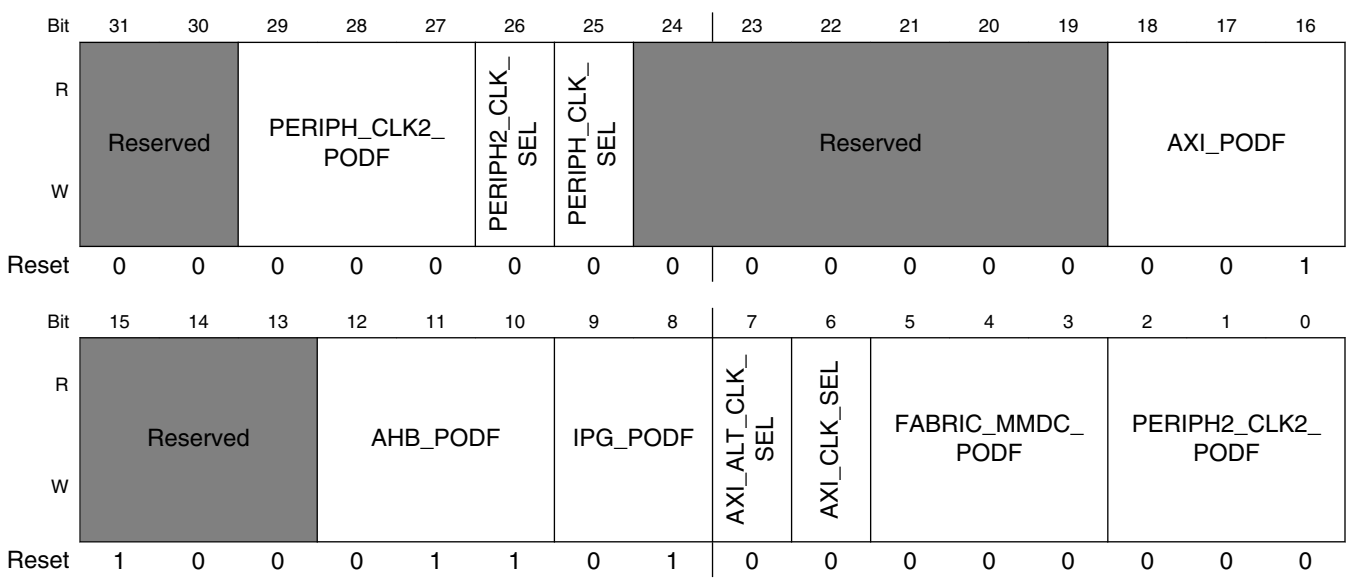
Field	Description
31–9 Reserved	This read-only field is reserved and always has the value 0.
8 STEP_SEL	Selects the option to be chosen for the step frequency when shifting ARM frequency. This will control the step_clk. **NOTE:** This mux is allowed to be changed only if its output is not used, i.e. ARM uses the output of pll1, and step_clk is not used. 0 derive clock from osc_clk (24M) - source for lp_apm. 1 derive clock from secondary_clk
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 SECONDARY_CLK_SEL	Select source to generate secondary_clk 0 PLL2 PFD2 (400 M) 1 PLL2 (528 M)
2 PLL1_SW_CLK_SEL	Selects source to generate pll1_sw_clk. 0 pll1_main_clk 1 step_clk
1 -	This field is reserved. Reserved
0 PLL3_SW_CLK_SEL	Selects source to generate pll3_sw_clk. This bit should only be used for testing purposes. 0 pll3_main_clk 1 pll3 bypass clock

18.6.5 CCM Arm Clock Root Register (CCM_CACRR)

The figure below represents the CCM Arm Clock Root register (CACRR). The CACRR register contains bits to control the ARM clock root generation. The table below provides its field descriptions.

Address: 20C_4000h base + 10h offset = 20C_4010h



CCM_CACRR field descriptions

Field	Description
31–3 Reserved	This read-only field is reserved and always has the value 0.
ARM_PODF	Divider for ARM clock root. **NOTE:** If arm_freq_shift_divider is set to '1' then any new write to arm_podf will be held until arm_clk_switch_req signal is asserted. **NOTE:** arm_podf should be >= 3 if fuse bit CPU_SPEED_LIMIT is set. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8

18.6.6 CCM Bus Clock Divider Register (CCM_CBCDR)

The figure below represents the CCM Bus Clock Divider Register (CBCDR). The CBCDR register contains bits to control the clock generation sub module dividers. The table below provides its field descriptions.

Address: 20C_4000h base + 14h offset = 20C_4014h

CCM_CBCDR field descriptions

Field	Description
31–30 -	This field is reserved. Reserved
29–27 PERIPH_CLK2_PODF	Divider for periph2 clock podf. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
26 PERIPH2_CLK_SEL	Selector for peripheral2 main clock (source of mmdc_clk_root). **NOTE:** Any change of this mux select will involve handshake with the MMDC. Refer to the CCDR and CDHIPR registers for the handshake bypass and busy bits. 0 PLL2 (pll2_main_clk) 1 derive clock from periph2_clk2_clk clock source.
25 PERIPH_CLK_SEL	Selector for peripheral main clock (source of MMDC_CLK_ROOT). **NOTE:** Alternative clock source should be used when PLL is relocked. For PLL relock procedure pls refer to the PLL chapter. **NOTE:** Any change of this sync mux select will involve handshake with the MMDC. Refer to the CCDR and CDHIPR registers for the handshake bypass and busy bits. 0 PLL2 (pll2_main_clk) 1 derive clock from periph_clk2_clk clock source.
24–19 -	This field is reserved. Reserved
18–16 AXI_PODF	Post divider for axi clock. **NOTE:** Any change of this divider might involve handshake with EMI. See CDHIPR register for the handshake busy bits. 000 Divide by 1 001 Divide by 2 010 Divide by 3 011 Divide by 4 100 Divide by 5 101 Divide by 6 110 Divide by 7 111 Divide by 8

PERIPH2_CLK2_PODF	Divider for periph2_clk2 podf. **NOTE:** Divider should be updated when output clock is gated. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8

18.6.7 CCM Bus Clock Multiplexer Register (CCM_CBCMR)

The figure below represents the CCM Bus Clock Multiplexer Register (CBCMR). The CBCMR register contains bits to control the multiplexers that generate the bus clocks. The table below provides its field descriptions.

NOTE

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and the respective clock is gated in LPCG. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

The change for arm_clk_sel should be done through sdma so that ARM will not use this clock during the change and the clock will be gated in LPCG.

PERCLK_PODF	Divider for perclk podf. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8

18.6.9 CCM Serial Clock Multiplexer Register 2 (CCM_CSCMR2)

The figure below represents the CCM Serial Clock Multiplexer Register 2 (CSCMR2). The CSCMR2 register contains bits to control the multiplexers that generate the serial clocks. The table below provides its field descriptions.

NOTE

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and the clock is gated. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

Address: 20C_4000h base + 20h offset = 20C_4020h

-	This field is reserved. Reserved

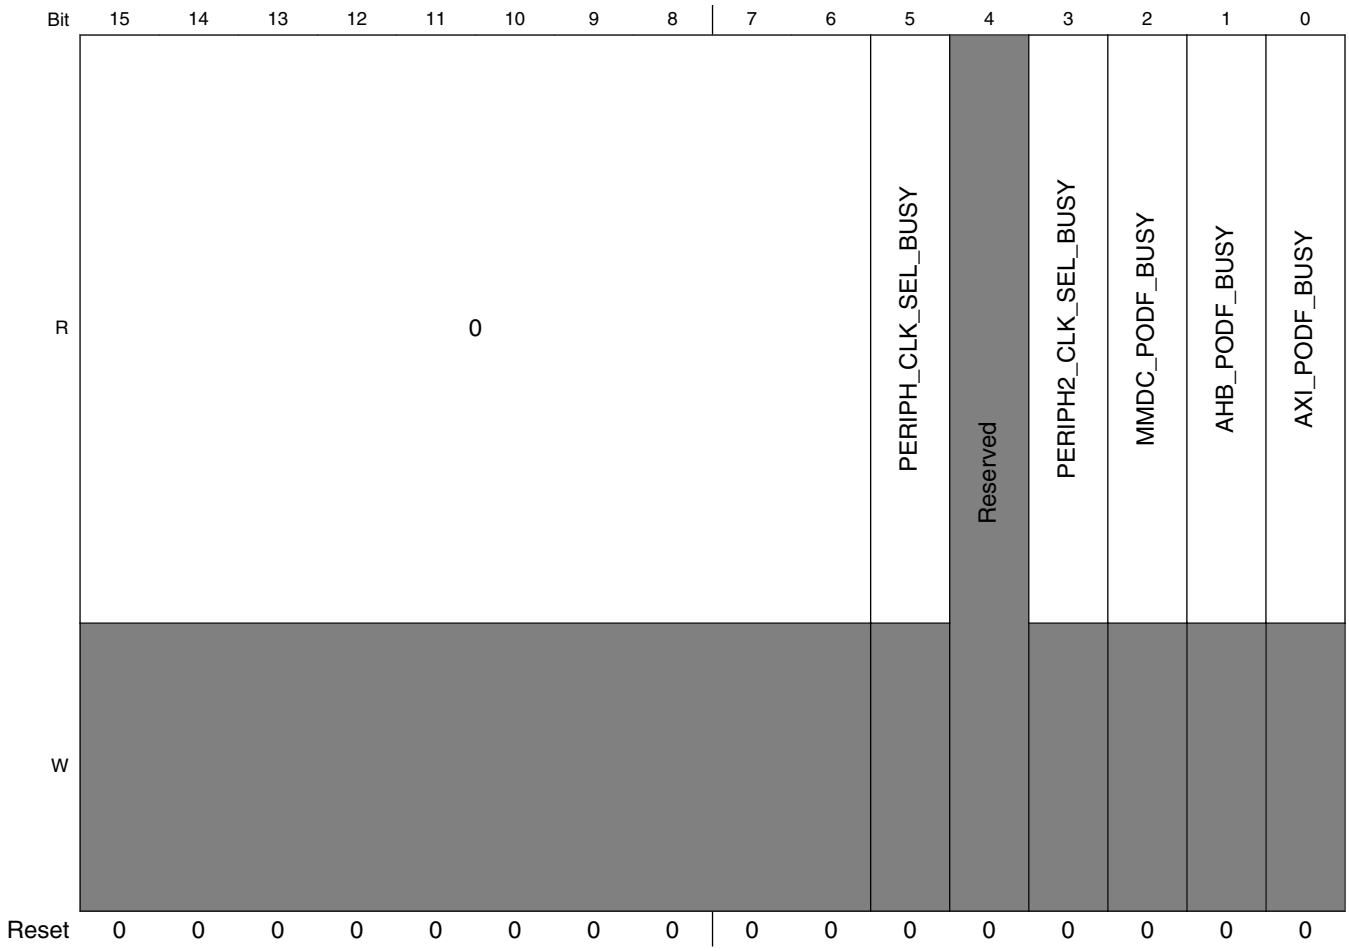
18.6.17 CCM Wakeup Detector Register (CCM_CWDR)

The figure below represents the CCM Wakeup Detector Register (CWDR). The CWDR register contains reserved, read-only bits.The table below provides its field descriptions.

Address: 20C_4000h base + 44h offset = 20C_4044h

CCM_CWDR field descriptions



Field	Description
Reserved	This read-only field is reserved and always has the value 0.

18.6.17 CCM Divider Handshake In-Process Register (CCM_CDHIPR)

The figure below represents the CCM Divider Handshake In-Process Register (CDHIPR). The CDHIPR register contains read-only bits that indicate that CCM is in the process of updating dividers or muxes that might need handshake with modules.

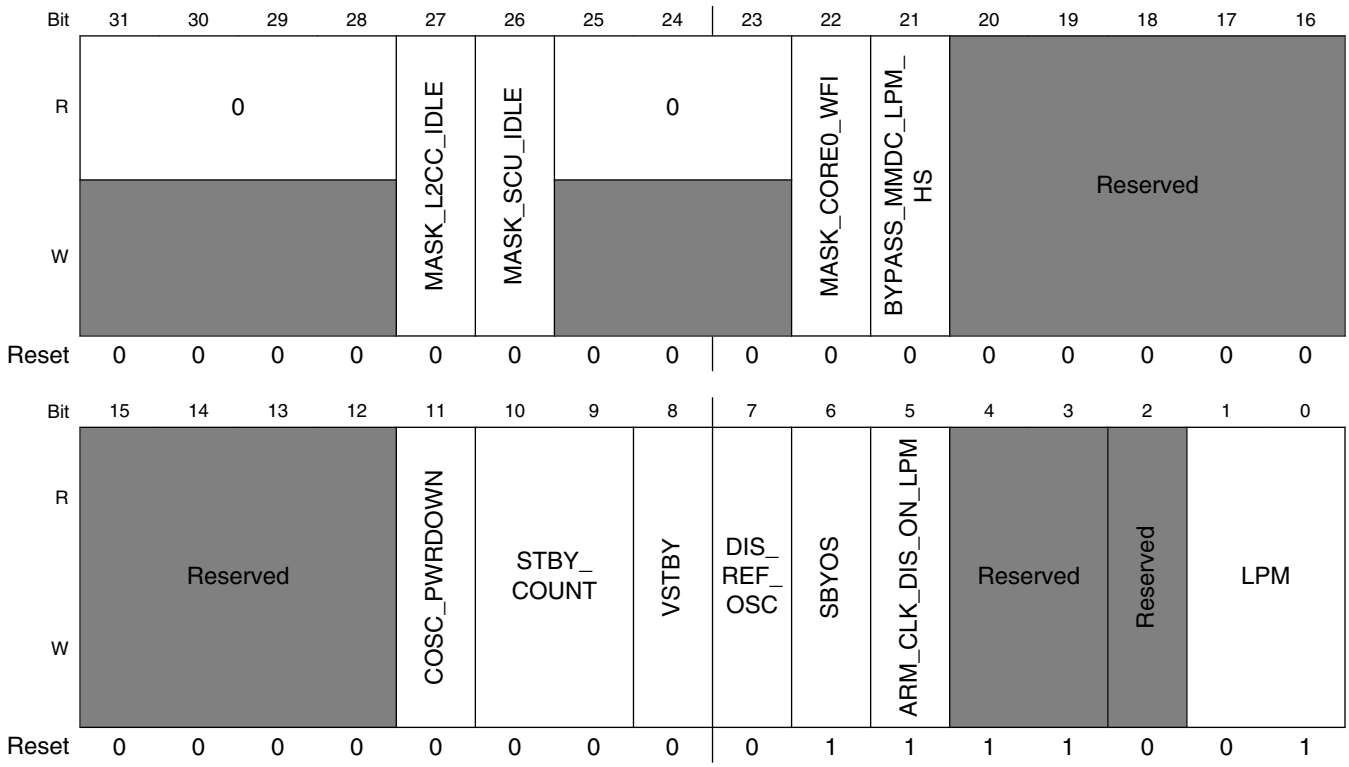
Address: 20C_4000h base + 48h offset = 20C_4048h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															ARM_PODF_BUSY
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CCM_CDHIPR field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 ARM_PODF_ BUSY	Busy indicator for arm_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the arm_podf will be applied.
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 PERIPH_CLK_ SEL_BUSY	Busy indicator for periph_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph_clk_sel represents the previous value of select, and after the handshake periph_clk_sel value will be applied.
4 -	This field is reserved. Reserved

Table continues on the next page...



CCM_CDHIPR field descriptions (continued)

Field	Description
3 PERIPH2_CLK_SEL_BUSY	Busy indicator for periph2_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph2_clk_sel represents the previous value of select, and after the handshake periph2_clk_sel value will be applied.
2 MMDC_PODF_BUSY	Busy indicator for mmdc_axi_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the mmdc_axi_podf will be applied.
1 AHB_PODF_BUSY	Busy indicator for ahb_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the ahb_podf will be applied.
0 AXI_PODF_BUSY	Busy indicator for axi_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the axi_podf will be applied.

18.6.18 CCM Low Power Control Register (CCM_CLPCR)

The figure below represents the CCM Low Power Control Register (CLPCR). The CLPCR register contains bits to control the low power modes operation.The table below provides its field descriptions.

Address: 20C_4000h base + 54h offset = 20C_4054h

CCM_CLPCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 MASK_L2CC_IDLE	Mask L2CC IDLE for entering low power mode. **NOTE:** Assertion of all bits[27:22] will generate low power mode request 1 L2CC IDLE is masked 0 L2CC IDLE is not masked
26 MASK_SCU_IDLE	Mask SCU IDLE for entering low power mode **NOTE:** Assertion of all bits[27:22] will generate low power mode request 1 SCU IDLE is masked 0 SCU IDLE is not masked

Table continues on the next page...

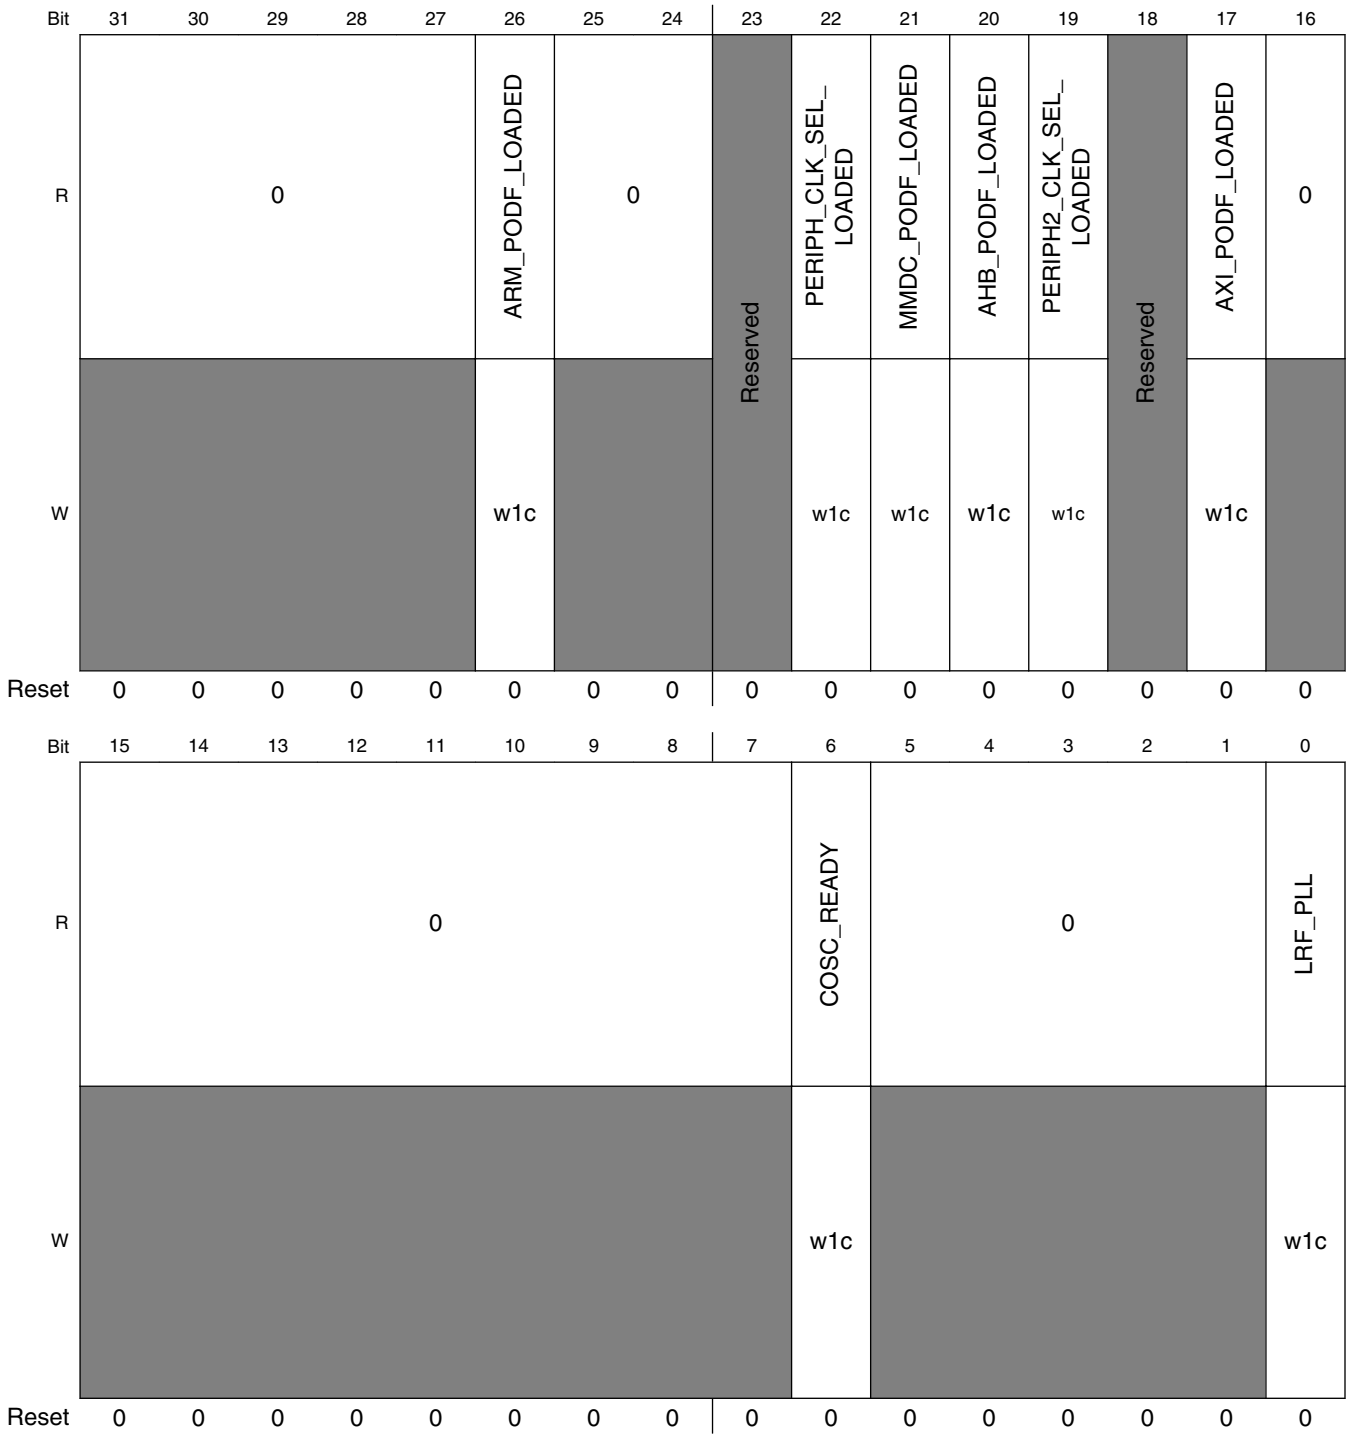
CCM_CLPCR field descriptions (continued)

Field	Description
25–23 Reserved	This read-only field is reserved and always has the value 0.
22 MASK_CORE0_WFI	Mask WFI of core0 for entering low power mode **NOTE:** Assertion of all bits[27:22] will generate low power mode request 0 WFI of core0 is not masked 1 WFI of core0 is masked
21 BYPASS_MMDC_LPM_HS	Bypass handshake with mmdc on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. Handshake also will be bypassed, if CGR3 CG10 is set to gate fast mmdc clock. 0 handshake with mmdc on next entrance to low power mode will be performed. . 1 handshake with mmdc on next entrance to low power mode will be bypassed.
20–12 -	This field is reserved. Reserved
11 COSC_PWRDOWN	In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on chip oscillator will be bypassed. The manual closing of onchip oscillator should be performed only in case the reference oscilator is not the source of all the clocks generation. 0 On chip oscillator will not be powered down, i.e. cosc_pwrdown = '0'. 1 On chip oscillator will be powered down, i.e. cosc_pwrdown = '1'.
10–9 STBY_COUNT	Standby counter definition. These two bits define, in the case of stop exit (if VSTBY bit was set). **NOTE:** Clock cycles ratio depends on pmic_delay_scaler, defined by CGPR[0] bit. 00 CCM will wait (1*pmic_delay_scaler)+1 ckil clock cycles 01 CCM will wait (3*pmic_delay_scaler)+1 ckil clock cycles 10 CCM will wait (7*pmic_delay_scaler)+1 ckil clock cycles 11 CCM will wait (15*pmic_delay_scaler)+1 ckil clock cycles
8 VSTBY	Voltage standby request bit. This bit defines if PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in STOP mode. 0 Voltage will not be changed to standby voltage after next entrance to STOP mode. (PMIC_STBY_REQ will remain negated - '0') 1 Voltage will be requested to change to standby voltage after next entrance to stop mode. (PMIC_STBY_REQ will be asserted - '1').
7 DIS_REF_OSC	dis_ref_osc - in run mode, software can manually control closing of external reference oscillator clock, i.e. generating '1' on CCM_REF_EN_B signal. If software closed manually the external reference clock, then sbyos functionality will be bypassed. The manual closing of external reference oscilator should be performed only in case the reference oscilator is not the source of any clock generation. **NOTE:** When returning from stop mode, the PMIC_STBY_REQ will be deasserted (if it was asserted when entering stop mode). See stby_count bits. 0 external high frequency oscillator will be enabled, i.e. CCM_REF_EN_B = '0'. 1 external high frequency oscillator will be disabled, i.e. CCM_REF_EN_B = '1'

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

Field	Description
6 SBYOS	Standby clock oscillator bit. This bit defines if cosc_pwrdown, which power down the on chip oscillator, will be asserted in STOP mode. This bit is discarded if cosc_pwrdown='1' for the on chip oscillator. 0 On-chip oscillator will not be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will remain asserted - '0' and cosc_pwrdown will remain de asserted - '0') 1 On-chip oscillator will be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will be deasserted - '1' and cosc_pwrdown will be asserted - '1'). When returning from STOP mode, external oscillator will be enabled again, on-chip oscillator will return to oscillator mode, and after oscnt count, CCM will continue with the exit from the STOP mode process.
5 ARM_CLK_DIS_ON_LPM	Define if ARM clocks (arm_clk, soc_mxclk, soc_pclk, soc_dbg_pclk, vl_wrck) will be disabled on wait mode. This is useful for debug mode, when the user still wants to simulate entering wait mode and still keep ARM clock functioning. **NOTE:** Software should not enable ARM power gating in wait mode if this bit is cleared. 0 ARM clock enabled on wait mode. 1 ARM clock disabled on wait mode. .
4–3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
LPM	Setting the low power mode that system will enter on next assertion of dsm_request signal. 00 Remain in run mode 01 Transfer to wait mode 10 Transfer to stop mode 11 Reserved



18.6.19 CCM Interrupt Status Register (CCM_CISR)

The figure below represents the CCM Interrupt Status Register (CISR). This is a write one to clear register. Once a interrupt is generated, software should write one to clear it. The table below provides its field descriptions.

NOTE

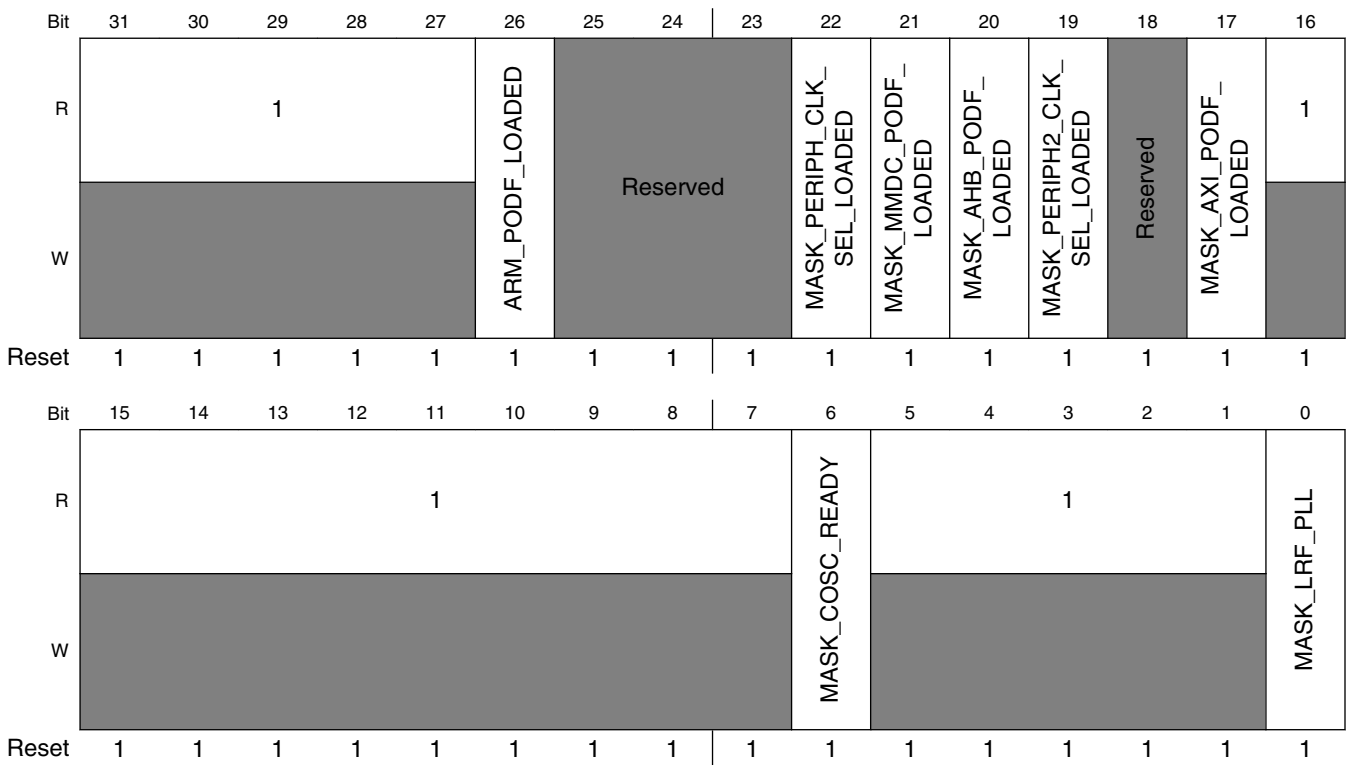
CCM interrupt request 1 can be masked by CCM interrupt request 1 mask bit. CCM interrupt request 2 can be masked by CCM interrupt request 2 mask bit.

Address: 20C_4000h base + 58h offset = 20C_4058h

CCM_CISR field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...



CCM_CISR field descriptions (continued)

Field	Description
26 ARM_PODF_ LOADED	CCM interrupt request 1 generated due to frequency change of arm_podf. The interrupt will commence only if arm_podf is loaded during a arm dvfs operation. 0 interrupt is not generated due to frequency change of arm_podf 1 interrupt generated due to frequency change of arm_podf
25–24 Reserved	This read-only field is reserved and always has the value 0.
23 -	This field is reserved. Reserved
22 PERIPH_CLK_ SEL_LOADED	CCM interrupt request 1 generated due to update of periph_clk_sel. 0 interrupt is not generated due to update of periph_clk_sel. 1 interrupt generated due to update of periph_clk_sel.
21 MMDC_PODF_ LOADED	CCM interrupt request 1 generated due to frequency change of mmdc_podf_ **loaded** 0 interrupt is not generated due to frequency change of mmdc_podf_ **loaded** 1 interrupt generated due to frequency change of mmdc_podf_ **loaded**
20 AHB_PODF_ LOADED	CCM interrupt request 1 generated due to frequency change of ahb_podf 0 interrupt is not generated due to frequency change of ahb_podf 1 interrupt generated due to frequency change of ahb_podf
19 PERIPH2_CLK_ SEL_LOADED	CCM interrupt request 1 generated due to frequency change of periph2_clk_sel 0 interrupt is not generated due to frequency change of periph2_clk_sel 1 interrupt generated due to frequency change of periph2_clk_sel
18 -	This field is reserved. Reserved
17 AXI_PODF_ LOADED	CCM interrupt request 1 generated due to frequency change of axi_podf 0 interrupt is not generated due to frequency change of axi_podf 1 interrupt generated due to frequency change of axi_podf
16–7 Reserved	This read-only field is reserved and always has the value 0.
6 COSC_READY	CCM interrupt request 2 generated due to on board oscillator ready, i.e. oscnt has finished counting. 0 interrupt is not generated due to on board oscillator ready 1 interrupt generated due to on board oscillator ready
5–1 Reserved	This read-only field is reserved and always has the value 0.
0 LRF_PLL	CCM interrupt request 2 generated due to lock of all enabled and not bypaseed PLLs 0 interrupt is not generated due to lock ready of all enabled and not bypaseed PLLs 1 interrupt generated due to lock ready of all enabled and not bypaseed PLLs

18.6.20 CCM Interrupt Mask Register (CCM_CIMR)

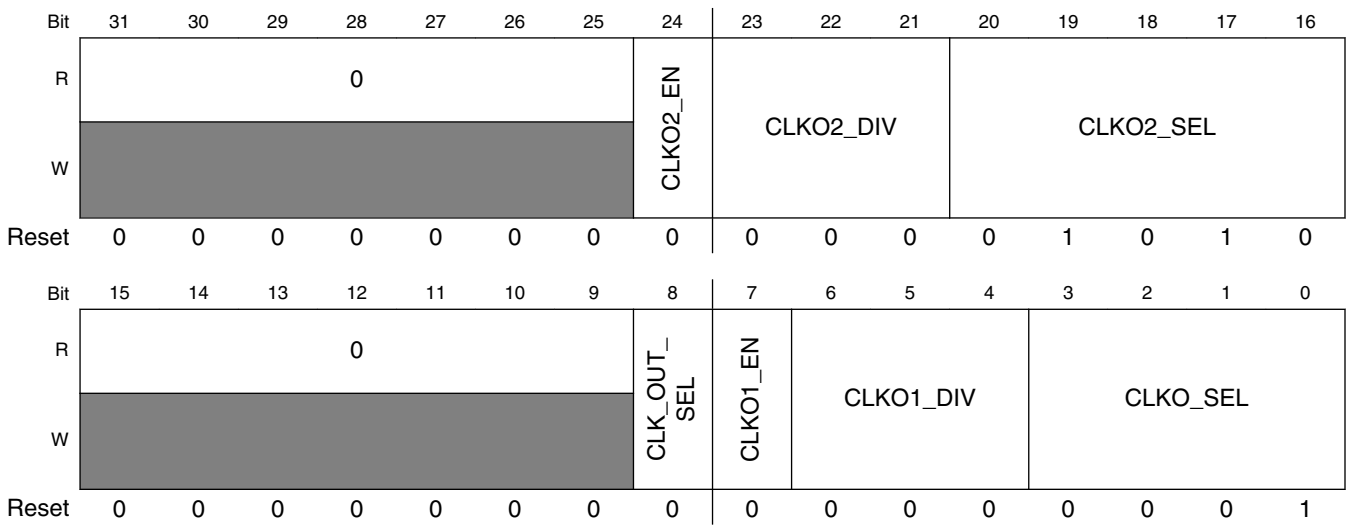
The figure below represents the CCM Interrupt Mask Register (CIMR). The table below provides its field descriptions.

Address: 20C_4000h base + 5Ch offset = 20C_405Ch

CCM_CIMR field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 1.
26 ARM_PODF_LOADED	mask interrupt generation due to frequency change of arm_podf 0 don't mask interrupt due to frequency change of arm_podf - interrupt will be created 1 mask interrupt due to frequency change of arm_podf
25–23 -	This field is reserved. Reserved
22 MASK_PERIPH_CLK_SEL_LOADED	mask interrupt generation due to update of periph_clk_sel. 0 don't mask interrupt due to update of periph_clk_sel - interrupt will be created 1 mask interrupt due to update of periph_clk_sel

Table continues on the next page...



CCM_CIMR field descriptions (continued)

Field	Description
21 MASK_MMDC_ PODF_LOADED	mask interrupt generation due to update of mask_mmdc_podf 0 don't mask interrupt due to update of mask_mmdc_podf - interrupt will be created 1 mask interrupt due to update of mask_mmdc_podf
20 MASK_AHB_ PODF_LOADED	mask interrupt generation due to frequency change of ahb_podf 0 don't mask interrupt due to frequency change of ahb_podf - interrupt will be created 1 mask interrupt due to frequency change of ahb_podf
19 MASK_ PERIPH2_CLK_ SEL_LOADED	mask interrupt generation due to update of periph2_clk_sel. 0 don't mask interrupt due to update of periph2_clk_sel - interrupt will be created 1 mask interrupt due to update of periph2_clk_sel
18 -	This field is reserved. Reserved
17 MASK_AXI_ PODF_LOADED	mask interrupt generation due to frequency change of axi_podf 0 don't mask interrupt due to frequency change of axi_podf - interrupt will be created 1 mask interrupt due to frequency change of axi_podf
16–7 Reserved	This read-only field is reserved and always has the value 1.
6 MASK_COSC_ READY	mask interrupt generation due to on board oscillator ready 0 don't mask interrupt due to on board oscillator ready - interrupt will be created 1 mask interrupt due to on board oscillator ready
5–1 Reserved	This read-only field is reserved and always has the value 1.
0 MASK_LRF_PLL	mask interrupt generation due to lrf of PLLs 0 don't mask interrupt due to lrf of PLLs - interrupt will be created 1 mask interrupt due to lrf of PLLs

18.6.21 CCM Clock Output Source Register (CCM_CCOSR)

The figure below represents the CCM Clock Output Source Register (CCOSR). The CCOSR register contains bits to control the clock that will be generated on the output ipp_do_clko1 (CCM_CLKO).The table below provides its field descriptions.

Address: 20C_4000h base + 60h offset = 20C_4060h

CCM_CCOSR field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 CLKO2_EN	Enable of CCM_CLKO2 clock 0 CCM_CLKO2 disabled. 1 CCM_CLKO2 enabled.
23–21 CLKO2_DIV	Setting the divider of CCM_CLKO2 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
20–16 CLKO2_SEL	Selection of the clock to be generated on CCM_CLKO2 00001 mmdc_clk_root 00010 gpmi_clk_root

Table continues on the next page...

18.6.22 CCM General Purpose Register (CCM_CGPR)

Fast PLL enable. Can be used to engage PLL faster after STOP mode, if 24MHz OSC was active

Address: 20C_4000h base + 64h offset = 20C_4064h

CCM_CGPR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 INT_MEM_CLK_LPM	Control for the Deep Sleep signal to the ARM Platform memories with additional control logic based on the ARM WFI signal. Used to keep the ARM Platform memory clocks enabled if an interrupt is pending when entering low power mode.

Table continues on the next page...

CCM_CGPR field descriptions (continued)

Field	Description
	NOTE: This bit should always bet set when the CCM_CLPCR_LPM bits are set to 01(WAIT Mode) or 10 (STOP mode) without power gating. This bit does not have to be set for STOP mode entry. 0 Disable the clock to the ARM platform memories when entering Low Power Mode 1 Keep the clocks to the ARM platform memories enabled only if an interrupt is pending when entering Low Power Modes (WAIT and STOP without power gating)
16 FPL	Fast PLL enable. 0 Engage PLL enable default way. 1 Engage PLL enable 3 CKIL clocks earlier at exiting low power mode (STOP). Should be used only if 24MHz OSC was active in low power mode.
15–14 SYS_MEM_DS_CTRL	System memory DS control 00 Disable memory DS mode always 01 Enable memory (outside ARM platform) DS mode when system STOP and PLL are disabled 1x enable memory (outside ARM platform) DS mode when system is in STOP mode
13–9 Reserved	This read-only field is reserved and always has the value 1.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–5 Reserved	This read-only field is reserved and always has the value 1.
4 EFUSE_PROG_SUPPLY_GATE	Defines the value of the output signal cgpr_dout[4]. Gate of program supply for efuse programing 0 fuse programing supply voltage is gated off to the efuse module 1 allow fuse programing.
3 -	This field is reserved. Reserved
2 MMDC_EXT_CLK_DIS	Disable external clock driver of MMDC during STOP mode 1 disable during stop mode 0 don't disable during stop mode.
1 -	Reserved. Keep default value set to '1' for proper operation.
0 PMIC_DELAY_SCALER	Defines clock dividion of clock for stby_count (pmic delay counter) 0 clock is not divided 1 clock is divided /8

18.6.23 CCM Clock Gating Register 0 (CCM_CCGR0)

CG(i) bits CCGR 0-6

These bits are used to turn on/off the clock to each module independently. The following table details the possible clock activity conditions for each module.

CGR value	Clock Activity Description
00	Clock is off during all modes. Stop enter hardware handshake is disabled.
01	Clock is on in run mode, but off in WAIT and STOP modes
10	Not applicable (Reserved).
11	Clock is on during all modes, except STOP mode.

Module should be stopped, before set its bits to "0"; clocks to the module will be stopped immediately.

The tables above show the register mapings for the different CGRs. The clock connectivity table should be used to match the "CCM output affected" to the actual clocks going into the modules.

The figure below represents the CCM Clock Gating Register 0 (CCM_CCGR0). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 7 CGR registers. The number of registers required is according to the number of peripherals in the system.

Address: 20C_4000h base + 68h offset = 20C_4068h

CG0	rom clock (rom_clk_enable)

18.6.29 CCM Clock Gating Register 6 (CCM_CCGR6)

The figure below represents the CCM Clock Gating Register 6 (CCM_CCGR6). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 8 CGR registers. The number of registers required is determined by the number of peripherals in the system.

Address: 20C_4000h base + 80h offset = 20C_4080h

CCM_CCGR6 field descriptions (continued)

Field	Description
17–16 CG8	pwm8 clocks (pwm8_clk_enable)
15–14 CG7	uart8 clocks (uart8_clk_enable)
13–12 CG6	Reserved
11–10 CG5	eim_slow clocks (eim_slow_clk_enable)
9–8 CG4	sim2_clock (sim2_clk_enable)
7–6 CG3	sim1_clock (sim1_clk_enable)
5–4 CG2	usdhc2 clocks (usdhc2_clk_enable)
3–2 CG1	usdhc1 clocks (usdhc1_clk_enable)
CG0	usboh3 clock (usboh3_clk_enable)

18.6.30 CCM Module Enable Overide Register (CCM_CMEOR)

The follow figure represents the CCM Module Enable Override Register (CMEOR). The CMEOR register contains bits to override the clock enable signal from the module. This bit will be applicable only for modules whose clock enable signals are used. The following table provides its field descriptions.

Address: 20C_4000h base + 88h offset = 20C_4088h

CCM_CMEOR field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 1.
30 MOD_EN_OV_CAN1_CPI	Overide clock enable signal from CAN1 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't overide module enable signal 1 overide module enable signal
29 Reserved	This read-only field is reserved and always has the value 1.
28 MOD_EN_OV_CAN2_CPI	Overide clock enable signal from CAN2 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't override module enable signal 1 override module enable signal
27–8 Reserved	This read-only field is reserved and always has the value 1.

Table continues on the next page...

CCM_CMEOR field descriptions (continued)

Field	Description
7 MOD_EN_ USDHC	overide clock enable signal from USDHC. 0 don't override module enable signal 1 override module enable signal
6 MOD_EN_OV_ EPIT	Overide clock enable signal from EPIT - clock will not be gated based on EPIT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
5 MOD_EN_OV_ GPT	Overide clock enable signal from GPT - clock will not be gated based on GPT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
Reserved	This read-only field is reserved and always has the value 1.

18.7 CCM Analog Memory Map/Register Definition

This section describes the registers for the analog PLLs. The registers which have the same description are grouped within {}. The register offsets for the various PLLs are:

- ARM PLL: {0h000, 0h004, 0h008, 0h00C}.
- USB1 PLL: {0h010, 0h014, 0h018, 0h01C}, {0h0F0, 0h0F4, 0h0F8, 0h0FC}.
- System PLL: {0h030, 0h034, 0h038, 0h03C}, 0h040, 0h050, 0h060, {0h100, 0h104, 0h108, 0h10C}.
- Audio / Video PLL: {0h070, 0h074, 0h078, 0h07C}, 0h080, 0h090, {0h0A0, 0h0A4, 0h0A8, 0h0AC}, 0h0B0, 0h0C0

CCM_ANALOG memory map

18.7.1 Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM*n*)

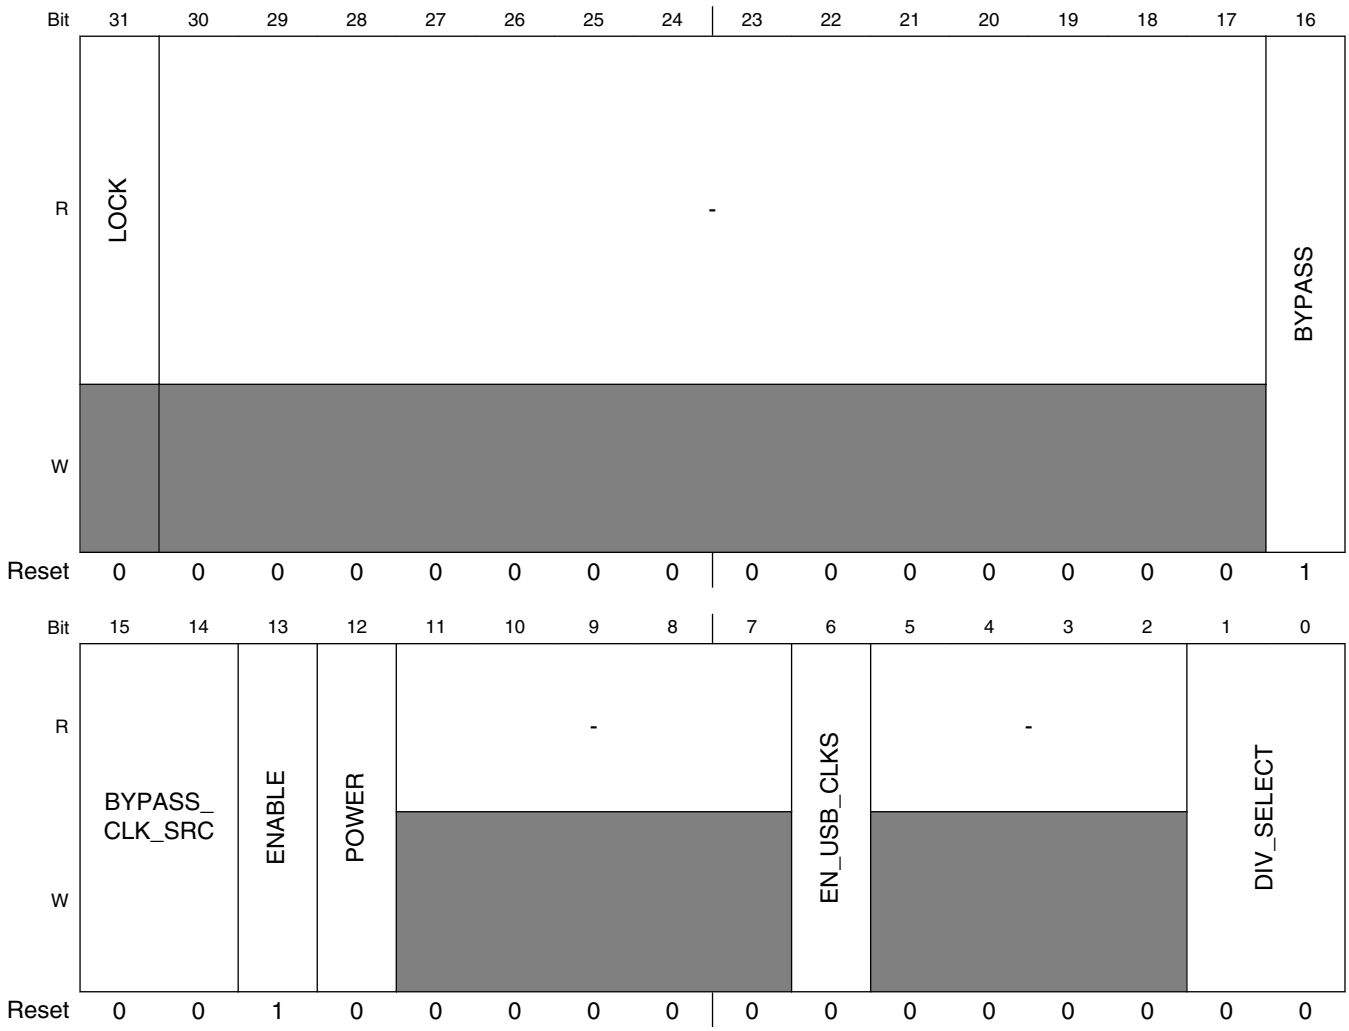
The control register provides control for the system PLL.

Address: 20C_8000h base + 0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_ARM*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–20 -	Always set to zero (0).
19 PLL_SEL	Reserved

Table continues on the next page...



CCM_ANALOG_PLL_ARM*n* field descriptions (continued)

Field	Description
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. **NOTE:** Changing the Bypass clock source also changes the PLL reference clock source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **Reserved** — 0x3 **Reserved** —
13 ENABLE	Enable the clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for divider value: 54-108. Fout = Fin * div_select/2.0.

18.7.2 Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1*n*)

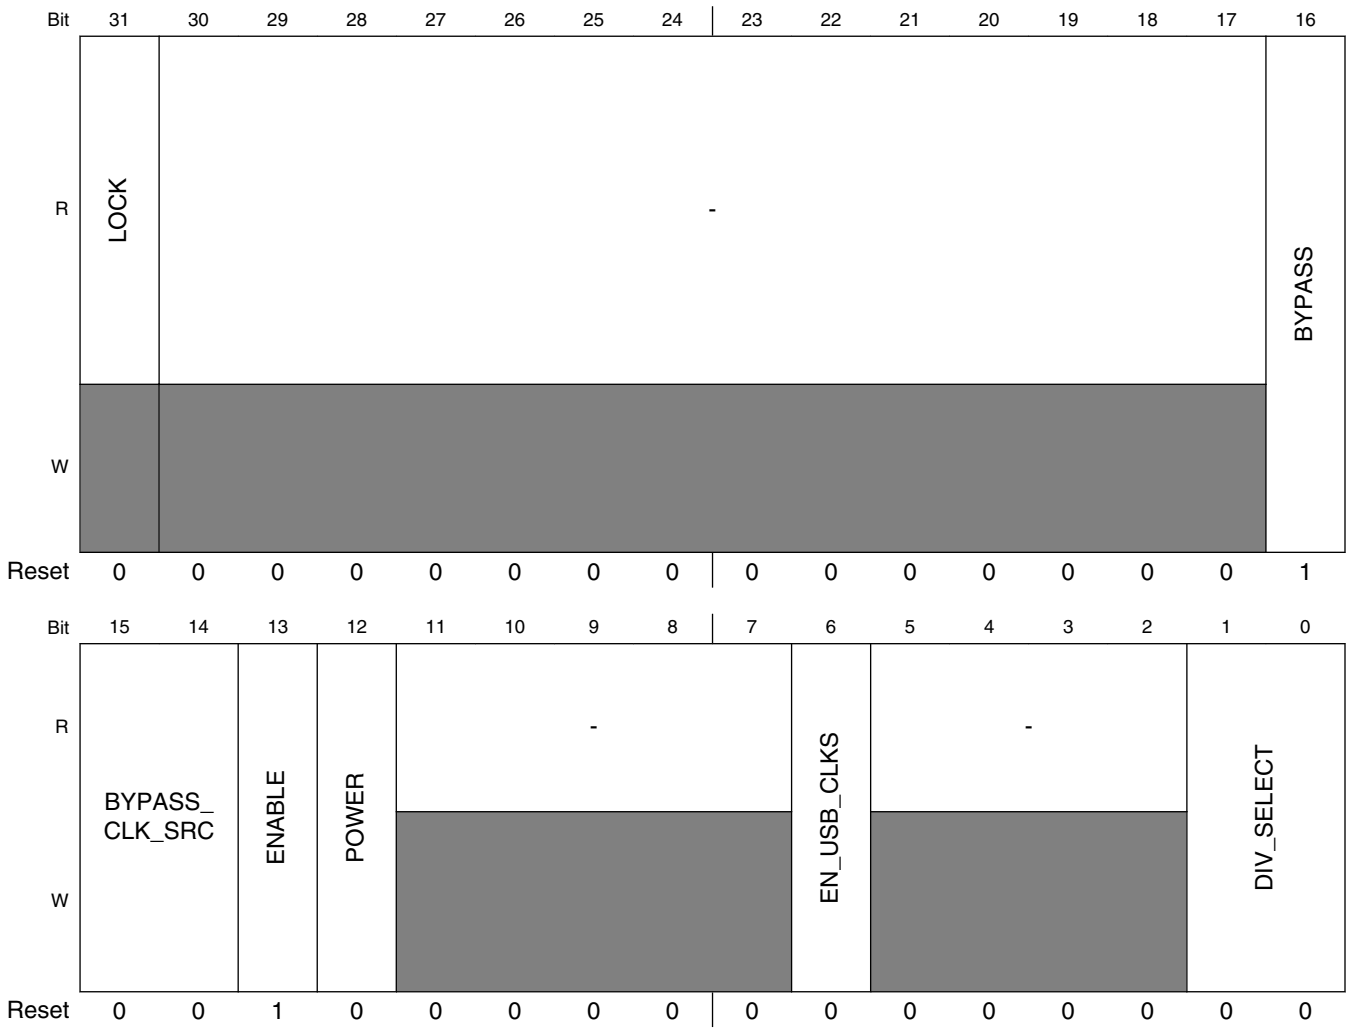
The control register provides control for USBPHY0 480MHz PLL.

Address: 20C_8000h base + 10h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_USB1*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.

Table continues on the next page...



CCM_ANALOG_PLL_USB1*n* field descriptions (continued)

Field	Description
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **GPANAIO** — 0x3 **CHRG_DET_B** —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY0 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	Powers the 9-phase PLL outputs for USBPHYn. Additionally, the UTMI clock gate must be deasserted in the USBPHYn to enable USBn operation (clear CLKGATE bit in USBPHYn_CTRL). This bit will be set automatically when USBPHYn remote wakeup event occurs. 0 PLL outputs for USBPHYn off. 1 PLL outputs for USBPHYn on.
5–2 -	Always set to zero (0).
DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

18.7.3 Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2*n*)

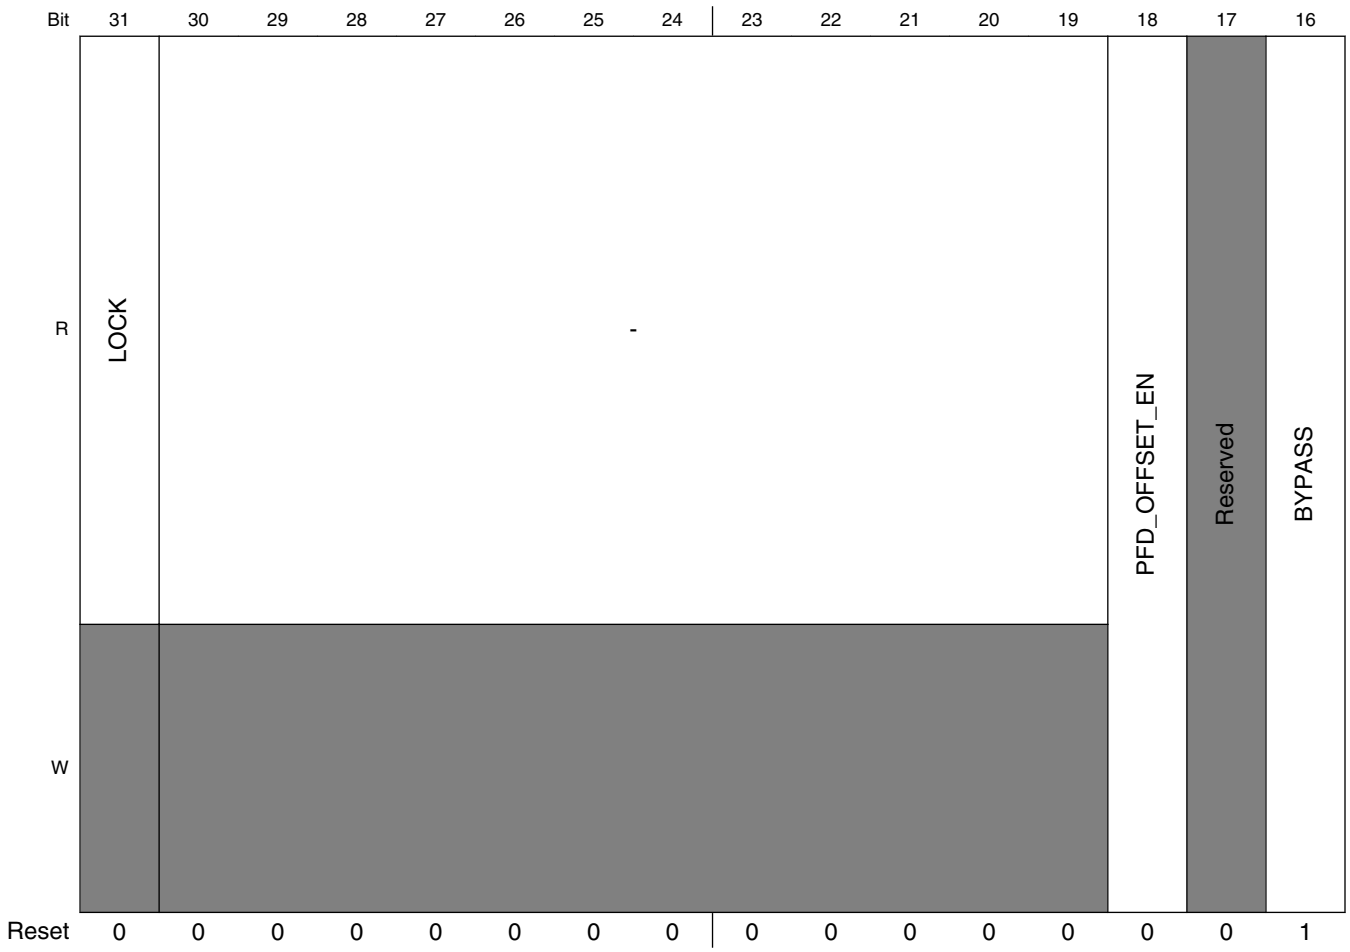
The control register provides control for USBPHY1 480MHz PLL.

Address: 20C_8000h base + 20h offset + (4d × i), where i=0d to 3d

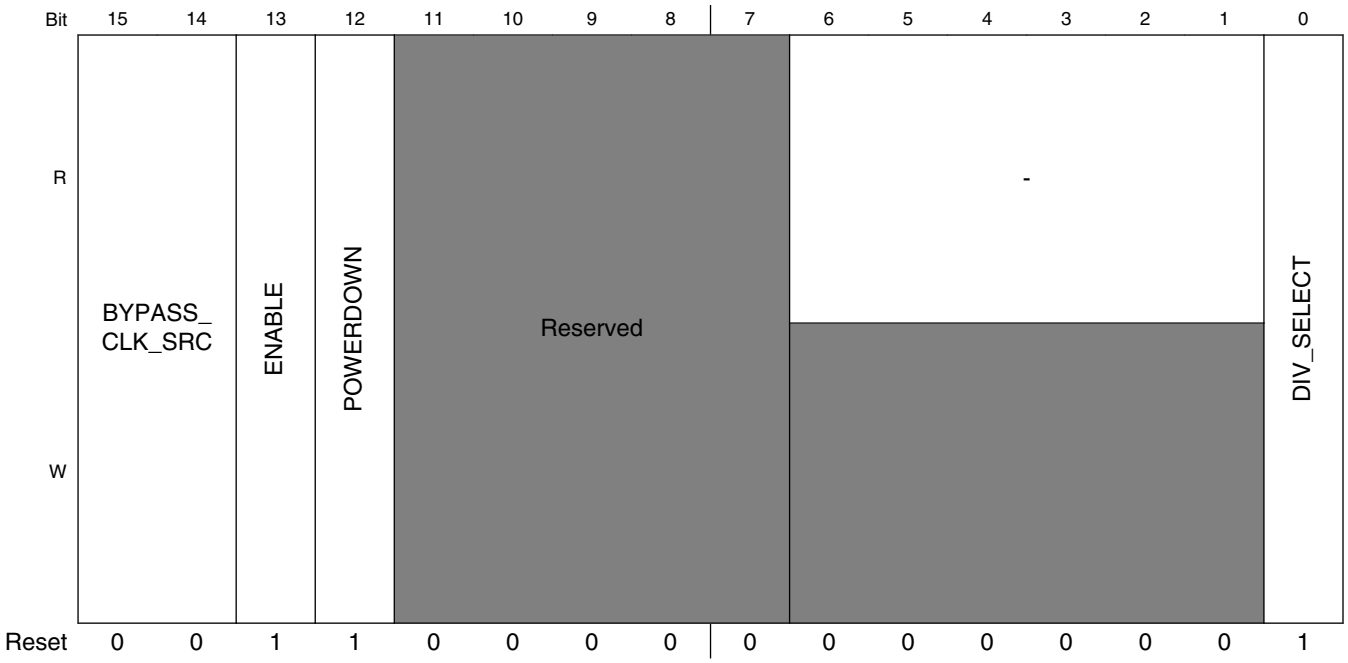
CCM_ANALOG_PLL_USB2*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.

Table continues on the next page...



CCM_ANALOG_PLL_USB2*n* field descriptions (continued)



Field	Description
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **Reserved** — 0x3 **Reserved** —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY1 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	0: 8-phase PLL outputs for USBPHY1 are powered down. If set to 1, 8-phase PLL outputs for USBPHY1 are powered up. Additionally, the utmi clock gate must be deasserted in the USBPHY1 to enable USB0 operation (clear CLKGATE bit in USBPHY1_CTRL).This bit will be set automatically when USBPHY1 remote wakeup event happens.
5–2 -	Always set to zero (0).
DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

18.7.4 Analog System PLL Control Register (CCM_ANALOG_PLL_SYS*n*)

The control register provides control for the 528MHz PLL.

Address: 20C_8000h base + 30h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_SYS*n* field descriptions

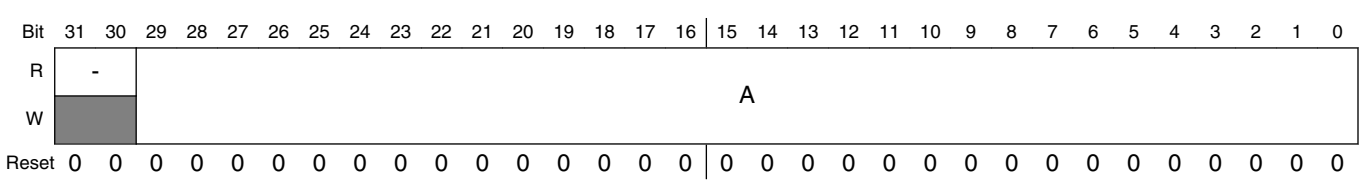
Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–19 -	Always set to zero (0).
18 PFD_OFFSET_ EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_ SRC	Determines the bypass source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **GPANAIO** — 0x3 **CHRG_DET_B** —
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–1 -	Always set to zero (0).
0 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

18.7.5 528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS)

This register contains the 528 PLL spread spectrum controls.

Address: 20C_8000h base + 40h offset = 20C_8040h

CCM_ANALOG_PLL_SYS_SS field descriptions



Field	Description
31–16 STOP	Frequency change = stop/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.
15 ENABLE	0 — Spread spectrum modulation disabled 1 — Soread spectrum modulation enabled
STEP	Frequency change step = step/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.

18.7.6 Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM)

This register contains the numerator of 528MHz PLL fractional loop divider (signed number).

Absoulte value should be less than denominator

Address: 20C_8000h base + 50h offset = 20C_8050h

CCM_ANALOG_PLL_SYS_NUM field descriptions

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator (A) of fractional loop divider (signed integer).

18.7.7 Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM)

This register contains the Denominator of 528MHz PLL fractional loop divider.

Address: 20C_8000h base + 60h offset = 20C_8060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

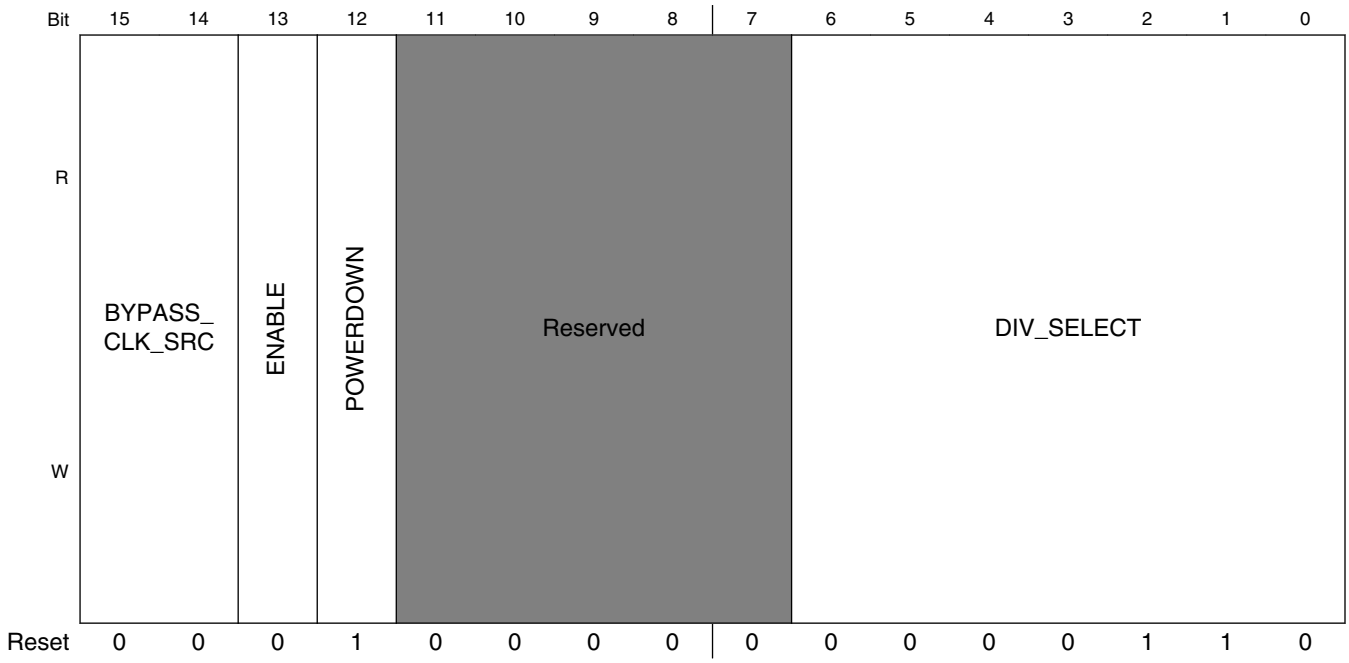
CCM_ANALOG_PLL_SYS_DENOM field descriptions



Field	Description
31–30 -	Always set to zero (0).
B	30 bit Denominator (B) of fractional loop divider (unsigned integer).

18.7.8 Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIO*n*)

The control register provides control for the audio PLL.

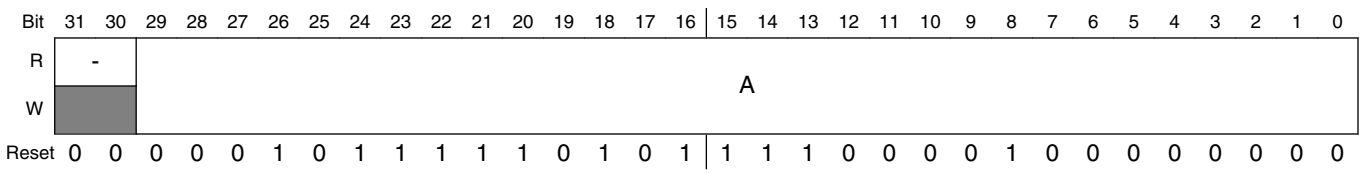
Address: 20C_8000h base + 70h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_AUDIO*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Reserved
20–19 POST_DIV_ SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_ EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Revsered
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_ SRC	Determines the bypass source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **Reserved** — 0x3 **Reserved** —

Table continues on the next page...

CCM_ANALOG_PLL_AUDIO*n* field descriptions (continued)



Field	Description
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

18.7.9 Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM)

This register contains the numerator (A) of Audio PLL fractional loop divider.(Signed number), absolute value should be less than denominator

Absolute value should be less than denominator

Address: 20C_8000h base + 80h offset = 20C_8080h

CCM_ANALOG_PLL_AUDIO_NUM field descriptions

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator of fractional loop divider.

18.7.10 Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM)

This register contains the Denominator (B) of Audio PLL fractional loop divider. (unsigned number)

Address: 20C_8000h base + 90h offset = 20C_8090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

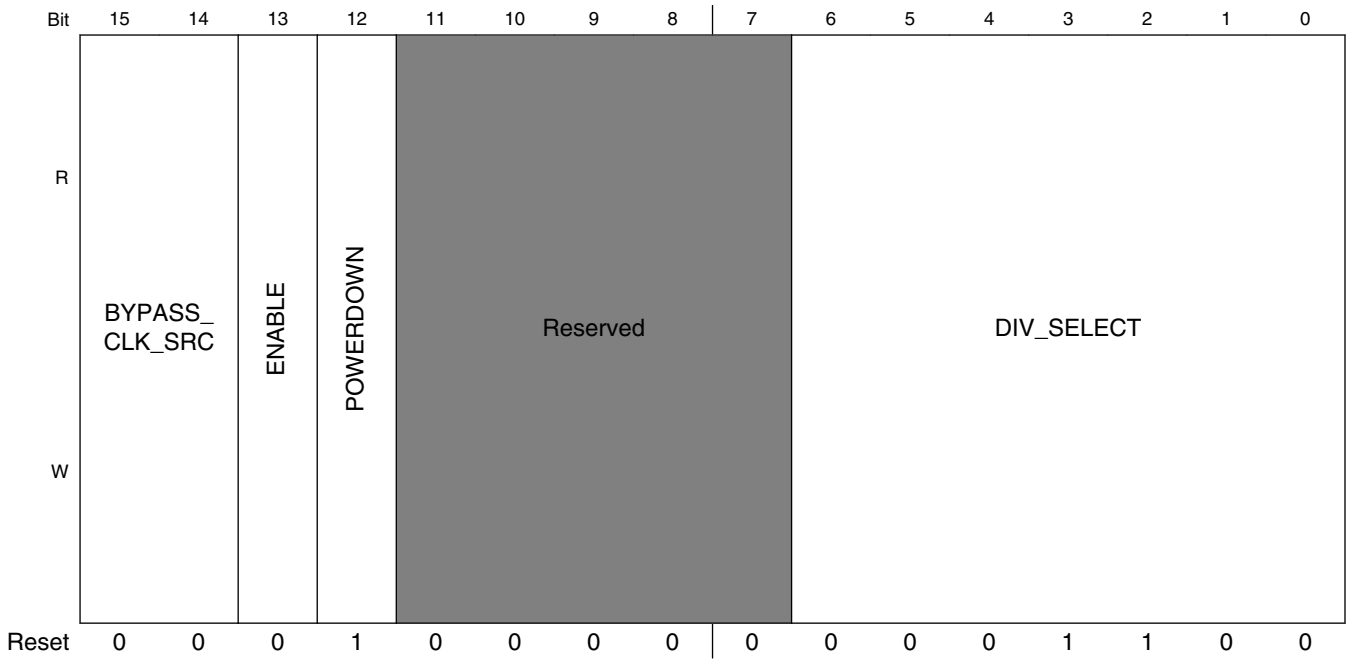
CCM_ANALOG_PLL_AUDIO_DENOM field descriptions



Field	Description
31–30 -	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

18.7.11 Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEO*n*)

The control register provides control for the Video PLL.

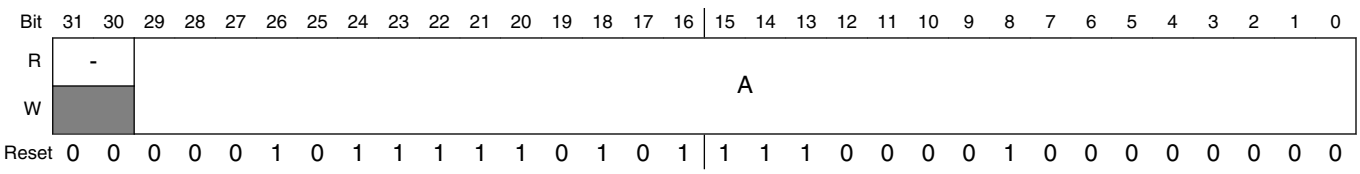
Address: 20C_8000h base + A0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_VIDEO*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Revserved
20–19 POST_DIV_ SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_ EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_ SRC	Determines the bypass source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **Reserved** — 0x3 **Reserved** —

Table continues on the next page...

CCM_ANALOG_PLL_VIDEO*n* field descriptions (continued)



Field	Description
13 ENABLE	Enalbe PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

18.7.12 Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM)

This register contains the numerator (A) of Video PLL fractional loop divider.(Signed number)

Absolute value should be less than denominator

Address: 20C_8000h base + B0h offset = 20C_80B0h

CCM_ANALOG_PLL_VIDEO_NUM field descriptions

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator of fractional loop divider(Signed number), absolute value should be less than denominator

18.7.13 Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM)

This register contains the Denominator (B) of Video PLL fractional loop divider. (Unsigned number)

Address: 20C_8000h base + C0h offset = 20C_80C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

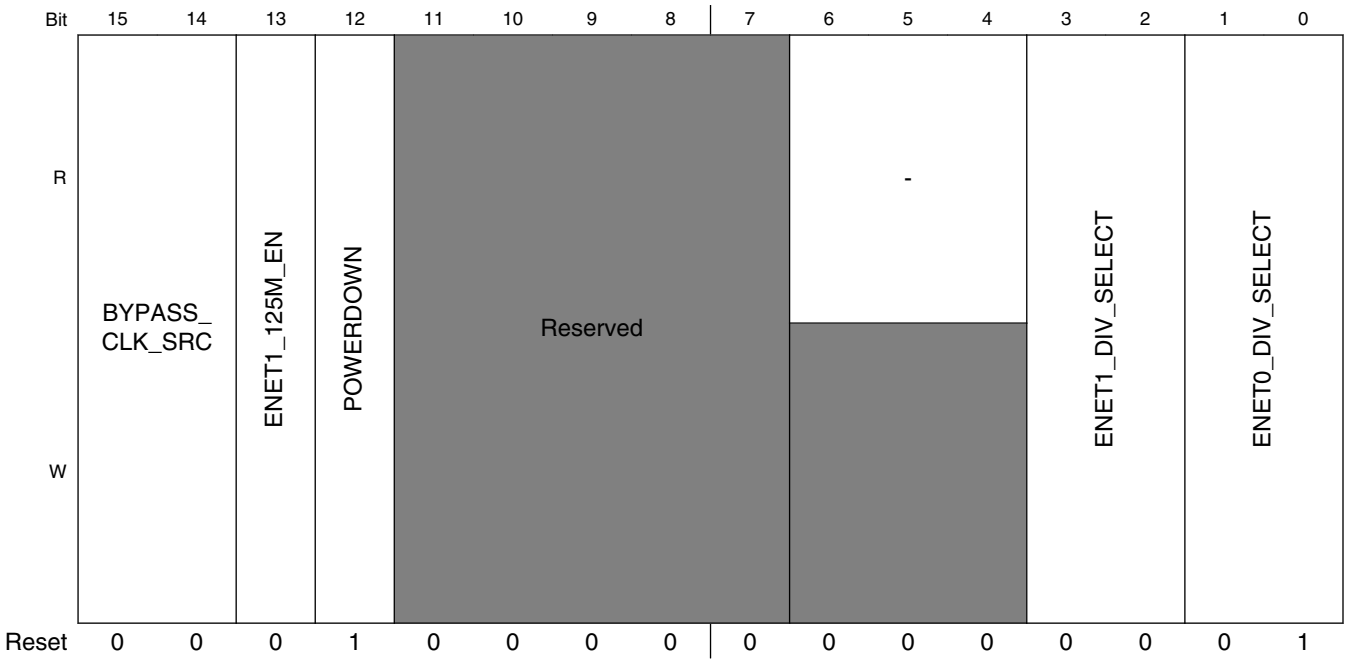
CCM_ANALOG_PLL_VIDEO_DENOM field descriptions



Field	Description
31–30 -	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

18.7.14 Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENET*n*)

The control register provides control for the ENET PLL.

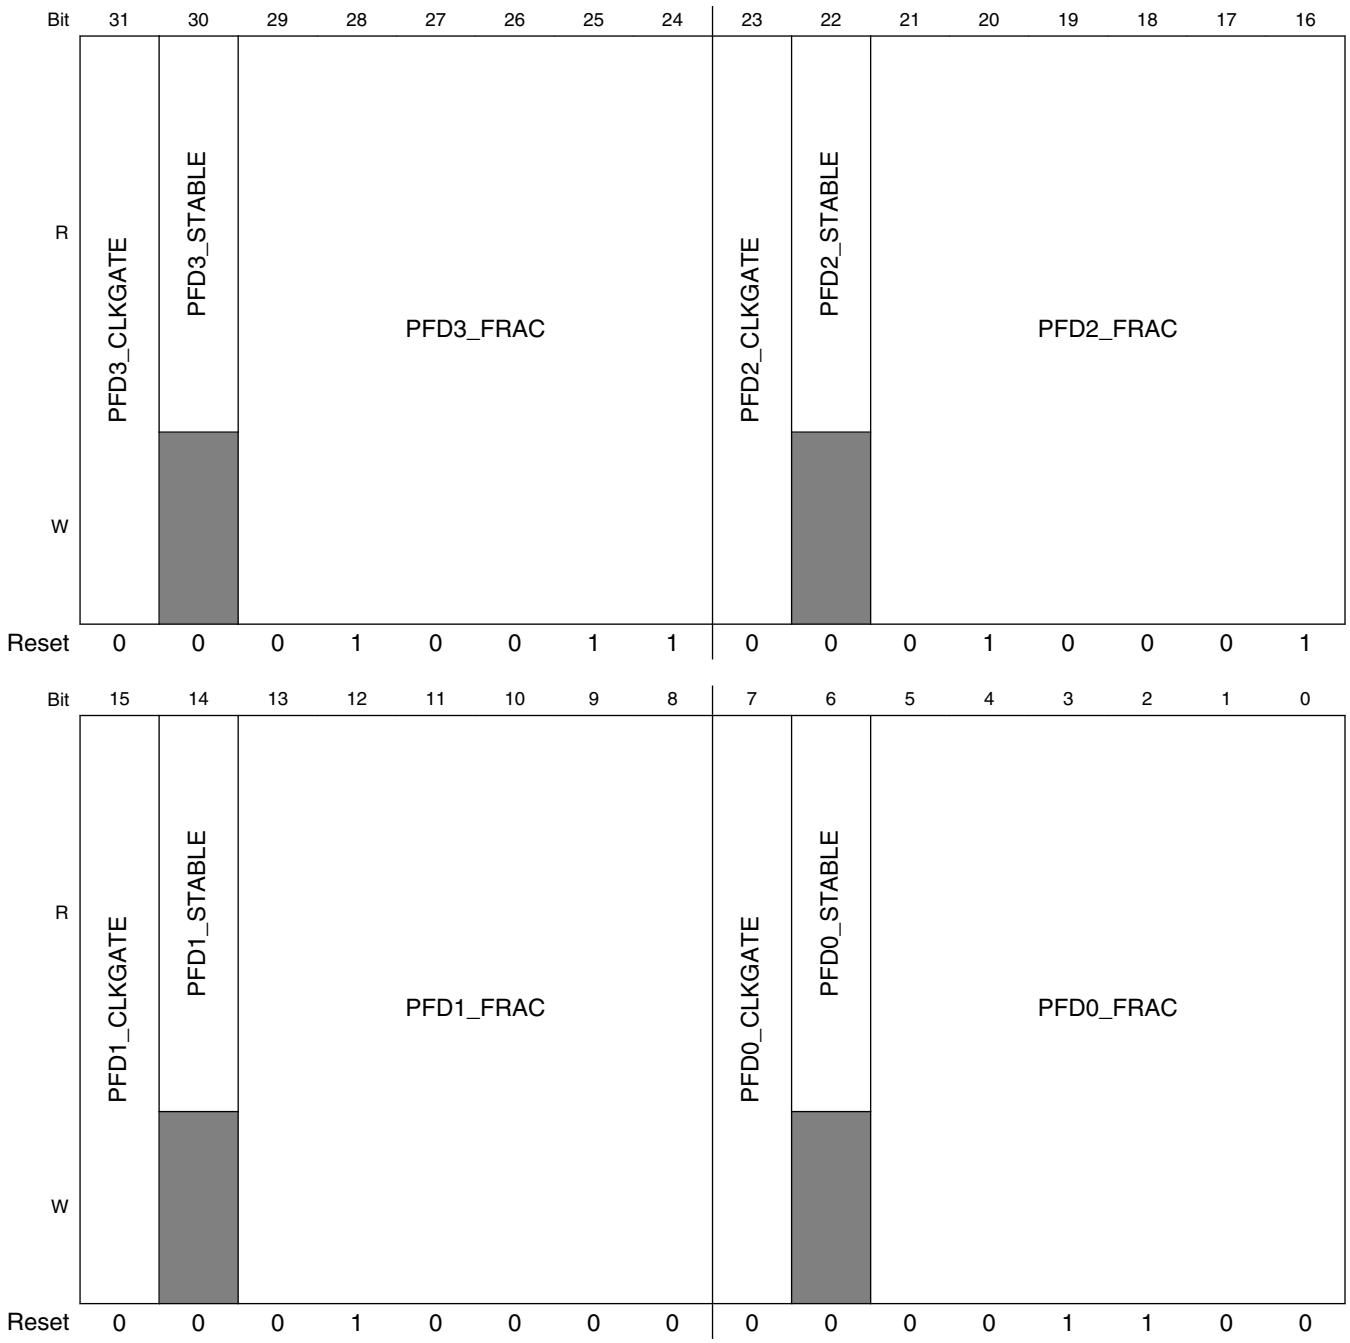
Address: 20C_8000h base + E0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_ENET*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 ENET_25M_ REF_EN	Enable the PLL providing ENET 25 MHz reference clock
20 ENET2_125M_ EN	Enable the PLL providing the ENET2 125 MHz reference clock
19 ENABLE_125M	Enables an offset in the phase frequency detector.
18 PFD_OFFSET_ EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_ SRC	Determines the bypass source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **Reserved** — 0x3 **Reserved** —

Table continues on the next page...

CCM_ANALOG_PLL_ENET*n* field descriptions (continued)



Field	Description
13 ENET1_125M_EN	Enable the PLL providing the ENET1 125 MHz reference clock.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–4 -	Always set to zero (0).
3–2 ENET1_DIV_SELECT	Controls the frequency of the ethernet1 reference clock. 00 25MHz 01 50MHz 10 100MHz (not 50% duty cycle) 11 125MHz
ENET0_DIV_SELECT	Controls the frequency of the ethernet0 reference clock. 00 25MHz 01 50MHz 10 100MHz (not 50% duty cycle) 11 125MHz

18.7.15 480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480*n*)

The PFD_480 control register provides control for PFD clock generation.

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

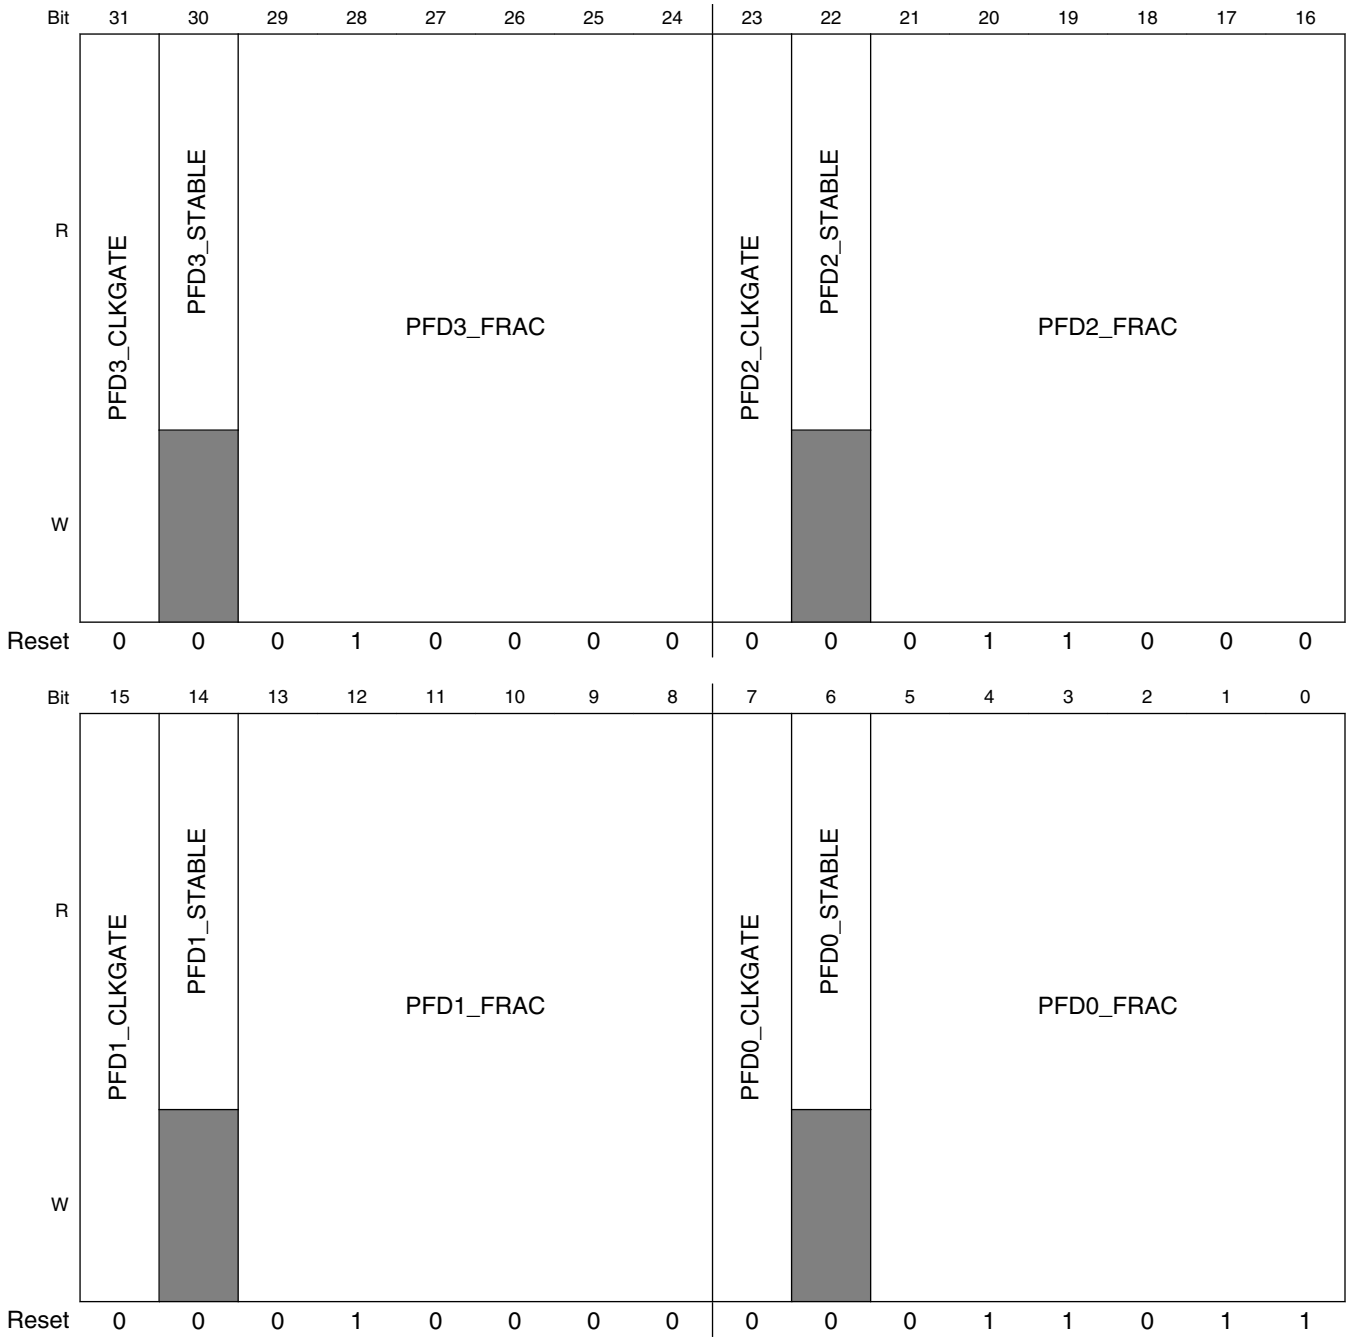
Address: 20C_8000h base + F0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PFD_480*n* field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

CCM_ANALOG_PFD_480*n* field descriptions (continued)



Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be 480*18/PFD3_FRAC where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be 480*18/PFD2_FRAC where PFD2_FRAC is in the range 12-35.
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be 480*18/PFD1_FRAC where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be 480*18/PFD0_FRAC where PFD0_FRAC is in the range 12-35.

18.7.16 528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528*n*)

The PFD_528 control register provides control for PFD clock generation.

This register controls the 3-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 20C_8000h base + 100h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PFD_528*n* field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

CCM_ANALOG_PFD_528*n* field descriptions (continued)

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be 528*18/PFD3_FRAC where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be 528*18/PFD2_FRAC where PFD2_FRAC is in the range 12-35. **NOTE:** The maximum allowed frequency of PFD2 is 400MHz
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. Need to assert this bit before PLL powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be 528*18/PFD1_FRAC where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled. Need to assert this bit before PLL powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be 528*18/PFD0_FRAC where PFD0_FRAC is in the range 12-35. **NOTE:** For QSPI boot at 76 MHz, this PFD is relocked to 307MHz, so the default value for this field (modified by ROM) would be 0x1f. Also for Low Freq Boot, ROM will relock this PFD to 307MHz, hence default would be 0x1f.

18.7.17 Miscellaneous Register 0 (CCM_ANALOG_MISC0*n*)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 20C_8000h base + 150h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CCM_ANALOG_MISC0*n* field descriptions

Field	Description
31 VID_PLL_ PREDIV	Predivider for the source clock of the PLL's. 0 Divide by 1 1 Divide by 2
30 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC)
29 RTC_XTAL_ SOURCE	This field indicates which chip source is being used for the rtc clock. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC) 0 Internal ring oscillator 1 RTC_XTAL
28–26 CLKGATE_ DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block. **NOTE:** Do not change the field during a low power event. This is not a field that the user would normally need to modify. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC) 000 0.5ms 001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms 101 5.0ms 110 6.0ms 111 7.0ms
25 CLKGATE_CTRL	This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block. **NOTE:** Do not change the field during a low power event. This is not a field that the user would normally need to modify. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC) 0 **ALLOW_AUTO_GATE** — Allow the logic to automatically gate the clock when the XTAL is powered down. 1 **NO_AUTO_GATE** — Prevent the logic from ever gating off the clock.
24–17 -	This field is reserved. Always set to zero.
16 OSC_XTALOK_ EN	This bit enables the detector that signals when the 24MHz crystal oscillator is stable. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC)
15 OSC_XTALOK	Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC)

Table continues on the next page...

CCM_ANALOG_MISC0*n* field descriptions (continued)

Field	Description
14–13 OSC_I	This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC) 00 **NOMINAL** — Nominal 01 **MINUS_12_5_PERCENT** — Decrease current by 12.5% 10 **MINUS_25_PERCENT** — Decrease current by 25.0% 11 **MINUS_37_5_PERCENT** — Decrease current by 37.5%
12 DISCON_HIGH_SNVS	This bit controls a switch from VDD_HIGH_IN to VDD_SNVS_IN. 0 Turn on the switch 1 Turn off the switch
11–10 STOP_MODE_CONFIG	Configure the analog behavior in stop mode. 00 All analog except rtc powered down on stop mode assertion. XtalOsc=on, RCOsc=off; 01 Certain analog functions such as certain regulators left up. XtalOsc=on, RCOsc=off; 10 XtalOsc=off, RCOsc=on, Old BG=on, New BG=off. 11 XtalOsc=off, RCOsc=on, Old BG=off, New BG=on.
9–8 -	This field is reserved. Reserved
7 REFTOP_VBGUP	Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
6–4 REFTOP_VBGADJ	**NOTE:** Not related to CCM. See Power Management Unit (PMU) 000 Nominal VBG 001 VBG+0.78% 010 VBG+1.56% 011 VBG+2.34% 100 VBG-0.78% 101 VBG-1.56% 110 VBG-2.34% 111 VBG-3.12%
3 REFTOP_SELFBIASOFF	Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap. **NOTE:** Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 0 Uses coarse bias currents for startup 1 Uses bandgap-based bias currents for best performance.
2–1 -	This field is reserved.

Table continues on the next page...

CCM_ANALOG_MISC0*n* field descriptions (continued)

Field	Description
0 REFTOP_PWD	Control bit to power-down the analog bandgap reference circuitry. **NOTE:** A note of caution, the bandgap is necessary for correct operation of most of the LDO, PLL, and other analog functions on the die. **NOTE:** Not related to CCM. See Power Management Unit (PMU)

18.7.18 Miscellaneous Register 1 (CCM_ANALOG_MISC1*n*)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 20C_8000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CCM_ANALOG_MISC1*n* field descriptions

Field	Description
31 IRQ_DIG_BO	This status bit is set to one when when any of the digital regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
30 IRQ_ANA_BO	This status bit is set to one when when any of the analog regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
29 IRQ_TEMPHIGH	This status bit is set to one when the temperature sensor high interrupt asserts for high temperature. **NOTE:** Not related to CCM. See Temperature Monitor (TEMPMON)
28 IRQ_TEMPLOW	This status bit is set to one when the temperature sensor low interrupt asserts for low temperature. **NOTE:** Not related to CCM. See Temperature Monitor (TEMPMON)
27 IRQ_ TEMPPANIC	This status bit is set to one when the temperature sensor panic interrupt asserts for a panic high temperature. **NOTE:** Not related to CCM. See Temperature Monitor (TEMPMON)
26–18 -	This field is reserved. Reserved
17 PFD_528_ AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_528 clocks anytime the PLL_528 is unlocked or powered off.
16 PFD_480_ AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_480 clocks anytime the USB1_PLL_480 is unlocked or powered off.
15–14 -	This field is reserved. Reserved
13 -	This field is reserved. Reserved
12 LVDSCLK1_ IBEN	This enables the LVDS input buffer for anaclk1/1b. Do not enable input and output buffers simultaneously.
11 -	This field is reserved. Reserved
10 LVDSCLK1_ OBEN	This enables the LVDS output buffer for anaclk1/1b. Do not enable input and output buffers simultaneously.
9–5 -	This field is reserved. Reserved
LVDS1_CLK_ SEL	This field selects the clk to be routed to anaclk1/1b. 00000 **ARM_PLL** — Arm PLL 00001 **SYS_PLL** — System PLL 00010 **PFD4** — ref_pfd4_clk == pll2_pfd0_clk

CCM_ANALOG_MISC2*n* field descriptions

Field	Description
31–30 VIDEO_DIV	Post-divider for video. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_VIDEOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16. 00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4
29–28 REG2_STEP_TIME	Number of clock periods (24MHz clock). **NOTE:** Not related to CCM. See Power Management Unit (PMU) 00 **64_CLOCKS** — 64 01 **128_CLOCKS** — 128 10 **256_CLOCKS** — 256 11 **512_CLOCKS** — 512
27–26 REG1_STEP_TIME	Number of clock periods (24MHz clock).

Table continues on the next page...

CCM_ANALOG_MISC2*n* field descriptions (continued)

Field	Description
	NOTE: Not related to CCM. See Power Management Unit (PMU) 00 **64_CLOCKS** — 64 01 **128_CLOCKS** — 128 10 **256_CLOCKS** — 256 11 **512_CLOCKS** — 512
25–24 REG0_STEP_TIME	Number of clock periods (24MHz clock). **NOTE:** Not related to CCM. See Power Management Unit (PMU) 00 **64_CLOCKS** — 64 01 **128_CLOCKS** — 128 10 **256_CLOCKS** — 256 11 **512_CLOCKS** — 512
23 AUDIO_DIV_MSB	MSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDIOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16. **NOTE:** MSB bit value pertains to the first bit, please program the LSB bit (bit 15) as well to change divider value for more information. 00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4
22 REG2_OK	Signals that the voltage is above the brownout level for the SOC supply. 1 = regulator output > brownout_target **NOTE:** Not related to CCM. See Power Management Unit (PMU)
21 REG2_ENABLE_BO	Enables the brownout detection. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
20 -	This field is reserved.
19 REG2_BO_STATUS	Reg2 brownout status bit. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
18–16 REG2_BO_OFFSET	This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

Table continues on the next page...

CCM_ANALOG_MISC2*n* field descriptions (continued)

Field	Description
15 AUDIO_DIV_LSB	LSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDIOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16. **NOTE:** LSB bit value pertains to the last bit, please program the MSB bit (bit 23) as well, to change divider value for more information. 00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4
14 - Reserved	This field is reserved.
13 REG1_ENABLE_BO	Enables the brownout detection. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
12 -	This field is reserved.
11 REG1_BO_STATUS	Reg1 brownout status bit. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 1 Brownout, supply is below target minus brownout offset.
10–8 REG1_BO_OFFSET	This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V
7 PLL3_disable	When USB is in low power suspend mode this Control bit is used to indicate if other system peripherals require the USB PLL3 clock when the SoC is not in low power mode. A user needs to set this bit if they want to optionally disable PLL3 while the SoC is not in any low power mode to save power. When the system does go into low power mode this bit setting would not have any affect. **NOTE:** When USB is in low power suspend mode users would need to ensure PLL3 is not being used before setting this bit in RUN mode. Please refer to the correct PLL disabling procedure in Disabling / Enabling PLLs 0 PLL3 is being used by peripherals and is enabled when SoC is not in any low power mode 1 PLL3 can be disabled when the SoC is not in any low power mode
6 -	This field is reserved.
5 REG0_ENABLE_BO	Enables the brownout detection. **NOTE:** Not related to CCM. See Power Management Unit (PMU)

Field	Description
4 -	This field is reserved.
3 REG0_BO_ STATUS	Reg0 brownout status bit. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 1 Brownout, supply is below target minus brownout offset.
REG0_BO_ OFFSET	This field defines the brown out voltage offset for the CORE power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. Some steps may be irrelevant because of input supply limitations or load operation. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

Chapter 19
CMOS Sensor Interface (CSI)

19.1 Overview

This chapter presents the CMOS Sensor Interface (CSI) architecture, operation principles, and programming model.

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit / 16-bit / 24-bit data port for YCbCr, YUV, or RGB data input.
- 8-bit / 10-bit / 16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit / pixel data format to 64-bitreceive FIFO packing.
- 256 x 64 FIFO to store received image pixel data.
- Reveive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support double bufferring two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources: Start of Frame, End of Frame, Change of Field, FIFO full, FIFO overrun, DMA transfer done, CCIR error and AHB bus response error.
- Configurable master clock frequency output to sensor.

- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).
- Supports simple deinterlacing of interlaced input.
- Supports TV Decoder (VADC) input.

19.2 External Signals

The table below describes the external signals for the CSI. The external signals are tied between the CSI module and an external CMOS sensor.

Table 19-1. CSI External Signals

Signal	Description	Pad	Mode	Direction
DATA0	Data Sensor Signal 0, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	LCD_DATA17	ALT3	I
		UART3_RX_DATA	ALT3	I

19.3 Clocks

The following table describes the clock sources for CSI. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 19-2. CSI Clocks

Clock name	Clock Root	Description
csi_hclk	ahb_clk_root	Module clock
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
ipg_clk_s_raw	ipg_clk_root	Peripheral raw data clock

19.4 Principles of Operation

The information found here describes the modes of operation of the sensor interface.

The CSI is designed to support generic sensor interface timing as well as CCIR656 video interface timing. Traditional CMOS sensors typically use VSYNC (SOF), HSYNC (BLANK), and PIXCLK signals to output Bayer or YUV data. Smart CMOS sensors, that come with on-chip imaging processing, usually support video mode transfer. They use an embedded timing codec to replace the VSYNC and HSYNC signal. The timing codec is defined by the CCIR656 standard.

The CSI can support connection with the sensor as follows.

- To connect with one 8-bit sensor, the sensor data interface should connect to CSI_DATA[9:2].
- To connect with one 10-bit sensor, the sensor data interface should connect to CSI_DATA[9:0].
- To connect with one 16-bit sensor, the sensor data interface should connect to CSI_DATA[15:0].

- To connect with one 24-bit data, either video pass-through or TV Decoder input, the sensor data interface should connect to CSI_DATA[23:0].
- To connect with two 8-bit sensors, the sensor data interfaces should connect to CSI_DATA[7:0] and CSI_DATA[15:8].

19.4.1 Data Transfer with the Embedded DMA Controllers

The CSI has two embedded DMA controllers, one for the receive FIFO and the other for the statistic FIFO. It supports 2D DMA transfer from the receive FIFO to the frame buffers in the external memory and linear DMA transfer from the statistic FIFO.

To transfer data from the RxFIFO to the external memory, the user should set the start address in the frame buffer where the transferred data is stored, the parameters of the frame buffers, and the parameters of the image coming from the sensor. The user can have two frame buffers in the external memory. Each one will store a frame of image coming from the sensor. The embedded DMA controller will first write the frame buffer1 and then frame buffer2. These two frame buffers will be written by turns. The start address should be aligned in double words and set in the CSIDMASA-FB1 and CSIDMASA-FB2 registers. In the CSIFBUF_PARA register, the user should set the stride of the frame buffer to show how many double words to skip before starting to write the next row of the image. In the CSIIMAG_PARA register, the user should set the width and height of the image coming from the sensor. The RxFF_LEVEL and DMA_REQ_EN_RFF bits in CSICR3 registers also need to be set before the data transfer starts. When the number of the data in the RxFIFO reaches the trigger level, a DMA request will be sent to the embedded DMA controller and the data will be read out from the RxFIFO and written through AHB bus into the external frame buffers. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA_BURST_TYPE_RFF bits in CSICR2 register. After all data in an image frame are transferred, the DMA_TSF_DONE_FB1 or DMA_TSF_DONE_FB2 bit will be set in CSISR register and the interrupt can be triggered if the corresponding enable bit is set in CSICR1 register. The DMA_REFLASH_RFF bit in CSICR3 can be used to activate or restart the embedded DMA controller.

The RxFIFO has the overrun protection mechanism in case the RxFIFO is overrun during data transfer. If the RxFIFO is full and more data needs to be received during the data transfer, the RxFIFO will be overwritten continuously and all 128 words of data in the RxFIFO before overrun occurred will be discarded; the corresponding 128 words memory space in the frame buffer will keep the previous values.

To transfer data from the statistic FIFO to the external memory, the user should set the start address of the externl memory where the transferred data is stored and the total transfer sizes. The start address and the transfer sizes are all aligned in double words and should be set in the CSIDMASA-STATFIFO and CSIDMATS-STATFIFO registers. The STATFF_LEVEL and DMA_REQ_EN_SFF bits in CSICR3 registers should also be set before the data transfer starts. When the number of the data in the STATFIFO reaches the trigger level, a dma request will be sent to the embedded DMA controller and the data will be read out from the STATFIFO and written through AHB bus into the external memory. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA_BURST_TYPE_SFF bits in CSICR2 register. After all expected data (defined by the total transfer sizes) are transferred, the DMA_TSF_DONE_SFF bit will be set in CSISR register and an interrupt can be triggered if the SFF_DMA_DONE_INTEN is enabled in CSICR1 register. The DMA_REFLASH_SFF bit in CSICR3 can be used to activate or re-start the embedded DMA controller.

19.4.2 Gated Clock Mode

VSYNC, HSYNC, and PIXCLK signals are used in gated clock mode.

A frame starts with an active edge on VSYNC, then HSYNC asserts and holds for the entire line. The Pixel clock is valid as long as HSYNC is asserted. Data is latched at the active edge of the valid pixel clocks. HSYNC deasserts at the end of line. Pixel clocks then become invalid and CSI stops receiving data from the stream. For the next line the HSYNC timing repeats. For the next frame the VSYNC timing repeats.

19.4.3 Non-Gated Clock Mode

In non-gated clock mode, only the VSYNC and PIXCLK signals are used; the HSYNC signal is ignored.

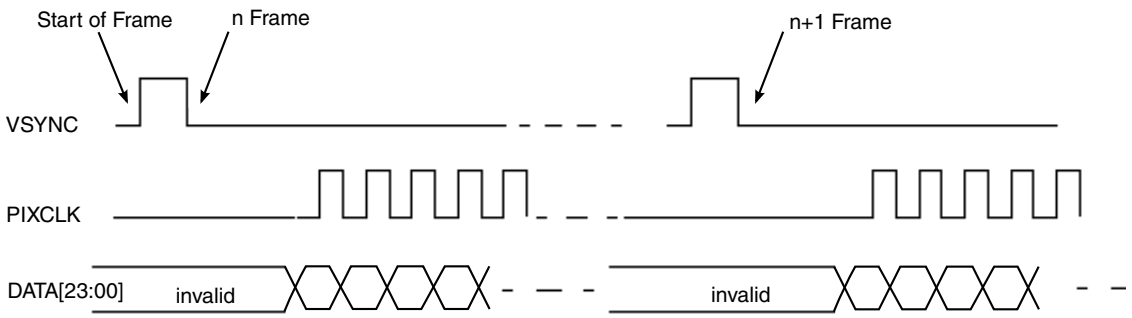

Figure 19-1. Non-Gated Clock Mode Timing Diagram

The overall timing of non-gated mode is the same as the gated-clock mode, except for the HSYNC signal. HSYNC signal is ignored by the CSI. All incoming pixel clocks are valid and cause data to be latched into RxFIFO. The PIXCLK signal is inactive (states low) until valid data is ready to be transmitted over the bus.

Figure 19-1 shows the timing of a typical sensor. Other sensors may have the slightly different timing from that shown. The CSI can be programed to support rising/falling-edge triggered VSYNC, active-high/low HSYNC, and rising/falling-edge triggered PIXCLK.

Below is the TV Decoder input mode timing diagram.

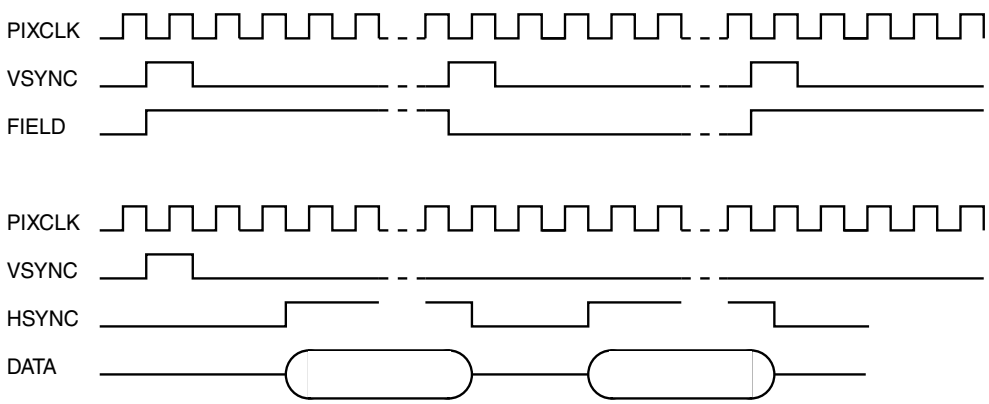

Figure 19-2. TV Decoder Input Mode Timing Diagram

19.4.4 CCIR656 Interlace Mode

In CCIR656 mode, only the PIXCLK and CSI_DATA[9:2] signals are used. The start of frame and blank signals are replaced by a timing codec which is embedded in the data stream. Each active line starts with an Start of Active Video (SAV) code and ends with

an End of Active Video (EAV) code. In some cases, digital blanking is inserted in between EAV and SAV code. The CSI decodes and filters out the timing-coding from the data stream, recovering VSYNC and HSYNC signals for internal use, such as statistical block control. Data is forwarded to the data receive and packing block in a sequential manner without reordering-that is, field 1 followed by field 2. The fields must be reordered in software to get back the original image.

Change of Field (COF) interrupt is triggered upon every field change. The interrupt service routine reads the status register to check for the current field.

According to the CCIR656 specification, the image must be in 625/50 PAL or 525/60 NTSC format. In addition, the image is interlaced into odd and even fields with vertical and horizontal blank data being filled into certain lines. Data must be in YCbCr422 format, each pixel contains 2 bytes, either Y + Cr or Y + Cb. These requirements are set for TV systems. The CSI module supports PAL and NTSC format only.

Figure below describes the frame structure in PAL system, showing vertical and horizontal blanking.

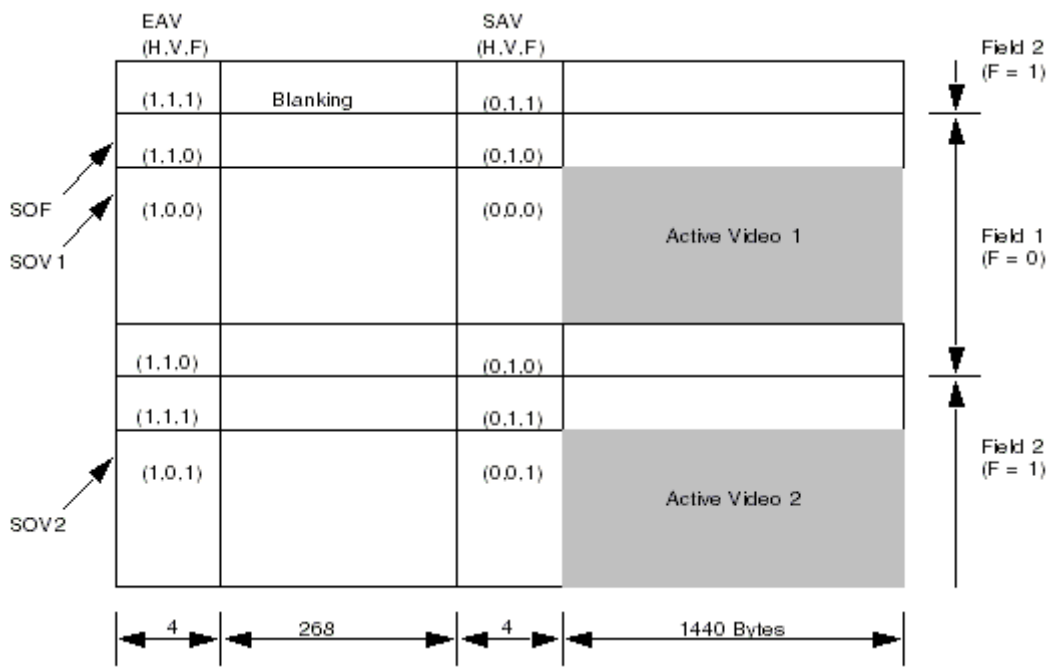

Figure 19-3. CCIR656 Interlace Mode (PAL)

Figure below describes the general timing for a single line, showing SAV and EAV.

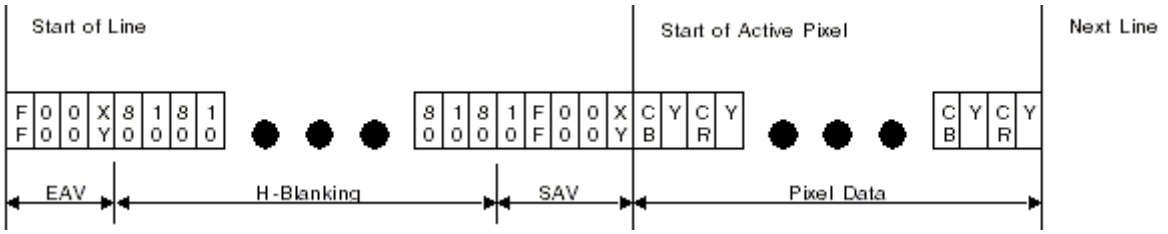

Figure 19-4. CCIR656 General Line Timing

The coding tables recommended by the CCIR656 specification are shown below. It is used in the CCIR656 mode to decode the video stream. An interrupt is generated for SOF, which is decoded from the embedded timing codec.

Table 19-4. Coding for SAV and EAV

Data Bit Number	1st Byte 0xFF	2nd Byte 0x00	3rd Byte 0x00	4th Byte 0xXY
7 (MSB)	1	0	0	1
6	1	0	0	F
5	1	0	0	V
4	1	0	0	H
3	1	0	0	P3
2	1	0	0	P2
1	1	0	0	P1
0	1	0	0	P0

Table 19-5. Codes with Protection bits for Error Detection/Correction

F	V	H	P3	P2	P1	P0
0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

Table 19-6. Representations by F-Bit

F-Bit	Representations
0	ODD FIELD (FIELD 1)
1	EVEN FIELD (FIELD 2)

19.4.5 CCIR656 Progressive Mode

For a CMOS camera system of VGA or CIF resolution, strict adherence to the interlace requirements stated in the CIR standard is not required.

The image is considered to have only 1 active field which is scanned in a progressive manner. This active field is regarded as field 1 and the F-bit in the timing codec is ignored by the decoder. Most sensors support CCIR timing in this mode (progressive) by default.

Figure below shows the typical flow of progressive mode.

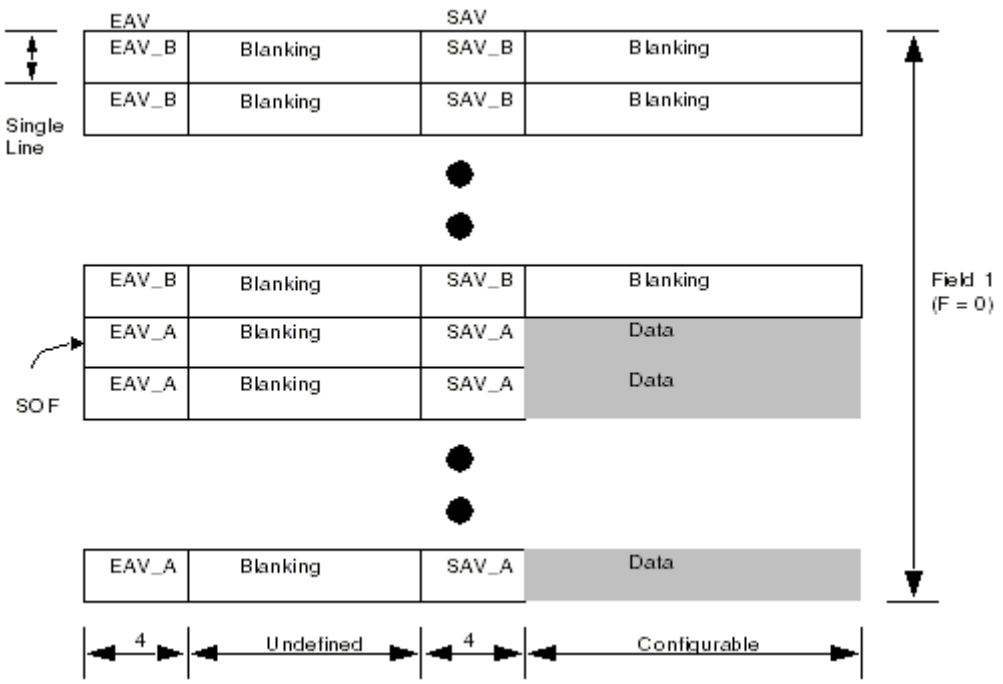

Figure 19-5. CCIR656 Progressive Mode (General Case)

An interrupt is generated for SOF but not for COF. In the general case, when SOF information is retrieved from the embedded coding, it is known as internal VSYNC mode. In other cases, when the VSYNC signal is provided by the sensor, it is known as external VSYNC mode. The CSI can be operated in internal or external VSYNC mode.

19.4.6 Error Correction for CCIR656 Coding

According to the algorithm for CCIR coding, protection bits in the SAV and EAV are encoded in the way that allows a 1-bit error to be corrected, or a 2-bit error to be detected by the decoder. This feature is supported by the interlace mode CCIR decoder in CSI.

For the 1-bit error case, users can select the error to be corrected automatically, or simply shown as a status flag instead. For the 2-bit error case, because the decoder is unable to make a correction, the error would be shown as a status flag only.

An interrupt can be generated upon the detection of an error. This signal can be enabled or disabled without affecting the operation of the status bit.

19.5 Interrupt Generation

The information found here describes CSI events that generate interrupts.

19.5.1 Start Of Frame Interrupt (SOF_INT)

The source of an SOF interrupt is dependent on the mode of operation.

In traditional mode, VSYNC signal is taken from sensor and SOF_INT is generated at the rising or falling edge (programmable) of VSYNC.

In CCIR interlace mode, the SOF interrupt information is retrieved from the embedded coding and SOF_INT is generated.

In CCIR progressive mode, there are two sources of an SOF interrupt:

- In *internal* VSYNC mode, SOF is retrieved from the embedded coding.
- In *external* VSYNC mode, VSYNC is taken from the sensor and SOF is generated at the rising edge of VSYNC.

19.5.2 End Of Frame Interrupt (EOF_INT)

An EOF interrupt is generated when the frame ends and the complete frame data in RXFIFO is read.

The EOF event triggering works with the RX count register (CSIRXCNT). Software sets the RX count register to the frame size (in words). The CSI RX logic then counts the number of pixel data being received and compares it with the RX count. If the preset value is reached, an EOF interrupt is generated and the data in the RXFIFO are read. If a SOF event is detected before this happens, the EOF interrupt is not generated.

19.5.3 Change Of Field Interrupt (COF_INT)

The Change of Field interrupt is only valid in CCIR Interlace mode. The COF interrupt is generated when the field toggles, either from field 1 to field 2, or field 2 to field 1.

Software should first check COF_INT bit in the CSI Status Register (CSISTAT) before checking that F1_INT or F2_INT is turned on.

In PAL systems, the field changes at the beginning of the frame and coincides with SOF. For the first field, a COF interrupt is not generated, only an SOF. The COF interrupt is generated for the second field.

19.5.4 CCIR Error Interrupt (ECC_INT)

The CCIR Error Interrupt is only valid for CCIR Interlace mode. An ECC interrupt is generated when an error is found on the SAV or EAV codes in the incoming stream. When this happens, the ECC_INT status bit is set.

19.5.5 RxFIFO Full Interrupt (RxFF_INT)

A RxFIFO full interrupt is generated when the number of data in RXFIFO reaches the water mark defined by RxFF_LEVEL in CSICR3.

19.5.6 Statistic FIFO Full Interrupt (STATFF_INT)

A StatFIFO full interrupt is generated when the number of data in STATFIFO reaches the water mark defined by STATFF_LEVEL in CSICR3.

19.5.7 RxFIFO Overrun Interrupt (RFF_OR_INT)

A RxFIFO Overrun interrupt is generated when the RxFIFO has 128 words data and more data is being written in.

19.5.8 Statistic FIFO Overrun Interrupt (SFF_OR_INT)

A StatFIFO Overrun interrupt is generated when the STATFIFO has 64 words data and more data is being written in.

19.5.9 Frame Buffer1 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB1)

A DMA transfer done interrupt of frame buffer1 is generated when one frame of data are transferred from RxFIFO to the frame buffer1 in the external memory.

19.5.10 Frame Buffer2 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB2)

A DMA transfer done interrupt of frame buffer2 is generated when one frame of data are transferred from RxFIFO to the frame buffer2 in the external memory.

19.5.11 Statistic FIFO DMA Transfer Done Interrupt (DMA_TSF_DONE_SFF)

A StatFIFO DMA transfer done interrupt is generated when all the data are transferred from StatFIFO to the external memory. The transfer size is defined in the STATFIFO DMA Transfer Size Register.

19.5.12 AHB Bus Response Error Interrupt (HRESP_ERR_INT)

An AHB Bus response error interrupt is generated when a bus error is detected.

19.5.13 DMA Field 0 Transfer Done Interrupt (DMA_FIELD0_DONE)

A DMA transfer done interrupt of field 0 is generated when one field of data are transferred from RxFIFO to the frame buffer in external memory. This signal should work on interlaced mode.

19.5.14 DMA Field 1 Transfer Done Interrupt (DMA_FIELD1_DONE)

A DMA transfer done interrupt of field 1 is generated when one field of data are transferred from RxFIFO to the frame buffer in external memory. This signal should work on interlaced mode.

19.5.15 Base Address Change Error Interrupt (BASEADDR_CHANGE_ERROR)

A Base Address change error is generated when the base address changed while the last frame data transfer are not finished.

19.6 Data Packing Style

Careful attention to endianess is needed given the different port sizes at different stages of the image capture path.

To enable flexible packing of image data before storage in the FIFOs, the CSI module can swap data fields by use of the PACK_DIR and the SWAP16_EN bit in CSI Control Register 1 (CSICR1).

The CSI module accepts 8-bit, 10-bit or 16-bit data from the sensor by configuring PIXEL_BIT bit in CSI Control Register 1 (CSICR1) and TWO_8BIT_SENSOR bit in CSI Control Register3 (CSICR3). The input data is packed according to the setting of PACK_DIR bit. The packed data is stored in the RX FIFO according to the setting of the SWAP16_EN bit.

For 10-bit per pixel data format, each pixel is expanded to 16 bits by appending 6 zeros bits to the most significant bit. For 16-bit data format, the data path can be a combination by two 8-bit sensors. One sensor is connected to the CSI_DATA[7:0]. The other sensor is connected to CSI_DATA[15:8].

19.6.1 RX FIFO Path

19.6.1.1 Bayer Data

Bayer data is a type of raw data from the image sensor. This byte-wide data must be converted to the RGB space or YUV space by software. The data path for Bayer data is from the CSI to memory. If the system is in little endian, then the PACK_DIR bit should be set to 0. 8-bit data format from a sensor is packed to 64 bits as P7.P6.P5.P4.P3.P2.P1.P0, where P0 is the pixel coming in time slot 0 (first data) and P3 is the pixel coming in time slot 3 (the last data in the 64-bit word). When the data is addressed as bytes by software, P0 is transferred first, P1 is transferred next, and so on. 10-bit data format is packed to 64 bits as 000000.P3.000000.P2.000000.P1.000000.P0, where P0 is the 10-bit data coming in time slot 0 (first pixel) and P3 is the 10-bit data coming in time slot 3 (fourth pixel). 16-bit data, from two sensors, is packed to 64 bits as P7.P6.P5.P4.P3.P2.P1.P0, where P0 and P1 are the two 8-bit data coming in time slot 0 (P0 is the first pixel of the sensor connected with CSI_DATA[7:0] and P1 is the first pixel of the sensor connected with CSI_DATA[15:8]). P2 and P3 are the two 8-bit data coming in time slot 1 (second pixels of the two sensors).

19.6.1.2 RGB565 Data

RGB565 data is processed data from the image sensor, which can be put directly into the display buffer. The data is 16 bits wide. The data path is from CSI to memory to the display controller. On the sensor side, data must be transmitted as P0 first, followed by P1, and so on. For each pixel, whether the MSB or LSB is sent first depends on the endianness of the sensor. Data is 16 bits wide with the MSB labeled RG, and the LSB labeled GB. P0 is represented as RG0 and GB0.

CSI receives data in one of the following sequence:

- RG0, GB0, RG1, GB1, while RG0 comes out at time slot 0 (first data), and GB1 comes out at time slot 3 (last data)
- GB0, RG0, GB1, RG1

Using the first sequence as an example, and assuming the system is running in little endian, the data is presented as:

- 8-bit data from sensor: RG0, GB0, RG1, GB1, …
- 64-bit data before storage in the CSI RX FIFO (PACK_DIR bit = 1): RG0GB0RG1GB1RG2GB2RG3GB3

- 64-bitdata in CSI RX FIFO (SWAP16_EN bit enabled): RG3GB3RG2GB2RG1GB1RG0GB0
- 64-bit transfer to system memory: RG3GB3RG2GB2RG1GB1RG0GB0
- 16-bit read by display controller: RG0GB0, RG1GB1

19.6.1.3 RGB888 Data

This is another kind of processed data from image sensor, which can be used for further image processing directly. Each of the data consist of 8-bit Red, 8-bit Green, and 8-bit Blue data. An example of timing scheme is shown in the figure below.

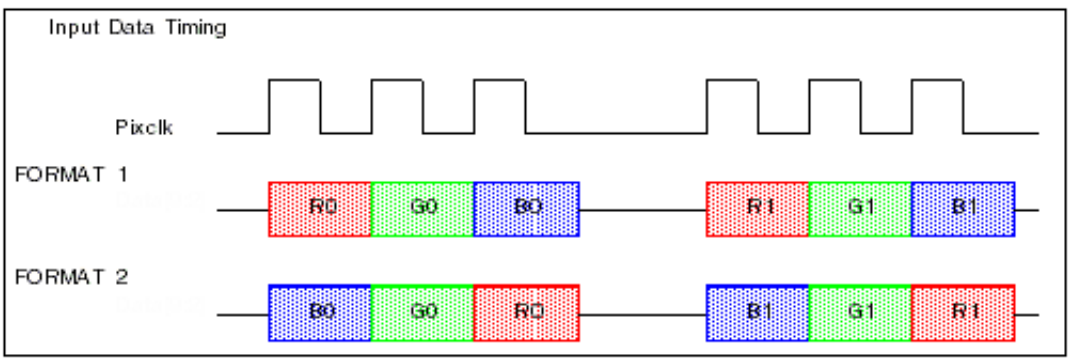

Figure 19-6. Sample Timing Diagram for RGB888 8 bits/cycle Data

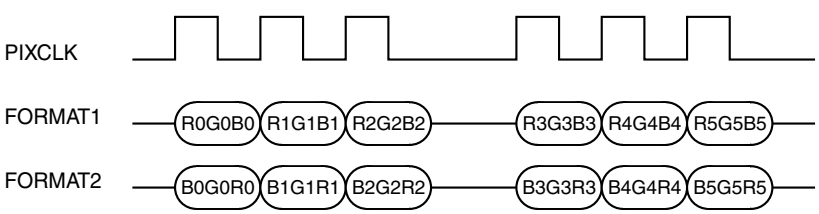

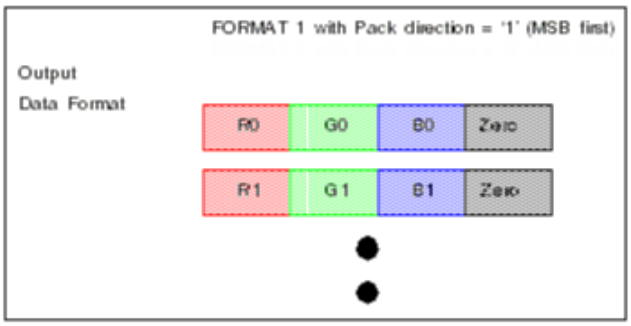

Figure 19-7. Sample Timing Diagram for RGB888 24 bits/cycle Data

An optional scheme to pack a dummy byte is provided. For every group of 3 bytes data, a dummy zero is packed to form a 32-bit word as shown in the figure below. The dummy zero can be packed at the LSB position or MSB position. Using RGB888A_FORMAT_SEL in CSI_CSICR18[18] to determine to put the dummy bytes packed at LSB or MSB position.

FORMAT 1 with Pack direction = '1' (MSB first)
Output
Data Format
R0
G0
B0
Zero
R1
G1
B1
Zero

19.6.2 STAT FIFO Path

Statistics only works for Bayer data in 8-bit per pixel format. It generates 16-bit statistical output from the 8-bit Bayer input (CSI_DATA[13:6]). The outputs are Sum of Green (G), Sum of Red (R), Sum of Blue (B), and Auto Focus (F). Each output is 16-bits wide.

The settings of PACK_DIR and SWAP16_EN bits in the CSICR1 register have no effect on the input path. The PACK_DIR only controls how the 16-bit stat output is packed into the 32-bit STAT FIFO.

When the PACK_DIR bit = 1, the stat data is packed as:

First 32-bit: RG

Second 32-bit: BF

…

When the PACK_DIR bit = 0, the stat data is packed as:

First 32-bit GR

Second 32-bit: FB

...

19.7 CSI Memory Map/Register Definition

All the 32-bit registers of the CSI module are summarized in the Memory Map below:

CSI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21C_4000	CSI Control Register 1 (CSI_CSICR1)	32	R/W	4000_0800h	19.7.1/751
21C_4004	CSI Control Register 2 (CSI_CSICR2)	32	R/W	0000_0000h	19.7.2/755
21C_4008	CSI Control Register 3 (CSI_CSICR3)	32	R/W	0000_0000h	19.7.3/757
21C_400C	CSI Statistic FIFO Register (CSI_CSISTATFIFO)	32	R	0000_0000h	19.7.4/759
21C_4010	CSI RX FIFO Register (CSI_CSIRFIFO)	32	R	0000_0000h	19.7.5/760
21C_4014	CSI RX Count Register (CSI_CSIRXCNT)	32	R/W	0000_9600h	19.7.6/760
21C_4018	CSI Status Register (CSI_CSISR)	32	R/W	0000_4000h	19.7.7/761

19.7.1 CSI Control Register 1 (CSI_CSICR1)

This register controls the sensor interface timing and interrupt generation. The interrupt enable bits in this register control the interrupt signals and the status bits. That means status bits will only function when the corresponding interrupt bits are enabled.

Address: 21C_4000h base + 0h offset = 21C_4000h

CSI_CSICR1 field descriptions

Field	Description
31 SWAP16_EN	SWAP 16-Bit Enable. This bit enables the swapping of 16-bit data. Data is packed from 8-bit or 10-bit to 32-bit first (according to the setting of PACK_DIR) and then swapped as 16-bit words before being put into the RX FIFO. The action of the bit only affects the RX FIFO and has no affect on the STAT FIFO. **NOTE:** Example of swapping enabled: Data input to FIFO = 0x11223344 Data in RX FIFO = 0x 33441122 **NOTE:** Example of swapping disabled: Data input to FIFO = 0x11223344 Data in RX FIFO = 0x11223344

Table continues on the next page...

CSI_CSICR1 field descriptions (continued)

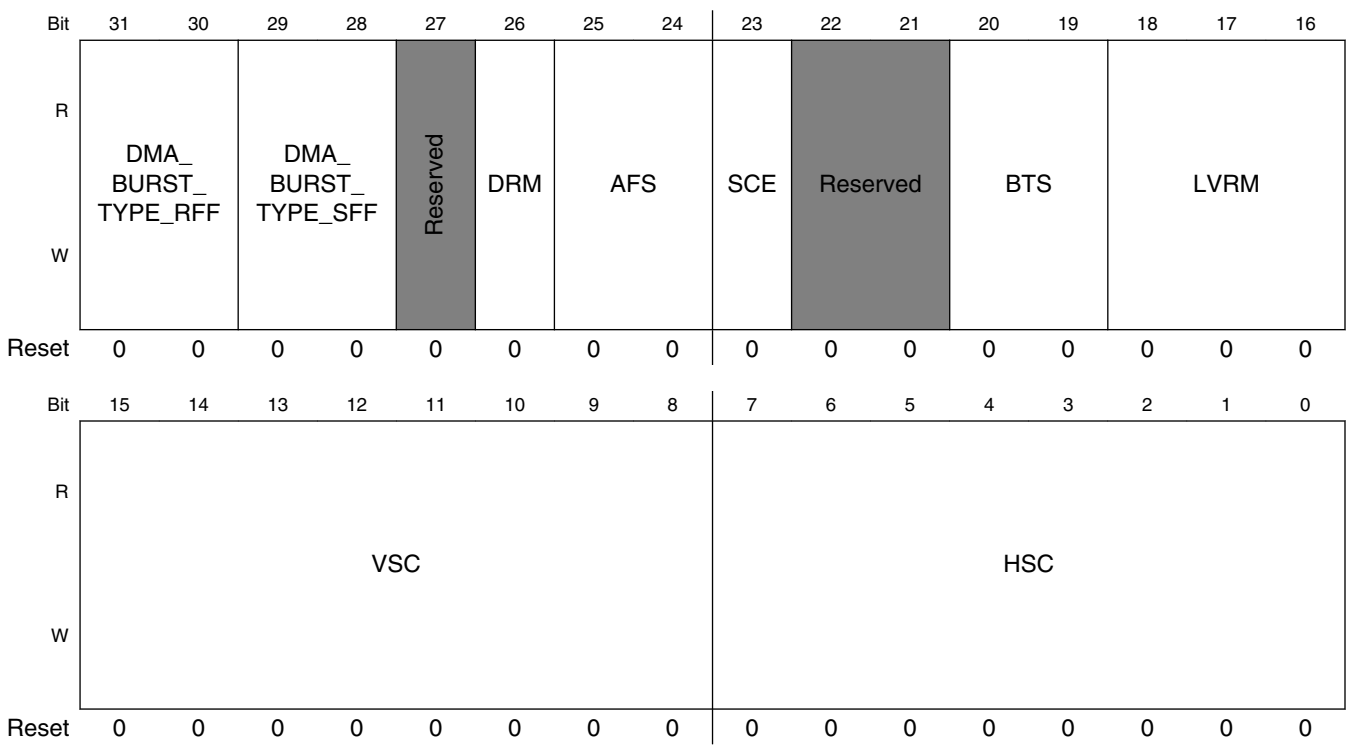
Field	Description
	0 Disable swapping 1 Enable swapping
30 EXT_VSYNC	External VSYNC Enable. This bit controls the operational VSYNC mode. **NOTE:** This only works when the CSI is in CCIR progressive mode. 0 Internal VSYNC mode 1 External VSYNC mode
29 EOF_INT_EN	End-of-Frame Interrupt Enable. This bit enables and disables the EOF interrupt. 0 EOF interrupt is disabled. 1 EOF interrupt is generated when RX count value is reached.
28 PrP_IF_EN	CSI-PrP Interface Enable. This bit controls the CSI to PrP bus. When enabled the RxFIFO is detached from the AHB bus and connected to PrP. All CPU reads or DMA accesses to the RxFIFO register are ignored. All CSI interrupts are also masked. 0 CSI to PrP bus is disabled 1 CSI to PrP bus is enabled
27 VIDEO_MODE	Video mode select. This bit controls the video mode in CCIR mode and TV decoder input. 0 Progressive mode is selected 1 Interlace mode is selected
26 COF_INT_EN	Change Of Image Field (COF) Interrupt Enable. This bit enables the COF interrupt. This bit works only in CCIR interlace mode which is when CCIR_EN = 1 and CCIR_MODE = 1. 0 COF interrupt is disabled 1 COF interrupt is enabled
25 SF_OR_INTEN	STAT FIFO Overrun Interrupt Enable. This bit enables the STATFIFO overrun interrupt. 0 STATFIFO overrun interrupt is disabled 1 STATFIFO overrun interrupt is enabled
24 RF_OR_INTEN	RxFIFO Overrun Interrupt Enable. This bit enables the RX FIFO overrun interrupt. 0 RxFIFO overrun interrupt is disabled 1 RxFIFO overrun interrupt is enabled
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 SFF_DMA_ DONE_INTEN	STATFIFO DMA Transfer Done Interrupt Enable. This bit enables the interrupt of STATFIFO DMA transfer done. 0 STATFIFO DMA Transfer Done interrupt disable 1 STATFIFO DMA Transfer Done interrupt enable
21 STATFF_INTEN	STATFIFO Full Interrupt Enable. This bit enables the STAT FIFO interrupt. 0 STATFIFO full interrupt disable 1 STATFIFO full interrupt enable
20 FB2_DMA_ DONE_INTEN	Frame Buffer2 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer2 DMA transfer done.

Table continues on the next page...

CSI_CSICR1 field descriptions (continued)

Field	Description
	0 Frame Buffer2 DMA Transfer Done interrupt disable 1 Frame Buffer2 DMA Transfer Done interrupt enable
19 FB1_DMA_DONE_INTEN	Frame Buffer1 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer1 DMA transfer done. 0 Frame Buffer1 DMA Transfer Done interrupt disable 1 Frame Buffer1 DMA Transfer Done interrupt enable
18 RXFF_INTEN	RxFIFO Full Interrupt Enable. This bit enables the RxFIFO full interrupt. 0 RxFIFO full interrupt disable 1 RxFIFO full interrupt enable
17 SOF_POL	SOF Interrupt Polarity. This bit controls the condition that generates an SOF interrupt. 0 SOF interrupt is generated on SOF falling edge 1 SOF interrupt is generated on SOF rising edge
16 SOF_INTEN	Start Of Frame (SOF) Interrupt Enable. This bit enables the SOF interrupt. 0 SOF interrupt disable 1 SOF interrupt enable
15–12 Reserved	This field is reserved. Reserved. This field is reserved.
11 HSYNC_POL	HSYNC Polarity Select. This bit controls the polarity of HSYNC. This bit only works in gated-clock-that is, GCLK_MODE = 1 and CCIR_EN = 0. 0 HSYNC is active low 1 HSYNC is active high
10 CCIR_EN	CCIR656 Interface Enable. This bit selects the type of interface used. When the CCIR656 timing decoder is enabled, it replaces the function of timing interface logic. 0 Traditional interface is selected. Timing interface logic is used to latch data. 1 CCIR656 interface is selected.
9 Reserved	This field is reserved. This field is reserved.
8 FCC	FIFO Clear Control. This bit determines how the RXFIFO and STATFIFO are cleared. When Synchronous FIFO clear is selected the RXFIFO and STATFIFO are cleared, and STAT block is reset, on every SOF. FIFOs and STAT block restarts immediately after reset. For information on the operation when Asynchronous FIFO clear is selected, refer to the descriptions for the CLR_RXFIFO and CLR_STATFIFO bits. 0 Asynchronous FIFO clear is selected. 1 Synchronous FIFO clear is selected.
7 PACK_DIR	Data Packing Direction. This bit Controls how 8-bit/10-bit image data is packed into 32-bit RX FIFO, and how 16-bit statistical data is packed into 32-bit STAT FIFO. 0 Pack from LSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x44332211 in RX FIFO. For stat data, 0xAAAA, 0xBBBB, it will appear as 0xBBBBAAAA in STAT FIFO. 1 Pack from MSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x11223344 in RX FIFO. For stat data, 0xAAAA, 0xBBBB, it will appear as 0xAAAABBBB in STAT FIFO.

Table continues on the next page...



CSI_CSICR1 field descriptions (continued)

Field	Description
6 CLR_STATFIFO	Asynchronous STATFIFO Clear. This bit clears the STATFIFO and Reset STAT block. This bit works only in async FIFO clear mode-that is, FCC = 0. Otherwise this bit is ignored. Writing 1 will clear STATFIFO and reset STAT block immediately, STATFIFO and STAT block then wait and restart after the arrival of next SOF. The bit is restored to 0 automatically after finish. Normally reads 0.
5 CLR_RXFIFO	Asynchronous RXFIFO Clear. This bit clears the RXFIFO. This bit works only in async FIFO clear mode-that is, FCC = 0. Otherwise this bit is ignored. Writing 1 clears the RXFIFO immediately, RXFIFO restarts immediately after that. The bit is restored to 0 automatically after finish. Normally reads 0.
4 GCLK_MODE	Gated Clock Mode Enable. Controls if CSI is working in gated or non-gated mode. This bit works only in traditional mode-that is, CCIR_EN = 0. Otherwise this bit is ignored. 0 Non-gated clock mode. All incoming pixel clocks are valid. HSYNC is ignored. 1 Gated clock mode. Pixel clock signal is valid only when HSYNC is active.
3 INV_DATA	Invert Data Input. This bit enables or disables internal inverters on the data lines. 0 CSI_D[7:0] data lines are directly applied to internal circuitry 1 CSI_D[7:0] data lines are inverted before applied to internal circuitry
2 INV_PCLK	Invert Pixel Clock Input. This bit determines if the Pixel Clock (CSI_PIXCLK) is inverted before it is applied to the CSI module. 0 CSI_PIXCLK is directly applied to internal circuitry 1 CSI_PIXCLK is inverted before applied to internal circuitry
1 REDGE	Valid Pixel Clock Edge Select. Selects which edge of the CSI_PIXCLK is used to latch the pixel data. 0 Pixel data is latched at the falling edge of CSI_PIXCLK 1 Pixel data is latched at the rising edge of CSI_PIXCLK
0 PIXEL_BIT	Pixel Bit. This bit indicates the bayer data width for each pixel. This bit should be configured before activating or re-starting the embedded DMA controller. 0 8-bit data for each pixel 1 10-bit data for each pixel

19.7.2 CSI Control Register 2 (CSI_CSICR2)

This register provides the statistic block with data about which live view resolution is being used, and the starting sensor pixel of the Bayer pattern. It also contains the horizontal and vertical count used to determine the number of pixels to skip between the 64 x 64 blocks of statistics when generating statistics on live view image that are greater than 512 x 384.

Address: 21C_4000h base + 4h offset = 21C_4004h

CSI_CSICR2 field descriptions

Field	Description
31–30 DMA_BURST_ TYPE_RFF	Burst Type of DMA Transfer from RxFIFO. Selects the burst type of DMA transfer from RxFIFO. X0 INCR8 01 INCR4 11 INCR16
29–28 DMA_BURST_ TYPE_SFF	Burst Type of DMA Transfer from STATFIFO. Selects the burst type of DMA transfer from STATFIFO. X0 INCR8 01 INCR4 11 INCR16

Table continues on the next page...

Field	Description
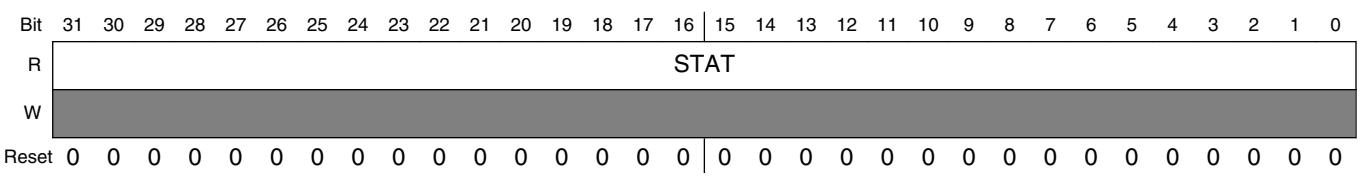
12 DMA_REQ_EN_RFF	DMA Request Enable for RxFIFO. This bit enables the dma request from RxFIFO to the embedded DMA controller. 0 Disable the dma request 1 Enable the dma request
11 DMA_REQ_EN_SFF	DMA Request Enable for STATFIFO. This bit enables the dma request from STATFIFO to the embedded DMA controller. 0 Disable the dma request 1 Enable the dma request
10–8 STATFF_LEVEL	STATFIFO Full Level. When the number of data in STATFIFO reach this level, STATFIFO full interrupt is generated, or STATFIFO DMA request is sent. 000 4 Double words 001 8 Double words 010 12 Double words 011 16 Double words 100 24 Double words 101 32 Double words 110 48 Double words 111 64 Double words
7 HRESP_ERR_EN	Hresponse Error Enable. This bit enables the hresponse error interrupt. 0 Disable hresponse error interrupt 1 Enable hresponse error interrupt
6–4 RxFF_LEVEL	**RxFIFO Full Level**. When the number of data in RxFIFO reaches this level, a RxFIFO full interrupt is generated, or an RXFIFO DMA request is sent. 000 4 Double words 001 8 Double words 010 16 Double words 011 24 Double words 100 32 Double words 101 48 Double words 110 64 Double words 111 96 Double words
3 TWO_8BIT_SENSOR	Two 8-bit Sensor Mode. This bit indicates one 16-bit sensor or two 8-bit sensors are connected to the 16-bit data ports. This bit should be set if there is one 16-bit sensor or two 8-bit sensors are connected. This bit should be configured before activating or restarting the embedded DMA controller. 0 Only one sensor is connected. 1 Two 8-bit sensors are connected or one 16-bit sensor is connected.
2 ZERO_PACK_EN	Dummy Zero Packing Enable. This bit causes a dummy zero to be packed with every 3 incoming bytes, forming a 32-bit word. The dummy zero is always packed to the LSB position. This packing function is only available in 8-bit/pixel mode. 0 Zero packing disabled 1 Zero packing enabled

Table continues on the next page...



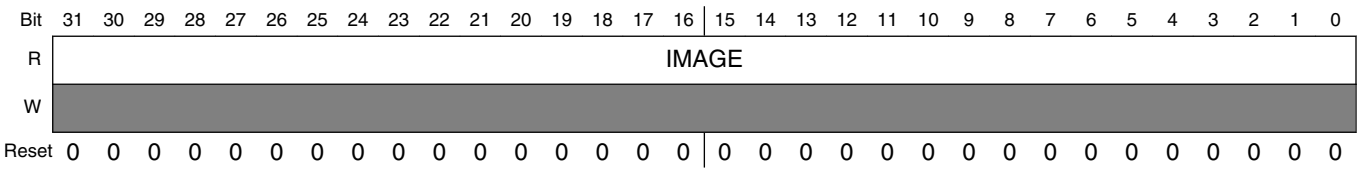
CSI_CSICR3 field descriptions (continued)

Field	Description
1 ECC_INT_EN	Error Detection Interrupt Enable. This bit enables and disables the error detection interrupt. This feature only works in CCIR interlace mode. 0 No interrupt is generated when error is detected. Only the status bit ECC_INT is set. 1 Interrupt is generated when error is detected.
0 ECC_AUTO_EN	Automatic Error Correction Enable. This bit enables and disables the automatic error correction. If an error occurs and error correction is disabled only the ECC_INT status bit is set. This feature only works in CCIR interlace mode. 0 Auto Error correction is disabled. 1 Auto Error correction is enabled.

19.7.4 CSI Statistic FIFO Register (CSI_CSISTATFIFO)

The StatFIFO is a read-only register containing statistic data from the sensor. Writing to this register has no effect.

Address: 21C_4000h base + Ch offset = 21C_400Ch



CSI_CSISTATFIFO field descriptions

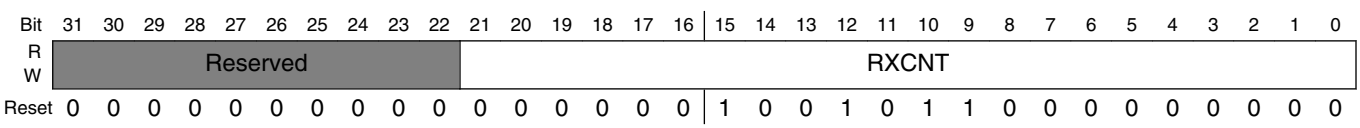
Field	Description
STAT	Static data from sensor

19.7.5 CSI RX FIFO Register (CSI_CSIRFIFO)

This read-only register contains received image data. Writing to this register has no effect.

Address: 21C_4000h base + 10h offset = 21C_4010h

CSI_CSIRFIFO field descriptions



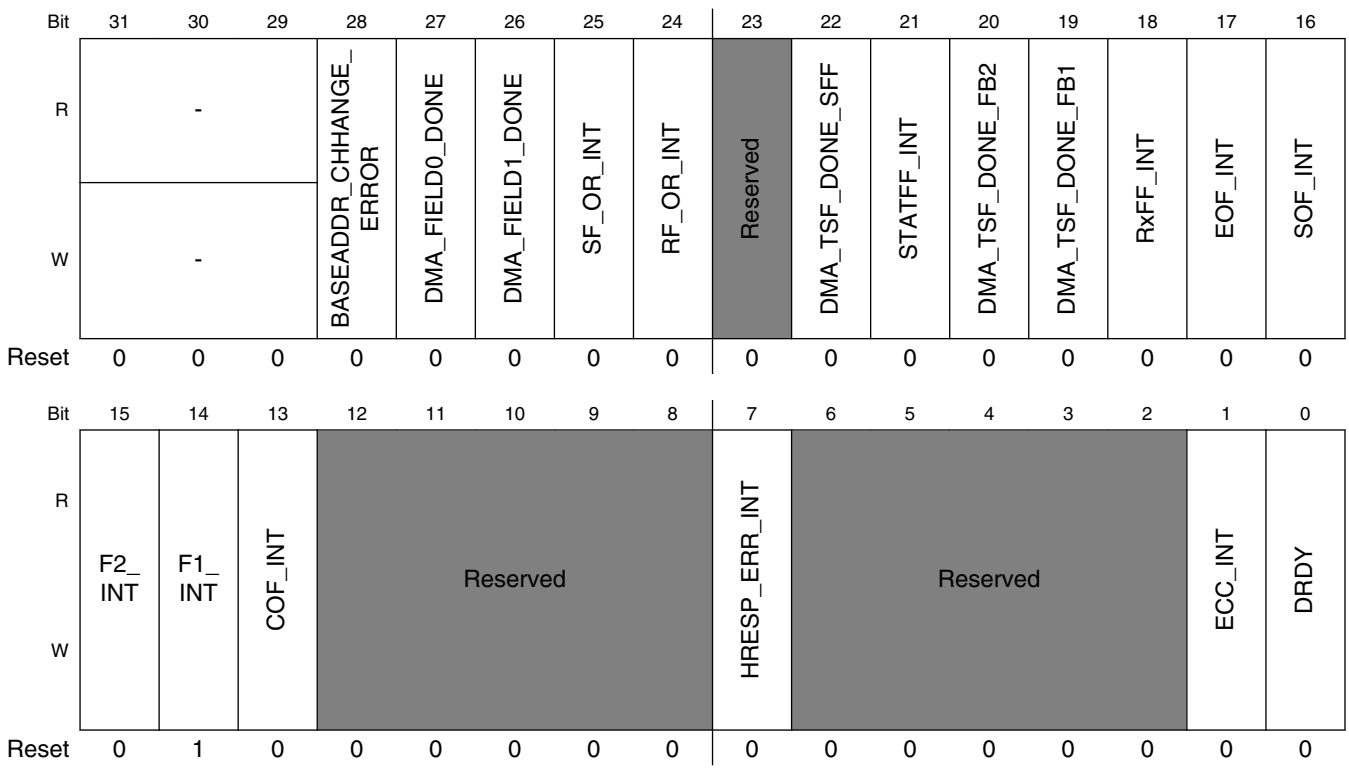
Field	Description
IMAGE	Received image data

19.7.6 CSI RX Count Register (CSI_CSIRXCNT)

This register works for EOF interrupt generation. It should be set to the number of words to receive that would generate an EOF interrupt.

There is an internal counter that counts the number of words read from the RX FIFO. Whenever the RX FIFO is being read, by either the CPU or the embedded DMA controller, the counter value is updated and compared with this register. If the values match, then an EOF interrupt is triggered.

Address: 21C_4000h base + 14h offset = 21C_4014h



CSI_CSIRXCNT field descriptions

Field	Description
31–22 -	This field is reserved. Reserved. These bits are reserved and should read 0.
RXCNT	RxFIFO Count. This 22-bit counter for RXFIFO is updated each time the RXFIFO is read by CPU or DMA.This counter should be set to the expected number of words to receive that would generate an EOF interrupt.

19.7.7 CSI Status Register (CSI_CSISR)

This read/write register shows sensor interface status, and which kind of interrupt is being generated. The corresponding interrupt bits must be set for the status bit to function. Status bits should function normally even if the corresponding interrupt enable bits are not enabled.

Address: 21C_4000h base + 18h offset = 21C_4018h

CSI_CSISR field descriptions

Field	Description
31–29 -	Reserved. These bits are reserved and should read 0.
28 BASEADDR_ CHHANGE_ ERROR	When using base address switching enable, this bit will be 1 when switching occur before DMA complete. This bit will be clear by writing 1. When this interrupt happens, follow the steps listed below. 1. Unassert the CSI enable, CSIx_CSICR18 bit31, 2. Reflash the DMA, assert the CSIX_CSICR3 bit 14, 3. Assert the CSI enable, CSIx_CSICR18 bit31.
27 DMA_FIELD0_ DONE	When DMA field 0 is complete, this bit will be set to 1(clear by writing 1).

Table continues on the next page...

CSI_CSISR field descriptions (continued)

Field	Description
26 DMA_FIELD1_DONE	When DMA field 0 is complete, this bit will be set to 1(clear by writing 1).
25 SF_OR_INT	STATFIFO Overrun Interrupt Status. Indicates the overflow status of the STATFIFO register. (Cleared by writing 1) 0 STATFIFO has not overflowed. 1 STATFIFO has overflowed.
24 RF_OR_INT	RxFIFO Overrun Interrupt Status. Indicates the overflow status of the RxFIFO register. (Cleared by writing 1) 0 RXFIFO has not overflowed. 1 RXFIFO has overflowed.
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 DMA_TSF_DONE_SFF	DMA Transfer Done from StatFIFO. Indicates that the dma transfer from StatFIFO is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by writting 1 or reflashing the StatFIFO dma controller in CSICR3.(Cleared by writing 1) 0 DMA transfer is not completed. 1 DMA transfer is completed.
21 STATFF_INT	STATFIFO Full Interrupt Status. Indicates the number of data in the STATFIFO reaches the trigger level. (this bit is cleared automatically by reading the STATFIFO) 0 STATFIFO is not full. 1 STATFIFO is full.
20 DMA_TSF_DONE_FB2	DMA Transfer Done in Frame Buffer2. Indicates that the DMA transfer from RxFIFO to Frame Buffer2 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by by writting 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1) 0 DMA transfer is not completed. 1 DMA transfer is completed.
19 DMA_TSF_DONE_FB1	DMA Transfer Done in Frame Buffer1. Indicates that the DMA transfer from RxFIFO to Frame Buffer1 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by by writting 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1) 0 DMA transfer is not completed. 1 DMA transfer is completed.
18 RxFF_INT	RXFIFO Full Interrupt Status. Indicates the number of data in the RxFIFO reaches the trigger level. (this bit is cleared automatically by reading the RxFIFO) 0 RxFIFO is not full. 1 RxFIFO is full.
17 EOF_INT	End of Frame (EOF) Interrupt Status. Indicates when EOF is detected. (Cleared by writing 1) 0 EOF is not detected. 1 EOF is detected.
16 SOF_INT	Start of Frame Interrupt Status. Indicates when SOF is detected. (Cleared by writing 1)

Table continues on the next page...

CSI_CSISR field descriptions (continued)

Field	Description
	0 SOF is not detected. 1 SOF is detected.
15 F2_INT	CCIR Field 2 Interrupt Status. Indicates the presence of field 2 of video in CCIR mode. (Cleared automatically when current field does not match) **NOTE:** Only works in CCIR Interlace mode. 0 Field 2 of video is not detected 1 Field 2 of video is about to start
14 F1_INT	CCIR Field 1 Interrupt Status. Indicates the presence of field 1 of video in CCIR mode. (Cleared automatically when current field does not match) **NOTE:** Only works in CCIR Interlace mode. 0 Field 1 of video is not detected. 1 Field 1 of video is about to start.
13 COF_INT	Change Of Field Interrupt Status. Indicates that a change of the video field has been detected. Only works in CCIR Interlace mode. Software should read this bit first and then dispatch the new field from F1_INT and F2_INT. (Cleared by writing 1) 0 Video field has no change. 1 Change of video field is detected.
12–8 -	This field is reserved. Reserved. These bits are reserved and should read 0.
7 HRESP_ERR_INT	Hresponse Error Interrupt Status. Indicates that a hresponse error has been detected. (Cleared by writing 1) 0 No hresponse error. 1 Hresponse error is detected.
6–2 -	This field is reserved. Reserved. These bits are reserved and should read 0.
1 ECC_INT	CCIR Error Interrupt. This bit indicates an error has occurred. This only works in CCIR Interlace mode. (Cleared by writing 1) 0 No error detected 1 Error is detected in CCIR coding
0 DRDY	RXFIFO Data Ready. Indicates the presence of data that is ready for transfer in the RxFIFO. (Cleared automatically by reading FIFO) 0 No data (word) is ready 1 At least 1 datum (word) is ready in RXFIFO.

19.7.8 CSI DMA Start Address Register - for STATFIFO (CSI_CSIDMASA_STATFIFO)

This register provides the start address for the embedded DMA controller of STATFIFO. The embedded DMA controller will read data from STATFIFO and write it to the external memory from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C_4000h base + 20h offset = 21C_4020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	DMA_START_ADDR_SFF															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DMA_START_ADDR_SFF														Reserved	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CSI_CSIDMASA_STATFIFO field descriptions

Field	Description
31–2 DMA_START_ ADDR_SFF	DMA Start Address for STATFIFO. Indicates the start address to write data. The embedded DMA controller will read data from STATFIFO and write it from this address through AHB bus. The address should be double words aligned.
-	This field is reserved. Reserved. These bits are reserved and should read 0.

19.7.9 CSI DMA Transfer Size Register - for STATFIFO (CSI_CSIDMATS_STATFIFO)

This register provides the total transfer size for the embedded DMA controller of STATFIFO. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C_4000h base + 24h offset = 21C_4024h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DMA_TSF_SIZE_SFF																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CSI_CSIDMATS_STATFIFO field descriptions

Field	Description
DMA_TSF_ SIZE_SFF	DMA Transfer Size for STATFIFO. Indicates how many words to be transfered by the embedded DMA controller. The size should be double words aligned.

19.7.10 CSI DMA Start Address Register - for Frame Buffer1 (CSI_CSIDMASA_FB1)

This register provides the start address in the frame buffer1 for the embedded DMA controller of RxFIFO. The embedded DMA controller will read data from RxFIFO and write it to the frame buffer1 from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C_4000h base + 28h offset = 21C_4028h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	DMA_START_ADDR_FB1															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DMA_START_ADDR_FB1														Reserved	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CSI_CSIDMASA_FB1 field descriptions

Field	Description
31–2 DMA_START_ ADDR_FB1	DMA Start Address in Frame Buffer1. Indicates the start address to write data. The embedded DMA controller will read data from RxFIFO and write it from this address through AHB bus. The address should be double words aligned.
-	This field is reserved. Reserved. These bits are reserved and should read 0.

19.7.11 CSI DMA Transfer Size Register - for Frame Buffer2 (CSI_CSIDMASA_FB2)

This register provides the start address in the frame buffer2 for the embedded DMA controller of RxFIFO. The embedded DMA controller will read data from RxFIFO and write it to the frame buffer2 from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C_4000h base + 2Ch offset = 21C_402Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

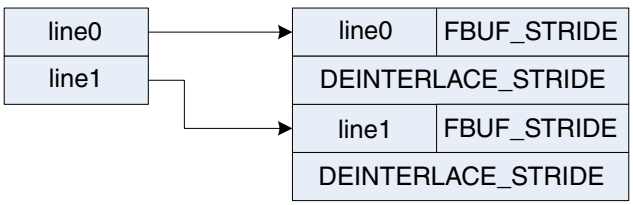
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DMA_START_ADDR_FB2														Reserved	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CSI_CSIDMASA_FB2 field descriptions

Field	Description
31–2 DMA_START_ADDR_FB2	DMA Start Address in Frame Buffer2. Indicates the start address to write data. The embedded DMA controller will read data from RxFIFO and write it from this address through AHB bus. The address should be double words aligned.
-	This field is reserved. Reserved. These bits are reserved and should read 0.



19.7.12 CSI Frame Buffer Parameter Register (CSI_CSIFBUF_PARA)

This register provides the stride of the frame buffer to show how many words to skip before starting to write the next row of the image. The width of the frame buffer minus the width of the image is the stride. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C_4000h base + 30h offset = 21C_4030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DEINTERLACE_STRIDE																FBUF_STRIDE															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CSI_CSIFBUF_PARA field descriptions

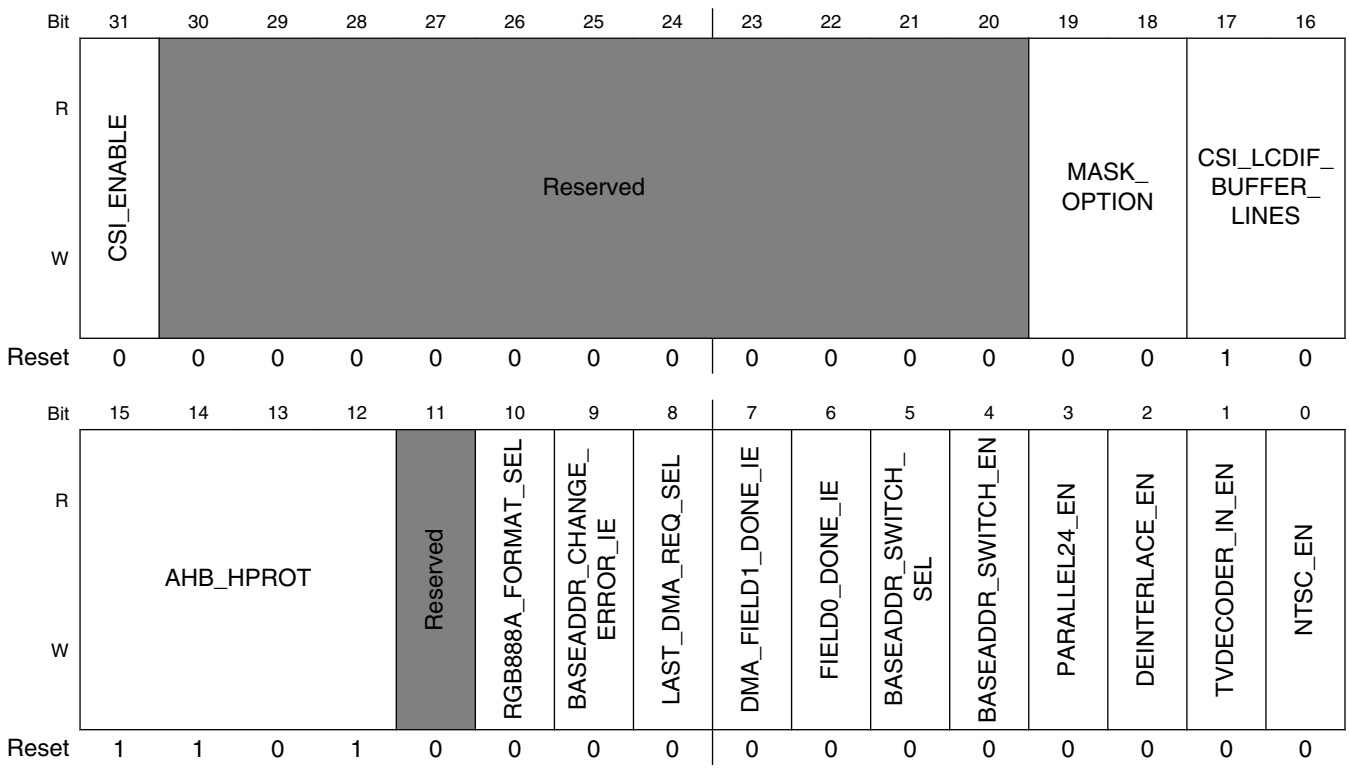
Field	Description
31–16 DEINTERLACE_ STRIDE	DEINTERLACE_STRIDE is only used in the deinterlace mode. If line stride feature is supported in deinterlace mode, FBUF_STRIDE and DEINTERLACE_STRIDE need to be configured at the same time. DEINTERLACE_STRIDE is configured the same as line width. In normal line stride feature, only FBUF_STRIDE needs to be configured. 
FBUF_STRIDE	Frame Buffer Parameter. Indicates the stride of the frame buffer. The width of the frame buffer(in double words) minus the width of the image(in double words) is the stride. The stride should be double words aligned. The embedded DMA controller will skip the stride before starting to write the next row of the image.

19.7.13 CSI Image Parameter Register (CSI_CSIIMAG_PARA)

This register provides the width and the height of the image from the sensor. The width and height should be aligned in pixel. The width of the image multiplied by the height is the total pixel size that will be transfered in a frame by the embedded DMA controller. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C_4000h base + 34h offset = 21C_4034h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	IMAGE_WIDTH																IMAGE_HEIGHT															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



CSI_CSIIMAG_PARA field descriptions

Field	Description
31–16 IMAGE_WIDTH	Image Width. Indicates how many pixels in a line of the image from the sensor. If the input data from the sensor is 8-bit/pixel format, the IMAGE_WIDTH should be a multiple of 8 pixels. If the input data from the sensor is 10-bit/pixel or 16-bit/pixel format, the IMAGE_WIDTH should be a multiple of 2 pixels.
IMAGE_HEIGHT	Image Height. Indicates how many pixels in a column of the image from the sensor.

19.7.14 CSI Control Register 18 (CSI_CSICR18)

This read/write register acts as an extension of the functionality of the CSI Control register 1

Address: 21C_4000h base + 48h offset = 21C_4048h

CSI_CSICR18 field descriptions

Field	Description
31 CSI_ENABLE	CSI global enable signal. Only when this bit is 1, CSI can start to receive the data and store to memory.
30–20 -	This field is reserved.
19–18 MASK_OPTION	These bits used to choose the method to mask the CSI input. 00 Writing to memory from first completely frame, when using this option, the CSI_ENABLE should be 1. 01 Writing to memory when CSI_ENABLE is 1. 02 Writing to memory from second completely frame, when using this option, the CSI_ENABLE should be 1. 03 Writing to memory when data comes in, not matter the CSI_ENABLE is 1 or 0.

Table continues on the next page...

CSI_CSICR18 field descriptions (continued)

Field	Description
17–16 CSI_LCDIF_ BUFFER_LINES	The number of lines are used in handshake mode with LCDIF. 00 4 lines 01 8 lines 02 16 lines 03 16 lines
15–12 AHB_HPROT	Hprot value in AHB bus protocol.
11 -	This field is reserved.
10 RGB888A_ FORMAT_SEL	Output is 32-bit format. 0 {8'h0, data[23:0]} 1 {data[23:0], 8'h0}
9 BASEADDR_ CHANGE_ ERROR_IE	Base address change error interrupt enable signal.
8 LAST_DMA_ REQ_SEL	Choosing the last DMA request condition. 0 fifo_full_level 1 hburst_length
7 DMA_FIELD1_ DONE_IE	When in interlace mode, field 1 done interrupt enable. 0 Interrupt disabled 1 Interrupt enabled
6 FIELD0_DONE_ IE	In interlace mode, fileld 0 means interrupt enabled. 0 Interrupt disabled 1 Interrupt enabled
5 BASEADDR_ SWITCH_SEL	CSI 2 base addresses switching method. When using this bit, BASEADDR_SWITCH_EN is 1. 0 Switching base address at the edge of the vsync 1 Switching base address at the edge of the first data of each frame
4 BASEADDR_ SWITCH_EN	When this bit is enabled, CSI DMA will switch the base address according to BASEADDR_SWITCH_SEL rather than atomically by DMA completed.
3 PARALLEL24_ EN	When input is parallel rgb888/yuv444 24bit, this bit can be enabled.
2 DEINTERLACE_ EN	This bit is used to select the output method When input is TVDECODER or standard CCIR656 video. 0 Deinterlace disabled 1 Deinterlace enabled
1 TVDECODER_ IN_EN	When input is from TV decoder, this bit is enabled.
0 NTSC_EN	This bit is used to select NTSC/PAL mode When input is TVDECODER or standard CCIR656 video.

Table continues on the next page...

CSI_CSICR18 field descriptions (continued)

Field	Description
	0 PAL 1 NTSC

19.7.15 CSI Control Register 19 (CSI_CSICR19)

This read/write register acts as an extension of the functionality of the CSI Control register 1

Address: 21C_4000h base + 4Ch offset = 21C_404Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved																								DMA_RFIFO_HIGHEST_ FIFO_LEVEL							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CSI_CSICR19 field descriptions

Field	Description
31–8 -	This field is reserved.
DMA_RFIFO_ HIGHEST_FIFO_ LEVEL	This byte stores the highest FIFO level achieved by CSI FIFO timely and will be clear by writing 8'ff to it.

Chapter 20
Enhanced Configurable SPI (ECSPI)

20.1 Overview

The Enhanced Configurable Serial Peripheral Interface (ECSPI) is a full-duplex, synchronous, four-wire serial communication block.

The ECSPI contains a 64 x 32 receive buffer (RXFIFO) and a 64 x 32 transmit buffer (TXFIFO). With data FIFOs, the ECSPI allows rapid data communication with fewer software interrupts. The figure below shows a block diagram of the ECSPI.

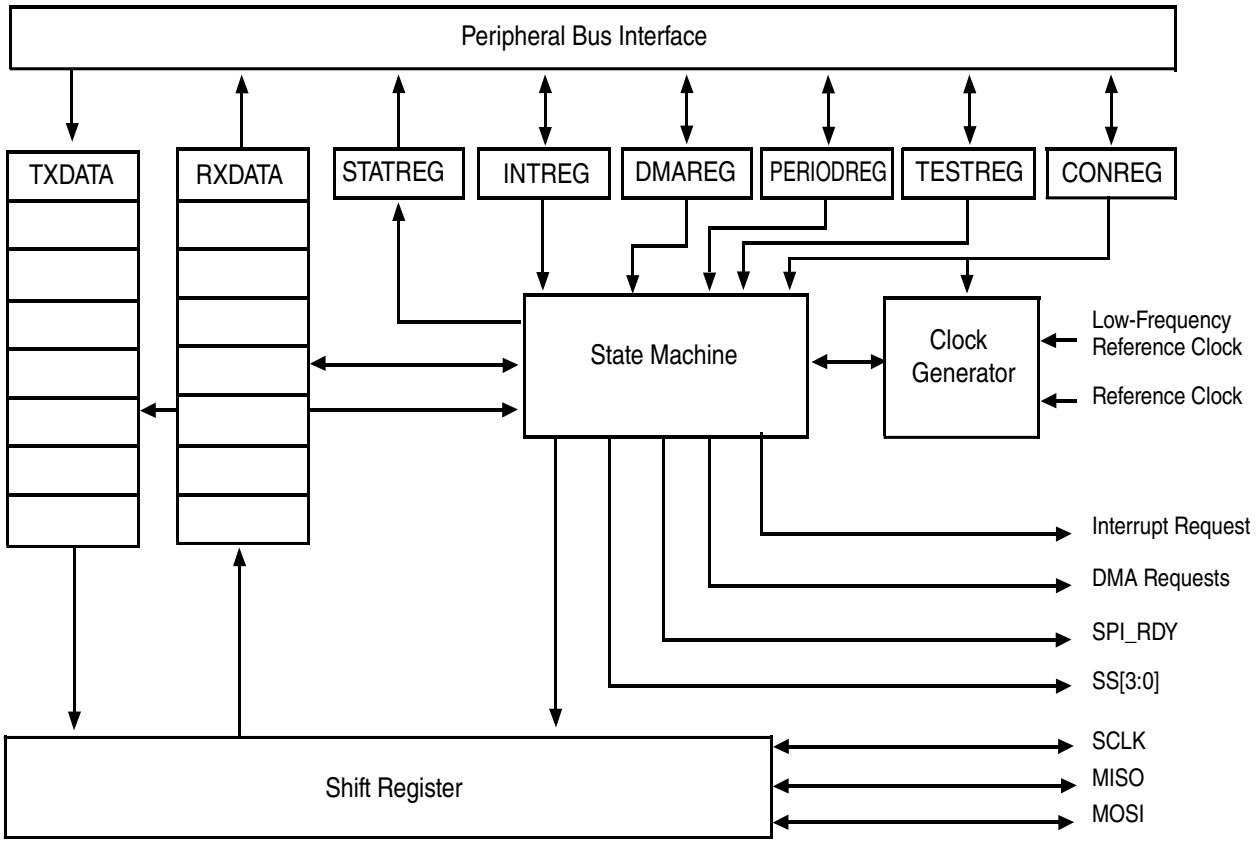


Figure 20-1. ECSPI Block Diagram

20.1.1 Features

Key features of the ECSPI include:

- Full-duplex synchronous serial interface
- Master/Slave configurable
- Four Chip Select (SS) signals to support multiple peripherals
- Transfer continuation function allows unlimited length data transfers
- 32-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SS) and SPI Clock (SCLK) are configurable
- Direct Memory Access (DMA) support
- Max operation frequency up to the reference clock frequency.

20.1.2 Modes and Operations

The ECSPI supports the modes described in the indicated sections:

- Master Mode
- Slave Mode
- Low Power Modes

As described in Operations, the ECSPI supports the operations described in the indicated sections:

- Typical Master Mode
  - Master Mode with SPI_RDY
  - Master Mode with Wait States
  - Master Mode with SS_CTL[3:0] Control
  - Master Mode with Phase Control
- Typical Slave Mode

20.2 External Signals

Figure 20-2 shows the ECSPI in master mode connected to four external devices in a one-way communication link.

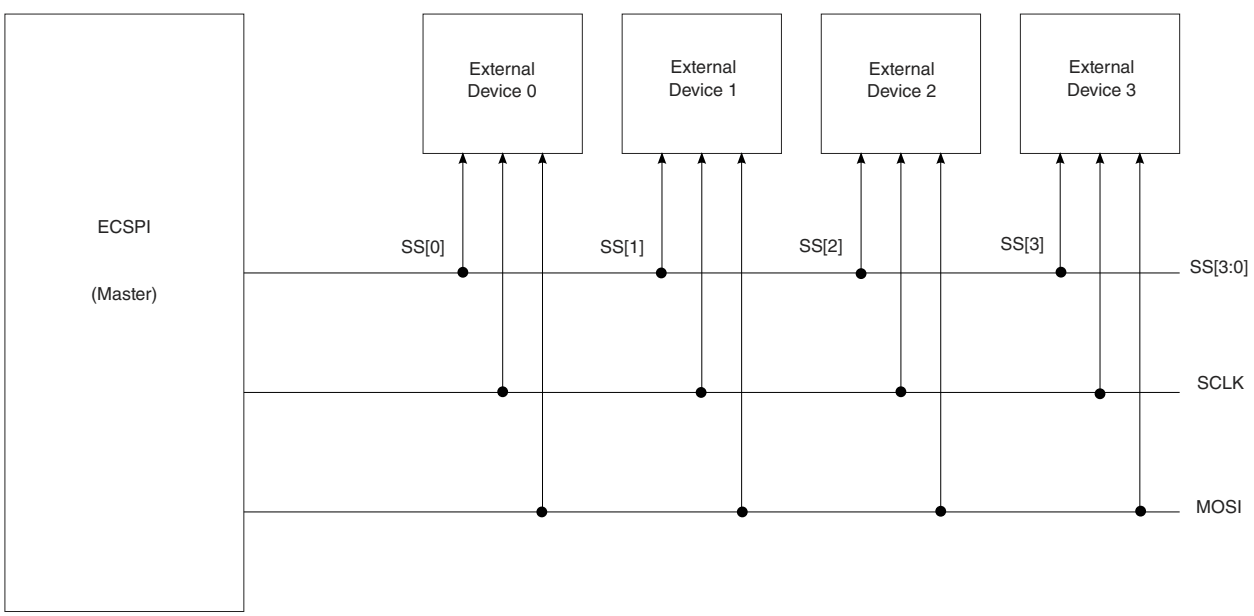

Figure 20-2. Example Connection Diagram

20.3 Clocks

The following table describes the clock sources for eCSPI. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 20-1. eCSPI Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_per	ecspi_clk_root	eCSPI module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

20.4 Functional Description

This section provides a complete functional description of the ECSPI. The figure found here shows the relationship of SCLK and data lines while ECSPI has been configured with different POL and PHA settings.

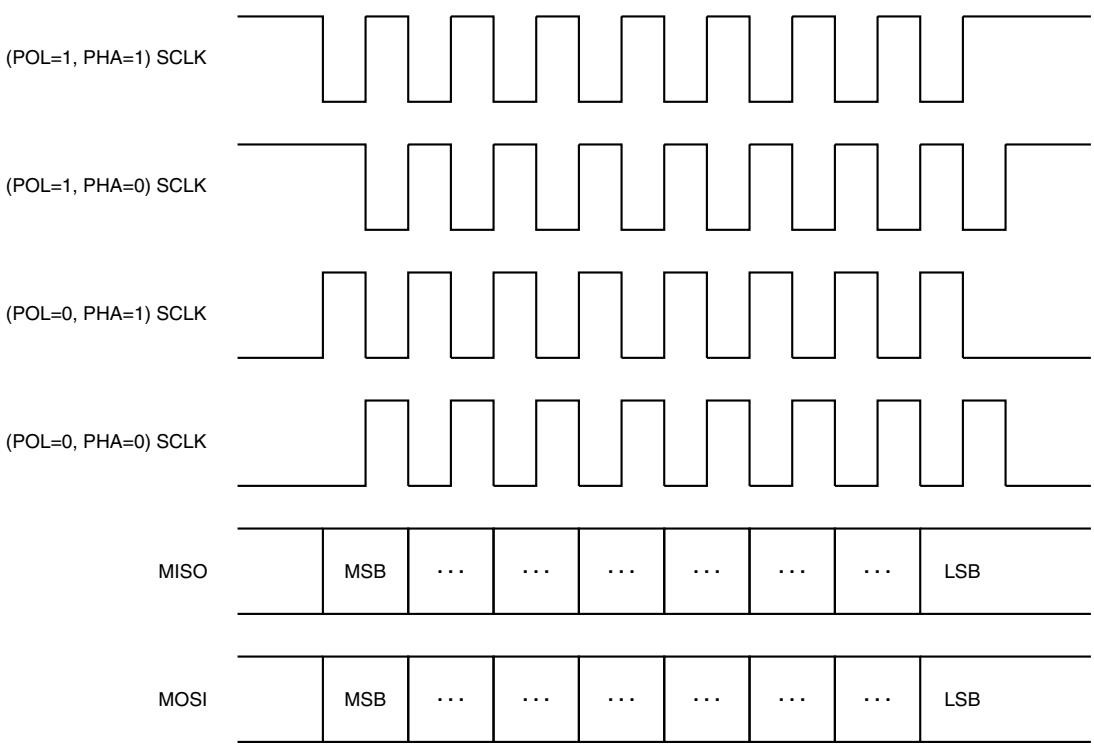

Figure 20-3. ECSPI SCLK, MISO, and MOSI Relationship

20.4.1 Master Mode

When the ECSPI is configured as a master, it uses a serial link to transfer data between the ECSPI and an external slave device.

One of the Chip Select (SS) signals and the clock signal (SCLK) are used to transfer data between two devices. If the external device is a transmit-only device, the ECSPI master's output port can be ignored and used for other purposes. In order to use the internal TXFIFO and RXFIFO, two auxiliary output signals, Chip Select (SS) and SPI_RDY, are used for data transfer rate control. Software can also configure the sample period control register to a fixed data transfer rate.

20.4.2 Slave Mode

When the ECSPI is configured as a slave, software can configure the ECSPI Control register to match the external SPI master's timing.

In this configuration, Chip Select ($\overline{SS}$) becomes an input signal, and is used to control data transfers through the Shift register, as well as to load/store the data FIFO.

Slave mode only supports the case when ECSPIx_CONFIGREG[SS_CTL] is cleared. The accurate burst length should always be specified using the BURST_LENGTH parameter. ECSPIx_CONFIGREG[SS_CTL] set to 1 is not supported in slave mode.

20.4.3 Low Power Modes

The ECSPI does not operate under low power mode.

It holds its operation when its clock is gated off in master mode. In slave mode, the ECSPI does not respond when its clock is gated off.

20.4.4 Operations

The information found here describes the ECSPI's operations.

20.4.4.1 Typical Master Mode

The ECSPI master uses the Chip Select (SS) signal to enable an external SPI device, and uses the SCLK signal to transfer data in and out of the Shift register.

The SPI_RDY enables fast data communication with fewer software interrupts. By programming the ECSPI_PERIODREG register accordingly, the ECSPI can be used for a fixed data transfer rate.

When the ECSPI is in Master mode the SS, SCLK, and MOSI are output signals, and the MISO signal is an input.

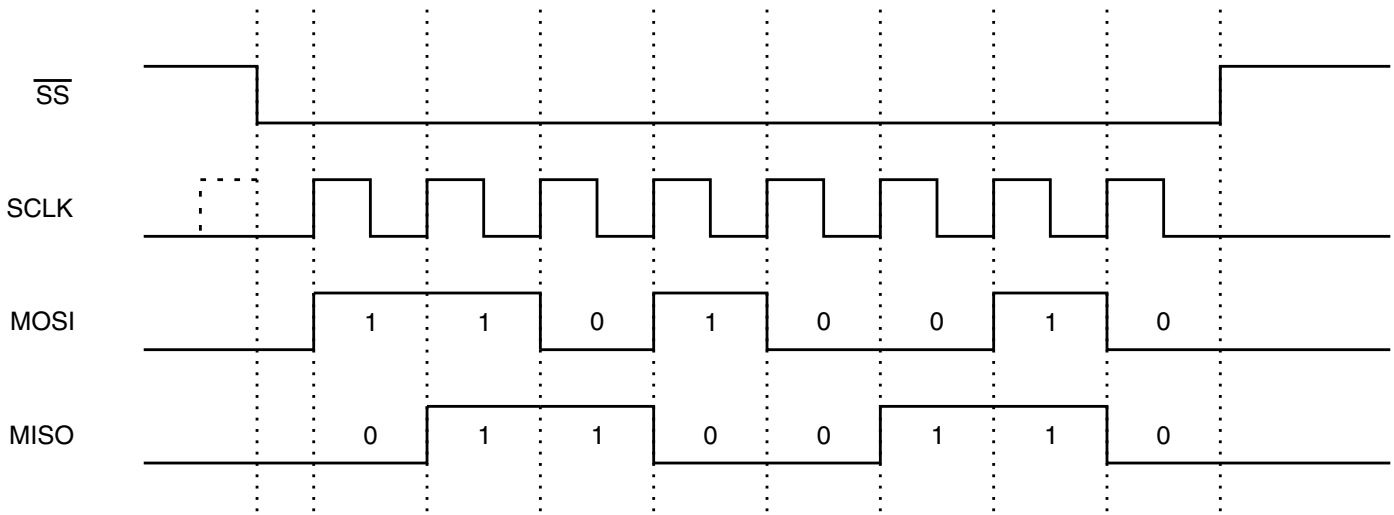

Figure 20-4. Typical SPI Burst (8-bit Transfer)

In the above figure, the Chip Select (SS) signal enables the selected external SPI device, and the SCLK synchronizes the data transfer. The MOSI and MISO signals change on rising edge of SCLK and the MISO signal is latched on the falling edge of the SCLK. The figure above shows a data of 0xD2 is shifted out, and a data of 0x66 is shifted in.

20.4.4.1.1 Master Mode with SPI_RDY

By default, the ECSPI does not use the SPI_RDY signal in master mode (MODE =1).

A SPI burst begins when the following events happen:

- The ECSPI is enabled, TXFIFO has data in it, and ECSPI_CONREG[XCH] bit or the ECSPI_CONREG[SMC] bit is set.
- When the SPI Data Ready Control (ECSPI_CONREG[DRCTL]) bits contains either 01 or 10, the SPI_RDY signal controls when a SPI burst starts.

A SPI burst is defined as a bus transaction that starts when the slave select is asserted and ends when the slave select is negated. The Chip Select (SS) signal will remain asserted until all the bits in a SPI burst are shifted out.

If ECSPI_CONREG[DRCTL] is set to 01, the SPI burst can be triggered only if a falling edge of the SPI_RDY signal has been detected.

The following figure shows the relationship between a SPI burst and the falling edge of SPI_RDY signal.

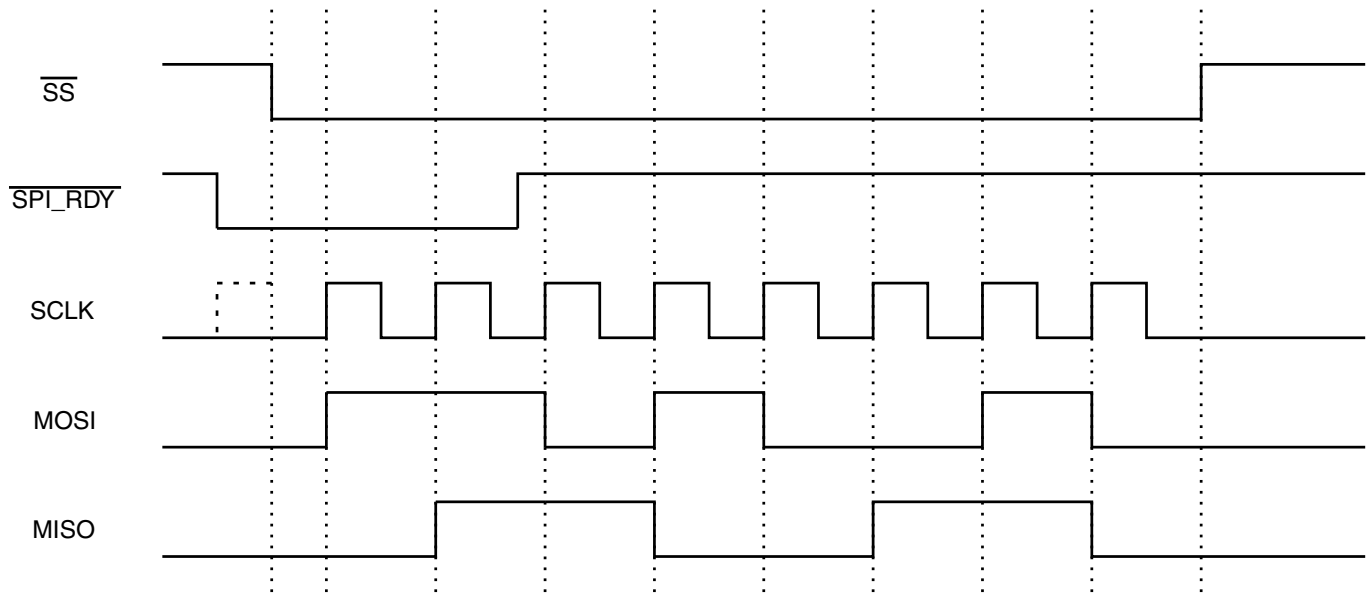

Figure 20-5. Relationship Between a SPI Burst and SPI_RDY: Falling-Edge Triggered

A SPI burst does not start until the falling edge of the SPI_RDY signal is detected. The next SPI burst starts when the next SPI_RDY falling edge is detected, after the last burst has finished.

If SPI Data Ready Control (ECSPI_CONREG[DRCTL]) is set to 10, the SPI burst can be triggered only if the SPI_RDY signal is low.

The following figure shows the relationship between a SPI burst and the SPI_RDY signal. The SPI burst does not begin until the SPI_RDY signal goes low. The ECSPI will keep transmitting SPI burst if the SPI_RDY signal remains low.

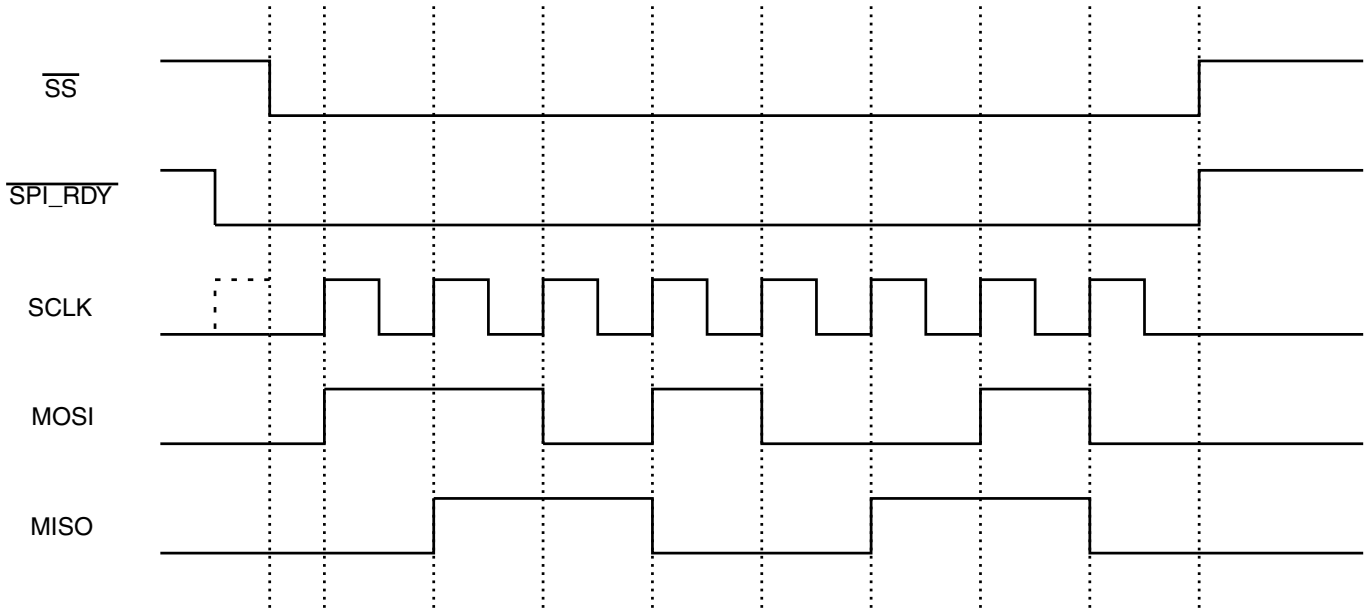

Figure 20-6. Relationship Between a SPI Burst and SPI_RDY: Low-Level Triggered

20.4.4.1.2 Master Mode with Wait States

Wait states can be inserted between SPI bursts. This provides a way for software to slow down the SPI burst to meet the timing requirements of a slower SPI device.

The following figure shows wait states inserted between SPI bursts.

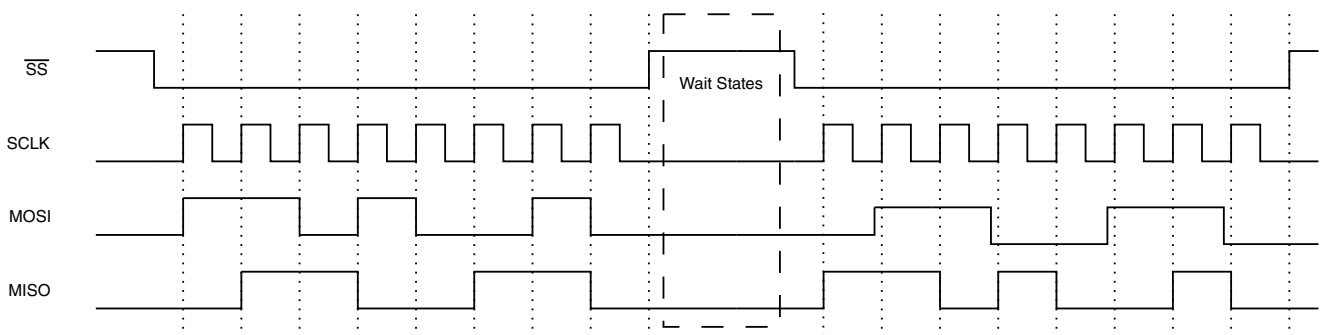

Figure 20-7. SPI Bursts with Wait States

In this case, the number of wait states is controlled by ECSPI_PERIODREG[SAMPLE PERIOD] and the wait states' clock source is selected by ECSPI_PERIODREG[CSRC].

20.4.4.1.3 Master Mode with SS_CTL[3:0] Control

The SPI SS Control (SS_CTL[3:0]) controls whether the current operation is single burst or multiple bursts.

When the SPI SS Wave Form Select (SS_CTL[3:0]) is set, the current operation is multiple bursts transfer. When the SPI SS Wave Form Select (SS_CTL[3:0]) bit is cleared, the current operation is single burst transfer. A SPI burst can contains multiple words as defined in the BURST LENGTH field of the ECSPI_CONREG register.

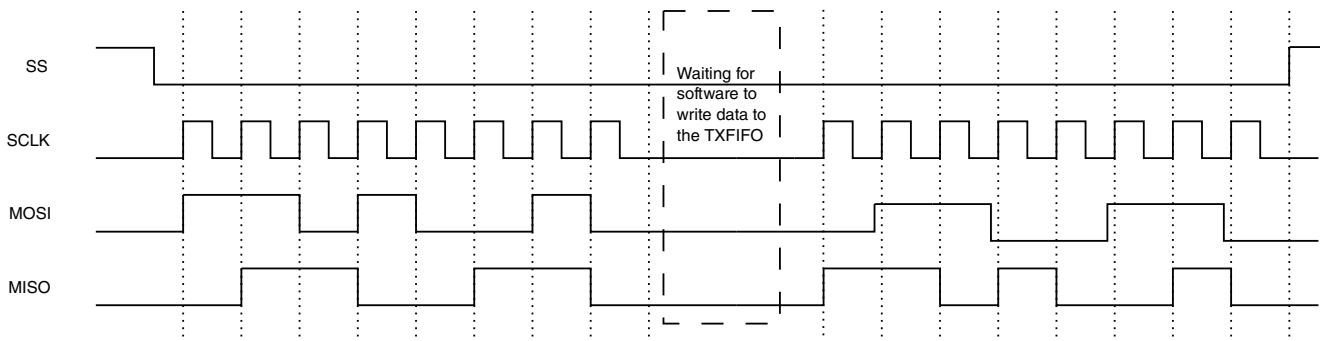

Figure 20-8. SPI Burst While SS_CTL[3:0] is Clear

In Figure 20-8, two 8-bit bursts in the TXFIFO have been combined and transmitted in one SPI burst. The maximum length of a single SPI burst is defined in the BURST LENGTH field of the ECSPI_CONREG control register. (Figure 20-8 corresponds to a BURST LENGTH of 8.) This provides a way for transferring a longer SPI burst by writing data into TXFIFO while the ECSPI is transmitting.

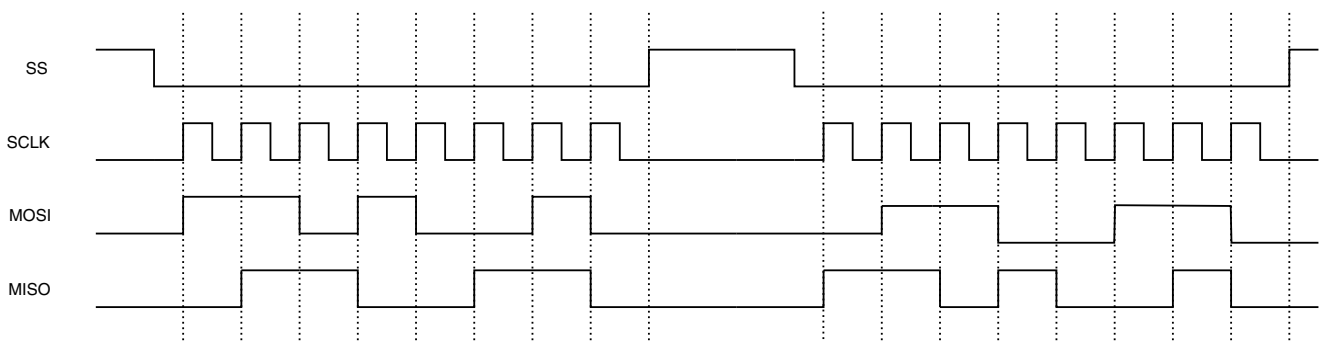

Figure 20-9. SPI Bursts While SS_CTL[3:0] is Set

In Figure 20-9, two FIFO entries are transmitted, one entry with each SPI burst. The ECSPI will continue to transmit SPI bursts until the TXFIFO is empty. When wait states can be inserted between SPI bursts, the SS will negate between SPI bursts until the wait states finish.

20.4.4.1.4 Master Mode with Phase Control

The Phase Control (ECSPI_CONREG[PHA]) bit controls how the transmit data shifts out and the receive data shifts in.

When the Phase control (ECSPI_CONREG[PHA]) bit is set, the transmit data will shift out on the rising edge of SCLK, and the receive data is latched on the falling edge of SCLK. The most-significant bit is output on the first rising SCLK edge.

When ECSPI_CONREG[PHA] is cleared, the transmit data is shifted out on the falling edge of SCLK and the receive data is latched on the rising edge of SCLK. The MSB is output when the host processor loads the transmitted data.

Inverting the SCLK polarity does not impact the edge-triggered operations because they are internal to the serial peripheral interface master. Figure 20-10 shows how SPI burst works with different POL and PHA configuration.

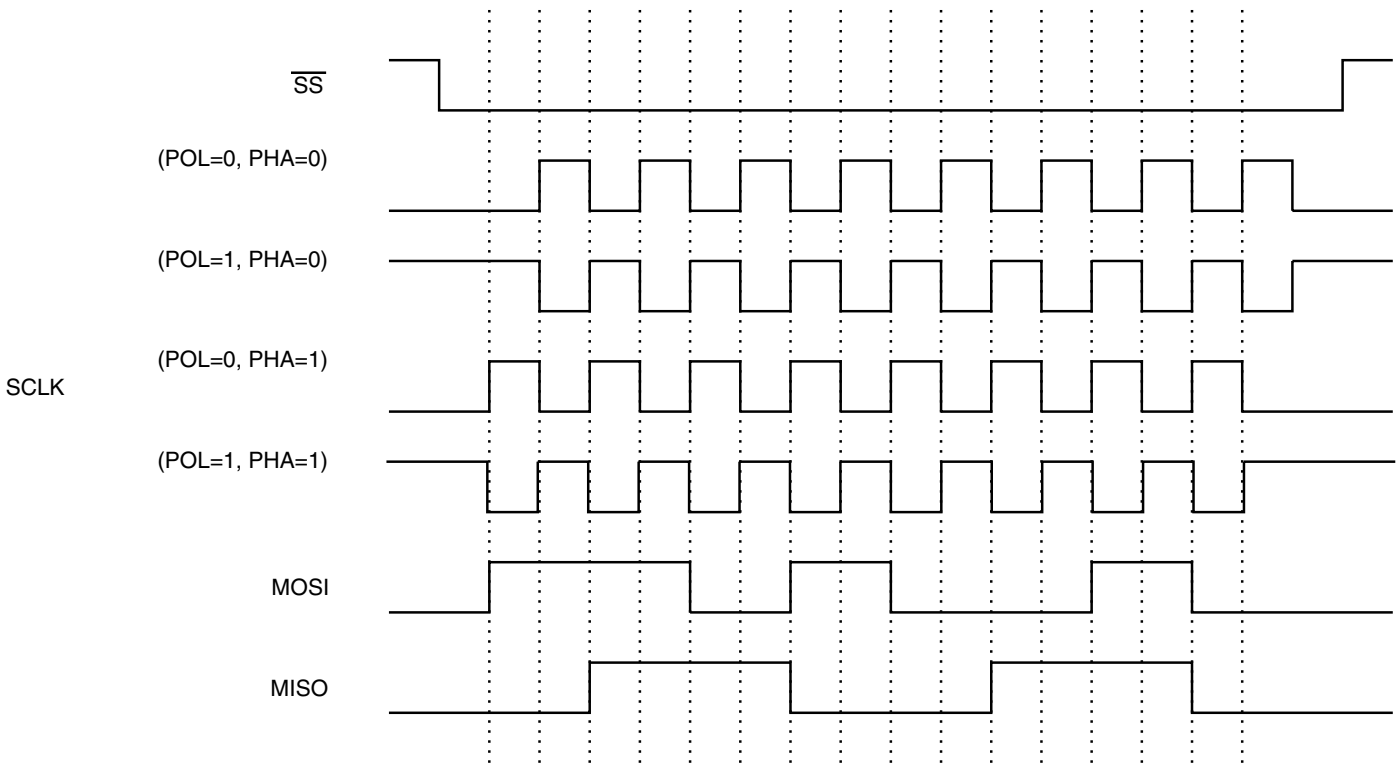

Figure 20-10. SPI Burst with Different POL and PHA Configurations

20.4.4.2 Typical Slave Mode

When the ECSPI is configured as a slave (Mode = 0), software can configure the ECSPI Control register to match the external SPI master's timing. In this configuration, SS becomes an input signal, and is used to latch data in and out of the internal data Shift registers, as well as to advance the data FIFO.

The SS, SCLK, and MOSI are inputs and MISO is output. Most of the timing diagrams are similar to the diagrams shown previously for the SPI in Master mode (Mode = 1), because the inputs come from a SPI master device.

However, the timing is different when SS is used to advance the data FIFO. When the SS_POL=0 while the ECSPI is configured in Slave mode, the data FIFO will advance on the rising edge of the SS signal. When the polarity is reversed (SS_POL = 1), the data FIFO will advance on the falling edge of the SS signal.

The figure below shows a SPI burst in which the data FIFO is advanced by the rising edge of the SS signal.

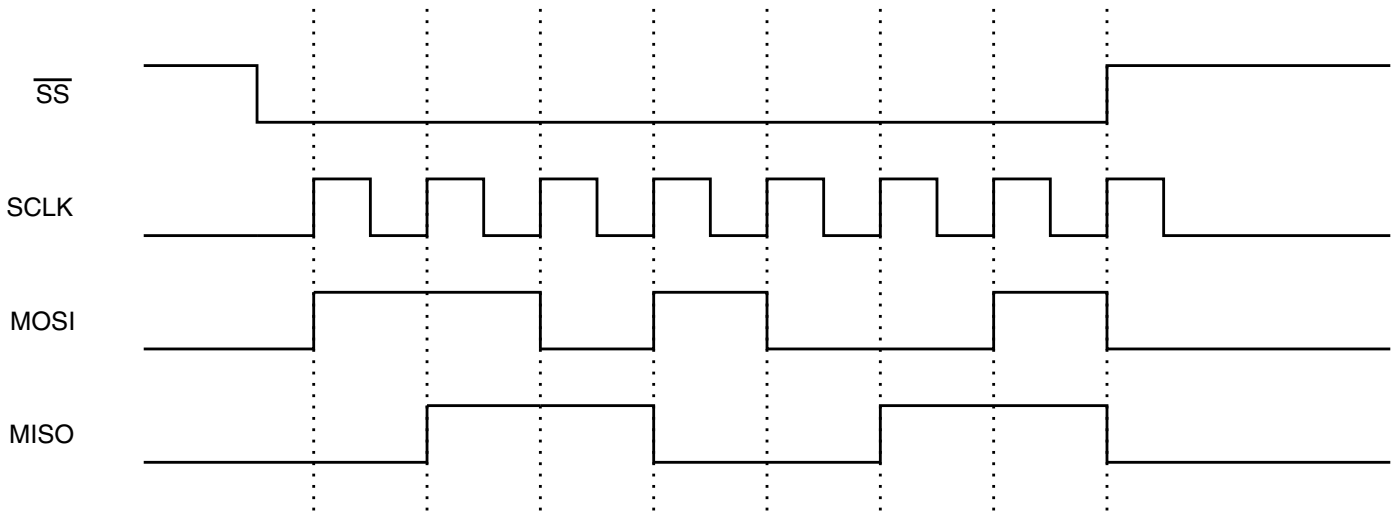

Figure 20-11. Advancing the Data FIFO on the Rising Edge of SS

In the above case, only the most significant 7 bits are loaded to the RXFIFO.

20.4.5 Reset

Whenever a device reset occurs, a reset is performed on the ECSPI, resetting all registers to their default values.

Software can reset the block using the CONREG[EN] bit; see ECSPI.

20.4.6 Interrupts

Interrupt control provides a way to manage the ECSPI FIFOs:

- For transmitting data, software can enable the TXFIFO empty, TXFIFO data request, and TXFIFO full interrupts to maintain the TXFIFO using an interrupt service routine.
- For receiving data, software can enable the RXFIFO ready, RXFIFO data request, and RXFIFO full interrupts to retrieve data from the RXFIFO using an interrupt service routine.

Other interrupt sources can be used to control or debug the SPI bursts:

- The transfer-completed interrupt means that there is no data left in the TXFIFO and that the data in the Shift register has been shifted out.
- The RXFIFO overflow interrupt means that the RXFIFO received more than 64 words and will not accept any other words.

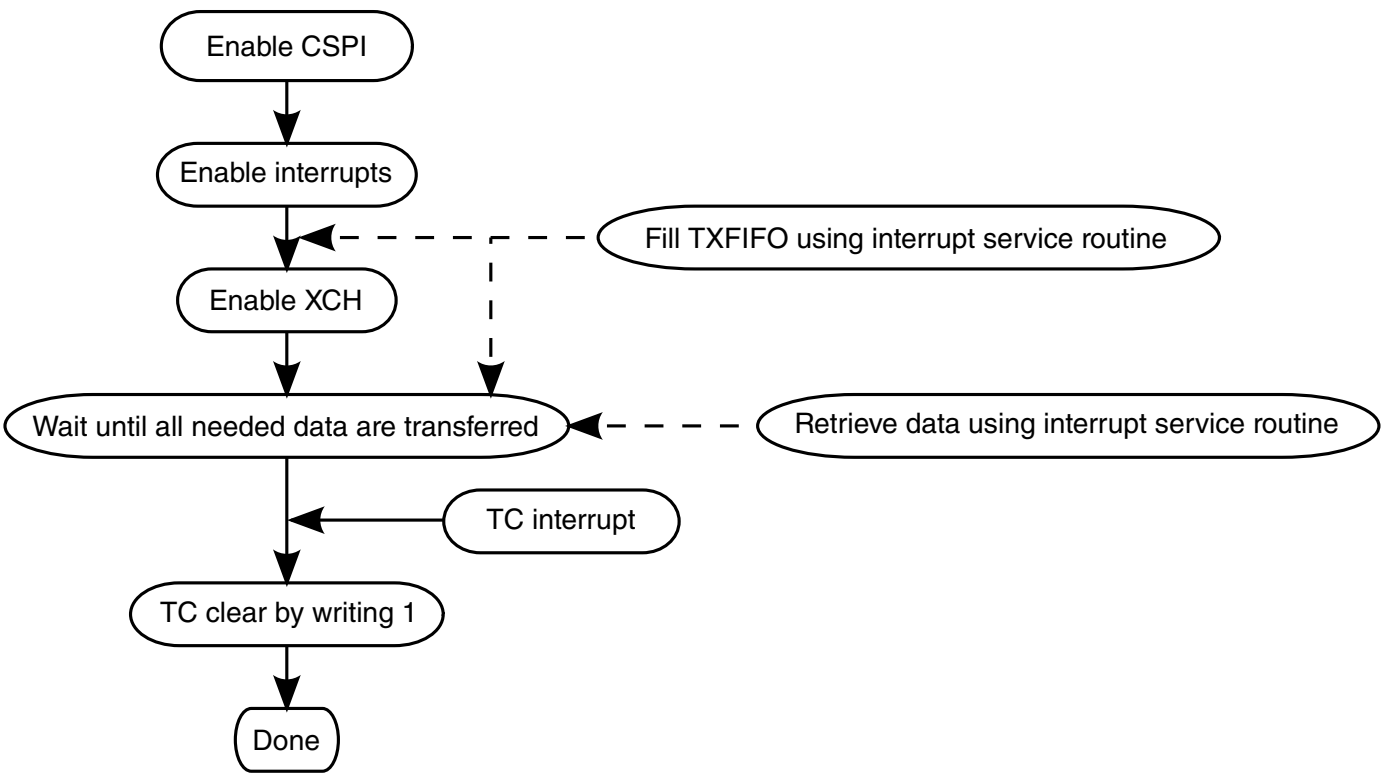

Figure 20-12. Program Sequence of SPI Burst Using Interrupt Control

20.4.7 DMA

DMA control provides another method to utilize the FIFOs in the ECSPI. By using DMA request and acknowledge signals, larger amounts of data can be transferred, and will reduce interrupts and host processor loading. When the appropriate conditions are matched, the block will send out a DMA request.

The DMA can deal with the following conditions:

- TXFIFO empty
- TXFIFO data request
- RXFIFO data request
- RXFIFO full

The figure below shows a program sequence of SPI bursts using DMA control.

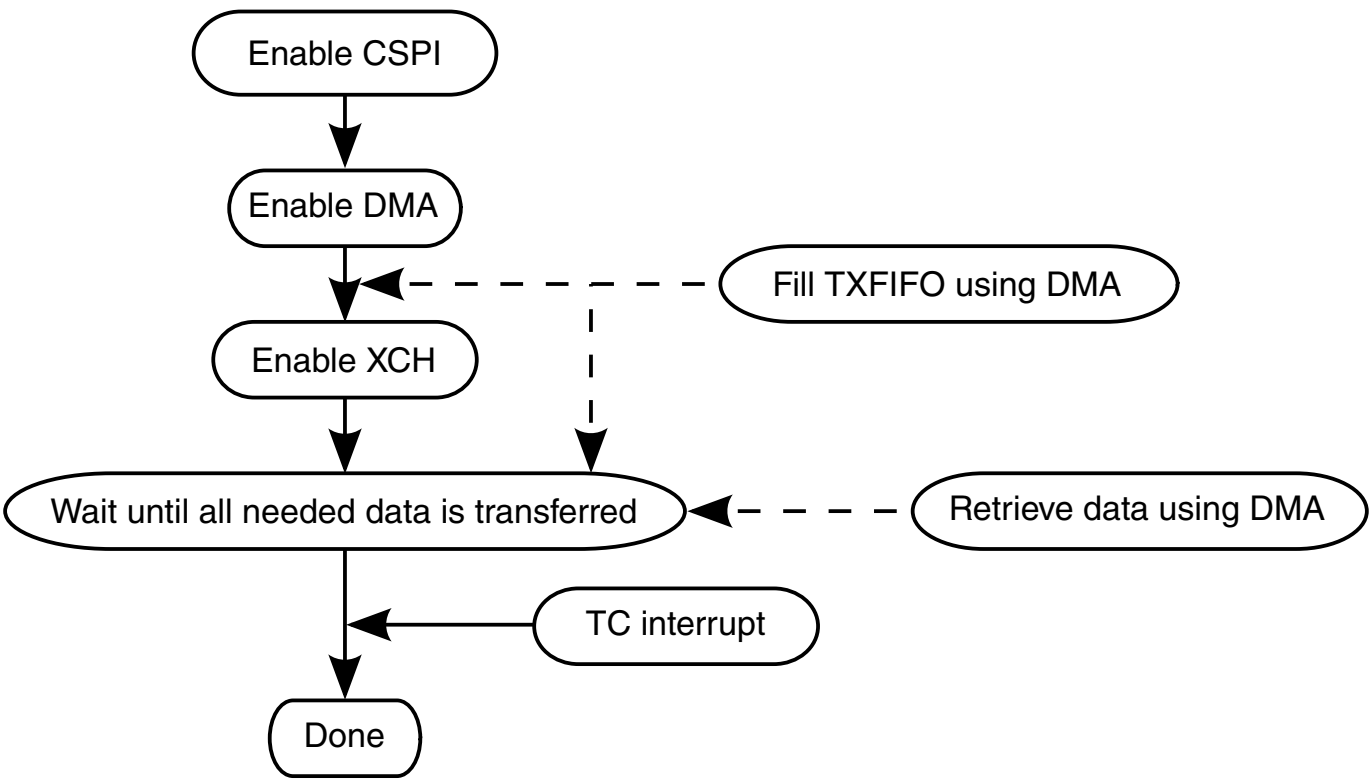

Figure 20-13. Program Sequence of SPI Burst Using DMA

20.4.8 Byte Order

The ECSPI does not support byte re-ordering in hardware.

20.5 Initialization

This section provides initialization information for ECSPI.

To initialize the block:

1. Clear the EN bit in ECSPI_CONREG to reset the block.
2. Enable the clocks for ECSPI.
3. Set the EN bit in ECSPI_CONREG to put ECSPI out of reset.
4. Configure corresponding IOMUX for ECSPI external signals.
5. Configure registers of ECSPI properly according to the specifications of the external SPI device.

20.6 Applications

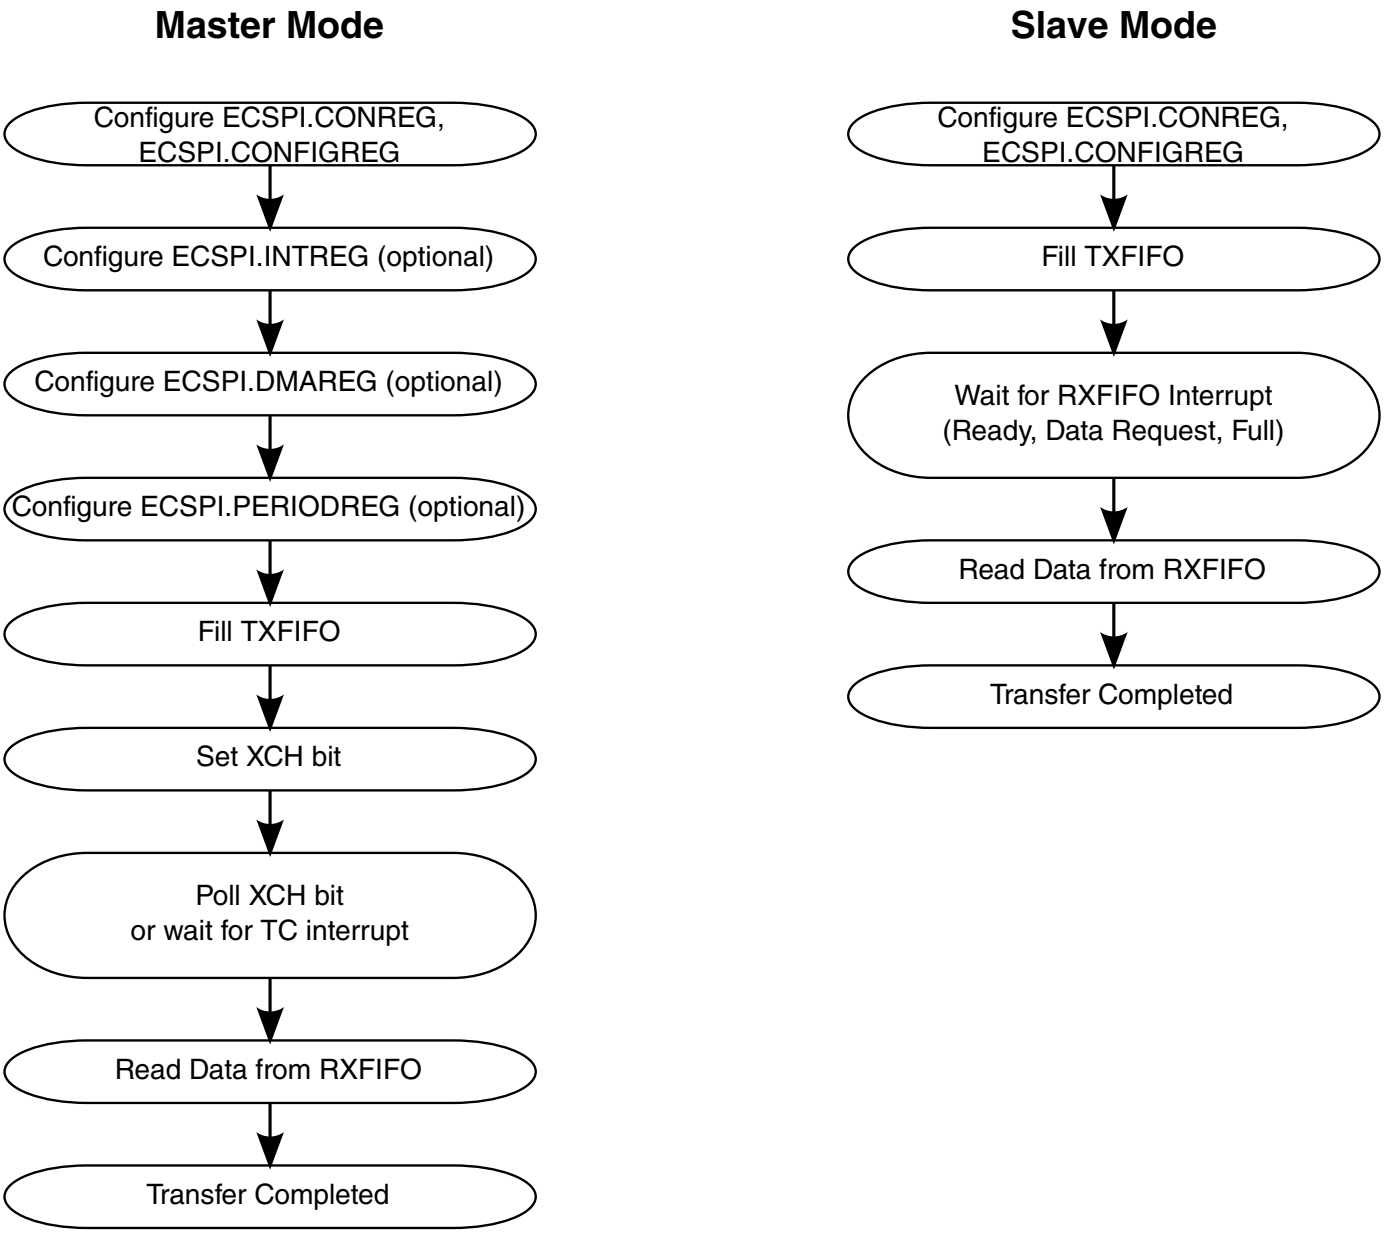

Figure 20-14. Flowchart of the ECSPI Operation

20.7 ECSPI Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a particular block instantiation, see the system memory map.

ECSPI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

20.7.1 Receive Data Register (ECSPIx_RXDATA)

The Receive Data register (ECSPI_RXDATA) is a read-only register that forms the top word of the 64 x 32 receive FIFO. This register holds the data received from an external SPI device during a data transaction. Only word-sized read operations are allowed.

Address: Base address + 0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_RXDATA field descriptions

Field	Description
ECSPI_RXDATA	Receive Data. This register holds the top word of the receive data FIFO. The FIFO is advanced for each read of this register. The data read is undefined when the Receive Data Ready (RR) bit in the Interrupt Control/Status register is cleared. Zeros are read when ECSPI is disabled.

20.7.2 Transmit Data Register (ECSPIx_TXDATA)

The Transmit Data (ECSPI_TXDATA) register is a write-only data register that forms the bottom word of the 64 x 32 TXFIFO. The TXFIFO can be written to as long as it is not full, even when the SPI Exchange bit (XCH) in ECSPI_CONREG is set. This allows software to write to the TXFIFO during a SPI data exchange process. Writes to this register are ignored when the ECSPI is disabled (ECSPI_CONREG[EN] bit is cleared).

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECSPIx_TXDATA field descriptions

Field	Description
ECSPI_TXDATA	Transmit Data. This register holds the top word of data loaded into the FIFO. Data written to this register must be a word operation. The number of bits actually transmitted is determined by the BURST_LENGTH field of the corresponding SPI Control register. If this field contains more bits than the number specified by BURST_LENGTH, the extra bits are ignored. For example, to transfer 10 bits of data, a 32-bit word must be written to this register. Bits 9-0 are shifted out and bits 31-10 are ignored. When the ECSPI is operating in Slave mode, zeros are shifted out when the FIFO is empty. Zeros are read when ECSPI is disabled.

20.7.3 Control Register (ECSPIx_CONREG)

The Control Register (ECSPI_CONREG) allows software to enable the ECSPI , configure its operating modes, specify the divider value, and SPI_RDY control signal, and define the transfer length.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_CONREG field descriptions

Field	Description
31–20 BURST_ LENGTH	Burst Length. This field defines the length of a SPI burst to be transferred. The Chip Select (SS) will remain asserted until all bits in a SPI burst are shifted out. A maximum of 2^12 bits can be transferred in a single SPI burst. In master mode, it controls the number of bits per SPI burst. Since the shift register always loads 32-bit data from transmit FIFO, only the n least-significant (n = BURST LENGTH + 1) will be shifted out. The remaining bits will be ignored. Number of Valid Bits in a SPI burst. 0x000 A SPI burst contains the 1 LSB in a word. 0x001 A SPI burst contains the 2 LSB in a word. 0x002 A SPI burst contains the 3 LSB in a word. ... 0x01F A SPI burst contains all 32 bits in a word. 0x020 A SPI burst contains the 1 LSB in first word and all 32 bits in second word. 0x021 A SPI burst contains the 2 LSB in first word and all 32 bits in second word. ... 0xFFE A SPI burst contains the 31 LSB in first word and 2^7 -1 words. 0xFFF A SPI burst contains 2^7 words.
19–18 CHANNEL_ SELECT	SPI CHANNEL SELECT bits. Select one of four external SPI Master/Slave Devices. In master mode, these two bits select the external slave devices by asserting the Chip Select (SSn) outputs. Only the selected Chip Select (SSn) signal can be active at a given time; the remaining three signals will be negated. 00 Channel 0 is selected. Chip Select 0 (SS0) will be asserted. 01 Channel 1 is selected. Chip Select 1 (SS1) will be asserted. 10 Channel 2 is selected. Chip Select 2 (SS2) will be asserted. 11 Channel 3 is selected. Chip Select 3 (SS3) will be asserted.
17–16 DRCTL	SPI Data Ready Control. This field selects the utilization of the $\overline{\text{SPI_RDY}}$ signal in master mode. ECSPI checks this field before it starts an SPI burst. 00 The $\overline{\text{SPI_RDY}}$ signal is a don't care. 01 Burst will be triggered by the falling edge of the SPI_RDY signal (edge-triggered). 10 Burst will be triggered by a low level of the SPI_RDY signal (level-triggered). 11 Reserved.
15–12 PRE_DIVIDER	SPI Pre Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the pre-divider of the reference clock. 0000 Divide by 1. 0001 Divide by 2. 0010 Divide by 3. ... 1101 Divide by 14. 1110 Divide by 15. 1111 Divide by 16.
11–8 POST_DIVIDER	SPI Post Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the post-divider of the reference clock using the equation: 2^{n} . 0000 Divide by 1. 0001 Divide by 2.

Table continues on the next page...

ECSPIx_CONREG field descriptions (continued)

Field	Description
	0010 Divide by 4. ... 1110 Divide by 2^{14}. 1111 Divide by 2^{15}.
7–4 CHANNEL_ MODE	SPI CHANNEL MODE selects the mode for each SPI channel. CHANNEL MODE[3] is for SPI channel 3. CHANNEL MODE[2] is for SPI channel 2. CHANNEL MODE[1] is for SPI channel 1. CHANNEL MODE[0] is for SPI channel 0. 0 Slave mode. 1 Master mode.
3 SMC	Start Mode Control. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). It controls how the ECSPI starts a SPI burst, either through the SPI exchange bit, or immediately when the TXFIFO is written to. 0 SPI Exchange Bit (XCH) controls when a SPI burst can start. Setting the XCH bit will start a SPI burst or multiple bursts. This is controlled by the SPI SS Wave Form Select (SS_CTL). Refer to XCH and SS_CTL descriptions. 1 Immediately starts a SPI burst when data is written in TXFIFO.
2 XCH	SPI Exchange Bit. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). If the Start Mode Control (SMC) bit is cleared, writing a 1 to this bit starts one SPI burst or multiple SPI bursts according to the SPI SS Wave Form Select (SS_CTL). The XCH bit remains set while either the data exchange is in progress, or when the ECSPI is waiting for an active input if SPIRDY is enabled through DRCTL. This bit is cleared automatically when all data in the TXFIFO and the shift register has been shifted out. 0 Idle. 1 Initiates exchange (write) or busy (read).
1 HT	Hardware Trigger Enable. This bit is used in master mode only. It enables hardware trigger (HT) mode. Note, HT mode is not supported by this product. 0 Disable HT mode. 1 Enable HT mode.
0 EN	SPI Block Enable Control. This bit enables the ECSPI. This bit must be set before writing to other registers or initiating an exchange. Writing zero to this bit disables the block and resets the internal logic with the exception of the ECSPI_CONREG. The block's internal clocks are gated off whenever the block is disabled. 0 Disable the block. 1 Enable the block.

20.7.4 Config Register (ECSPIx_CONFIGREG)

The Config Register (ECSPI_CONFIGREG) allows software to configure each SPI channel, configure its operating modes, specify the phase and polarity of the clock, configure the Chip Select (SS), and define the HT transfer length. Note, HT mode is not supported by this product.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved			HT_LENGTH					SCLK_CTL				DATA_CTL				SS_POL				SS_CTL				SCLK_POL				SCLK_PHA			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_CONFIGREG field descriptions

Field	Description
31–29 -	This field is reserved. Reserved
28–24 HT_LENGTH	HT LENGTH. This field defines the message length in HT Mode. Note, HT mode is not supported by this product. The length in bits of one message is (HT LENGTH + 1).
23–20 SCLK_CTL	SCLK CTL. This field controls the inactive state of SCLK for each SPI channel. SCLK CTL[3] is for SPI channel 3. SCLK CTL[2] is for SPI channel 2. SCLK CTL[1] is for SPI channel 1. SCLK CTL[0] is for SPI channel 0. 0 Stay low. 1 Stay high.
19–16 DATA_CTL	DATA CTL. This field controls inactive state of the data line for each SPI channel. DATA CTL[3] is for SPI channel 3. DATA CTL[2] is for SPI channel 2. DATA CTL[1] is for SPI channel 1. DATA CTL[0] is for SPI channel 0. 0 Stay high. 1 Stay low.
15–12 SS_POL	SPI SS Polarity Select. In both Master and Slave modes, this field selects the polarity of the Chip Select (SS) signal. SS POL[3] is for SPI channel 3. SS POL[2] is for SPI channel 2. SS POL[1] is for SPI channel 1. SS POL[0] is for SPI channel 0.

Table continues on the next page...

ECSPIx_CONFIGREG field descriptions (continued)

Field	Description
	0 Active low. 1 Active high.
11–8 SS_CTL	SPI SS Wave Form Select. In master mode, this field controls the output wave form of the Chip Select (SS) signal when the SMC (Start Mode Control) bit is cleared. The SS_CTL are ignored if the SMC bit is set. SS CTL[3] is for SPI channel 3. SS CTL[2] is for SPI channel 2. SS CTL[1] is for SPI channel 1. SS CTL[0] is for SPI channel 0. In slave mode, this bit controls when the SPI burst is completed. An SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data. 0 In master mode - only one SPI burst will be transmitted. 1 In master mode - Negate Chip Select (SS) signal between SPI bursts. Multiple SPI bursts will be transmitted. The SPI transfer will automatically stop when the TXFIFO is empty. 1 Reserved
7–4 SCLK_POL	SPI Clock Polarity Control. This field controls the polarity of the SCLK signal. See Figure 20-10 for more information. SCLK_POL[3] is for SPI channel 3. SCLK_POL[2] is for SPI channel 2. SCLK_POL[1] is for SPI channel 1. SCLK_POL[0] is for SPI channel 0. 0 Active high polarity (0 = Idle). 1 Active low polarity (1 = Idle).
SCLK_PHA	SPI Clock/Data Phase Control. This field controls the clock/data phase relationship. See Figure 20-10 for more information. SCLK PHA[3] is for SPI channel 3. SCLK PHA[2] is for SPI channel 2. SCLK PHA[1] is for SPI channel 1. SCLK PHA[0] is for SPI channel 0. 0 Phase 0 operation. 1 Phase 1 operation.

20.7.5 Interrupt Control Register (ECSPIx_INTREG)

The Interrupt Control Register (ECSPI_INTREG) enables the generation of interrupts to the host processor. If the ECSPI is disabled, this register reads zero.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved

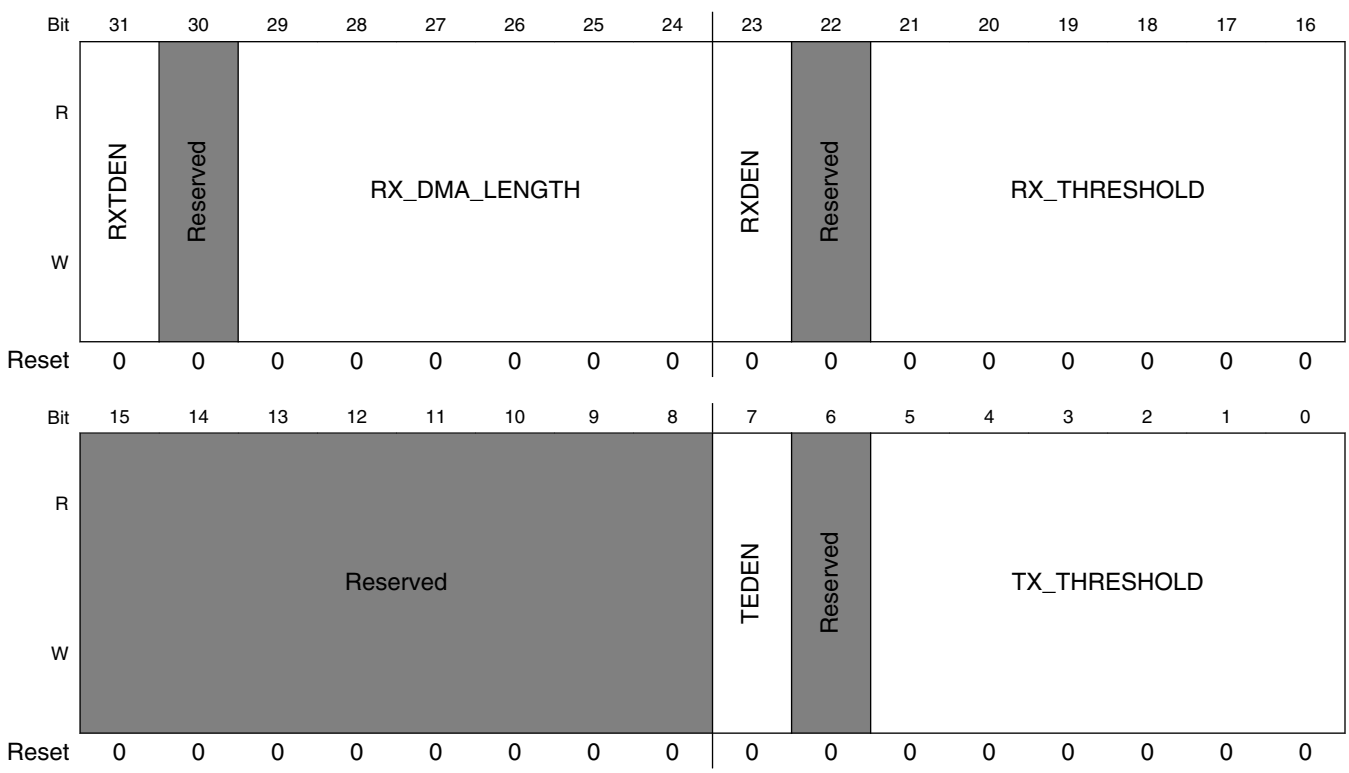
ECSPIx_INTREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TCEN	Transfer Completed Interrupt enable. This bit enables the Transfer Completed Interrupt. 0 Disable 1 Enable
6 ROEN	RXFIFO Overflow Interrupt enable. This bit enables the RXFIFO Overflow Interrupt. 0 Disable 1 Enable
5 RFEN	RXFIFO Full Interrupt enable. This bit enables the RXFIFO Full Interrupt. 0 Disable 1 Enable
4 RDREN	RXFIFO Data Request Interrupt enable. This bit enables the RXFIFO Data Request Interrupt when the number of data entries in the RXFIFO is greater than RX_THRESHOLD. 0 Disable 1 Enable
3 RREN	RXFIFO Ready Interrupt enable. This bit enables the RXFIFO Ready Interrupt. 0 Disable 1 Enable

Table continues on the next page...

ECSPIx_INTREG field descriptions (continued)



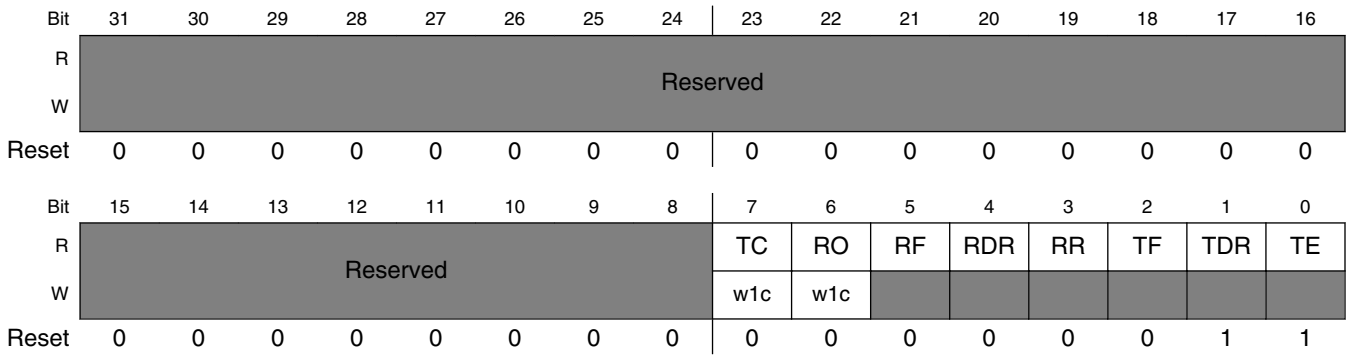
Field	Description
2 TFEN	TXFIFO Full Interrupt enable. This bit enables the TXFIFO Full Interrupt. 0 Disable 1 Enable
1 TDREN	TXFIFO Data Request Interrupt enable. This bit enables the TXFIFO Data Request Interrupt when the number of data entries in the TXFIFO is less than or equal to TX_THRESHOLD. 0 Disable 1 Enable
0 TEEN	TXFIFO Empty Interrupt enable. This bit enables the TXFIFO Empty Interrupt. 0 Disable 1 Enable

20.7.6 DMA Control Register (ECSPIx_DMAREG)

The Direct Memory Access Control Register (ECSPI_DMAREG) provides software a way to use an on-chip DMA controller for ECSPI data. Internal DMA request signals enable direct data transfers between the ECSPI FIFOs and system memory. The ECSPI sends out DMA requests when the appropriate FIFO conditions are matched.

If the ECSPI is disabled, this register is read as 0.

Address: Base address + 14h offset



ECSPIx_DMAREG field descriptions

Field	Description
31 RXTDEN	RXFIFO TAIL DMA Request Enable. This bit enables an internal counter that is increased at each read of the RXFIFO. This counter is cleared automatically when it reaches RX DMA LENGTH. If the number of words remaining in the RXFIFO is greater than or equal to RX DMA LENGTH, a DMA request is generated even if it is less than or equal to RX_THRESHOLD. 0 Disable 1 Enable
30 -	This field is reserved. Reserved
29–24 RX_DMA_ LENGTH	RX DMA LENGTH. This field defines the burst length of a DMA operation. Applies only when RXTDEN is set.
23 RXDEN	RXFIFO DMA Request Enable. This bit enables/disables the RXFIFO DMA Request. 0 Disable 1 Enable
22 -	This field is reserved. Reserved
21–16 RX_ THRESHOLD	RX THRESHOLD. This field defines the FIFO threshold that triggers a RX DMA/INT request. A RX DMA/INT request is issued when the number of data entries in the RXFIFO is greater than RX_THRESHOLD.
15–8 -	This field is reserved. Reserved
7 TEDEN	TXFIFO Empty DMA Request Enable. This bit enables/disables the TXFIFO Empty DMA Request. 0 Disable 1 Enable
6 -	This field is reserved. Reserved
TX_ THRESHOLD	TX THRESHOLD. This field defines the FIFO threshold that triggers a TX DMA/INT request. A TX DMA/INT request is issued when the number of data entries in the TXFIFO is not greater than TX_THRESHOLD.

20.7.7 Status Register (ECSPIx_STATREG)

The ECSPI Status Register (ECSPI_STATREG) reflects the status of the ECSPI's operating condition. If the ECSPI is disabled, this register reads 0x0000_0003.

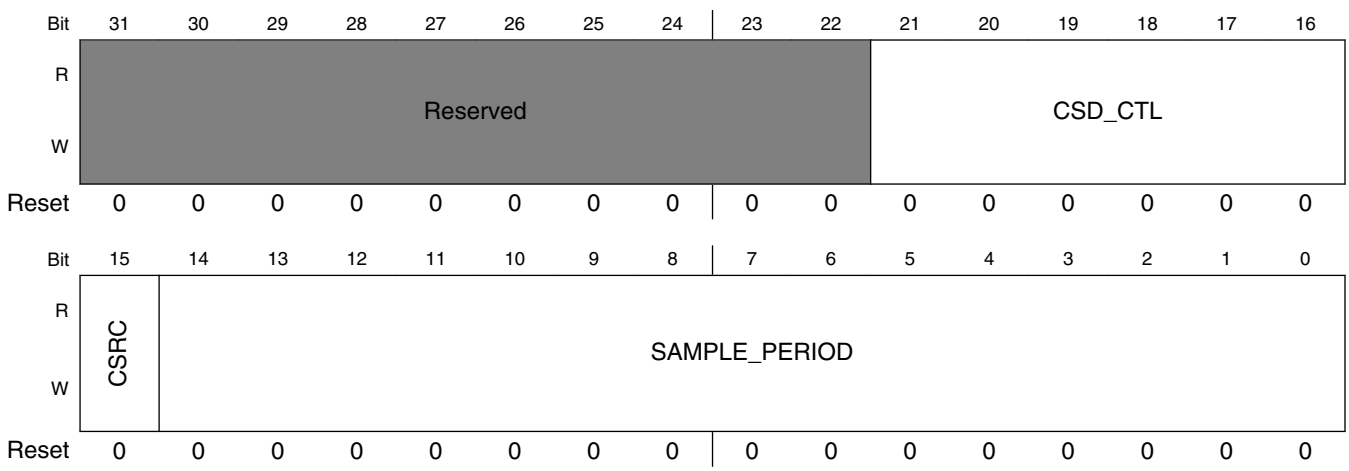
Address: Base address + 18h offset

ECSPIx_STATREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TC	Transfer Completed Status bit. Writing 1 to this bit clears it. 0 Transfer in progress. 1 Transfer completed.
6 RO	RXFIFO Overflow. When set, this bit indicates that RXFIFO has overflowed. Writing 1 to this bit clears it. 0 RXFIFO has no overflow. 1 RXFIFO has overflowed.
5 RF	RXFIFO Full. This bit is set when the RXFIFO is full. 0 Not Full. 1 Full.
4 RDR	RXFIFO Data Request. 0 When RXTDE is set - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is set - Number of data entries in the RXFIFO is greater than RX_THRESHOLD or a DMA TAIL DMA condition exists. 0 When RXTDE is clear - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is clear - Number of data entries in the RXFIFO is greater than RX_THRESHOLD.
3 RR	RXFIFO Ready. This bit is set when one or more words are stored in the RXFIFO. 0 No valid data in RXFIFO. 1 More than 1 word in RXFIFO.
2 TF	TXFIFO Full. This bit is set when if the TXFIFO is full.

Table continues on the next page...

ECSPIx_STATREG field descriptions (continued)



Field	Description
	0 TXFIFO is not Full. 1 TXFIFO is Full.
1 TDR	TXFIFO Data Request. 0 Number of valid data slots in TXFIFO is greater than TX_THRESHOLD. 1 Number of valid data slots in TXFIFO is not greater than TX_THRESHOLD.
0 TE	TXFIFO Empty. This bit is set if the TXFIFO is empty. 0 TXFIFO contains one or more words. 1 TXFIFO is empty.

20.7.8 Sample Period Control Register (ECSPIx_PERIODREG)

The Sample Period Control Register (ECSPI_PERIODREG) provides software a way to insert delays (wait states) between consecutive SPI transfers. Control bits in this register select the clock source for the sample period counter and the delay count indicating the number of wait states to be inserted between data transfers.

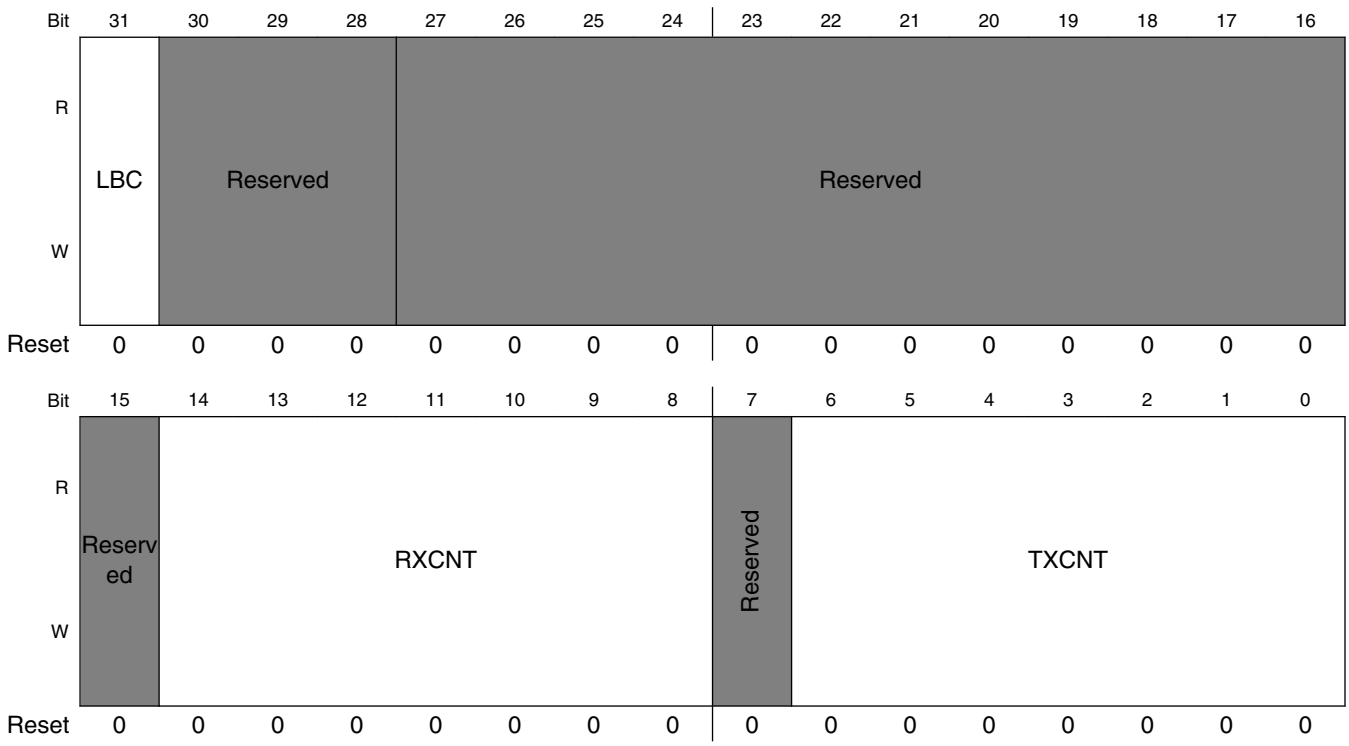
The delay counts apply only when the current channel is operating in Master mode (ECSPI_CONREG[CHANNEL MODE] = 1).ECSPI_PERIODREG also contains the CSD CTRL field used to insert a delay between the Chip Select's active edge and the first SPI Clock edge.

Address: Base address + 1Ch offset

ECSPIx_PERIODREG field descriptions

Field	Description
31–22 -	This field is reserved. Reserved

Table continues on the next page...



ECSPIx_PERIODREG field descriptions (continued)

Field	Description
21–16 CSD_CTL	Chip Select Delay Control bits. This field defines how many SPI clocks will be inserted between the chip select's active edge and the first SPI clock edge. The range is from 0 to 63.
15 CSRC	Clock Source Control. This bit selects the clock source for the sample period counter. 0 SPI Clock (SCLK) 1 Low-Frequency Reference Clock (32.768 KHz)
SAMPLE_ PERIOD	Sample Period Control. These bits control the number of wait states to be inserted in data transfers. During the idle clocks, the state of the SS output will operate according to the SS_CTL control field in the ECSPI_CONREG register. 0x0000 0 wait states inserted 0x0001 1 wait state inserted ... ... 0x7FFE 32766 wait states inserted 0x7FFF 32767 wait states inserted

20.7.9 Test Control Register (ECSPIx_TESTREG)

The Test Control Register (ECSPI_TESTREG) provides software a mechanism to internally connect the receive and transmit devices of the ECSPI, and monitor the contents of the receive and transmit FIFOs.

Address: Base address + 20h offset

ECSPIx_TESTREG field descriptions

Field	Description
31 LBC	Loop Back Control. This bit is used in Master mode only. When this bit is set, the ECSPI connects the transmitter and receiver sections internally, and the data shifted out from the most-significant bit of the shift register is looped back into the least-significant bit of the Shift register. In this way, a self-test of the complete transmit/receive path can be made. The output pins are not affected, and the input pins are ignored. 0 Not connected. 1 Transmitter and receiver sections internally connected for Loopback.
30–28 -	This field is reserved. Reserved, all bits should be ignored.
27–15 -	This field is reserved. Reserved
14–8 RXCNT	RXFIFO Counter. This field indicates the number of words in the RXFIFO.

Table continues on the next page...

ECSPIx_TESTREG field descriptions (continued)

Field	Description
7 -	This field is reserved. Reserved
TXCNT	TXFIFO Counter. This field indicates the number of words in the TXFIFO.

20.7.10 Message Data Register (ECSPIx_MSGDATA)

The Message Data Register (ECSPI_MSGDATA) forms the top word of the 16 x 32 MSG Data FIFO. Only word-size accesses are allowed for this register. Reads to this register return zero, and writes to this register store data in the MSG Data FIFO.

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	ECSPI_MSGDATA																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_MSGDATA field descriptions

Field	Description
ECSPI_ MSGDATA	ECSPI_MSGDATA holds the top word of MSG Data FIFO. The MSG Data FIFO is advanced for each write of this register. The data read is zero. The data written to this register is stored in the MSG Data FIFO.

Chapter 21
External Interface Module (EIM)

21.1 Overview

The EIM handles the interface to devices external to the chip, including generation of chip selects, clock and control for external peripherals and memory. It provides asynchronous access to devices with SRAM-like interface and synchronous access to devices with NOR-Flash-like or PSRAM-like interface.

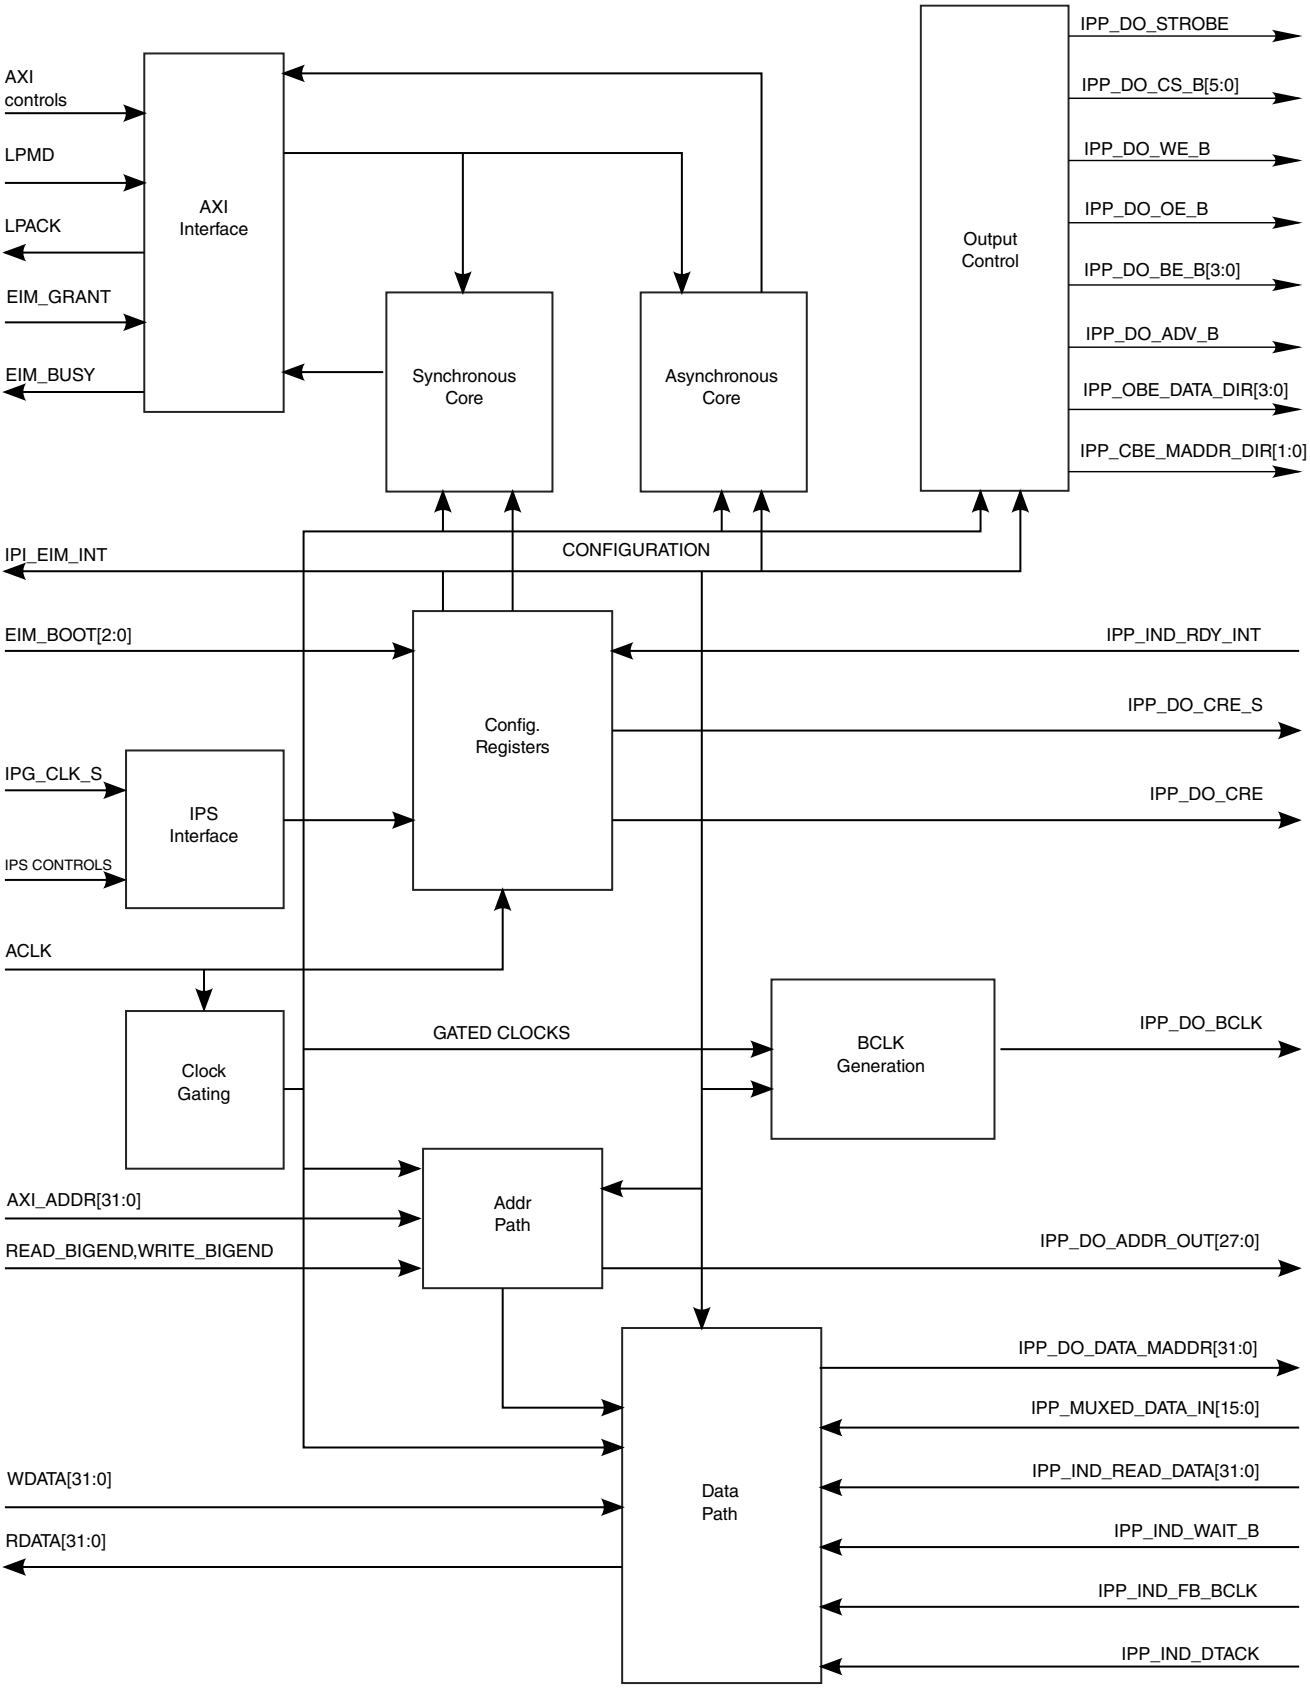


Figure 21-1. EIM Diagram

21.1.1 Features

- Four chip selects for external devices
  - Flexible address decoding. Each chip select memory space determined separately, according to VIA port configuration (see Chip Select Memory Map). Configurable Chip Select 0 base address (by VIA)
  - Individual select signal for each one of the memory space defined. Up to 6 memory spaces may be defined and programmed individually.
  - 128 MByte maximum supported density by default (AUS bit is cleared). When the AUS bit is set, maximum supported density is 32 MBytes.
- Selectable Write Protection for each Chip Select
- Support for multiplexed address / data bus operation x16 port size
- Programmable Data Port Size for each Chip Select (x8, x16)
- Programmable Wait-State generator for each Chip Select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Support for Asynchronous page mode accesses (x16 port size)
- Independent synchronous Memory Burst Read Mode support for NOR-Flash and PSRAM memories (x16 port size)
- Independent synchronous Memory Burst Write Mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Support of NAND-Flash devices with NOR-Flash like interface - MDOC™ (M-Systems), OneNAND™ (Samsung)
- Independent programmable variable/fix Latency support for read and write synchronous (burst) mode
- Support for Big Endian and Little Endian operation modes per access
- ARM AXI slave interface. One ID at a time support.

21.1.2 Modes of Operation

The EIM has the following modes of operation:

- Asynchronous Mode
- Asynchronous Page Mode
- Multiplexed Address/Data mode
- Burst Clock Mode
- Low Power Modes
- Boot Mode

See details in the EIM Operational Modes.

21.1.2.1 Asynchronous Mode

This is a non-burst mode that is used for SRAM access. In this mode, a single data is read/written with each access (asserted address).

All controls' timings are controlled by preset values in Chip Select Configuration Registers.

21.1.2.2 Asynchronous Page Read Mode

Setting the APR bit causes the EIM to perform memory burst accesses by emulating page mode operation.

The external address asserts for each piece of data. The initial access timing is according to RWSC field, and the next address assertions timing is according to PAT field. When APR bit is set, RCSN OEN, RADVN and RBEN fields are ignored for burst access to the external device.

The page size can be set via the BL field to 2, 4, 8, 16, or 32 words (the word size is determined by the DSZ field).

21.1.2.3 Multiplexed Address/Data Mode

In this mode, multiplexing addresses and data bits on the same pins is supported for synchronous/asynchronous accesses to x8/x16 data width memory devices.

For more information about the pins that drive data/address in 8/16 non-muxed mode and 16 muxed mode, see the following table.

Table 21-1. EIM Multiplexing

Setup	Non Multiplexed Addresss/Data Mode						Multiplexed Address/ Data Mode
	8-Bit				16-Bit		16 Bit
	NUM = 0, DSZ = 100	NUM = 0, DSZ = 101	NUM = 0, DSZ = 110	NUM = 0, DSZ = 111	NUM = 0, DSZ = 001	NUM = 0, DSZ = 010	NUM = 1, DSZ = 001

21.1.2.4 Burst Clock Mode

The controller has the ability to support burst synchronous operations in various frequencies, depending on the frequency of the input clock supplied by the system (EIM clock).

The EIM clock can be divided by one, two, three or four, and its frequency can be changed according to the requirements. Variable and fix latency are supported for this mode, according to the external device requirements.

- Synchronous read mode. This is a burst mode, which is used for reading from Flash/ PSRAM memory devices. In this mode, after address assertion a burst of sequential data can be read. Data exchange is carried out according to BCLK being generated by EIM. An access is delayed according to external WAIT_B signal assertion (signal from the memory device).
- Synchronous write mode. A burst mode used for accessing external devices, which support synchronous write type of access (PSRAM protocol). In this mode, after address assertion a burst of sequential data can be written to the external device. Access may be delayed according to WAIT_B signal assertion (signal from the memory device) before first piece of data arrived to the external device.

NOTE

Maximum frequency of the EIM main clock is 133 Mhz. It may be reduced by the system for special cases of external devices, which demand a different frequency then integer division of the 133 MHz clock.

21.1.2.5 Low Power Modes

The input clock is gated by ACT_CS bits. When all the ACT_CS are negated (all CS disable) the internal clock is turned off; awready/wready & arready signal are de-asserted and the master can't access the EIM.

21.1.2.6 Boot Mode

It is possible to perform a boot operation from external device located on CS0. The configuration of the relevant bits are done with boot mode signals according to the external device parameters (for example, port size and protocol assertion).

See for more details.

21.2 External Signals

The following table describes the external signals of EIM:

21.2.1 Other Important Block I/O Signals Internal to the SoC

The following table provides a description of other signals which are internal to the i.MX 6UltraLite that are important to understand the function of EIM.

Name	I/O	Description
EIM_FB_BCLK	Input	Burst Clock Feedback. This block input is used to sample read data during high transfer speeds. The signal provides feedback from the I/O pad of the BCLK output pin and tends to align more closely with data from the external memory device.
EIM_BOOT	Input	EIM Boot Configuration. These block inputs determine the reset state of DSZ[1:0] and MUM.
ACLK	Input	AXI clock, maximum frequency 133 Mhz
IPG_CLK_S	Input	EIM module IPG clock
RST_B	Input	Active low HW reset
EIM_WARM_RESET	Input	Warm Reset. If this signal is asserted the rst_b will reset only the internal FF and state machine while S/W registers will keep their current state. This signal is active high signal.

21.3 Clocks

The following table describes the clock sources for EIM. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 21-2. EIM Clocks

Clock name	Clock Root	Description
aclk	aclk_eim_slow_clk_root	EIM clock (main)
aclk_slow	aclk_eim_slow_clk_root	EIM clock (slow)
ipg_clk_s	ipg_clk_root	Peripheral access clock
aclk_exsc	aclk_eim_slow_clk_root	EIM clock (external device)

- ACLK: EIM clock (main clock, AXI clock) with a Max frequency of 133 MHz. Can be gated externally when there is no active AXI access.
- ACLK_SLOW: EIM all time running ACLK. Used for flip-flops that must be active even when EIM is in low power down mode to provide clock for lpack/lpmd registers, IP registers and IP to AXI sync registers.
- IPG_CLK_S: IPG clock for IP accesses. IP registers are activated by ACLK_SLOW clock.
- ACLK_EXSC: Clock created from EIM clock for External device usage. Integer division by 1, 2, 3 and 4 of the clock can be use with BCD bit field configuration, according to external devices demands. EIM clock frequency may be reduced for lower frequency support which cannot be achieved via BCD bit field.

21.4 Chip Select Memory Map

The EIM memory space is mapped into 128 MB total memory space in the processor memory. For addresses, see the System memory map table and the CM4 memory map table. The total 128 MB of memory can be divided among the EIM four chip selects. The memory configuration across the chip selects is controlled by the IOMUXC_GPR1 register. The ADDRSn[10] fields control how much memory is allotted to each chip select.

The following four configurations are supported:

- CS0 (128 MB), CS1 (0 MB), CS2 (0 MB), CS3 (0 MB) [default configuration]
- CS0 (64 MB), CS1 (64 MB), CS2 (0 MB), CS3 (0 MB)
- CS0 (64 MB), CS1 (32 MB), CS2 (32 MB), CS3 (0 MB)
- CS0 (32 MB), CS1 (32 MB), CS2 (32 MB), CS3 (32 MB)

21.5 Functional Description

This section provides the functional description for the EIM.

21.5.1 Bus Sizing Configuration

The EIM supports byte, half word and word operands allowing access to x8, x16, x32 ports. It can be address/data multiplexed in x16, x32 ports. The port size is programmable via the DSZ bit field in the corresponding Chip Select Configuration Register. An 8-bit port can reside in each one of the bytes of the data bus. A 16-bit port can reside on the lower 16 bits of the data bus, DATA_IN/OUT[15:0] or on the higher 16 bits of the data bus, DATA_IN/OUT[31:16].

In the case of a multi-cycle transfer, the lower two address bits (ADDR[1:0]) are incremented appropriately. The EIM address bus is configured according to DSZ bit field and AUS bits. There is either one bit (for x16 port size) or two bits (for x32 port size) right shift of the address bits (only when AUS=0) and no bit shift when AUS = 1 or DSZ[2] = 1.

The EIM has a data multiplexer which takes the four bytes of the AXI data bus and routes them to their required positions to properly interface to memory.

NOTE

A word access to or from a x16 port requires two external bus cycles to complete the transfer.

A word access to or from a x8 port requires four external bus cycles to complete the transfer.

21.5.1.1 8 BIT PORT SUPPORT

EIM has limited support for mot68000 & intel 386 protocols.

21.5.1.1.1 MOTOROLA 68000

EIM has limited support for mot68000 protocol. Only basic read or write asynchronous operations are supported.

The following operations are not supported:

- Read modify write
- Sync access
- All special accesses (ARM platform space, bus arbitration, bus control, bus error & reset operations)
- FC outputs

21.5.1.1.2 INTEL 386

EIM has limited support for intel 386 protocol. Only basic read or write async non-pipelined operations are supported.

The following operations are not supported:

- Other bus cycles (interrupt, halt & refresh)
- Bus lock
- M/IO, DC, LBA, NA, REFRESH & BS8 signals

21.5.2 EIM Operational Modes

Listed here are the main operational modes for EIM selected by control bit fields settings.

For details, see the bit field descriptions of SWR / SRD / MUM. All modes are supported in with 8-, 16- or 32-bit port configuration, according to DSZ bit field.

Table 21-3. EIM Operation Modes Field Settings

Control bit fields			Brief mode description
MUM	SRD	SWR	
0	0	0	Asynchronous write / Asynchronous read for APR=0 / Asynchronous page read for APR=1, none multiplexed
		1	Synchronous write/ Asynchronous read or APR=0 / Asynchronous page read for APR=1,none multiplexed
	1	0	Asynchronous write/Synchronous read none multiplexed
		1	Synchronous write/read none multiplexed
1	0	0	Asynchronous write/read multiplexed
		1	Synchronous write/ Asynchronous read multiplexed
	1	0	Asynchronous write/Synchronous read multiplexed
		1	Synchronous write/read multiplexed

21.5.3 Burst Mode (Synchronous) Memory Operation

This mode is enabled for read or write access. Bit SWR sets the burst mode for write operations at the corresponding chip select and bit SRD sets it for read operation.

When this mode is set, the controller attempts to translate the Master burst accesses to memory burst accesses, being limited by the memory burst length, predefined by BL value, or memory and Master WRAP/INCR boundary crossing non-matching. Only the first address accessed is put by the controller on the external address bus in a memory burst sequence.

EIM may translate from some Master sequential accesses to one or several memory bursts, but not from two Master individual accesses to one memory burst.

For the first access in a memory burst sequence, the EIM asserts $\overline{\text{ADV}}$, causing the external burst device to latch the starting burst address; then toggle the burst clock (BCLK) for a predefined number of cycles in order to latch the first unit of data. Subsequent accessed data units can then be burst in fewer clock cycles, realizing an overall increase in bus bandwidth.

NOTE

The BCLK signal toggles only when burst access is executed toward the external device (BCM=1'b0 for normal mode use). It runs with a 50% duty cycle until the end of access is reached. When access is terminated, BCLK stops toggling.

Memory burst accesses are terminated by the EIM whenever it detects the following:

- The specific burst length has executed completely (end of access)
- Write access - missing data in write buffer (Master is delaying the data transfer toward the EIM)
- Next sequential access crosses boundary with unequal condition (wrap/increment, burst length) on the Master and memory
- Current memory burst length reached

21.5.4 Burst Clock Divisor (BCD)

In some cases, it may be necessary to slow the external bus in relation to the internal bus to allow accesses to burst devices that have a maximum operating frequency less than the operating frequency of the internal bus.

The internal bus frequency can be divided by one, two, three or four for presentation on the external bus in burst mode operation.

BCLK can only be set to integer divisions of the incoming clock frequency. To get a specific frequency on BCLK, configure the divider to change the incoming EIM clock accordingly.

By programming the BCD bit field to various values, two signals on the external bus are affected; $\overline{ADV}$ and BCLK. The $\overline{ADV}$ signal is asserted according to RADVA or WADVA bit fields programming, and is negated according to the formula mentioned in RADVN and WADVN bit fields description. The BCLK signal runs with a 50% duty cycle until the end of access is reached.

If BCM = 1, the BCLK runs at frequency according to GBCD bit field settings on every async memory access, regardless of the SWR and SRD bits configuration. Caution should be exercised when using BCM bit; GBCD bit field should be updated once and should not change when BCLK is toggling. The BCM bit is used mainly for system debug mode. It has no functional use of the EIM in normal mode.

21.5.5 Burst Clock Start (BCS)

In an effort to allow greater flexibility in achieving the minimum number of wait states on burst accesses, you can determine when you want the BCLK to start toggling after the start of access. This allows the BCLK to be skewed from point of data capture on the EIM clock by any number of EIM clock cycles.

Care must be exercised when setting BCS bit field in conjunction with the BCD and RWSC/WWSC bit fields. See the external timing diagrams in Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=1 and Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=0 for examples of how to use the BCS, BCD and RWSC/WWSC bit fields together.

21.5.6 Multiplexed Address/Data Mode Support

The control bit MUM allows support memory with multiplexed address/data bus both in asynchronous and in synchronous modes.

Caution should be exercised for using OEA/WEA & ADH bit fields. They should be configured according to the external device requirements, as it determines the time point of end of address phase and start of data phase.

21.5.7 Mixed Master/Memory Burst Modes Support

To provide mixed sequential/wrap accesses with different length, EIM interprets burst signal and generate additional $\overline{ADV}$ signals whenever there appear unequal address or burst boundary crossing condition.

BL bit field is used to notify EIM about current memory burst and wrap condition for properly external address generation. In case of non-matching boundaries in both the memory and Master access, EIM starts a new memory burst access by updating address from Master on address bus and generating $\overline{\text{ADV}}$ signal.

21.5.8 AXI (Master) Bus Cycles Support

The EIM uses an ARM AXI slave interface. It has a 32-bit bus and supports one access (one ID) at a time. No out of order or parallel accesses are supported.

The following AXI protocol signals are not supported:

- AWLOCK
- AWCACHE
- ARLOCK
- ARCACHE

ARID bus is sampled when:

- new read access is valid on the read address channel and is reflected on the RID bus output toward the master.

AWID bus is sampled when:

- new write access is valid on the write address channel and is reflected on the WID/BID bus output toward the master.

ARPROT and AWPROT signal are partially used. ARPROT[0] and AWPROT[0] bits are used for normal/privileged access detection. ARPROT[2:1] and AWPROT[2:1] are not used.

When sampling a valid access on both of the address channels, the read access will be performed first while write access is pending. After last data transfer completed, the pending write will be executed.

A new access may be executed one cycle after sampling a valid access on the read or write address channels, assuming there is no current access (back to back) which can cause a recovery or end of access penalty cycles, for write access, also assuming data is in write buffer for fast execution.

NOTE

- Only 32-bit word size accesses are supported for burst mode accesses.
- Only 8-bit (1 byte), 16-bit (2 byte) and 32-bit (4 byte) word size supported for single access.

- Maximum number of burst length is 16.
- According to AXI protocol, burst access should not cross 4 KB blocks. In case EIM gets an access that crosses the 4 KB, memory address calculation is invalid.

AXI transfers shown in the table below are also supported. These AXI cycles will be translated into the necessary cycles on the memory side. For example, for optimal operation in case ARM cache is configured to 8 beat burst with wrap, a synchronous flash and cellular RAM memory should be configured in 16 word wrap burst mode when using a 16-bit data port, and in 8 word wrap burst mode when using a 32-bit data port. EIM uses BL bit field to support different memory configurations. The controller splits the transaction when needed in some cases. See Table 21-5.

Table 21-4. AXI Burst Cycles Supported

Burst Length - Number of data transfers	Burst size - Bytes in transfer	Burst type	Description
1	1	INCR	Single transfer
1	2	INCR	Single transfer
1	4	INCR	Single transfer
2	4	WRAP	2-beat wrapping burst
4	4	WRAP	4-beat wrapping burst
8	4	WRAP	8-beat wrapping burst
16	4	WRAP	16-beat wrapping burst
2	4	INCR	2-beat incrementing burst
3	4	INCR	3-beat incrementing burst
4	4	INCR	4-beat incrementing burst
5	4	INCR	5-beat incrementing burst
6	4	INCR	6-beat incrementing burst
7	4	INCR	7-beat incrementing burst
8	4	INCR	8-beat incrementing burst
9	4	INCR	9-beat incrementing burst
10	4	INCR	10-beat incrementing burst
11	4	INCR	11-beat incrementing burst
12	4	INCR	12-beat incrementing burst
13	4	INCR	13-beat incrementing burst
14	4	INCR	14-beat incrementing burst
15	4	INCR	15-beat incrementing burst
16	4	INCR	16-beat incrementing burst

Table 21-5. AXI to Memory Burst Splits Number

	Cont.	2	2	2

21.5.9 WAIT_B Signal, RWSC and WWSC bit fields Usage

Most of the external devices supporting burst mode for write or read accesses provide a signal which indicates data is valid on the memory bus (a.k.a. handshake mode). For this mode, RFL and WFL bits should be cleared and RWSC/ WWSC bit fields indicate when the controller should start sampling this signal from the external device or, in other words, how many BCLK cycles should be masked.

For devices which do not use this signal or have a fixed latency ability, the RFL and WFL bits may be set for internal calculation regarding BCLK cycles penalty until data is valid (memory initial access time). For this mode, RWSC/ WWSC indicates when the data is ready for sampling by the controller (read access) or the external device (write access). There is separation between read and write accesses wait-state control. For read access, RWSC bit field is valid and WWSC bit field is ignored; for write access, WWSC is valid and RWSC is ignored.

21.5.10 IPS Register Interface

Access to the registers of the EIM, read or write, is made with IPS protocol signals. The system should avoid changing the registers while master/memory transaction is valid, as this can cause an unknown behavior of the controller.

Register access size is 32-bit as the register size definition, other size of access (byte or half word) is not supported.

21.5.11 MRS Set for PSRAM

Memory registers of PSRAM devices can be configured according to external signal, which indicates whether the access is to a memory array or memory register domain.

When the CRE bit is set, the following transactions to the external device will assert the CRE signal. The polarity of this signal is determined by the CREP bit for active low or active high assertion of the signal.

21.5.12 EIM Access Termination

EIM is monitoring the corresponding CSx control signal every time variable latency access or dtack access is performed toward the external device.

In variable latency accesses, the Watchdog Timer (WDOG-1) counts BCLK cycles. If it reaches the wdog_limit (according to the WDOG_LIMIT bit field in the WCR) before the device signals can drive/sample new data, the controller will terminate the access and generate an error response transfer toward the Master.

In dtack access, WDOG-1 counts ACLK cycles instead of BCLK and it reaches the wdog_limit before the device asserts the dtack signal, the controller will terminate the access and generate an error response transfer toward the Master.

WDOG-1 can by disabled by WDOG_EN bit in the WCR.

21.5.13 Error Conditions

The following conditions cause an error (AXI error or IPS error) response signal:

- AXI errors
  - Access to a disabled chip select - access to a mapped chip select address space where the CSEN bit in the corresponding chip select Configuration Register is clear

- Access to a non mapped address - access to an address that is not mapped to any CS.
- User access to a supervisor-protected chip select address space (the SP bit in the corresponding chip select Configuration Register is set)
- User access in fixed mode access
- User performs write access to write protected chip select
- First write data ID and write address ID do not match. (No data is written to the memory.)
- First Write Data ID and write address ID match but one or more of the other Write data IDs does not match the First Write data ID (data is written to memory according)
- Access duration to external device from CSx signal assertion is 128/256/512/1024 cycles (access is terminated by the controller) - This error can be disabled be software.

- IPS errors
  - User read or write access to a reserved/non-valid address in the EIM Configuration Register

21.5.14 DTACK Mode

In DTACK mode, the EIM uses DTACK signal as an indication of when to end the access.

DTACK is an asynchronous edge/level sensitive signal. DTACK polarity is configurable by the DAP bit in CsxGCR2 (default value is 0).

In this case, EIM begins the access and after a few cycles (according DAPS field) and waits until DTACK (after synchronization) becomes asserted, then samples the data in read access and completes the current data access (see Figure 21-15, Figure 21-16 & Figure 21-17).

If more than one data is needed, CS will be negated between access (CSREC field is not zero) and the AXI burst access will be split into single accesses (see Figure 21-19).

21.5.15 EIM_GRANT / EIM_BUSY Handshake Description

Prior to executing command to one of the external device (chip select), EIM assert EIM_BUSY signal (1'b1) and checks the EIM_GRANT signal status.

If EIM_GRANT signal is high, it indicates external data bus is not used by other slaves (NAND Flash Controller) and EIM may start to execute the access. If EIM_GRANT is low, EIM waits until it is set (1'b1) before executing the access.

EIM keeps EIM_BUSY signal set until it completes the access toward the external device.

Once EIM_GRANT signal is set, it can not be reset until EIM_BUSY signal is cleared by EIM.

NOTE

In 16-bit Muxed EIM doesn't use the data bus, therefore there is no sharing of the data bus with NFC. EIM doesn't wait for EIM_GRANT signal from NFC and doesn't assert the EIM_BUSY signal.

21.5.16 LPMD / LPACK Handshake Description

These signals are used for frequency and/or voltage change, and for entering low power mode during normal operation of the EIM. Before any change can take place, the controller and all the relevant external devices should be in idle state, which means no access or data transfer is in process.

LPMD input signal is asserted once EIM detects the assertion of LPMD, all ready signals of the AXI channels are negated, and EIM is not sampling new accesses. It finishes all the ongoing accesses and already pending ones. When EIM is in idle state, the LPACK output signal is asserted. EIM will stay in idle state and the LPACK signal will stay asserted until the LPMD signal is negated.

21.5.17 Endianness

Big and Little endianness are supported by the controller according to the following table.

Table 21-6. EIM Out/in Data in Case AXI Out/in Data is 0xB3B2B1B0

Endian mode	AXI access	AXI address [1:0]	Port size and used bits								
			Word port				Half word port			Byte port	
			[31:24]	[23:16]	[15:8]	[7:0]	External address [0]	[31:24] ([15:8])	[23:16] ([7:0])	External address [1:0]	[31:24] ([23:16]) ([15:8]) ([7:0])
Big	Word	0	0xB3	0xB2	0xB1	0xB0	0	0xB3	0xB2	0	0xB3
										1	0xB2
							1	0xB1	0xB0	2	0xB1
										3	0xB0
	Half Word	0			0xB1	0xB0	0	0xB3	0xB2	0	0xB3
										1	0xB2
		2	0xB3	0xB2			1	0xB1	0xB0	2	0xB1
										3	0xB0
	Byte	0				0xB0	0		0xB3	0	0xB3
		1			0xB1			0xB2		1	0xB2
		2		0xB2			1		0xB1	2	0xB1

										1	0xB1
		2	0xB3	0xB2			1	0xB3	0xB2	2	0xB2
										3	0xB3
	Byte	0				0xB0	0		0xB0	0	0xB0
		1			0xB1			0xB1		1	0xB1
		2		0xB2			1		0xB2	2	0xB2
		3	0xB3					0xB3		3	0xB3

21.5.18 Strobe Signal Use

The strobe signal is toggling according to address/data valid condition on the external bus for read and write accesses, and for both synchronous and asynchronous modes.

At any time point when address/data is valid on the external bus, the strobe signal will generate a positive edge, which can be used to sample the external data and control signal.

NOTE

Strobe signal for read data is active (RL + 1) cycles after data on external bus is valid.

21.6 Initialization Information

21.6.1 Booting from EIM

EIM is ready to work with CS0 after the hardware reset, but it has been configured for very slow access (for boot purposes), with additional setup and hold time.

Other CSs are disabled by hardware reset. Therefore, all CSs must be properly initialized before use in writing values to the corresponding chip select configuration registers.

DSZ[1:0] and MUM fields are set according to EIM_BOOT [2:0] block inputs.

21.7 Typical Application

Application note uses following functions to illustrate EIM and memory accesses:

- WR16(address, data) is a 16 bit write access
- WR32(address, data) is a 32 bit write access
- RD16(address, data) is a 16 bit read access
- RD32(address, data) is a 32 bit read access
- WR_I(address, data, delta, counter) is a write data sequence, there data(i+1) = data(i) + delta
- COMMAND_SEQUENCE
- CHECK_STATUS

NOTE

COMMAND_SEQUENCE and CHECK_STATUS are described in AMD Flash Utility, Intel Sibley Flash Utility, MDOC Device Utility, Samsung OneNAND Utility, and Spansion Flash Utility.

All addresses are byte addresses. "CS0" is a Chip Select 0 base address. "EIM_" is a prefix of EIM's registers. 'h is a prefix of hexadecimal constant. "//" is a comment beginning. csba[cs] is a dimension of CS base addresses. "addr" means an address offset in current CS address space. Examples use CS0 address space, but it may apply to any CS except for boot mode functionality.

Configuration examples were verfied with the memory models listed below and may require some adjustments for other family members.

21.7.1 Access to Intel Sibley Flash

The following configurations are intended to Sibley family muxed and non-muxed devices.

21.7.1.1 Intel Sibley Flash Asynchronous Mode Configuration

- WR32('EIM_CS0GCR1,'h00210081);
- WR32('EIM_CS0RCR1,'h0e020000);
- WR32('EIM_CS0RCR2,'h00000000);
- WR32('EIM_CS0WCR1,'h0704a040);

21.7.1.2 Intel Sibley Flash Synchronous Mode Configuration

Configuration used for 133 MHz synchronous access to flash:

```
// Set memory to synchronous read mode
     WR16('CS0+('h5903<<1),'h0060);
     WR16('CS0+('h5903<<1),'h0003);
     WR16('CS0+('h0000<<1),'h00ff);
// Set EIM configuration to synchronous timing
     WR32('EIM_CS0GCR1,'h50214225);                    // 133 MHz
     WR32('EIM_CS0RCR1,'h0c000000);                    // 12 cycles on memory
```

Configuration used for 66 MHz synchronous access to muxed flash:

```
// Set memory to synchronous read mode
     WR16('CS0+('h3103<<1),'h0060);
     WR16('CS0+('h3103<<1),'h0003);
     WR16('CS0+('h0000<<1),'h00ff);
//-------------------------------------------------------------------------
// Set EIM configuration to synchronous timing
     WR32('EIM_CS0GCR1,'h5021122d);                    // 66 MHz
     WR32('EIM_CS0RCR1,'h07000000);                    // 7cycles on memory
```

21.7.1.3 Intel Sibley Flash Utility

```
// Single data word programming to addr
     WR16('CS0+addr,'h0060);                 // Unlock
     WR16('CS0+addr,'h00d0);
     WR16('CS0+addr, 'h0041);
     WR16('CS0+addr, data);
     WR16('CS0+caddr, 'h0070);                 // Read Status command
     while('CS0+data[7] == 0)                              // Wait / Polling
         RD16('CS0+addr, data);              // Read status
     RD16('CS0+addr, data);                  // Read status
```

```
    WR16('CS0+'h0000,'h00ff);
// Write buffer programming
    WR16('CS0+addr,'h0060);                 // Unlock
    WR16('CS0+addr,'h00d0);
    data    = 0;
    WR16('CS0+addr, 'h0070);                // Read Status command
    while(data[7] == 0)                             // Wait
        RD16('CS0+addr, data);              // Read status
    WR16('CS0+'h0000,'h00ff);
    WR16('CS0+addr,'h00e9);           // Write Buffer command
    WR16('CS0+addr,255);              // Word counter (<256)
    for(i=0; i<'h200; i = i + 'h40)
       WR_I('CS0+addr+i, data+((i>2)*'h0010_0001), 'h0010_0001, 16); // Data
    WR16('CS0+addr,'h00d0);           // Write Confirm command
    data  = 0;
    while(data[7] == 0)                      // Wait
       RD16('CS0+addr, data);         // Read status
    RD16('CS0+addr, data);            // Read status
    WR16('CS0+'h0000,'h00ff);
```

21.7.2 Access to MDOC Device

The following configurations are intended to MDOC H3 device.

21.7.2.1 MDOC Device Boot

To boot from the MDOC device the ERRST bit should be configured to 1, so that EIM will hold the first read access to CS0 until the MDOC asserts the RDY signal.

21.7.2.2 MDOC Device Asynchronous Mode Configuration

```
// Non-muxed mode
WR32('EIM_CS0GCR1,'h00410081);
WR32('EIM_CS0RCR1,'h0e121010);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h12092492);
// Muxed mode
WR32('EIM_CS0GCR1,'h00410081);
WR32('EIM_CS0RCR1,'h0e121010);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h12092492);
```

21.7.2.3 MDOC Device Utility

```
// Read Manufacturer ID and Device ID
    RE16('CS0+'h9400,'h4833);
    RE16('CS0+'h9422,'hb7cc);
```

21.7.3 Access to Micron PSRAM

The following configurations are intended to mt45w4mw16bfb_706.

21.7.3.1 Micron PSRAM Asynchronous Mode Configuration

```
// 16 bit memory
    WR32('EIM_CS0GCR1,'h403104b1);
    WR32('EIM_CS0RCR1,'h0b010000);
    WR32('EIM_CS0RCR2,'h00000008);
    WR32('EIM_CS0WCR1,'h0b040040);
// 32 bit memory
    WR32('EIM_CS0GCR1,'h403304b1);
    WR32('EIM_CS0RCR1,'h0f010000);
    WR32('EIM_CS0RCR2,'h00000008);
    WR32('EIM_CS0WCR1,'h0f040040);
```

21.7.3.2 Micron PSRAM Synchronous Mode Configuration

```
// 16 bit memory
    WR32('EIM_CS0GCR1,'h403104b1);
    WR32('EIM_CS0WCR1,'h0b040000);
    WR16('CS0+('h85947<<1),'h0040); // memory configuration
    WR32('EIM_CS0GCR1,'h4021_5487);// fixed latency memory wrap 4
    WR32('EIM_CS0RCR1,'h04000000);
    WR32('EIM_CS0RCR2,'h00000008);
    WR32('EIM_CS0WCR1,'h04000000);
// 32 bit memory
    WR32('EIM_CS0GCR1,'h6003_04f1);
    WR32('EIM_CS0WCR1,'h0b04_0000);
    WR32('CS0+('h85947<<2),'h0040); // memory configuration
    WR32('EIM_CS0GCR1,'h4003_1487); // var latency memory inc. page size 128
    WR32('EIM_CS0RCR1,'h04000000);
    WR32('EIM_CS0RCR2,'h00000008);
    WR32('EIM_CS0WCR1,'h04000000);
```

21.7.4 Access to Samsung OneNAND

Mentioned below are the configurations intended for Samsung OneNAND muxed and non-muxed devices.

21.7.4.1 Samsung OneNAND Boot

There are two ways to boot from Samsung OneNAND. In the first way, the ERRST bit is set to 0 and the user has to poll the interrupt status in the OneNAND interrupt register (or set interrupt handler there). In the second way, the ERRST bit is set to 1 and the user should enable the device interrupt output before the first read from CS0 access is issued.

Load sectors 2,3 to DataRAM, page 0 done in the next example:

- WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
- WR16('CS0+('hF100<<1),'h0); // block[8:0] address
- WR16('CS0+('hF107<<1),'h2); // sector[1:0] and page[7:2] addresses
- WR16('CS0+('hF200<<1),'h802); // buffer[11:8] address and counter[1:0]
- WR16('CS0+('hF101<<1),'h0); // DDP choose
- WR16('CS0+('hF220<<1),'h0); // Set command

21.7.4.2 Samsung OneNAND Asynchronous Mode Configuration

```
// Non-muxed memory
    WR32('EIM_CS0GCR1,'h00410081);
    WR32('EIM_CS0RCR1,'h0b010000);
    WR32('EIM_CS0RCR2,'h00000000);
    WR32('EIM_CS0WCR1,'h0c092480);
// Muxed memory
    WR32('EIM_CS0GCR1,'h00410089);
    WR32('EIM_CS0RCR1,'h0b010000);
    WR32('EIM_CS0RCR2,'h00000000);
    WR32('EIM_CS0WCR1,'h0c092480);
```

21.7.4.3 Samsung OneNAND Synchronous Mode Configuration

Set memory and EIM to synchronous read mode is shown in the next example:

```
    WR16('CS0+('hF221<<1),'hc0e0); // Synchronous read, 4 clk latency
    WR32('EIM_CS0GCR1,'h50412405); // 44 MHz (non-muxed)
    WR32('EIM_CS0RCR1,'h05010000);
```

The muxed Samsung OneNAND supports synchronous write, too:

```
// Set memory & EIM to synchronous read and write mode
    WR16('CS0+('hF221<<1),'hc0f2); // Sync. read and write, 4 clk latency
    WR32('EIM_CS0GCR1,'h5041240f); // 44 MHz
    WR32('EIM_CS0RCR1,'h05010000);
    WR32('EIM_CS0WCR1,'h05040000);
```

21.7.4.4 Samsung OneNAND Utility

The following utility algorithms are used on the Samsung OneNAND:

```
// Unlock Block command
    WR16('CS0+('hF100<<1),'h0);        // DFS
    WR16('CS0+('hF100<<1),'h0);        // DBS
    WR16('CS0+('hF24c<<1),'h2);        // SBA - block number (2)
    WR16('CS0+('hF241<<1),'h0);        // Clear interrupt status
    WR16('CS0+('hF220<<1),'h23);       // Unlock command
    data ='h0;
    while(!(data &'h0004))             // Polling
       RD32('WIAR, data); // Read status
// Erase block command
    WR16('CS0+('hF100<<1),'h2);        // DFS and block ([8:0]) address
    WR16('CS0+('hF101<<1),'h0);        // DBS
    WR16('CS0+('hF241<<1),'h0);        // Clear interrupt status
```

```
                    WR16('CS0+('hF220<<1),'h94);            // Erase command
          data ='h0;
          while(!(data &'h0004))                    // Wait
              RD32('WIAR, data); // Read status
     // Program page command
          WR16('CS0+('hF100<<1),'h2);               // DFS and block[8:0] address
          WR16('CS0+('hF107<<1),'h0);               // sector[1:0] and page[7:2] addresses
          WR16('CS0+('hF200<<1),'h800);             // buffer[11:8] address and counter[1:0]
          WR16('CS0+('hF241<<1),'h0);               // Clear interrupt status
          WR16('CS0+('hF220<<1),'h80);              // Program command
          data ='h0;
          while(!(data &'h0004))                    // Wait
              RD32('WIAR, data); // Read status
```

21.7.5 Access to Samsung UtRAM

Below mentioned configurations are intended for Samsung UtRAM.

21.7.5.1 Samsung UtRAM Asynchronous Mode Configuration

```
          WR32('EIM_CS0GCR1,'h400104b1);
          WR32('EIM_CS0RCR1,'h0a010000);
          WR32('EIM_CS0RCR2,'h00000008);
          WR32('EIM_CS0WCR1,'h0b040040);
```

21.7.5.2 Samsung UtRAM Synchronous Mode Configuration

```
          RD16('CS0+('hff_ffff<<1),data);             // command sequence
          RD16('CS0+('hff_ffff<<1),data);
          RD16('CS0+('hff_ffff<<1),data);
          RD16('CS0+('hff_feff<<1),data);
          RD16('CS0+('h00_82a0<<1),data);             // memory sync. configuration
          WR32('EIM_CS0GCR1,'h4021_53b7);            // fixed latency memory wrap 32
          WR32('EIM_CS0RCR1,'h0500_0000);
          WR32('EIM_CS0WCR1,'h0300_0000);
```

21.7.6 Access to Spansion Flash

Below mentioned configurations are intended for Spansion Flash.

21.7.6.1 Spansion Flash Asynchronous Mode Configuration

```
          WR32('EIM_CS0GCR1,'h00410081);
          WR32('EIM_CS0RCR1,'h0a018000);
          WR32('EIM_CS0RCR2,'h00000000);
          WR32('EIM_CS0WCR1,'h0704a240);
WR16('CS0+('hF220<<1),'h94);            // Erase command
          data ='h0;
          while(!(data &'h0004))                    // Wait
              RD32('WIAR, data); // Read status
     // Program page command
```

```
    WR16('CS0+('hF100<<1),'h2);             // DFS and block[8:0] address
    WR16('CS0+('hF107<<1),'h0);             // sector[1:0] and page[7:2] addresses
    WR16('CS0+('hF200<<1),'h800);           // buffer[11:8] address and counter[1:0]
    WR16('CS0+('hF241<<1),'h0);             // Clear interrupt status
    WR16('CS0+('hF220<<1),'h80);            // Program command
    data ='h0;
    while(!(data &'h0004))                  // Wait
        RD32('WIAR, data); // Read status
```

21.7.6.2 Spansion Flash Synchronous Mode Configuration

```
    WR16('CS0+('h0555<<1),'h00aa);   // command sequence
    WR16('CS0+('h02aa<<1),'h0055);
    WR16('CS0+('h0555<<1),'hd0);
    WR16('CS0+('h0000<<1),'h1ec4);   // memory sync. configuration
    WR32('EIM_CS0GCR1,'h50411325); // 66 MHz
    WR32('EIM_CS0RCR1,'h05000000); // 5 cycles on memory
```

21.7.6.3 Spansion Flash Utility

```
// Single word programming
    COMMAND_SEQUENCE(cs,16,'ha0);           // single word programming
    WR16('CS0+addr, data);
    CHECK_STATUS('CS0+addr,data,16,1,errst);
// Write buffer programming
    COMMAND_SEQUENCE(0,16,'h25);              // write buffer programming
    WR16('CS0+addr,'h001f);                     // counter-1
    WR_I('CS0+addr, data, 'h0010_0001, 16); // data
    WR16('CS0+addr,'h0029);                     // write buffer to flash
    CHECK_STATUS('CS0+addr+'h3e,data[31:16]+'h00f0,16,1,errst);
```

There COMMAND_SEQUENCE and CHECK_STATUS are next functions:

```
task COMMAND_SEQUENCE;
    input[2:0]    cs;
    input[7:0]    port_size;
    input[31:0]   code;
begin
    if(port_size == 16)
       begin
       WR16(csba[cs]+('h0555<<1),'h00aa);
       WR16(csba[cs]+('h02aa<<1),'h0055);
       WR16(csba[cs]+('h0555<<1),code);
       end
    else
       begin

21.9 EIM Memory Map/Register Definition

The EIM includes 33 user-accessible 32-bit registers. The the EIM Configuration Register (EIM_WCR) contains control bits that configure the EIM for certain operation modes.

The 160 bits used to control Individual Chip Select are divided into five registers:

- Chip Select n General Configuration Register 1 (EIM_CSnGCR1)
- Chip Select n General Configuration Register 2 (EIM_CSnGCR2)
- Chip Select n Read Configuration Register 1 (EIM_CSnRCR1)
- Chip Select n Read Configuration Register 2 (EIM_CSnRCR2)
- Chip Select n Write Configuration Register (EIM_CSnWCR)

In addition there are 3 general registers: EIM_WCR, EIM_WIAR & EIM_EAR.

NOTE

- All EIM registers are sampled by IPG_CLK_S, therefore IPG_CLK_S must be active when accessing through IP bus.
- Read access from all registers (except EIM_WIAR & EIM_EAR) will generate one IPG_XFR_WAIT cycle.
- Read access from EIM_WIAR & EIM_EAR will generate six IPG_XFR_WAIT cycles.
- Write access to all registers (except EIM_EAR) will generate three IPG_XFR_WAIT cycles.
- Write access to EIM_EAR will generate six IPG_XFR_WAIT cycles.

EIM_CS*n*GCR1 field descriptions

Field	Description
31–28 PSZ	Page Size. This bit field indicates memory page size in words (word is defined by the DSZ field). PSZ is used when fix latency mode is applied, WFL=1 for sync. write accesses, RFL=1 for sync. Read accesses. When working in fix latency mode WAIT signal from the external device is not being monitored, PSZ is used to determine if page boundary is reached and renewal of access is preformed. This bit field is ignored when sync. Mode is disabled or fix latency mode is not being used for write or read access separately. It can be valid for both access type, read or write, or only for one type, according to configuration. PSZ is cleared by a hardware reset. 0000 8 words page size 0001 16 words page size 0010 32 words page size 0011 64 words page size 0100 128 words page size 0101 256 words page size 0110 512 words page size 0111 1024 (1k) words page size 1000 2048 (2k) words page size 1001 - 1111 Reserved
27 WP	Write Protect. This bit prevents writes to the address range defined by the corresponding chip select. WP is cleared by a hardware reset. 0 Writes are allowed in the memory range defined by chip. 1 Writes are prohibited. All attempts to write to an address mapped by this chip select result in a error response and no assertion of the chip select output.
26–24 GBC	Gap Between Chip Selects. This bit field, according to the settings shown below, determines the minimum time between end of access to the current chip select and start of access to different chip select. GBC is cleared by a hardware reset.

Table continues on the next page...

EIM_CS*n*GCR1 field descriptions (continued)

Field	Description
	Example settings: 000 minimum of 0 EIM clock cycles before next access from different chip select (async. mode only) 001 minimum of 1 EIM clock cycles before next access from different chip select 010 minimum of 2 EIM clock cycles before next access from different chip select 111 minimum of 7 EIM clock cycles before next access from different chip select
23 AUS	Address UnShifted. This bit indicates an unshifted mode for address assertion for the relevant chip select accesses. AUS bit is cleared by hardware reset. 0 Address shifted according to port size (DSZ config) (128 Mbyte maximum supported memory density). 1 Address unshifted (32 Mbyte maximum supported memory density).
22–20 CSREC	CS Recovery. This bit field, according to the settings shown below, determines the minimum pulse width of CS, OE, and WE control signals before executing a new back to back access to the same chip select. CSREC is cleared by a hardware reset. **NOTE:** The reset value for EIM_CS0GCR1, CSREC[2:0] is 0b110. For EIM_CS1GCR1 - EIM_CS5GCR, the reset value is 0b000. Example settings: 000 0 EIM clock cycles minimum width of CS, OE and WE signals (read async. mode only) 001 1 EIM clock cycles minimum width of CS, OE and WE signals 010 2 EIM clock cycles minimum width of CS, OE and WE signals 111 7 EIM clock cycles minimum width of CS, OE and WE signals
19 SP	Supervisor Protect. This bit prevents accesses to the address range defined by the corresponding chip select when the access is attempted in the User mode. SP is cleared by a hardware reset. 0 User mode accesses are allowed in the memory range defined by chip select. 1 User mode accesses are prohibited. All attempts to access an address mapped by this chip select in User mode results in an error response and no assertion of the chip select output.
18–16 DSZ	Data Port Size. This bit field defines the width of an external device's data port as shown below. **NOTE:** Only async. access supported for 8 bit port. **NOTE:** The reset value for EIM_CS0GCR1, DSZ[2] = 0, DSZ[1:0] = EIM_BOOT[1:0]. For EIM_CS1GCR1 - EIM_CS5GCR1, the reset value is 0b001. 000 Reserved. 001 16 bit port resides on DATA[15:0] 010 16 bit port resides on DATA[31:16] 011 32 bit port resides on DATA[31:0] 100 8 bit port resides on DATA[7:0] 101 8 bit port resides on DATA[15:8] 110 8 bit port resides on DATA[23:16] 111 8 bit port resides on DATA[31:24]
15–14 BCS	Burst Clock Start. When SRD=1 or SWR=1,this bit field determines the number of EIM clock cycles delay from start of access before the first rising edge of BCLK is generated. When BCD=0 value of BCS=0 results in a half clock delay after the start of access. For other values of BCD a one clock delay after the start of access is applied, not an immediate assertion. BCS is cleared by a hardware reset. 00 0 EIM clock cycle additional delay

Table continues on the next page...

EIM_CS*n*GCR1 field descriptions (continued)

Field	Description
	01 1 EIM clock cycle additional delay 10 2 EIM clock cycle additional delay 11 3 EIM clock cycle additional delay
13–12 BCD	Burst Clock Divisor. This bit field contains the value used to program the burst clock divisor for BCLK generation. It is used to divide the internal EIMbus frequency. BCD is cleared by a hardware reset. **NOTE:** For other then the mentioned below frequency such as 104 MHz, EIM clock (input clock) should be adjust accordingly. 00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
11 WC	Write Continuous. The WI bit indicates that write access to the memory are always continuous accesses regardless of the BL field value. WI is cleared by hardware reset. 0 Write access burst length occurs according to BL value. 1 Write access burst length is continuous.
10–8 BL	Burst Length. The BL bit field indicates memory burst length in words (word is defined by the DSZ field) and should be properly initialized for mixed wrap/increment accesses support. Continuous BL value corresponds to continuous burst length setting of the external memory device. For fix memory burst size, type is always wrap. In case not matching wrap boundaries in both the memory (BL field) and Master access on the current address, EIM update address on the external device address bus and regenerates the access. BL is cleared by a hardware reset. When APR=1, Page Read Mode is applied, BL determine the number of words within the read page burst. BL is cleared by a hardware reset for EIM_CS0GCR1 - EIM_CS5GCR1. 000 4 words Memory wrap burst length (read page burst size when APR = 1) 001 8 words Memory wrap burst length (read page burst size when APR = 1) 010 16 words Memory wrap burst length (read page burst size when APR = 1) 011 32 words Memory wrap burst length (read page burst size when APR = 1) 100 Continuous burst length (2 words read page burst size when APR = 1) 101 Reserved 110 Reserved 111 Reserved
7 CREP	Configuration Register Enable Polarity. This bit indicates CRE memory pin assertion state, active-low or active-high, while executing a memory register set command to the external device (PSRAM memory type). CREP is set by a hardware reset. **NOTE:** Whenever PSRAM is connected the CREP value must be correct also for accesses where CRE is disabled. For Non-PSRAM memory CREP value should be 1. 0 CRE signal is active low 1 CRE signal is active high
6 CRE	Configuration Register Enable. This bit indicates CRE memory pin state while executing a memory register set command to PSRAM external device. CRE is cleared by a hardware reset.

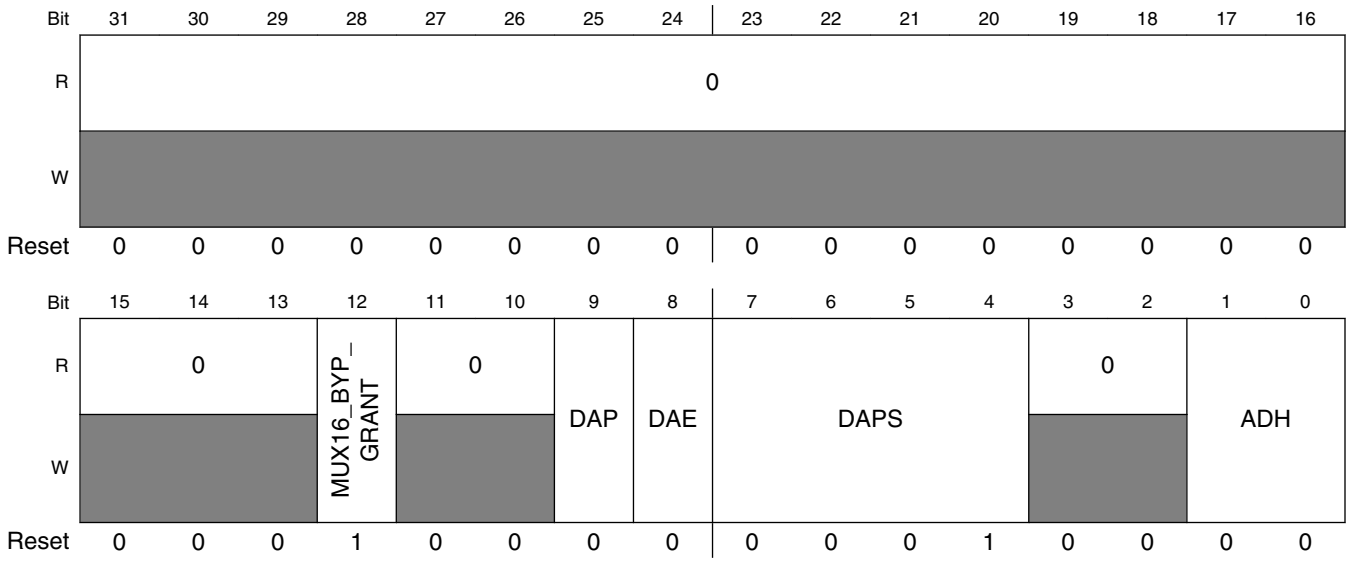

Table continues on the next page...

EIM_CS*n*GCR1 field descriptions (continued)

Field	Description
	0 CRE signal use is disable 1 CRE signal use is enable
5 RFL	Read Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start sampling data according to RWSC field, it only valid in synchronous mode. RFL is cleared by a hardware reset. When RFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device. 0 the External device WAIT signal is being monitored, and it reflect the external data bus state 1 the state of the External devices is determined internally (Fix latency mode only)
4 WFL	Write Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start data transfer according to WWSC field, it only valid in synchronous mode. WFL is cleared by a hardware reset. When WFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device 0 the External device WAIT signal is being monitored, and it reflect the external data bus state 1 the state of the External devices is determined internally (Fix latency mode only)
3 MUM	Multiplexed Mode. This bit determines the address/data multiplexed mode for asynchronous and synchronous accesses for 8 bit, 16 bit or 32 bit devices (DSZ config. dependent). **NOTE:** The reset value for EIM_CS0GCR1[MUM] = EIM_BOOT[2]. For EIM_CS1GCR1 - EIM_CS5GCR1 the reset value is 0. 0 Multiplexed Mode disable 1 Multiplexed Mode enable
2 SRD	Synchronous Read Data. This bit field determine the read accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SRD is cleared by a hardware reset. **NOTE:** Sync. accesses supported only for 16/32 bit port. 0 read accesses are in Asynchronous mode 1 read accesses are in Synchronous mode
1 SWR	Synchronous Write Data. This bit field determine the write accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SWR is cleared by a hardware reset. **NOTE:** Sync. accesses supported only for 16/32 bit port. 0 write accesses are in Asynchronous mode 1 write accesses are in Synchronous mode
0 CSEN	CS Enable. This bit controls the operation of the chip select pin. CSEN is set by a hardware reset for CSGCR0 to allow external boot operation. CSEN is cleared by a hardware reset to CSGCR1-CSGCR5. **NOTE:** Reset value for EIM_CS0GCR1 for CSEN is 1. For EIM_CS1GCR1-CS1GCR5 reset value is 0. 0 Chip select function is disabled; attempts to access an address mapped by this chip select results in an error respond and no assertion of the chip select output 1 Chip select is enabled, and is asserted when presented with a valid access.

21.9.2 Chip Select n General Configuration Register 2 (EIM_CS*n*GCR2)

Address: 21B_8000h base + 4h offset + (24d × i), where i=0d to 3d

EIM_CS*n*GCR2 field descriptions

Field	Description
31–13 Reserved	This read-only field is reserved and always has the value 0.
12 MUX16_BYP_GRANT	Muxed 16 bypass grant. This bit when asserted causes EIM to bypass the grant/ack. arbitration with NFC (only for 16 bit muxed mode accesses). 0 EIM waits for grant before driving a 16 bit muxed mode access to the memory. 1 EIM ignores the grant signal and immediately drives a 16 bit muxed mode access to the memory.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9 DAP	Data Acknowledge Polarity. This bit indicates DTACK memory pin assertion state, active-low or active-high, while executing an async access using DTACK signal from the external device. DAP is cleared by a hardware reset. 0 DTACK signal is active high 1 DTACK signal is active low
8 DAE	Data Acknowledge Enable. This bit indicates external device is using DTACK pin as strobe/terminator of an async. access. DTACK signal may be used only in asynchronous single read (APR=0) or write accesses. DTACK poling start point is set by DAPS bit field. polarity of DTACK is set by DAP bit field. DAE is cleared by a hardware reset. 0 DTACK signal use is disable 1 DTACK signal use is enable
7–4 DAPS	Data Acknowledge Poling Start. This bit field determine the starting point of DTACK input signal polling. DAPS is used only in asynchronous single read or write accesses.

Table continues on the next page...

EIM_CS*n*GCR2 field descriptions (continued)

Field	Description
	NOTE: Since DTACK is an async. signal the start point of DTACK signal polling is at least 3 cycles after the start of access. DAPS is cleared by a hardware reset. Example settings: 0000 3 EIM clk cycle between start of access and first $\overline{\text{DTACK}}$ check 0001 4 EIM clk cycles between start of access and first $\overline{\text{DTACK}}$ check 0010 5 EIM clk cycles between start of access and first $\overline{\text{DTACK}}$ check 0111 10 EIM clk cycles between start of access and first $\overline{\text{DTACK}}$ check 1011 14 EIM clk cycles between start of access and first DTACK check 1111 18 EIM clk cycles between start of access and first DTACK check
3–2 Reserved	This read-only field is reserved and always has the value 0.
ADH	Address hold time - This bit field determine the address hold time after ADV negation when mum = 1 (muxed mode). When mum = 0 this bit has no effect. For read accesses the field determines when the pads direction will be switched. **NOTE:** Reset value for EIM_CS0GCR2 for ADH is 0b10. For EIM_CS1GCR2-EIM_CS5GCR2 reset value is 0b00. 00 0 cycle after ADV negation 01 1 cycle after ADV negation 10 2 cycle after ADV negation 11 Reserved

21.9.3 Chip Select n Read Configuration Register 1 (EIM_CS*n*RCR1)

Address: 21B_8000h base + 8h offset + (24d × i), where i=0d to 3d

EIM_CS*n*RCR1 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

EIM_CS*n*RCR1 field descriptions (continued)

Field	Description
29–24 RWSC	Read Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous read access to the external device connected to the chip select. When SRD=1 and RFL=0, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the controller can start sample data.Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode. When SRD=1 and RFL=1, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode. When SRD=0, RFL bit is ignored, RWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer. RWSC is cleared by a hardware reset. **NOTE:** The reset value for EIM_CS0RCR1, RWSC[5:0] = 0b011100. For CG1RCR1 - CS1RCR5 the reset value is 0b000000. Example settings: 000000 Reserved 000001 RWSC value is 1 000010 RWSC value is 2 111101 RWSC value is 61 111110 RWSC value is 62 111111 RWSC value is 63
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 RADVA	ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous read modes according to the settings shown below. RADVA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of access and ADV assertion 001 1 EIM clock cycles between beginning of access and ADV assertion 010 2 EIM clock cycles between beginning of access and ADV assertion 111 7 EIM clock cycles between beginning of access and ADV assertion
19 RAL	Read ADV Low. This bit field determine ADV signal negation time. When RAL=1, RADVN bit field is ignored and ADV signal will stay asserted until end of access. When RAL=0 negation of ADV signal is according to RADVN bit field configuration.
18–16 RADVN	ADV Negation. This bit field determines when ADV signal to memory is negated during read accesses. When SRD=1 (synchronous read mode), ADV negation occurs according to the following formula: (RADVN + RADVA + BCD + BCS + 1) EIM clock cycles from start of access. When asynchronous read mode is applied (SRD=0) and RAL=0 ADV negation occurs according to the following formula: (RADVN + RADVA + 1) EIM clock cycles from start of access. RADVN is cleared by a hardware reset. **NOTE:** The reset value for EIM_CS0RCR1[RADVN] = 0b010. For EIM_CS1RCR1 - EIM_CS5RCR1, the reset value is 0b000. **NOTE:** This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time with the end of access user should RAL bit.

Table continues on the next page...

EIM_CS*n*RCR1 field descriptions (continued)

Field	Description
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 OEA	OE Assertion. This bit field determines when OE signal are asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. OEA is cleared by a hardware reset. In muxed mode OE assertion occurs (OEA + RADVN + RADVA + ADH +1) EIM clock cycles from start of access. **NOTE:** The reset value for EIM_CS0RCR1[OEA] is 0b000 if EIM_BOOT[2] = 0. If EIM_BOOT[2] is 1, the reset value for EIM_CS0RCR1[OEA] is 0b010. The reset value of this field for EIM_CS1RCR1 - EIM_CS5RCR1 is 0b000. Example settings: 000 0 EIM clock cycles between beginning of access and OE assertion 001 1 EIM clock cycles between beginning of access and OE assertion 010 2 EIM clock cycles between beginning of access and OE assertion 111 7 EIM clock cycles between beginning of access and OE assertion
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 OEN	OE Negation. This bit field determines when OE signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. OEN is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between end of access and OE negation 001 1 EIM clock cycles between end of access and OE negation 010 2 EIM clock cycles between end of access and OE negation 111 7 EIM clock cycles between end of access and OE negation
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RCSA	Read CS Assertion. This bit field determines when CS signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RCSA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of read access and CS assertion 001 1 EIM clock cycles between beginning of read access and CS assertion 010 2 EIM clock cycles between beginning of read access and CS assertion 111 7 EIM clock cycles between beginning of read access and CS assertion
3 Reserved	This read-only field is reserved and always has the value 0.
RCSN	Read CS Negation. This bit field determines when CS signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. RCSN is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between end of read access and CS negation 001 1 EIM clock cycles between end of read access and CS negation 010 2 EIM clock cycles between end of read access and CS negation 111 7 EIM clock cycles between end of read access and CS negation

21.9.4 Chip Select n Read Configuration Register 2 (EIM_CS*n*RCR2)

Address: 21B_8000h base + Ch offset + (24d × i), where i=0d to 3d

EIM_CS*n*RCR2 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 APR	Asynchronous Page Read. This bit field determine the asynchronous read mode to the external device. When APR=0, the async. read access is done as single word (where word is defined by the DSZ field). when APR=1, the async. read access executed as page read. page size is according to BL field config., RCSN,RBEN,OEN and RADVN are being ignored. APR is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1. **NOTE:** SRD=0 and MUM=0 must apply when APR=1
14–12 PAT	Page Access Time. This bit field is used in Asynchronous Page Read mode only (APR=1). the initial access is set by RWSC as in regular asynchronous mode. the consecutive address assertions width determine by PAT field according to the settings shown below. when APR=0 this field is ignored. PAT is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1. 000 Address width is 2 EIM clock cycles 001 Address width is 3 EIM clock cycles 010 Address width is 4 EIM clock cycles 011 Address width is 5 EIM clock cycles 100 Address width is 6 EIM clock cycles 101 Address width is 7 EIM clock cycles 110 Address width is 8 EIM clock cycles 111 Address width is 9 EIM clock cycles
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 RL	Read Latency. This bit field indicates cycle latency when executing a synchronous read operation. The fields holds the feedback clock loop delay in aclk cycle units. This field is cleared by a hardware reset. 00 Feedback clock loop delay is up to 1 cycle for BCD = 0 or 1.5 cycles for BCD != 0 01 Feedback clock loop delay is up to 2 cycles for BCD = 0 or 2.5 cycles for BCD != 0

Table continues on the next page...

EIM_CS*n*RCR2 field descriptions (continued)

Field	Description
	10 Feedback clock loop delay is up to 3 cycles for BCD = 0 or 3.5 cycles for BCD != 0 11 Feedback clock loop delay is up to 4 cycles for BCD = 0 or 4.5 cycles for BCD != 0
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RBEA	Read BE Assertion. This bit field determines when BE signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RBEA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of read access and BE assertion 001 1 EIM clock cycles between beginning of read access and BE assertion 010 2 EIM clock cycles between beginning of read access and BE assertion 111 7 EIM clock cycles between beginning of read access and BE assertion
3 RBE	Read BE enable. This bit field determines if BE will be asserted during read access. 0 BE are disabled during read access. 1 BE are enable during read access according to value of RBEA & RBEN bit fields.
RBEN	Read BE Negation. This bit field determines when BE signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR=0), according to the settings shown below. This bit field is ignored when SRD=1. RBEN is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between end of read access and BE negation 001 1 EIM clock cycles between end of read access and BE negation 010 2 EIM clock cycles between end of read access and BE negation 111 7 EIM clock cycles between end of read access and BE negation

21.9.5 Chip Select n Write Configuration Register 1 (EIM_CS*n*WCR1)

Address: 21B_8000h base + 10h offset + (24d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EIM_CS*n*WCR1 field descriptions

Field	Description
31 WAL	Write ADV Low. This bit field determine ADV signal negation time in write accesses. When WAL=1, WADVN bit field is ignored and ADV signal will stay asserted until end of access. When WAL=0 negation of ADV signal is according to WADVN bit field configuration.
30 WBED	Write Byte Enable Disable. When asserted this bit prevent from IPP_DO_BE_B[x] to be asserted during write accesses.This bit is cleared by hardware reset.
29–24 WWSC	Write Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous write access to the external device connected to the chip select. When SWR=1 and WFL=0, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the memory can sample the first data.Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode. When SWR=1 and WFL=1, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode. When SWR=0, WFL bit is ignored, WWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer. WWSC is cleared by a hardware reset. **NOTE:** The reset value for EIM_CS0WCR1, WWSC[5:0] = 0b011100. For EIM_CS1WCR1 - EIM_CS5WCR1, the reset value of this field is 0b000000. Example settings: 000000 Reserved 000001 WWSC value is 1 000010 WWSC value is 2 000011 WWSC value is 3 111111 WWSC value is 63
23–21 WADVA	ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous write modes according to the settings shown below. WADVA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of access and ADV assertion 001 1 EIM clock cycles between beginning of access and ADV assertion 010 2 EIM clock cycles between beginning of access and ADV assertion 111 7 EIM clock cycles between beginning of access and ADV assertion
20–18 WADVN	ADV Negation. This bit field determines when ADV signal to memory is negated during write accesses. When SWR=1 (synchronous write mode), ADV negation occurs according to the following formula: (WADVN + WADVA + BCD + BCS + 1) EIM clock cycles. When asynchronous read mode is applied (SWR=0) ADV negation occurs according to the following formula: (WADVN + WADVA + 1) EIM clock cycles. **NOTE:** Reset value for EIM_CS0WCR for WADVN is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000. **NOTE:** This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time as the end of access, S/W should set the WAL bit.
17–15 WBEA	BE Assertion. This bit field determines when BE signal is asserted during write cycles in async. mode only (SWR=0), according to the settings shown below. BEA is cleared by a hardware reset.

Table continues on the next page...

EIM_CS*n*WCR1 field descriptions (continued)

Field	Description
	NOTE: Reset value for EIM_CS0WCR for WBEA is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000. Example settings: 000 0 EIM clock cycles between beginning of access and BE assertion 001 1 EIM clock cycles between beginning of access and BE assertion 010 2 EIM clock cycles between beginning of access and BE assertion 111 7 EIM clock cycles between beginning of access and BE assertion
14–12 WBEN	BE[3:0] Negation. This bit field determines when BE[3:0] bus signal is negated during write cycles in async. mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. BEN is cleared by a hardware reset. **NOTE:** Reset value for EIM_CS0WCR for WBEN is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000. Example settings: 000 0 EIM clock cycles between end of access and WE negation 001 1 EIM clock cycles between end of access and WE negation 010 2 EIM clock cycles between end of access and WE negation 111 7 EIM clock cycles between end of access and WE negation
11–9 WEA	WE Assertion. This bit field determines when WE signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below. This bit field is ignored when executing a read access to the external device. WEA is cleared by a hardware reset. **NOTE:** Reset value for EIM_CS0WCR for WEA is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000. Example settings: 000 0 EIM clock cycles between beginning of access and WE assertion 001 1 EIM clock cycles between beginning of access and WE assertion 010 2 EIM clock cycles between beginning of access and WE assertion 111 7 EIMclock cycles between beginning of access and WE assertion
8–6 WEN	WE Negation. This bit field determines when WE signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. WEN is cleared by a hardware reset. **NOTE:** Reset value for EIM_CS0WCR for WEN is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000. Example settings: 000 0 EIM clock cycles between beginning of access and WE assertion 001 1 EIM clock cycles between beginning of access and WE assertion 010 2 EIM clock cycles between beginning of access and WE assertion 111 7 EIM clock cycles between beginning of access and WE assertion
5–3 WCSA	Write CS Assertion. This bit field determines when CS signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below.this bit field is ignored when executing a read access to the external device. WCSA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of write access and CS assertion

Table continues on the next page...

EIM_CS*n*WCR2 field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 WBCDD	Write Burst Clock Divisor Decrement. If this bit is asserted and BCD value is 0 sync. write access will be preformed as if BCD value is 1.When this bit is negated or BCD value is not 0 this bit has no affect. This bit is cleared by hardware reset.

21.9.7 EIM Configuration Register (EIM_WCR)

Address: 21B_8000h base + 90h offset = 21B_8090h

EIM_WCR field descriptions

Field	Description
31–12 Reserved	Reserved This read-only field is reserved and always has the value 0.
11 FRUN_ACLK_EN	Free run ACLK enable
10–9 WDOG_LIMIT	Memory Watchdog (WDOG) cycle limit. This bit field determines the number of BCLK cycles (ACLK cycles in dtack mode) before the WDOG counter terminates the access and send an error response to the master. 00 128 BCLK cycles 01 256 BCLK cycles 10 512 BCLK cycles 11 1024 BCLK cycles
8 WDOG_EN	Memory WDOG enable. This bit controls the operation of the wdog counter that terminates the EIM access. 0 Memory WDOG is Disabled 1 Memory WDOG is Enabled

Table continues on the next page...

EIM_WCR field descriptions (continued)

Field	Description
7–6 Reserved	This read-only field is reserved and always has the value 0.
5 INTPOL	Interrupt Polarity. This bit field determines the polarity of the external device interrupt. 0 External interrupt polarity is active low 1 External interrupt polarity is active high
4 INTEN	Interrupt Enable. When this bit is set the External signal RDY_INT as active interrupt. When interrupt occurs, INT bit at the WCR will be set and t EIM_EXT_INT signal will be asserted correspondingly. This bit is cleared by a hardware reset. 0 External interrupt Disable 1 External interrupt Enable
3 CONT_BCLK_ SEL	Continuous BCLK select When this bit is set BCLK pin output continuous clock. Otherwize, BCLK will output clock only when nesserary. 0 BCLK When nesserary 1 BCLK Continuous
2–1 GBCD	General Burst Clock Divisor. When BCM bit is set, this bit field contains the value used to program the burst clock divisor for Continuous BCLK generation. The other BCD bit fields for each chip select are ignored. It is used to divide the internal AXI bus frequency. When BCM=0 GBCD bit field has no influence. GBCD is cleared by a hardware reset. 00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
0 BCM	Burst Clock Mode. This bit selects the burst clock mode of operation. It is used for system debug mode. BCM is cleared by a hardware reset. **NOTE:** The BCLK frequency in this mode is according to GBCD bit field. **NOTE:** The BCLK phase is opposite to the EIM clock in this mode if GBCD is 0. **NOTE:** This bit should be used only in async. accesses. No sync access can be executed if this bit is set. **NOTE:** When this bit is set bcd field shouldn't be configured to 0. 0 The burst clock runs only when accessing a chip select range with the SWR/SRD bits set. When the burst clock is not running it remains in a logic 0 state. When the burst clock is running it is configured by the BCD and BCS bit fields in the chip select Configuration Register. 1 The burst clock runs whenever ACLK is active (independent of chip select configuration)

Chapter 22
10/100-Mbps Ethernet MAC (ENET)

22.1 Introduction

The MAC-NET core, in conjunction with a 10/100-Mbit/s MAC, implements layer 3 network acceleration functions. These functions are designed to accelerate the processing of various common networking protocols, such as IP, TCP, UDP, and ICMP, providing wire speed services to client applications.

22.2 Overview

The core implements a dual-speed 10/100-Mbit/s Ethernet MAC compliant with the IEEE802.3-2002 standard. The MAC layer provides compatibility with half- or full-duplex 10/100-Mbit/s Ethernet LANs.

The MAC operation is fully programmable and can be used in Network Interface Card (NIC), bridging, or switching applications. The core implements the remote network monitoring (RMON) counters according to IETF RFC 2819.

The core also implements a hardware acceleration block to optimize the performance of network controllers providing TCP/IP, UDP, and ICMP protocol services. The acceleration block performs critical functions in hardware, which are typically implemented with large software overhead.

The core implements programmable embedded FIFOs that can provide buffering on the receive path for lossless flow control.

Advanced power management features are available with magic packet detection and programmable power-down modes.

A unified DMA (uDMA), internal to the ENET module, optimizes data transfer between the ENET core and the SoC, and supports an enhanced buffer descriptor programming model to support IEEE 1588 functionality.

The programmable Ethernet MAC with IEEE 1588 integrates a standard IEEE 802.3 Ethernet MAC with a time-stamping module. The IEEE 1588 standard provides accurate clock synchronization for distributed control nodes for industrial automation applications.

22.2.1 Features

The MAC-NET core includes the following features.

22.2.1.1 Ethernet MAC features

- Implements the full 802.3 specification with preamble/SFD generation, frame padding generation, CRC generation and checking
- Supports zero-length preamble
- Dynamically configurable to support 10/100-Mbit/s operation
- Supports 10/100 Mbit/s full-duplex and configurable half-duplex operation
- Compliant with the AMD magic packet detection with interrupt for node remote power management
- Seamless interface to commercial ethernet PHY devices via one of the following:
  - a 4-bit Media Independent Interface (MII) operating at 2.5/25 MHz.
  - a 4-bit non-standard MII-Lite (MII without the CRS and COL signals) operating at 2.5/25 MHz.
  - a 2-bit Reduced MII (RMII) operating at 50 MHz.
- Simple 64-Bit FIFO user-application interface
- CRC-32 checking at full speed with optional forwarding of the frame check sequence (FCS) field to the client
- CRC-32 generation and append on transmit or forwarding of user application provided FCS selectable on a per-frame basis
- In full-duplex mode:
  - Implements automated pause frame (802.3 x31A) generation and termination, providing flow control without user application intervention
  - Pause quanta used to form pause frames — dynamically programmable
  - Pause frame generation additionally controllable by user application offering flexible traffic flow control
  - Optional forwarding of received pause frames to the user application
  - Implements standard flow-control mechanism
- In half-duplex mode: provides full collision support, including jamming, backoff, and automatic retransmission
- Supports VLAN-tagged frames according to IEEE 802.1Q
- Programmable MAC address: Insertion on transmit; discards frames with mismatching destination address on receive (except broadcast and pause frames)

- Programmable promiscuous mode support to omit MAC destination address checking on receive
- Multicast and unicast address filtering on receive based on 64-entry hash table, reducing higher layer processing load
- Programmable frame maximum length providing support for any standard or proprietary frame length
- Statistics indicators for frame traffic and errors (alignment, CRC, length) and pause frames providing for IEEE 802.3 basic and mandatory management information database (MIB) package and remote network monitoring (RFC 2819)
- Simple handshake user application FIFO interface with fully programmable depth and threshold levels
- Provides separate status word for each received frame on the user interface providing information such as frame length, frame type, VLAN tag, and error information
- Multiple internal loopback options
- MDIO master interface for PHY device configuration and management supports two programmable MDIO base addresses, and standard (IEEE 802.3 Clause 22) and extended (Clause 45) MDIO frame formats
- Supports legacy FEC buffer descriptors
- Interrupt coalescing reduces the number of interrupts generated by the MAC, reducing CPU loading

22.2.1.2 IP protocol performance optimization features

- Operates on TCP/IP and UDP/IP and ICMP/IP protocol data or IP header only
- Enables wire-speed processing
- Supports IPv4 and IPv6
- Transparent passing of frames of other types and protocols
- Supports VLAN tagged frames according to IEEE 802.1q with transparent forwarding of VLAN tag and control field
- Automatic IP-header and payload (protocol specific) checksum calculation and verification on receive
- Automatic IP-header and payload (protocol specific) checksum generation and automatic insertion on transmit configurable on a per-frame basis
- Supports IP and TCP, UDP, ICMP data for checksum generation and checking
- Supports full header options for IPv4 and TCP protocol headers

- Provides IPv6 support to datagrams with base header only — datagrams with extension headers are passed transparently unmodifed/unchecked
- Provides statistics information for received IP and protocol errors
- Configurable automatic discard of erroneous frames
- Configurable automatic host-to-network (RX) and network-to-host (TX) byte order conversion for IP and TCP/UDP/ICMP headers within the frame
- Configurable padding remove for short IP datagrams on receive
- Configurable Ethernet payload alignment to allow for 32-bit word-aligned header and payload processing
- Programmable store-and-forward operation with clock and rate decoupling FIFOs

22.2.1.3 IEEE 1588 features

- Supports all IEEE 1588 frames.
- Allows reference clock to be chosen independently of network speed.
- Software-programmable precise time-stamping of ingress and egress frames
- Timer monitoring capabilities for system calibration and timing accuracy management
- Precise time-stamping of external events with programmable interrupt generation
- Programmable event and interrupt generation for external system control
- Supports hardware- and software-controllable timer synchronization.
- Provides a 4-channel IEEE 1588 timer. Each channel supports input capture and output compare using the 1588 counter.

22.2.2 Block diagram

22.3 External Signals

The table found here describes the external signals of ENET.

Table 22-1. ENET1 External Signals

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET1_1588_EVENT0_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in	MII / RMII / RGMII	SD3_DATA7	ALT6	IO

Table continues on the next page...

Table 22-1. ENET1 External Signals (continued)

Signal	Description	Mode	Pad	Alt Mode	Direction
	ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.				
ENET1_1588_EVENT0_OUT	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII / RMII / RGMII	SD3_DATA6	ALT6	IO
ENET1_1588_EVENT1_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII / RMII / RGMII	SD1_DATA0	ALT6	IO
ENET1_1588_EVENT1_OUT	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII / RMII / RGMII	SD1_DATA1	ALT6	IO

	detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.				
ENET1_COL	Asserted upon detection of a collision and remains asserted while the collision persists. This signal is not defined for fullduplex mode.	MII	ENET1_COL	ALT0	IO
ENET1_CRS	Carrier sense. When asserted, indicates transmit or receive medium is not idle. In RMII mode, this signal is present on the ENET_RX_EN pin.	MII	ENET1_CRS	ALT0	IO
ENET1_MDC	Output clock provides a timing reference to the PHY for data transfers on the MDIO signal.	MII / RMII	ENET1_MDC	ALT0	IO
			ENET2_COL	ALT1	
			GPIO1_IO04	ALT2	
ENET1_MDIO	Transfers control information between the external PHY and the mediaaccess controller. Data is synchronous to MDC. This signal is an input after reset.	MII / RMII	ENET1_MDIO	ALT0	IO
			ENET2_CRS	ALT1	
			GPIO1_IO05	ALT2	
ENET1_REF_CLK1	In RMII mode, this signal is the reference clock for receive, transmit, and the control interface.	RMII	ENET1_TX_CLK	ALT1	IO
			GPIO1_IO05	ALT4	
ENET1_REF_CLK_25M	25 MHz Reference Clock	-	ENET1_RX_CLK	ALT1	IO
			GPIO1_IO03	ALT2	
ENET1_RGMII_RXC	In MII mode, provides a timing reference for RX_EN, RX_DATA[3:0], and RX_ER. In RGMII mode, provides a timing reference for RX_DATA[3:0] and RX_CTL.	RGMII	RGMII1_RXC	ALT0	IO
ENET1_RGMII_TXC	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII1_TXC	ALT0	IO
ENET1_RX_CLK	In MII mode, provides a timing reference for RX_EN, RX_DATA[3:0], and RX_ER. In RGMII mode, provides a timing reference for RX_DATA[3:0] and RX_CTL.	MII	ENET1_RX_CLK	ALT0	IO

Table continues on the next page...

Table 22-1. ENET1 External Signals (continued)

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET1_RX_DATA0	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RMII / RGMII	RGMII1_RD0	ALT0	IO
ENET1_RX_DATA1	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RMII / RGMII	RGMII1_RD1	ALT0	IO
ENET1_RX_DATA2	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RGMII	RGMII1_RD2	ALT0	IO
ENET1_RX_DATA3	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RGMII	RGMII1_RD3	ALT0	IO
ENET1_RX_EN	Asserting this input indicates the PHY has valid nibbles present on the MII. RX_EN must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RX_EN must start no later than the SFD and exclude any EOF. In RMII mode, this pin also generates the CRS signal. In RGMII mode, contains RXDV on the rising edge of RX_CLK, and a logical derivative of RX_EV and RX_ER (RX_EV XOR RX_ER) on the falling edge of RX_CLK.	MII / RMII / RGMII	RGMII1_RX_CTL	ALT0	IO
ENET1_RX_ER	When asserted with RXDV, indicates the PHY detects an error in the current frame.	MII / RMII	RGMII1_RXC	ALT1	IO
ENET1_TX_CLK	Input clock, which provides a timing reference for TX_EN, TX_DATA[3:0], and TX_ER.	MII	ENET1_TX_CLK	ALT0	IO
ENET1_TX_DATA0	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RMII / RGMII	RGMII1_TD0	ALT0	IO
ENET1_TX_DATA1	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RMII / RGMII	RGMII1_TD1	ALT0	IO
ENET1_TX_DATA2	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RGMII	RGMII1_TD2	ALT0	IO
ENET1_TX_DATA3	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RGMII	RGMII1_TD3	ALT0	IO
ENET1_TX_EN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame. In RGMII mode,	MII / RMII / RGMII	RGMII1_TX_CTL	ALT0	IO

Table continues on the next page...

Table 22-1. ENET1 External Signals (continued)

Signal	Description	Mode	Pad	Alt Mode	Direction
	contains TX_EN on the rising edge of TX_CTL, and a logical derivative of TX_EN and TX_ER (TX_EN XOR TX_ER) on the falling edge of TX_CTL.				
ENET1_TX_ER	When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols.	MII	RGMII1_TXC	ALT1	IO

Table 22-2. ENET2 External Signals

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET2_1588_EVENT0_IN	Capture/compare block input/ output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII / RMII / RGMII	SD3_DATA4	ALT6	IO
ENET2_1588_EVENT0_OUT	Capture/compare block input/ output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII / RMII / RGMII	SD3_DATA5	ALT6	IO

ENET2_TX_EN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame. In RGMII mode, contains TX_EN on the rising edge of TX_CTL, and a logical derivative of TX_EN and TX_ER (TX_EN XOR TX_ER) on the falling edge of TX_CTL.	MII / RMII / RGMII	RGMII2_TX_CTL	ALT0	IO
ENET2_TX_ER	When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols.	MII	RGMII2_TXC	ALT1	IO

22.4 Clocks

The table found here describes the clock sources for ENET. Please see for clock setting, configuration and gating information.

22.5 Memory map/register definition

ENET registers must be read or written with 32-bit accesses. Non-32 bit accesses will terminate with an error.

Reserved bits should be written with 0 and ignored on read. Unused registers read zero and a write has no effect.

This table shows Ethernet registers organization.

Table 22-3. Register map summary

Offset Address	Section	Description
0x0000 – 0x01FF	Configuration	Core control and status registers
0x0200 – 0x03FF	Statistics counters	MIB and Remote Network Monitoring (RFC 2819) registers
0x0400 – 0x0430	1588 control	1588 adjustable timer (TSM) and 1588 frame control
0x0600 – 0x07FC	Capture/Compare block	Registers for the Capture/Compare block

ENET memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20B_4004	Interrupt Event Register (ENET2_EIR)	32	w1c	0000_0000h	22.5.1/888
20B_4008	Interrupt Mask Register (ENET2_EIMR)	32	R/W	0000_0000h	22.5.2/891

22.5.1 Interrupt Event Register (ENETx_EIR)

When an event occurs that sets a bit in EIR, an interrupt occurs if the corresponding bit in the interrupt mask register (EIMR) is also set. Writing a 1 to an EIR bit clears it; writing 0 has no effect. This register is cleared upon hardware reset.

NOTE

TxBD[INT] and RxBD[INT] must be set to 1 to allow setting the corresponding EIR register flags in enhanced mode,

ENET_ECR[EN1588] = 1. Legacy mode does not require these flags to be enabled.

Address: Base address + 4h offset

ENETx_EIR field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30 BABR	Babbling Receive Error Indicates a frame was received with length in excess of RCR[MAX_FL] bytes.
29 BABT	Babbling Transmit Error Indicates the transmitted frame length exceeds RCR[MAX_FL] bytes. Usually this condition is caused when a frame that is too long is placed into the transmit data buffer(s). Truncation does not occur.
28 GRA	Graceful Stop Complete This interrupt is asserted after the transmitter is put into a pause state after completion of the frame currently being transmitted. See Graceful Transmit Stop (GTS) for conditions that lead to graceful stop. **NOTE:** The GRA interrupt is asserted only when the TX transitions into the stopped state. If this bit is cleared by writing 1 and the TX is still stopped, the bit is not set again.
27 TXF	Transmit Frame Interrupt Indicates a frame has been transmitted and the last corresponding buffer descriptor has been updated.
26 TXB	Transmit Buffer Interrupt Indicates a transmit buffer descriptor has been updated.

Table continues on the next page...

ENETx_EIR field descriptions (continued)

Field	Description
25 RXF	Receive Frame Interrupt Indicates a frame has been received and the last corresponding buffer descriptor has been updated.
24 RXB	Receive Buffer Interrupt Indicates a receive buffer descriptor is not the last in the frame has been updated.
23 MII	MII Interrupt. Indicates that the MII has completed the data transfer requested.
22 EBERR	Ethernet Bus Error Indicates a system bus error occurred when a uDMA transaction is underway. When this bit is set, ECR[ETHEREN] is cleared, halting frame processing by the MAC. When this occurs, software must ensure proper actions, possibly resetting the system, to resume normal operation.
21 LC	Late Collision Indicates a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame truncates with a bad CRC and the remainder of the frame is discarded.
20 RL	Collision Retry Limit Indicates a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. This error can only occur in half-duplex mode.
19 UN	Transmit FIFO Underrun Indicates the transmit FIFO became empty before the complete frame was transmitted. A bad CRC is appended to the frame fragment and the remainder of the frame is discarded.
18 PLR	Payload Receive Error Indicates a frame was received with a payload length error. See Frame Length/Type Verification: Payload Length Check for more information.
17 WAKEUP	Node Wakeup Request Indication Read-only status bit to indicate that a magic packet has been detected. Will act only if ECR[MAGICEN] is set.
16 TS_AVAIL	Transmit Timestamp Available Indicates that the timestamp of the last transmitted timing frame is available in the ATSTMP register.
15 TS_TIMER	Timestamp Timer The adjustable timer reached the period event. A period event interrupt can be generated if ATCR[PEREN] is set and the timer wraps according to the periodic setting in the ATPER register. Set the timer period value before setting ATCR[PEREN].
14–13 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
12 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

Field	Description
Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

22.5.2 Interrupt Mask Register (ENETx_EIMR)

EIMR controls which interrupt events are allowed to generate actual interrupts. A hardware reset clears this register. If the corresponding bits in the EIR and EIMR registers are set, an interrupt is generated. The interrupt signal remains asserted until a 1 is written to the EIR field (write 1 to clear) or a 0 is written to the EIMR field.

ENETx_EIMR field descriptions

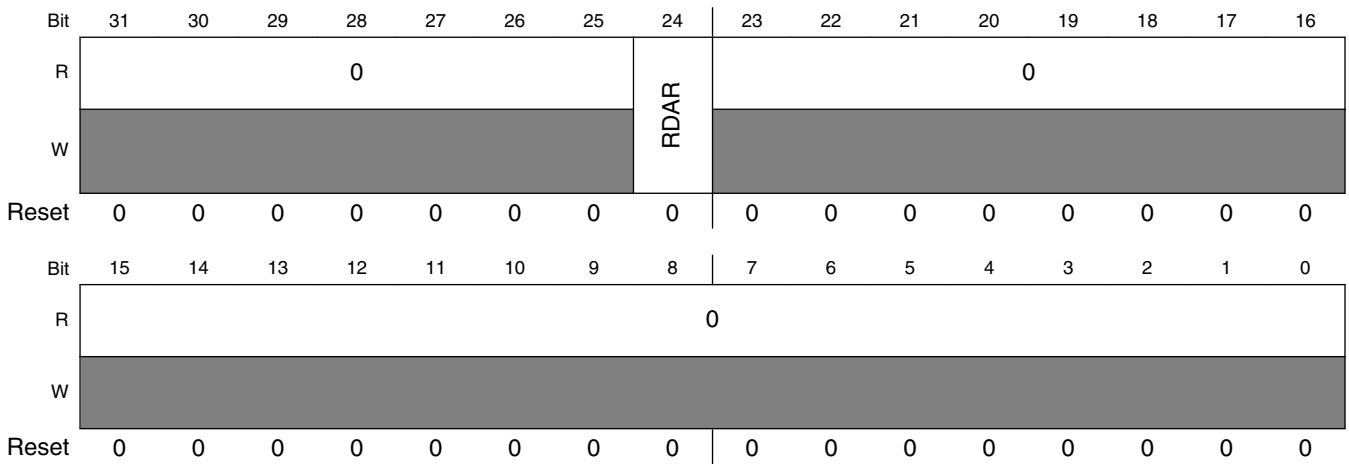
Field	Description
31 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
30 BABR	BABR Interrupt Mask Corresponds to interrupt source EIR[BABR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
29 BABT	BABT Interrupt Mask Corresponds to interrupt source EIR[BABT] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABT field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.

Table continues on the next page...

ENETx_EIMR field descriptions (continued)

Field	Description
	0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
28 GRA	GRA Interrupt Mask Corresponds to interrupt source EIR[GRA] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR GRA field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
27 TXF	TXF Interrupt Mask Corresponds to interrupt source EIR[TXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
26 TXB	TXB Interrupt Mask Corresponds to interrupt source EIR[TXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
25 RXF	RXF Interrupt Mask Corresponds to interrupt source EIR[RXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
24 RXB	RXB Interrupt Mask Corresponds to interrupt source EIR[RXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXB field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
23 MII	MII Interrupt Mask Corresponds to interrupt source EIR[MII] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR MII field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
22 EBERR	EBERR Interrupt Mask Corresponds to interrupt source EIR[EBERR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR EBERR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.

Table continues on the next page...



ENETx_EIMR field descriptions (continued)

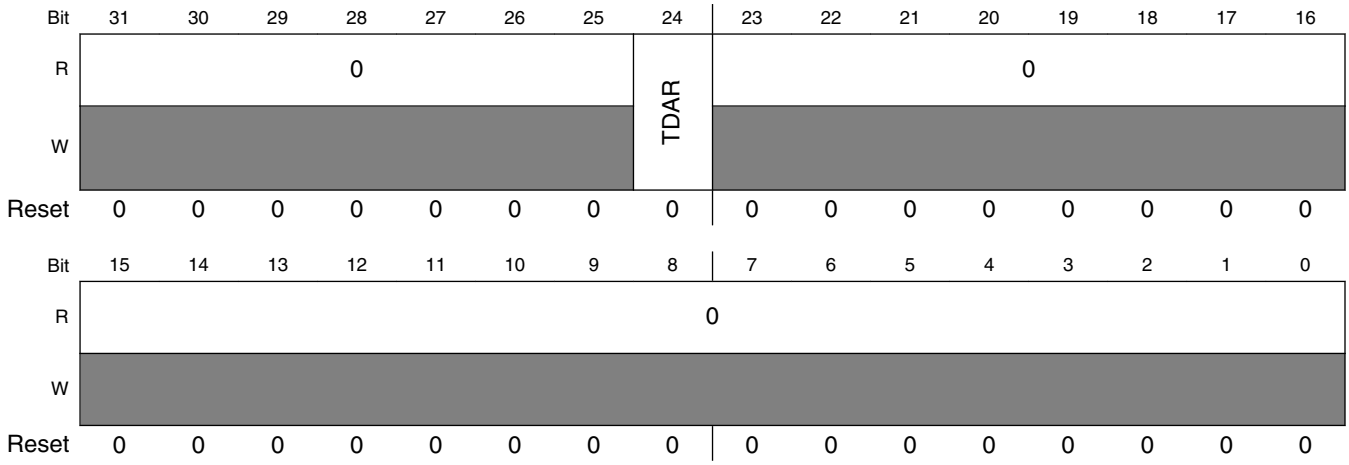
Field	Description
21 LC	LC Interrupt Mask Corresponds to interrupt source EIR[LC] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR LC field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
20 RL	RL Interrupt Mask Corresponds to interrupt source EIR[RL] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
19 UN	UN Interrupt Mask Corresponds to interrupt source EIR[UN] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR UN field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
18 PLR	PLR Interrupt Mask Corresponds to interrupt source EIR[PLR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR PLR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
17 WAKEUP	WAKEUP Interrupt Mask Corresponds to interrupt source EIR[WAKEUP] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR WAKEUP field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
16 TS_AVAIL	TS_AVAIL Interrupt Mask Corresponds to interrupt source EIR[TS_AVAIL] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_AVAIL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
15 TS_TIMER	TS_TIMER Interrupt Mask Corresponds to interrupt source EIR[TS_TIMER] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_TIMER field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
14–13 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
12 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
11–9 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

22.5.3 Receive Descriptor Active Register (ENETx_RDAR)

RDAR is a command register, written by the user, to indicate that the receive descriptor ring has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: Base address + 10h offset

ENETx_RDAR field descriptions



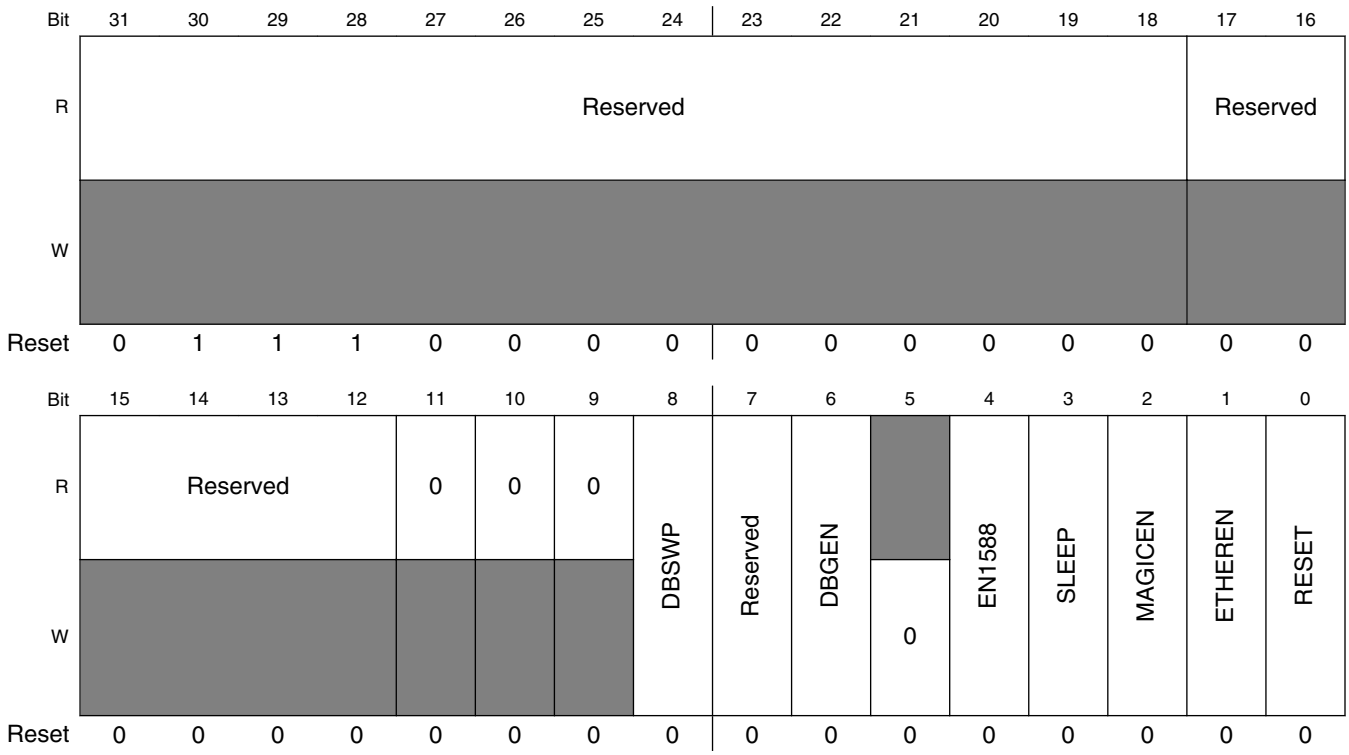
Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 RDAR	Receive Descriptor Active Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

22.5.4 Transmit Descriptor Active Register (ENETx_TDAR)

The TDAR is a command register that the user writes to indicate that the transmit descriptor ring has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Address: Base address + 14h offset



ENETx_TDAR field descriptions

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 TDAR	Transmit Descriptor Active Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

22.5.5 Ethernet Control Register (ENETx_ECR)

ECR is a read/write user register, though hardware may also alter fields in this register. It controls many of the high level features of the Ethernet MAC, including legacy FEC support through the EN1588 field.

Address: Base address + 24h offset

ENETx_ECR field descriptions

Field	Description
31–18 Reserved	This field is reserved. This field must be set to 01110000000000b.
17–12 Reserved	This field is reserved. This field must be set to 0.
11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 DBSWP	Descriptor Byte Swapping Enable Swaps the byte locations of the buffer descriptors. **NOTE:** This field must be written to 1 after reset.

Table continues on the next page...

ENETx_ECR field descriptions (continued)

Field	Description
	0 The buffer descriptor bytes are not swapped to support big-endian devices. 1 The buffer descriptor bytes are swapped to support little-endian devices.
7 Reserved	This field is reserved. This field must be set to zero.
6 DBGEN	Debug Enable Enables the MAC to enter hardware freeze mode when the device enters debug mode. 0 MAC continues operation in debug mode. 1 MAC enters hardware freeze mode when the processor is in debug mode.
5 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
4 EN1588	EN1588 Enable Enables enhanced functionality of the MAC. 0 Legacy FEC buffer descriptors and functions enabled. 1 Enhanced frame time-stamping functions enabled.
3 SLEEP	Sleep Mode Enable 0 Normal operating mode. 1 Sleep mode.
2 MAGICEN	Magic Packet Detection Enable Enables/disables magic packet detection. **NOTE:** MAGICEN is relevant only if the SLEEP field is set. If MAGICEN is set, changing the SLEEP field enables/disables sleep mode and magic packet detection. 0 Magic detection logic disabled. 1 The MAC core detects magic packets and asserts EIR[WAKEUP] when a frame is detected.
1 ETHEREN	Ethernet Enable Enables/disables the Ethernet MAC. When the MAC is disabled, the buffer descriptors for an aborted transmit frame are not updated. The uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers. Hardware clears this field under the following conditions: • RESET is set by software • An error condition causes the EBERR field to set. **NOTE:** • ETHEREN must be set at the very last step during ENET configuration/setup/initialization, only *after* all other ENET-related registers have been configured. • If ETHEREN is cleared to 0 by software then next time ETHEREN is set, the EIR interrupts must cleared to 0 due to previous pending interrupts. 0 Reception immediately stops and transmission stops after a bad CRC is appended to any currently transmitted frame. 1 MAC is enabled, and reception and transmission are possible.
0 RESET	Ethernet MAC Reset When this field is set, it clears the ETHEREN field.

22.5.6 MII Management Frame Register (ENETx_MMFR)

Writing to MMFR triggers a management frame transaction to the PHY device unless MSCR is programmed to zero.

If MSCR is changed from zero to non-zero during a write to MMFR, an MII frame is generated with the data previously written to the MMFR. This allows MMFR and MSCR to be programmed in either order if MSCR is currently zero.

If the MMFR register is written while frame generation is in progress, the frame contents are altered. Software must use the EIR[MII] interrupt indication to avoid writing to the MMFR register while frame generation is in progress.

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENETx_MMFR field descriptions

Field	Description
31–30 ST	Start Of Frame Delimiter See Table 22-41 (Clause 22) or Table 22-43 (Clause 45) for correct value.
29–28 OP	Operation Code See Table 22-41 (Clause 22) or Table 22-43 (Clause 45) for correct value.
27–23 PA	PHY Address See Table 22-41 (Clause 22) or Table 22-43 (Clause 45) for correct value.
22–18 RA	Register Address See Table 22-41 (Clause 22) or Table 22-43 (Clause 45) for correct value.
17–16 TA	Turn Around This field must be programmed to 10 to generate a valid MII management frame.
DATA	Management Frame Data This is the field for data to be written to or read from the PHY register.

22.5.7 MII Speed Control Register (ENETx_MSCR)

MSCR provides control of the MII clock (MDC pin) frequency and allows a preamble drop on the MII management frame.

The MII_SPEED field must be programmed with a value to provide an MDC frequency of less than or equal to 2.5 MHz to be compliant with the IEEE 802.3 MII specification. The MII_SPEED must be set to a non-zero value to source a read or write management frame. After the management frame is complete, the MSCR register may optionally be cleared to turn off MDC. The MDC signal generated has a 50% duty cycle except when MII_SPEED changes during operation. This change takes effect following a rising or falling edge of MDC.

For example, if the internal module clock (i.e., IPS bus clock) is 25 MHz, programming MII_SPEED to 0x4 results in an MDC as given in the following equation:

MII clock frequency = 25 MHz / ((4 + 1) x 2) = 2.5 MHz

The following table shows the optimum values for MII_SPEED as a function of IPS bus clock frequency.

Table 22-4. Programming Examples for MSCR

Internal module clock frequency	MSCR [MII_SPEED]	MDC frequency
25 MHz	0x4	2.50 MHz
33 MHz	0x6	2.36 MHz
40 MHz	0x7	2.50 MHz
50 MHz	0x9	2.50 MHz
66 MHz	0xD	2.36 MHz

Address: Base address + 44h offset

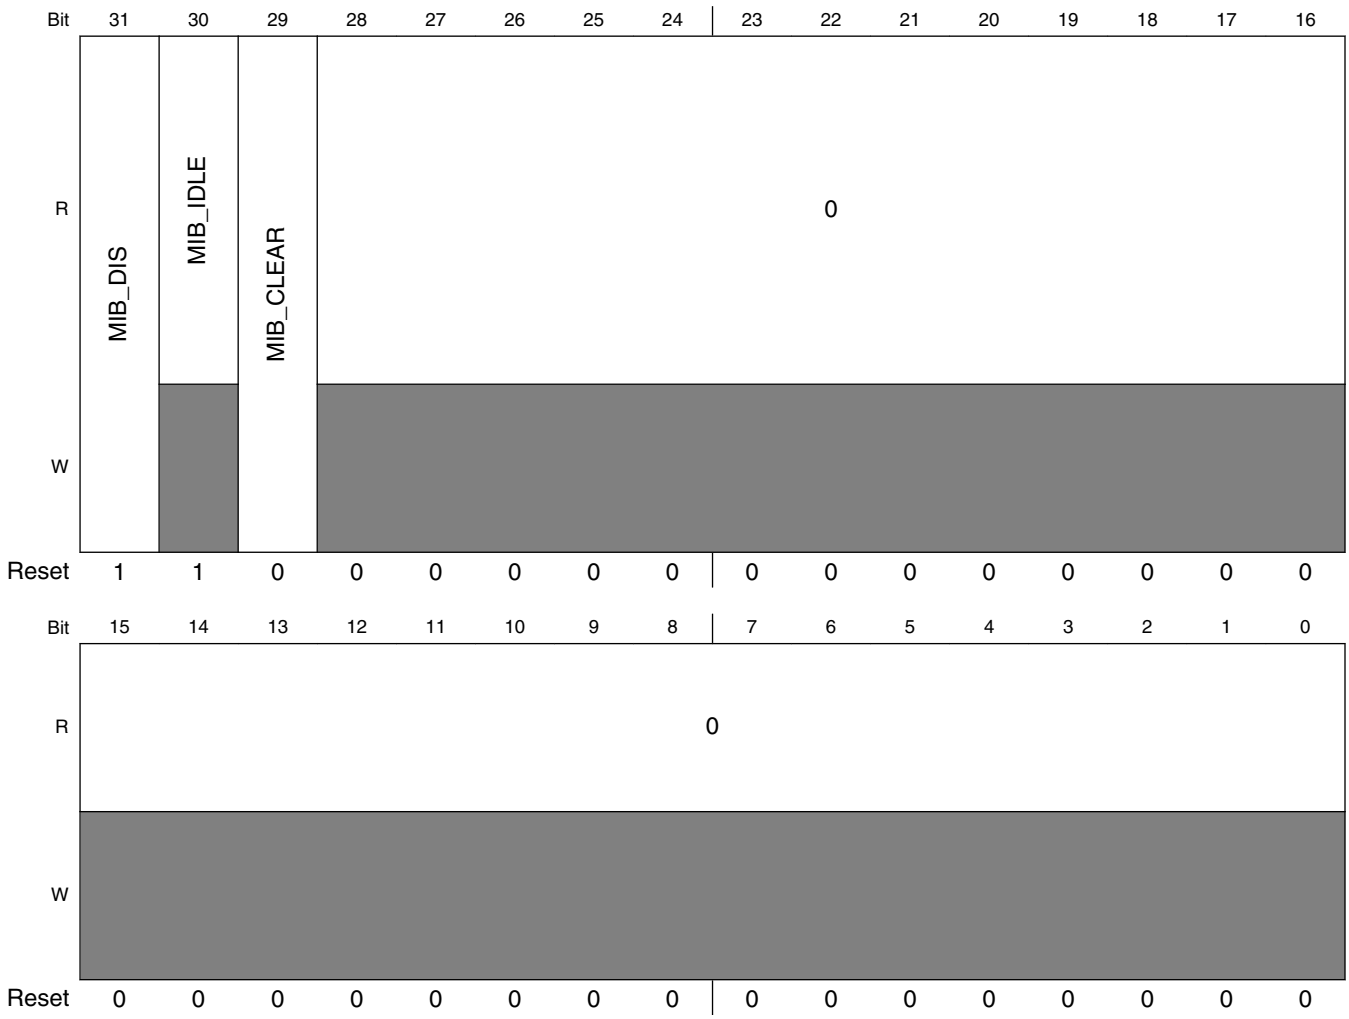
ENETx_MSCR field descriptions

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–8 HOLDTIME	Hold time On MDIO Output IEEE802.3 clause 22 defines a minimum of 10 ns for the hold time on the MDIO output. Depending on the host bus frequency, the setting may need to be increased. 000 1 internal module clock cycle 001 2 internal module clock cycles

Table continues on the next page...



ENETx_MSCR field descriptions (continued)

Field	Description
	010 3 internal module clock cycles 111 8 internal module clock cycles
7 DIS_PRE	Disable Preamble Enables/disables prepending a preamble to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY devices do not require it. 0 Preamble enabled. 1 Preamble (32 ones) is not prepended to the MII management frame.
6–1 MII_SPEED	MII Speed Controls the frequency of the MII management interface clock (MDC) relative to the internal module clock. A value of 0 in this field turns off MDC and leaves it in low voltage state. Any non-zero value results in the MDC frequency of: 1/((MII_SPEED + 1) x 2) of the internal module clock frequency
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

22.5.8 MIB Control Register (ENETx_MIBC)

MIBC is a read/write register controlling and observing the state of the MIB block. Access this register to disable the MIB block operation or clear the MIB counters. The MIB_DIS field resets to 1.

Address: Base address + 64h offset

ENETx_MIBC field descriptions

Field	Description
31 MIB_DIS	Disable MIB Logic If this control field is set, 0 MIB logic is enabled. 1 MIB logic is disabled. The MIB logic halts and does not update any MIB counters.
30 MIB_IDLE	MIB Idle

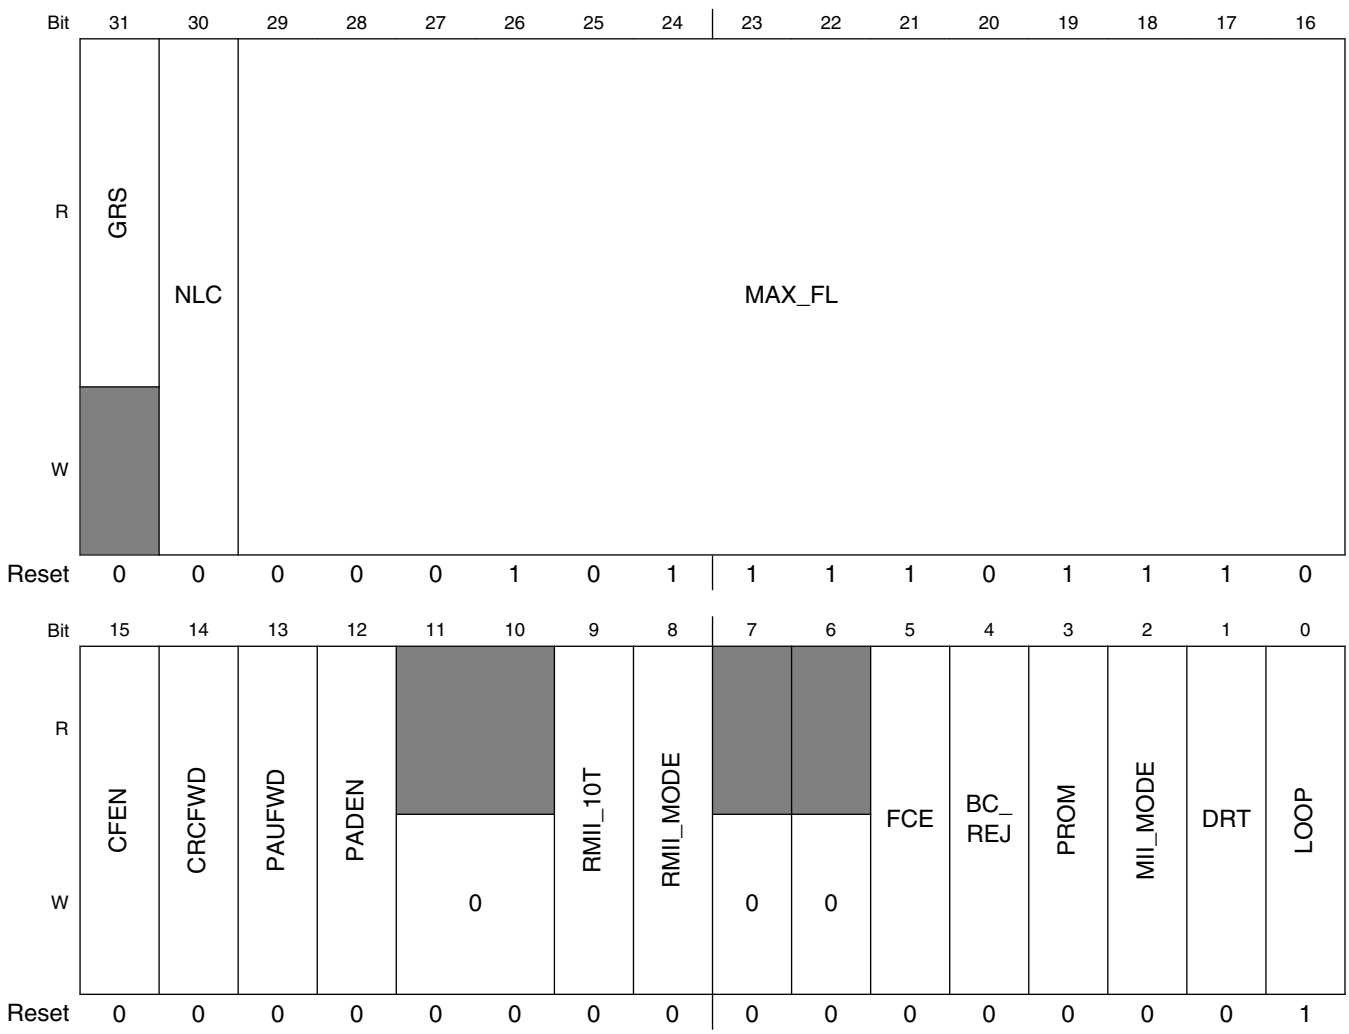


Table continues on the next page...

ENETx_MIBC field descriptions (continued)

Field	Description
	0 The MIB block is updating MIB counters. 1 The MIB block is not currently updating any MIB counters.
29 MIB_CLEAR	MIB Clear **NOTE:** This field is not self-clearing. To clear the MIB counters set and then clear this field. 0 See note above. 1 All statistics counters are reset to 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

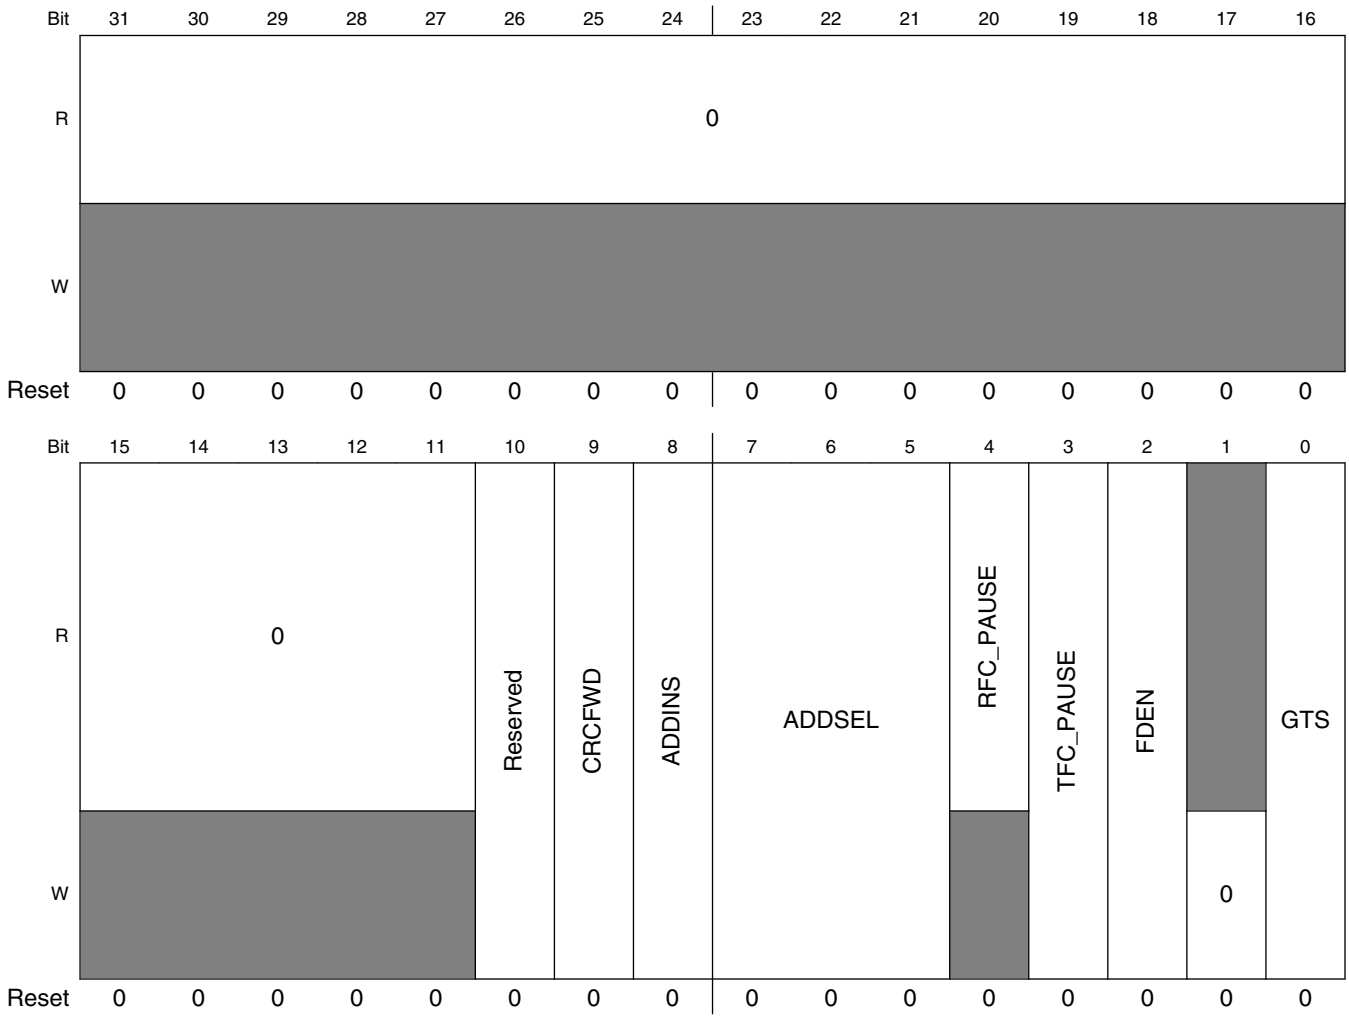
22.5.9 Receive Control Register (ENETx_RCR)

Address: Base address + 84h offset

ENETx_RCR field descriptions

Field	Description
31 GRS	Graceful Receive Stopped Read-only status indicating that the MAC receive datapath is stopped.
30 NLC	Payload Length Check Disable Enables/disables a payload length check. 0 The payload length check is disabled. 1 The core checks the frame's payload length with the frame length/type field. Errors are indicated in the EIR[PLC] field.
29–16 MAX_FL	Maximum Frame Length Resets to decimal 1518. Length is measured starting at DA and includes the CRC at the end of the frame. Transmit frames longer than MAX_FL cause the BABT interrupt to occur. Receive frames longer than MAX_FL cause the BABR interrupt to occur and set the LG field in the end of frame receive buffer descriptor. The recommended default value to be programmed is 1518 or 1522 if VLAN tags are supported.
15 CFEN	MAC Control Frame Enable Enables/disables the MAC control frame. 0 MAC control frames with any opcode other than 0x0001 (pause frame) are accepted and forwarded to the client interface. 1 MAC control frames with any opcode other than 0x0001 (pause frame) are silently discarded.
14 CRCFWD	Terminate/Forward Received CRC Specifies whether the CRC field of received frames is transmitted or stripped. **NOTE:** If padding function is enabled (PADEN = 1), CRCFWD is ignored and the CRC field is checked and always terminated and removed. 0 The CRC field of received frames is transmitted to the user application. 1 The CRC field is stripped from the frame.
13 PAUFWD	Terminate/Forward Pause Frames Specifies whether pause frames are terminated or forwarded. 0 Pause frames are terminated and discarded in the MAC. 1 Pause frames are forwarded to the user application.
12 PADEN	Enable Frame Padding Remove On Receive Specifies whether the MAC removes padding from received frames. 0 No padding is removed on receive by the MAC. 1 Padding is removed from received frames.
11–10 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
9 RMII_10T	Enables 10-Mbit/s mode of the RMII . 0 100-Mbit/s operation. 1 10-Mbit/s operation.

Table continues on the next page...



ENETx_RCR field descriptions (continued)

Field	Description
8 RMII_MODE	RMII Mode Enable Specifies whether the MAC is configured for MII mode or RMII operation . 0 MAC configured for MII mode. 1 MAC configured for RMII operation.
7 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
6 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
5 FCE	Flow Control Enable If set, the receiver detects PAUSE frames. Upon PAUSE frame detection, the transmitter stops transmitting data frames for a given duration.
4 BC_REJ	Broadcast Frame Reject If set, frames with destination address (DA) equal to 0xFFFF_FFFF_FFFF are rejected unless the PROM field is set. If BC_REJ and PROM are set, frames with broadcast DA are accepted and the MISS (M) is set in the receive buffer descriptor.
3 PROM	Promiscuous Mode All frames are accepted regardless of address matching. 0 Disabled. 1 Enabled.
2 MII_MODE	Media Independent Interface Mode This field must always be set. 0 Reserved. 1 MII or RMII mode, as indicated by the RMII_MODE field.
1 DRT	Disable Receive On Transmit 0 Receive path operates independently of transmit (i.e., full-duplex mode). Can also be used to monitor transmit activity in half-duplex mode. 1 Disable reception of frames while transmitting. (Normally used for half-duplex mode.)
0 LOOP	Internal Loopback This is an MII internal loopback, therefore MII_MODE must be written to 1 and RMII_MODE must be written to 0. 0 Loopback disabled. 1 Transmitted frames are looped back internal to the device and transmit MII output signals are not asserted. DRT must be cleared.

22.5.10 Transmit Control Register (ENETx_TCR)

TCR is read/write and configures the transmit block. This register is cleared at system reset. FDEN can only be modified when ECR[ETHEREN] is cleared.

Address: Base address + C4h offset

ENETx_TCR field descriptions

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 Reserved	This field is reserved. This field is read/write and must be set to 0.
9 CRCFWD	Forward Frame From Application With CRC 0 TxBD[TC] controls whether the frame has a CRC from the application. 1 The transmitter does not append any CRC to transmitted frames, as it is expecting a frame with CRC from the application.

Table continues on the next page...

ENETx_TCR field descriptions (continued)

Field	Description
8 ADDINS	Set MAC Address On Transmit 0 The source MAC address is not modified by the MAC. 1 The MAC overwrites the source MAC address with the programmed MAC address according to ADDSEL.
7–5 ADDSEL	Source MAC Address Select On Transmit If ADDINS is set, indicates the MAC address that overwrites the source MAC address. 000 Node MAC address programmed on PADDR1/2 registers. 100 Reserved. 101 Reserved. 110 Reserved.
4 RFC_PAUSE	Receive Frame Control Pause This status field is set when a full-duplex flow control pause frame is received and the transmitter pauses for the duration defined in this pause frame. This field automatically clears when the pause duration is complete.
3 TFC_PAUSE	Transmit Frame Control Pause Pauses frame transmission. When this field is set, EIR[GRA] is set. With transmission of data frames stopped, the MAC transmits a MAC control PAUSE frame. Next, the MAC clears TFC_PAUSE and resumes transmitting data frames. If the transmitter pauses due to user assertion of GTS or reception of a PAUSE frame, the MAC may continue transmitting a MAC control PAUSE frame. 0 No PAUSE frame transmitted. 1 The MAC stops transmission of data frames after the current transmission is complete.
2 FDEN	Full-Duplex Enable If this field is set, frames transmit independent of carrier sense and collision inputs. Only modify this bit when ECR[ETHEREN] is cleared.
1 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
0 GTS	Graceful Transmit Stop When this field is set, MAC stops transmission after any frame currently transmitted is complete and EIR[GRA] is set. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission finishes, clear GTS to restart. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS is set, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There may be old frames in the transmit FIFO that transmit when GTS is reasserted. To avoid this, clear ECR[ETHEREN] following the GRA interrupt.

22.5.11 Physical Address Lower Register (ENETx_PALR)

PALR contains the lower 32 bits (bytes 0, 1, 2, 3) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 0 through 3 of the six-byte source address field when transmitting PAUSE frames.

Address: Base address + E4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENETx_PALR field descriptions

Field	Description
PADDR1	Pause Address Bytes 0 (bits 31:24), 1 (bits 23:16), 2 (bits 15:8), and 3 (bits 7:0) of the 6-byte individual address are used for exact match and the source address field in PAUSE frames.

22.5.12 Physical Address Upper Register (ENETx_PAUR)

PAUR contains the upper 16 bits (bytes 4 and 5) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 4 and 5 of the six-byte source address field when transmitting PAUSE frames. Bits 15:0 of PAUR contain a constant type field (0x8808) for transmission of PAUSE frames.

Address: Base address + E8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENETx_PAUR field descriptions

Field	Description
31–16 PADDR2	Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address used for exact match, and the source address field in PAUSE frames.
TYPE	Type Field In PAUSE Frames These fields have a constant value of 0x8808.

22.5.13 Opcode/Pause Duration Register (ENETx_OPD)

OPD is read/write accessible. This register contains the 16-bit opcode and 16-bit pause duration fields used in transmission of a PAUSE frame. The opcode field is a constant value, 0x0001. When another node detects a PAUSE frame, that node pauses transmission for the duration specified in the pause duration field. The lower 16 bits of this register are not reset and you must initialize it.

Address: Base address + ECh offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
31 ICEN	Interrupt Coalescing Enable

Table continues on the next page...

ENETx_TXIC field descriptions (continued)

Field	Description
	0 Disable Interrupt coalescing. 1 Enable Interrupt coalescing.
30 ICCS	Interrupt Coalescing Timer Clock Source Select 0 Use MII/GMII TX clocks. 1 Use ENET system clock.
29–28 Reserved	This field must be set to 0. This field is reserved.
27–20 ICFT	Interrupt coalescing frame count threshold This value determines the number of frames needed to be transmitted for raising an interrupt. Frame counter restarts after reaching this threshold value or after the expiring of the coalescing timer. Must be greater than zero to avoid unpredictable behavior.
19–16 Reserved	This field must be set to 0. This field is reserved.
ICTT	Interrupt coalescing timer threshold Interrupt coalescing timer threshold in units of 64 clock periods. This value determines the maximum amount of time after transmitting a frame before raising an interrupt. The threshold timer is disabled after expiring or number of frame transmission defined by ICFT and starts again upon transmission of the next first frame. Must be greater than zero to avoid unpredictable behavior.

22.5.15 Receive Interrupt Coalescing Register (ENETx_RXIC)

See Interrupt coalescence for more information.

Address: Base address + 100h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ENETx_RXIC field descriptions

Field	Description
31 ICEN	Interrupt Coalescing Enable 0 Disable Interrupt coalescing. 1 Enable Interrupt coalescing.

Table continues on the next page...

ENETx_RXIC field descriptions (continued)

Field	Description
30 ICCS	Interrupt Coalescing Timer Clock Source Select 0 Use MII/GMII TX clocks. 1 Use ENET system clock.
29–28 Reserved	This field must be set to 0. This field is reserved.
27–20 ICFT	Interrupt coalescing frame count threshold This value determines the number of frames needed to be received for raising an interrupt. Frame counter restarts after reaching this threshold value or after the expiring of the coalescing timer. Must be greater than zero to avoid unpredictable behavior.
19–16 Reserved	This field must be set to 0. This field is reserved.
ICTT	Interrupt coalescing timer threshold Interrupt coalescing timer threshold in units of 64 clock periods. This value determines the maximum amount of time after receiving a frame before raising an interrupt. The threshold timer is disabled after expiring or number of frame reception defined by ICFT and starts again upon reception of the next first frame. Must be greater than zero to avoid unpredictable behavior.

22.5.16 Descriptor Individual Upper Address Register (ENETx_IAUR)

IAUR contains the upper 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the destination address (DA) field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: Base address + 118h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

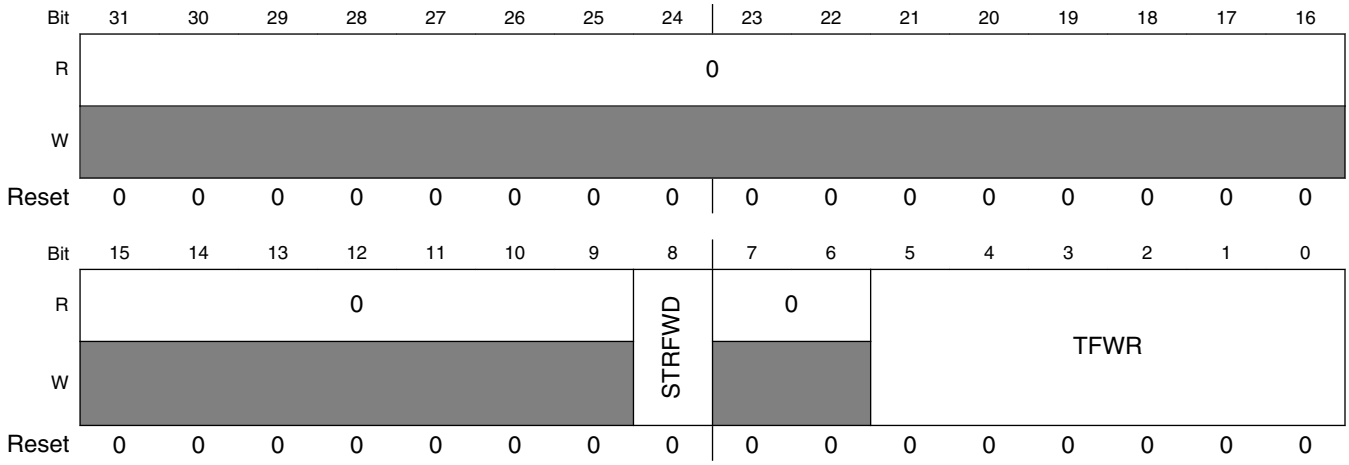
ENETx_GALR field descriptions

Field	Description
GADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR2 contains hash index bit 31. Bit 0 of GADDR2 contains hash index bit 0.

22.5.20 Transmit FIFO Watermark Register (ENETx_TFWR)



If TFWR[STRFWD] is cleared, TFWR[TFWR] controls the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows you to minimize transmit latency (TFWR = 00 or 01) or allow for larger bus access latency (TFWR = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. The byte counts associated with the TFWR field may need to be modified to match a given system requirement, for example, worst-case bus access latency by the transmit data uDMA channel.

When the FIFO level reaches the value the TFWR field and when the STR_FWD is set to ‘0’, the MAC transmit control logic starts frame transmission even before the end-of-frame is available in the FIFO (cut-through operation).

If a complete frame has a size smaller than the threshold programmed with TFWR, the MAC also transmits the Frame to the line.

To enable store and forward on the Transmit path, set STR_FWD to ‘1’. In this case, the MAC starts to transmit data only when a complete frame is stored in the Transmit FIFO.

Address: Base address + 144h offset

ENETx_TFWR field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 STRFWD	Store And Forward Enable 0 Reset. The transmission start threshold is programmed in TFWR[TFWR]. 1 Enabled.
7–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TFWR	Transmit FIFO Write If TFWR[STRFWD] is cleared, this field indicates the number of bytes, in steps of 64 bytes, written to the transmit FIFO before transmission of a frame begins. **NOTE:** If a frame with less than the threshold is written, it is still sent independently of this threshold setting. The threshold is relevant only if the frame is larger than the threshold given. 000000 64 bytes written. 000001 64 bytes written. 000010 128 bytes written. 000011 192 bytes written. ... ... 011111 1984 bytes written.

22.5.21 Receive Descriptor Ring Start Register (ENETx_RDSR)

RDSR points to the beginning of the circular receive buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, for optimal performance the pointer should be 512-bit aligned, that is, evenly divisible by 64.

NOTE

This register must be initialized prior to operation

Address: Base address + 180h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ENETx_RDSR field descriptions

Field	Description
31–3 R_DES_START	Pointer to the beginning of the receive buffer descriptor queue.
2 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

22.5.22 Transmit Buffer Descriptor Ring Start Register (ENETx_TDSR)

TDSR provides a pointer to the beginning of the circular transmit buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, for optimal performance the pointer should be 512-bit aligned, that is, evenly divisible by 64.

NOTE

This register must be initialized prior to operation.

Address: Base address + 184h offset

ENETx_TDSR field descriptions

Field	Description
31–3 X_DES_START	Pointer to the beginning of the transmit buffer descriptor queue.
2 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

22.5.23 Maximum Receive Buffer Size Register (ENETx_MRBR)

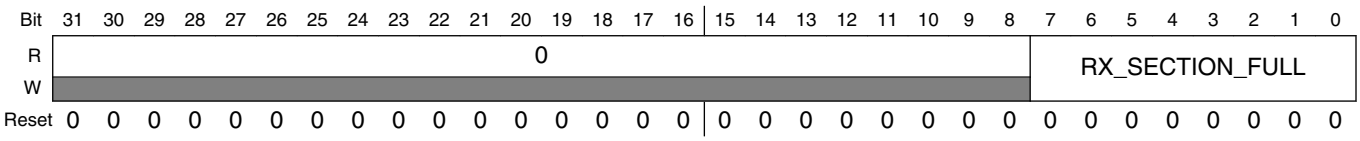
The MRBR is a user-programmable register that dictates the maximum size of all receive buffers. This value should take into consideration that the receive CRC is always written into the last receive buffer.

- R_BUF_SIZE is concatentated with the four least-significant bits of this register and are used as the maximum receive buffer size.
- To allow one maximum size frame per buffer, MRBR must be set to RCR[MAX_FL] or larger.
- To properly align the buffer, MRBR must be evenly divisible by 64. To ensure this, set the lower two bits of R_BUF_SIZE to zero. The lower four bits of this register are already set to zero by the device.
- To minimize bus usage (descriptor fetches), set MRBR greater than or equal to 256 bytes.

NOTE

This register must be initialized before operation.

Address: Base address + 188h offset



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

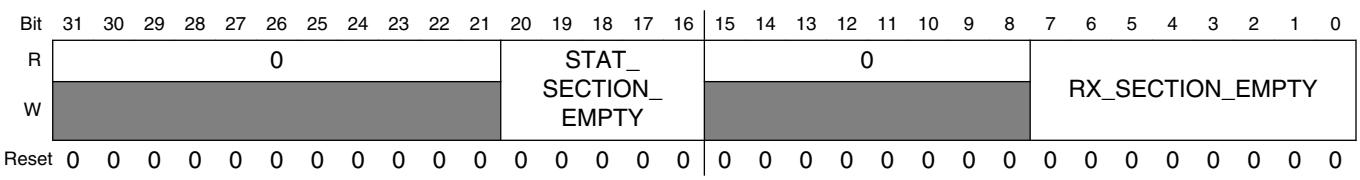
ENETx_MRBR field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13–4 R_BUF_SIZE	Receive buffer size in bytes. This value, concatenated with the four least-significant bits of this register (which are always zero), is the effective maximum receive buffer size.
Reserved	This field, which is always zero, is the four least-significant bits of the maximum receive buffer size. This field is reserved. This read-only field is reserved and always has the value 0.

22.5.24 Receive FIFO Section Full Threshold (ENETx_RSFL)

Address: Base address + 190h offset



ENETx_RSFL field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_SECTION_ FULL	Value Of Receive FIFO Section Full Threshold Value, in 64-bit words, of the receive FIFO section full threshold. Clear this field to enable store and forward on the RX FIFO. When programming a value greater than 0 (cut-through operation), it must be greater than RAEM[RX_ALMOST_EMPTY]. When the FIFO level reaches the value in this field, data is available in the Receive FIFO (cut-through operation).

22.5.25 Receive FIFO Section Empty Threshold (ENETx_RSEM)

Address: Base address + 194h offset

ENETx_RSEM field descriptions

Field	Description
31–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–16 STAT_ SECTION_ EMPTY	RX Status FIFO Section Empty Threshold Defines number of frames in the receive FIFO, independent of its size, that can be accepted. If the limit is reached, reception will continue normally, however a pause frame will be triggered to indicate a possible congestion to the remote device to avoid FIFO overflow. A value of 0 disables automatic pause frame generation
15–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_SECTION_ EMPTY	Value Of The Receive FIFO Section Empty Threshold Value, in 64-bit words, of the receive FIFO section empty threshold. When the FIFO has reached this level, a pause frame will be issued.

Table continues on the next page...

ENETx_RSEM field descriptions (continued)

Field	Description
	A value of 0 disables automatic pause frame generation. When the FIFO level goes below the value programmed in this field, an XON pause frame is issued to indicate the FIFO congestion is cleared to the remote Ethernet client. **NOTE:** The section-empty threshold indications from both FIFOs are OR'ed to cause XOFF pause frame generation.

22.5.26 Receive FIFO Almost Empty Threshold (ENETx_RAEM)

Address: Base address + 198h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																RX_ALMOST_EMPTY															
W

ENETx_RAEM field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_ALMOST_EMPTY	Value Of The Receive FIFO Almost Empty Threshold Value, in 64-bit words, of the receive FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field and the end-of-frame has not been received for the frame yet, the core receive read control stops FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. A minimum value of 4 should be set.

22.5.27 Receive FIFO Almost Full Threshold (ENETx_RAFL)

Address: Base address + 19Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

ENETx_RAFL field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_ALMOST_FULL	Value Of The Receive FIFO Almost Full Threshold

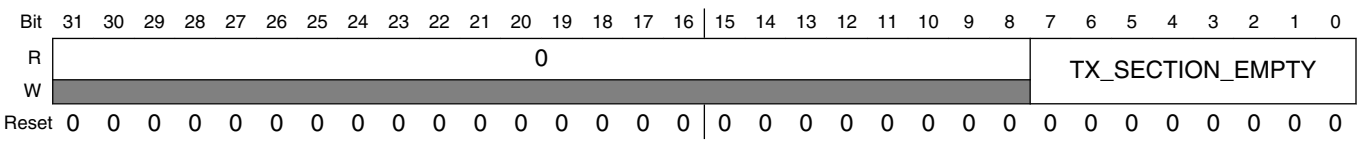

Table continues on the next page...

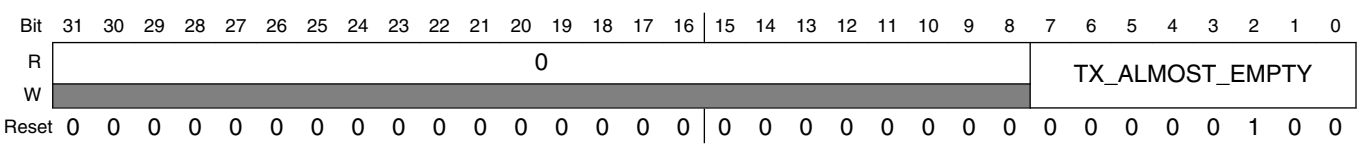
ENETx_RAFL field descriptions (continued)

Field	Description
	Value, in 64-bit words, of the receive FIFO almost full threshold. When the FIFO level comes close to the maximum, so that there is no more space for at least RX_ALMOST_FULL number of words, the MAC stops writing data in the FIFO and truncates the received frame to avoid FIFO overflow. The corresponding error status will be set when the frame is delivered to the application. A minimum value of 4 should be set.

22.5.28 Transmit FIFO Section Empty Threshold (ENETx_TSEM)

Address: Base address + 1A0h offset



ENETx_TSEM field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_SECTION_EMPTY	Value Of The Transmit FIFO Section Empty Threshold Value, in 64-bit words, of the transmit FIFO section empty threshold. See Transmit FIFO for more information.

22.5.29 Transmit FIFO Almost Empty Threshold (ENETx_TAEM)

Address: Base address + 1A4h offset

ENETx_TAEM field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_ALMOST_EMPTY	Value of Transmit FIFO Almost Empty Threshold Value, in 64-bit words, of the transmit FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field, and no end-of-frame is available for the frame, the MAC transmit logic, to avoid FIFO underflow, stops reading the FIFO and transmits a frame with an MII error indication. See Transmit FIFO for more information. A minimum value of 4 should be set.

22.5.30 Transmit FIFO Almost Full Threshold (ENETx_TAFL)

Address: Base address + 1A8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																TX_ALMOST_FULL															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

ENETx_TAFL field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_ALMOST_FULL	Value Of The Transmit FIFO Almost Full Threshold Value, in 64-bit words, of the transmit FIFO almost full threshold. A minimum value of six is required . A recommended value of at least 8 should be set allowing a latency of two clock cycles to the application. If more latency is required the value can be increased as necessary (latency = TAFL - 5). When the FIFO level comes close to the maximum, so that there is no more space for at least TX_ALMOST_FULL number of words, the pin ff_tx_rdy is deasserted. If the application does not react on this signal, the FIFO write control logic, to avoid FIFO overflow, truncates the current frame and sets the error status. As a result, the frame will be transmitted with an GMII/MII error indication. See Transmit FIFO for more information. **NOTE:** A FIFO overflow is a fatal error and requires a global reset on the transmit datapath or at least deassertion of ETHEREN.

22.5.31 Transmit Inter-Packet Gap (ENETx_TIPG)

Address: Base address + 1ACh offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENETx_FTRL field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TRUNC_FL	Frame Truncation Length Indicates the value a receive frame is truncated, if it is greater than this value. Must be greater than or equal to RCR[MAX_FL]. **NOTE:** Truncation happens at TRUNC_FL. However, when truncation occurs, the application (FIFO) may receive less data, guaranteeing that it never receives more than the set limit.

22.5.33 Transmit Accelerator Function Configuration (ENETx_TACC)

TACC controls accelerator actions when sending frames. The register can be changed before or after each frame, but it must remain unmodified during frame writes into the transmit FIFO.

The TFWR[STRFWD] field must be set to use the checksum feature.

Address: Base address + 1C0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ENETx_TACC field descriptions

Field	Description
31–5 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
4 PROCHK	Enables insertion of protocol checksum. 0 Checksum not inserted. 1 If an IP frame with a known protocol is transmitted, the checksum is inserted automatically into the frame. The checksum field must be cleared. The other frames are not modified.
3 IPCHK	Enables insertion of IP header checksum. 0 Checksum is not inserted. 1 If an IP frame is transmitted, the checksum is inserted automatically. The IP header checksum field must be cleared. If a non-IP frame is transmitted the frame is not modified.
2–1 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
0 SHIFT16	TX FIFO Shift-16 0 Disabled. 1 Indicates to the transmit data FIFO that the written frames contain two additional octets before the frame data. This means the actual frame begins at bit 16 of the first word written into the FIFO. This function allows putting the frame payload on a 32-bit boundary in memory, as the 14-byte Ethernet header is extended to a 16-byte header.

22.5.34 Receive Accelerator Function Configuration (ENETx_RACC)

Address: Base address + 1C4h offset

Field	Description
31–8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

Table continues on the next page...

ENETx_RACC field descriptions (continued)

Field	Description
7 SHIFT16	RX FIFO Shift-16 When this field is set, the actual frame data starts at bit 16 of the first word read from the RX FIFO aligning the Ethernet payload on a 32-bit boundary. **NOTE:** This function only affects the FIFO storage and has no influence on the statistics, which use the actual length of the frame received. 0 Disabled. 1 Instructs the MAC to write two additional bytes in front of each frame received into the RX FIFO.
6 LINEDIS	Enable Discard Of Frames With MAC Layer Errors 0 Frames with errors are not discarded. 1 Any frame received with a CRC, length, or PHY error is automatically discarded and not forwarded to the user application interface.
5–3 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
2 PRODIS	Enable Discard Of Frames With Wrong Protocol Checksum 0 Frames with wrong checksum are not discarded. 1 If a TCP/IP, UDP/IP, or ICMP/IP frame is received that has a wrong TCP, UDP, or ICMP checksum, the frame is discarded. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
1 IPDIS	Enable Discard Of Frames With Wrong IPv4 Header Checksum 0 Frames with wrong IPv4 header checksum are not discarded. 1 If an IPv4 frame is received with a mismatching header checksum, the frame is discarded. IPv6 has no header checksum and is not affected by this setting. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
0 PADREM	Enable Padding Removal For Short IP Frames 0 Padding not removed. 1 Any bytes following the IP payload section of the frame are removed from the frame.

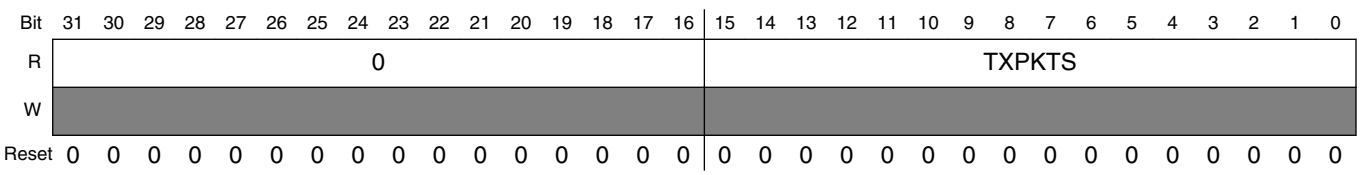
ENETx_RMON_T_P256TO511 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of 256- to 511-byte transmit packets

22.5.49 Tx 512- to 1023-byte Packets Statistic Register (ENETx_RMON_T_P512TO1023)

.

Address: Base address + 238h offset

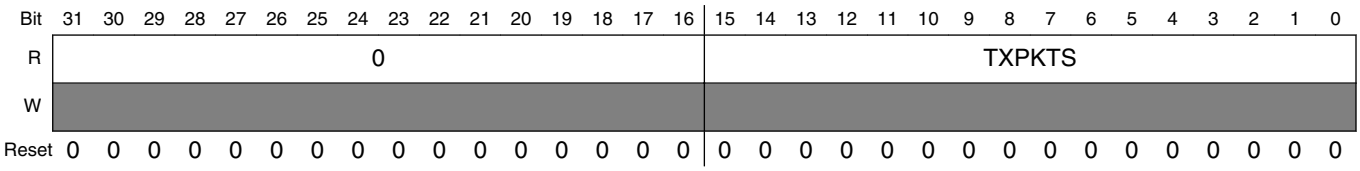


ENETx_RMON_T_P512TO1023 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of 512- to 1023-byte transmit packets

22.5.50 Tx 1024- to 2047-byte Packets Statistic Register (ENETx_RMON_T_P1024TO2047)

Address: Base address + 23Ch offset

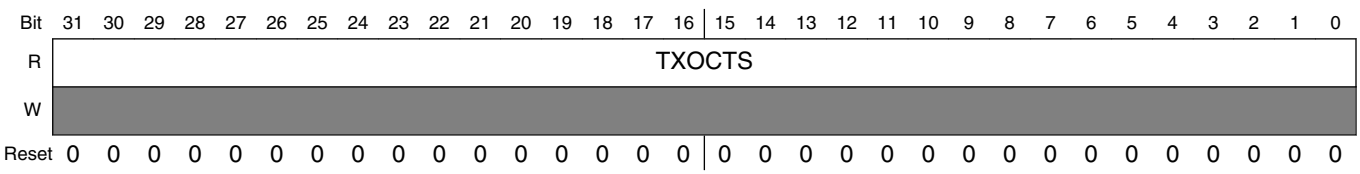


ENETx_RMON_T_P1024TO2047 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of 1024- to 2047-byte transmit packets

22.5.51 Tx Packets Greater Than 2048 Bytes Statistic Register (ENETx_RMON_T_P_GTE2048)

Address: Base address + 240h offset

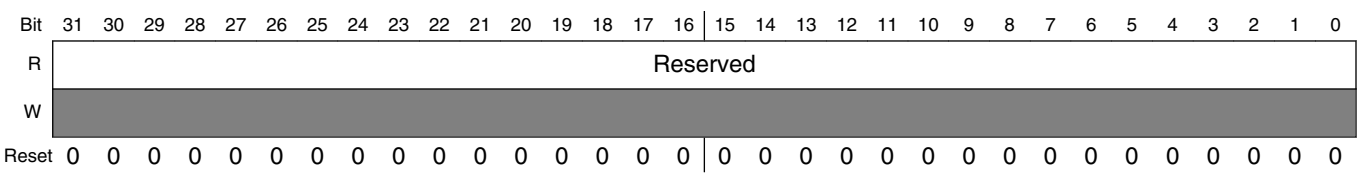


ENETx_RMON_T_P_GTE2048 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of transmit packets greater than 2048 bytes

22.5.52 Tx Octets Statistic Register (ENETx_RMON_T_OCTETS)

Address: Base address + 244h offset

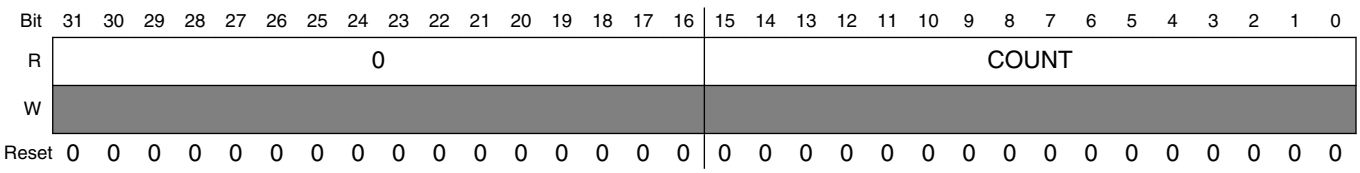


ENETx_RMON_T_OCTETS field descriptions

Field	Description
TXOCTS	Number of transmit octets

22.5.53 Reserved Statistic Register (ENETx_IEEE_T_DROP)

Address: Base address + 248h offset

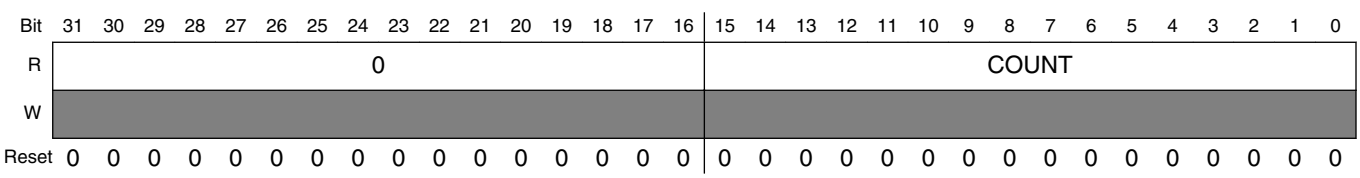


ENETx_IEEE_T_DROP field descriptions

Field	Description
Reserved	This read-only field always has the value 0. This field is reserved.

22.5.54 Frames Transmitted OK Statistic Register (ENETx_IEEE_T_FRAME_OK)

Address: Base address + 24Ch offset

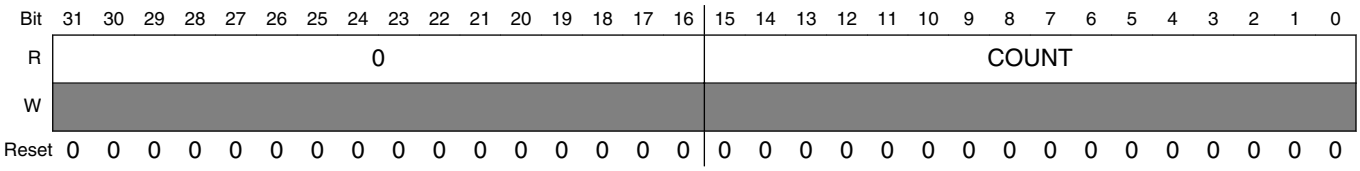


ENETx_IEEE_T_FRAME_OK field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted OK **NOTE:** Does not increment for the broadcast frames when broadcast reject is enabled and promiscuous mode is disabled within the receive control register (RCR).

22.5.55 Frames Transmitted with Single Collision Statistic Register (ENETx_IEEE_T_1COL)

Address: Base address + 250h offset

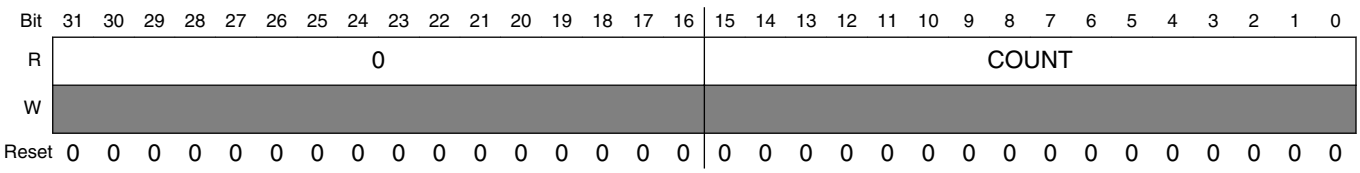


ENETx_IEEE_T_1COL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with one collision

22.5.56 Frames Transmitted with Multiple Collisions Statistic Register (ENETx_IEEE_T_MCOL)

Address: Base address + 254h offset

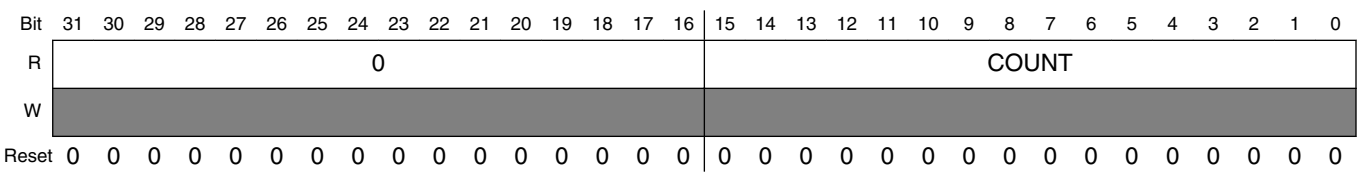


ENETx_IEEE_T_MCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with multiple collisions

22.5.57 Frames Transmitted after Deferral Delay Statistic Register (ENETx_IEEE_T_DEF)

Address: Base address + 258h offset

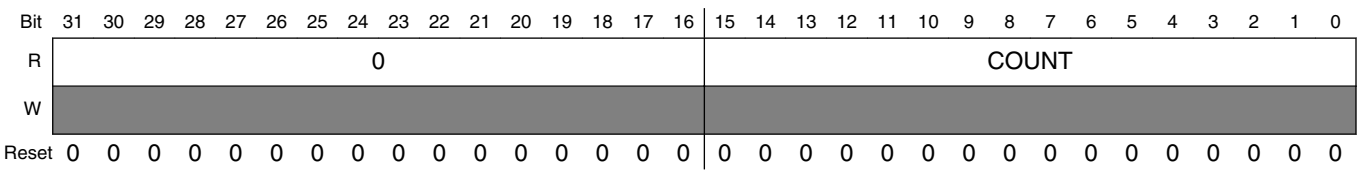


ENETx_IEEE_T_DEF field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with deferral delay

22.5.58 Frames Transmitted with Late Collision Statistic Register (ENETx_IEEE_T_LCOL)

Address: Base address + 25Ch offset

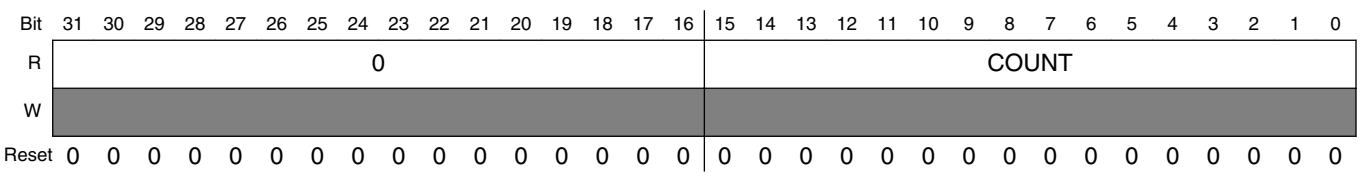


ENETx_IEEE_T_LCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with late collision

22.5.59 Frames Transmitted with Excessive Collisions Statistic Register (ENETx_IEEE_T_EXCOL)

Address: Base address + 260h offset



ENETx_IEEE_T_EXCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with excessive collisions

22.5.60 Frames Transmitted with Tx FIFO Underrun Statistic Register (ENETx_IEEE_T_MACERR)

Address: Base address + 264h offset

ENETx_IEEE_T_MACERR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with transmit FIFO underrun

22.5.61 Frames Transmitted with Carrier Sense Error Statistic Register (ENETx_IEEE_T_CSERR)

Address: Base address + 268h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_IEEE_T_CSERR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with carrier sense error

22.5.62 Reserved Statistic Register (ENETx_IEEE_T_SQE)

Address: Base address + 26Ch offset

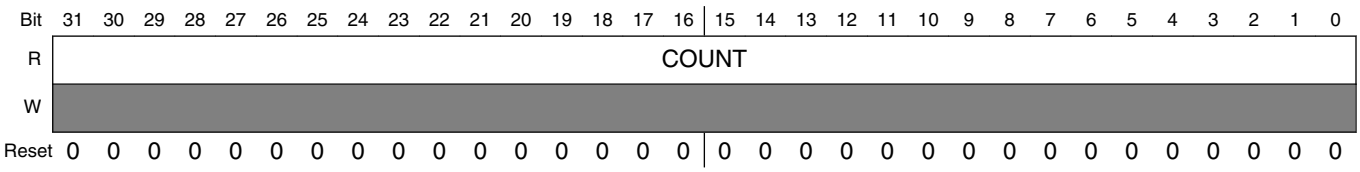
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_IEEE_T_SQE field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	This read-only field is reserved and always has the value 0. **NOTE:** Counter not implemented as no SQE information is available.

22.5.63 Flow Control Pause Frames Transmitted Statistic Register (ENETx_IEEE_T_FDXFC)

Address: Base address + 270h offset



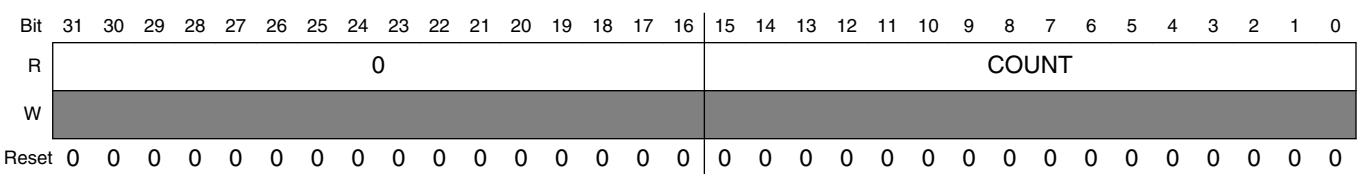
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_IEEE_T_FDXFC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of flow-control pause frames transmitted

22.5.64 Octet Count for Frames Transmitted w/o Error Statistic Register (ENETx_IEEE_T_OCTETS_OK)

Address: Base address + 274h offset

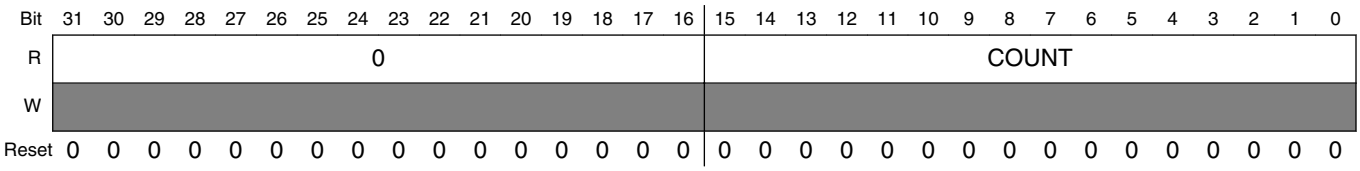


ENETx_IEEE_T_OCTETS_OK field descriptions

Field	Description
COUNT	Octet count for frames transmitted without error **NOTE** Counts total octets (includes header and FCS fields).

22.5.65 Rx Packet Count Statistic Register (ENETx_RMON_R_PACKETS)

Address: Base address + 284h offset

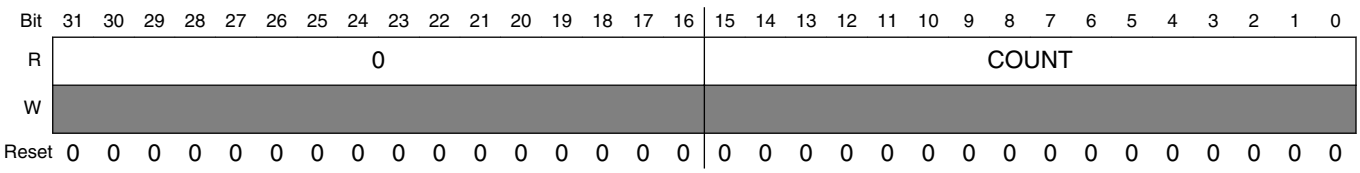


ENETx_RMON_R_PACKETS field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of packets received

22.5.66 Rx Broadcast Packets Statistic Register (ENETx_RMON_R_BC_PKT)

Address: Base address + 288h offset

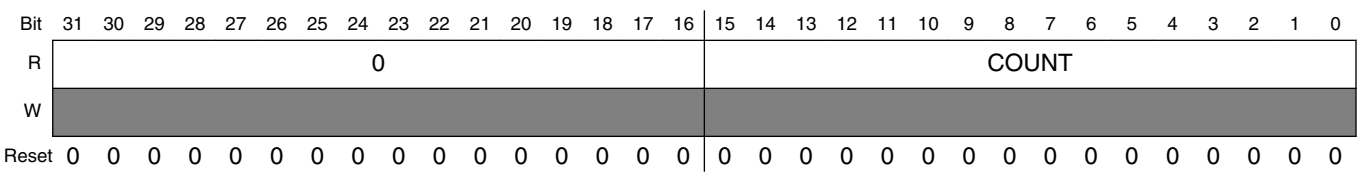


ENETx_RMON_R_BC_PKT field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive broadcast packets

22.5.67 Rx Multicast Packets Statistic Register (ENETx_RMON_R_MC_PKT)

Address: Base address + 28Ch offset



ENETx_RMON_R_MC_PKT field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive multicast packets

22.5.68 Rx Packets with CRC/Align Error Statistic Register (ENETx_RMON_R_CRC_ALIGN)

Address: Base address + 290h offset

ENETx_RMON_R_CRC_ALIGN field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive packets with CRC or align error

22.5.69 Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENETx_RMON_R_UNDERSIZE)

Address: Base address + 294h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

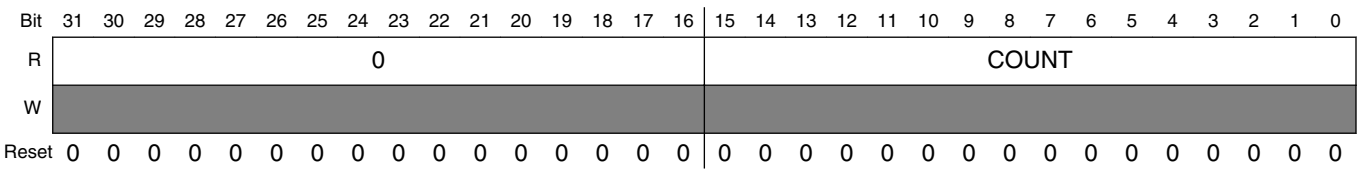
ENETx_RMON_R_OVERSIZE field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive packets greater than MAX_FL and good CRC

22.5.71 Rx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENETx_RMON_R_FRAG)

Address: Base address + 29Ch offset

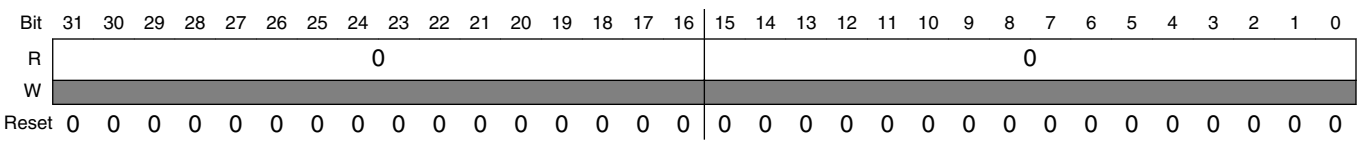


ENETx_RMON_R_FRAG field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive packets with less than 64 bytes and bad CRC

22.5.72 Rx Packets Greater Than MAX_FL Bytes and Bad CRC Statistic Register (ENETx_RMON_R_JAB)

Address: Base address + 2A0h offset

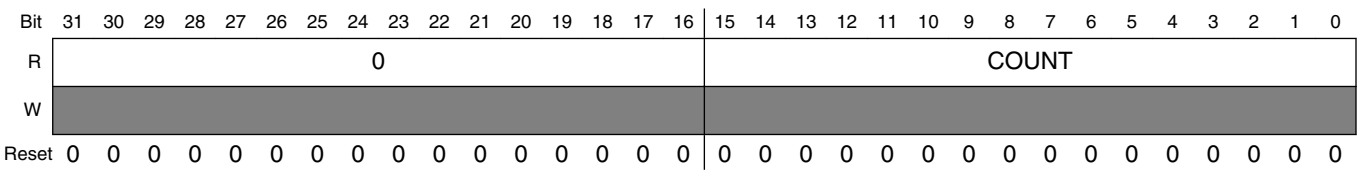


ENETx_RMON_R_JAB field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive packets greater than MAX_FL and bad CRC

22.5.73 Reserved Statistic Register (ENETx_RMON_R_RESVD_0)

Address: Base address + 2A4h offset

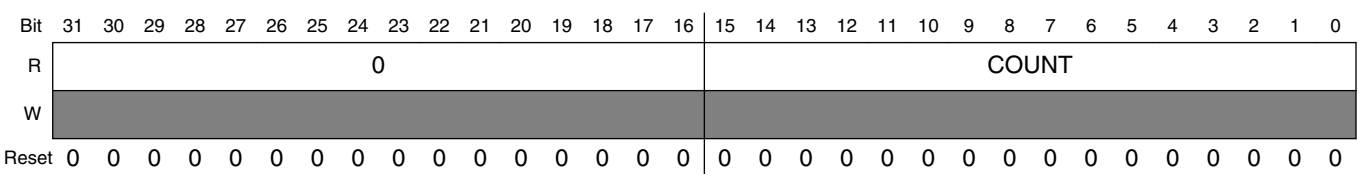


ENETx_RMON_R_RESVD_0 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

22.5.74 Rx 64-Byte Packets Statistic Register (ENETx_RMON_R_P64)

Address: Base address + 2A8h offset



ENETx_RMON_R_P64 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of 64-byte receive packets

22.5.75 Rx 65- to 127-Byte Packets Statistic Register (ENETx_RMON_R_P65TO127)

Address: Base address + 2ACh offset

ENETx_RMON_R_P65TO127 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of 65- to 127-byte recieve packets

22.5.76 Rx 128- to 255-Byte Packets Statistic Register (ENETx_RMON_R_P128TO255)

Address: Base address + 2B0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

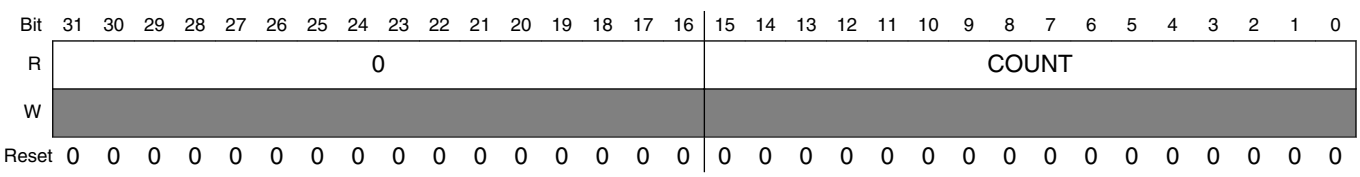
ENETx_RMON_R_P_GTE2048 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of greater-than-2048-byte recieve packets

22.5.81 Rx Octets Statistic Register (ENETx_RMON_R_OCTETS)

Address: Base address + 2C4h offset



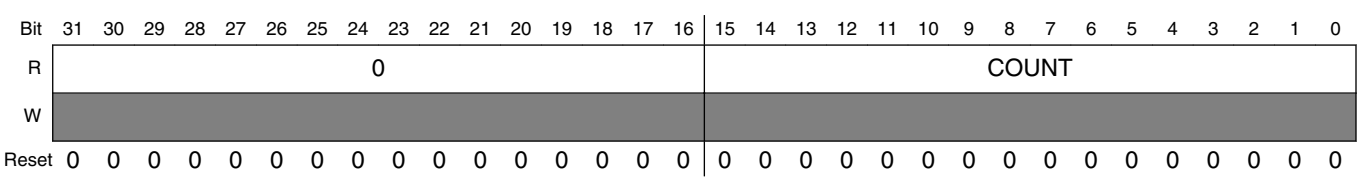
ENETx_RMON_R_OCTETS field descriptions

Field	Description
COUNT	Number of receive octets

22.5.82 Frames not Counted Correctly Statistic Register (ENETx_IEEE_R_DROP)

Counter increments if a frame with invalid or missing SFD character is detected and has been dropped. None of the other counters increments if this counter increments.

Address: Base address + 2C8h offset



ENETx_IEEE_R_DROP field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Frame count

22.5.83 Frames Received OK Statistic Register (ENETx_IEEE_R_FRAME_OK)

Address: Base address + 2CCh offset

ENETx_IEEE_R_FRAME_OK field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames received OK

22.5.84 Frames Received with CRC Error Statistic Register (ENETx_IEEE_R_CRC)

Address: Base address + 2D0h offset

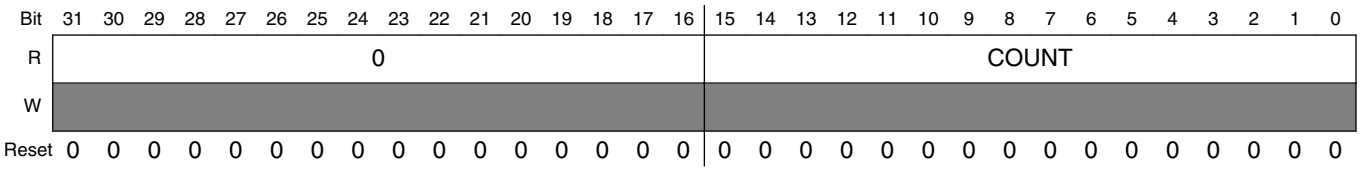
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_IEEE_R_CRC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames received with CRC error

22.5.85 Frames Received with Alignment Error Statistic Register (ENETx_IEEE_R_ALIGN)

Address: Base address + 2D4h offset



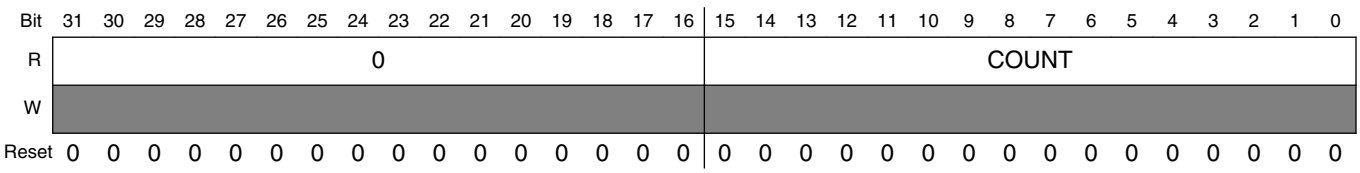
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_IEEE_R_ALIGN field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames received with alignment error

22.5.86 Receive FIFO Overflow Count Statistic Register (ENETx_IEEE_R_MACERR)

Address: Base address + 2D8h offset

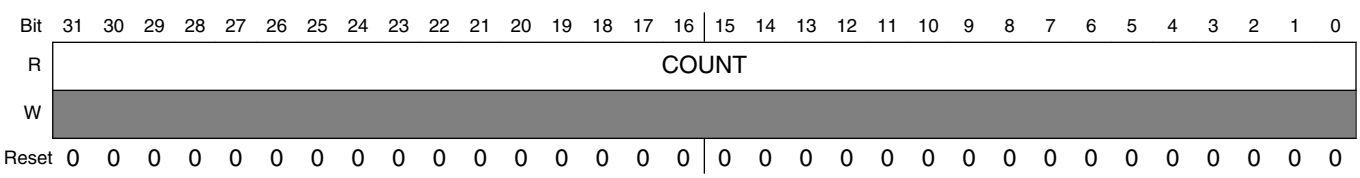


ENETx_IEEE_R_MACERR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Receive FIFO overflow count

22.5.87 Flow Control Pause Frames Received Statistic Register (ENETx_IEEE_R_FDXFC)

Address: Base address + 2DCh offset

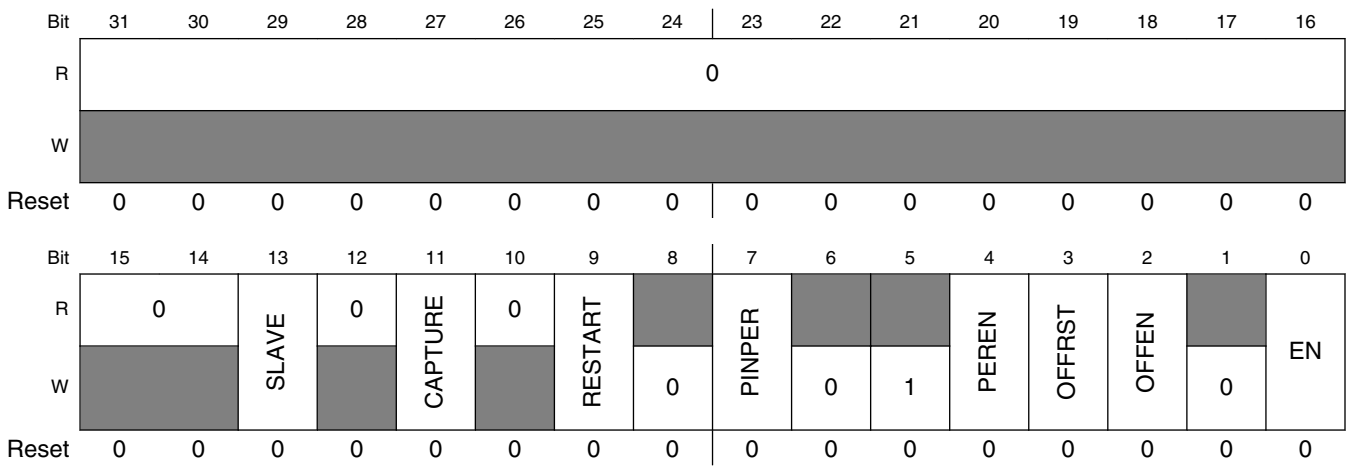


ENETx_IEEE_R_FDXFC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of flow-control pause frames received

22.5.88 Octet Count for Frames Received without Error Statistic Register (ENETx_IEEE_R_OCTETS_OK)

Address: Base address + 2E0h offset



ENETx_IEEE_R_OCTETS_OK field descriptions

Field	Description
COUNT	Number of octets for frames received without error **NOTE:** Counts total octets (includes header and FCS fields). Does not increment for the broadcast frames when broadcast reject is enabled and promiscuous mode is disabled within the receive control register (RCR).

22.5.89 Adjustable Timer Control Register (ENETx_ATCR)

ATCR command fields can trigger the corresponding events directly. It is not necessary to preserve any of the configuration fields when a command field is set in the register, that is, no read-modify-write is required.

Address: Base address + 400h offset

ENETx_ATCR field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 SLAVE	Enable Timer Slave Mode 0 The timer is active and all configuration fields in this register are relevant. 1 The internal timer is disabled and the externally provided timer value is used. All other fields, except CAPTURE, in this register have no effect. CAPTURE can still be used to capture the current timer value.
12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 CAPTURE	Capture Timer Value

Table continues on the next page...

ENETx_ATCR field descriptions (continued)

Field	Description
	When this field is set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes. 0 No effect. 1 The current time is captured and can be read from the ATVR register.
10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9 RESTART	Reset Timer Resets the timer to zero. This has no effect on the counter enable. If the counter is enabled when this field is set, the timer is reset to zero and starts counting from there. When set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes.
8 Reserved	This field is reserved.
7 PINPER	Enables event signal output assertion on period event. **NOTE:** Not all devices contain the event signal output. See the chip configuration details. 0 Disable. 1 Enable.
6 Reserved	This field is reserved.
5 Reserved	This field is reserved. **NOTE:** This field must be written always with one.
4 PEREN	Enable Periodical Event 0 Disable. 1 A period event interrupt can be generated (EIR[TS_TIMER]) and the event signal output is asserted when the timer wraps around according to the periodic setting ATPER. The timer period value must be set before setting this bit. **NOTE:** Not all devices contain the event signal output. See the chip configuration details.
3 OFFRST	Reset Timer On Offset Event 0 The timer is not affected and no action occurs, besides clearing OFFEN, when the offset is reached. 1 If OFFEN is set, the timer resets to zero when the offset setting is reached. The offset event does not cause a timer interrupt.
2 OFFEN	Enable One-Shot Offset Event 0 Disable. 1 The timer can be reset to zero when the given offset time is reached (offset event). The field is cleared when the offset event is reached, so no further event occurs until the field is set again. The timer offset value must be set before setting this field.
1 Reserved	This field is reserved.
0 EN	Enable Timer 0 The timer stops at the current value. 1 The timer starts incrementing.

22.5.90 Timer Value Register (ENETx_ATVR)

Address: Base address + 404h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENETx_ATPER field descriptions

Field	Description
PERIOD	Value for generating periodic events. Each instance the timer reaches this value, the period event occurs and the timer restarts. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds. The value should be initialized to 1,000,000,000 (1×10^9) to represent a timer wrap around of one second. The increment value set in ATINC should be set to the true nanoseconds of the period of clock ts_clk, hence implementing a true 1 second counter. **NOTE:** The value of PERIOD has the following constraint:

ENETx_ATPER field descriptions (continued)

Field	Description
	2^{32} – ENET_ATINC[INC_COR] – 3×ENET_ATINC[INC] ≥ PERIOD > 0.

22.5.93 Timer Correction Register (ENETx_ATCOR)

Address: Base address + 410h offset

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_TCCR*n* field descriptions

Field	Description
TCC	Timer Capture Compare This register is double buffered between the module clock and 1588 clock domains. When configured for compare, the 1588 clock domain updates with the value in the module clock domain whenever the Timer Channel is first enabled and on each subsequent compare. Write to this register with the first compare value before enabling the Timer Channel. When the Timer Channel is enabled, write the second compare value either immediately, or at least before the first compare occurs. After each compare, write the next compare value before the previous compare occurs and before clearing the Timer Flag. The compare occurs one 1588 clock cycle after the IEEE 1588 Counter increments past the compare value in the 1588 clock domain. If the compare value is less than the value of the 1588 Counter when the Timer Channel is first enabled, then the compare does not occur until following the next overflow of the 1588 Counter. If the compare value is greater than the IEEE 1588 Counter when the 1588 Counter overflows, or the compare value is less than the value of the IEEE 1588 Counter after the overflow, then the compare occurs one 1588 clock cycle following the overflow. When configured for capture, the value of the IEEE 1588 Counter is captured into the 1588 clock domain and then updated into the module clock domain, provided the Timer Flag is clear. Always read the capture value before clearing the Timer Flag.

22.6 Functional description

This section provides a complete functional description of the MAC-NET core.

22.6.1 Ethernet MAC frame formats

The IEEE 802.3 standard defines the Ethernet frame format as follows:

- Minimum length of 64 bytes
- Maximum length of 1518 bytes excluding the preamble and the start frame delimiter (SFD) bytes

An Ethernet frame consists of the following fields:

- Seven bytes preamble
- Start frame delimiter (SFD)
- Two address fields
- Length or type field
- Data field
- Frame check sequence (CRC value)

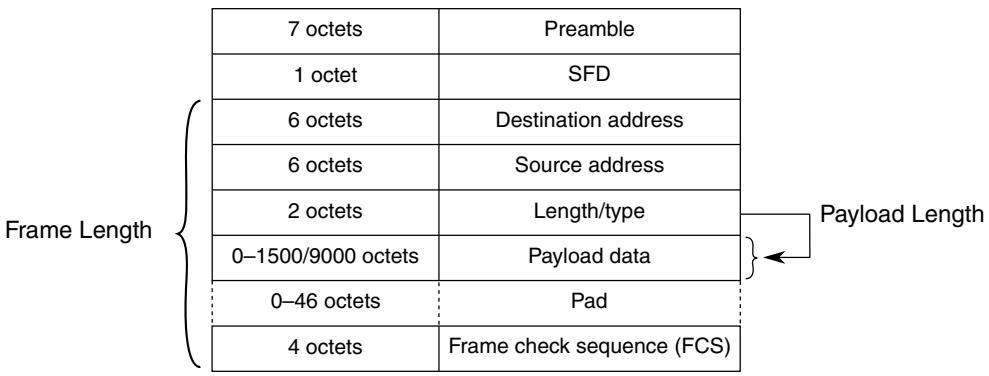

Figure 22-2. MAC frame format overview

Optionally, MAC frames can be VLAN-tagged with an additional four-byte field inserted between the MAC source address and the type/length field. VLAN tagging is defined by the IEEE P802.1q specification. VLAN-tagged frames have a maximum length of 1522 bytes, excluding the preamble and the SFD bytes.

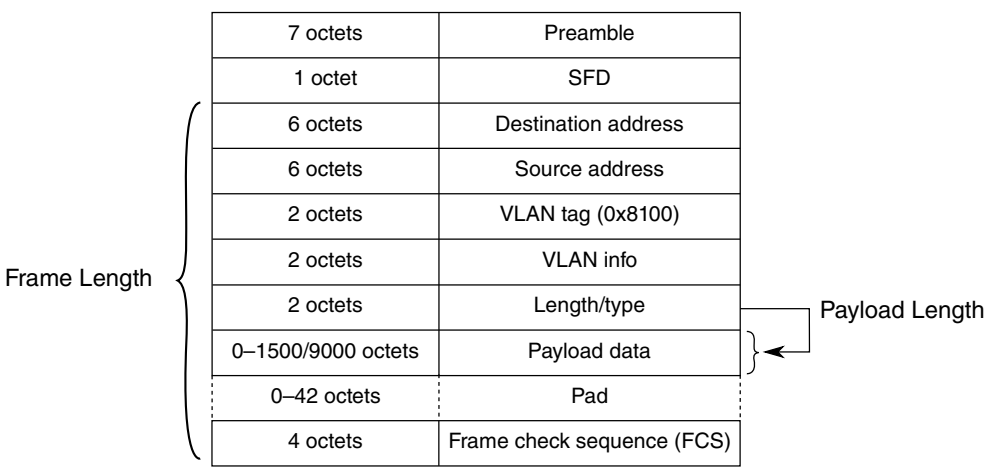

Figure 22-3. VLAN-tagged MAC frame format overview

Table 22-5. MAC frame definition

Term	Description
Frame length	Defines the length, in octets, of the complete frame without preamble and SFD. A frame has a valid length if it contains at least 64 octets and does not exceed the programmed maximum length.
Payload length	The length/type field indicates the length of the frame's payload section. The most significant byte is sent/received first. • If the length/type field is set to a value less than 46, the payload is padded so that the minimum frame length requirement (64 bytes) is met. For VLAN-tagged frames, a value less than 42 indicates a padded frame. • If the length/type field is set to a value larger than the programmed frame maximum length (e.g. 1518) it is interpreted as a type field.
Destination and source address	48-bit MAC addresses. The least significant byte is sent/received first and the first two least significant bits of the MAC address distinguish MAC frames, as detailed in MAC address check.

Note

Although the IEEE specification defines a maximum frame length, the MAC core provides the flexibility to program any value for the frame maximum length.

22.6.1.1 Pause Frames

The receiving device generates a pause frame to indicate a congestion to the emitting device, which should stop sending data.

Pause frames are indicated by the length/type set to 0x8808. The two first bytes of a pause frame following the type, defines a 16-bit opcode field set to 0x0001 always. A 16-bit pause quanta is defined in the frame payload bytes 2 (P1) and 3 (P2) as defined in the following table. The P1 pause quanta byte is the most significant.

Table 22-6. Pause Frame Format (Values in Hex)

1	2	3	4	5	6	7	8	9	10	11	12	13	14
55	55	55	55	55	55	55	D5	01	80	C2	00	00	01
						Preamble	SFD	Multicast Destination Address					
15	16	17	18	19	20	21	22	23	24	25	26	27 –68	
00	00	00	00	00	00	88	08	00	01	hi	lo	00	
				Source Address		Type		Opcode		P1	P2	pad (42)	
69	70	71	72										
26	6B	AE	0A										
			CRC-32										

There is no payload length field found within a pause frame and a pause frame is always padded with 42 bytes (0x00).

If a pause frame with a pause value greater than zero (XOFF condition) is received, the MAC stops transmitting data as soon the current frame transfer is completed. The MAC stops transmitting data for the value defined in pause quanta. One pause quanta fraction refers to 512 bit times.

If a pause frame with a pause value of zero (XON condition) is received, the transmitter is allowed to send data immediately (see Full-duplex flow control operation for details).

22.6.1.2 Magic packets

A magic packet is a unicast, multicast, or broadcast packet, which carries a defined sequence in the payload section.

Magic packets are received and inspected only under specific conditions as described in Magic packet detection.

The defined sequence to decode a magic packet is formed with a synchronization stream which consists of six consecutive 0xFF bytes, and is followed by sequence of sixteen consecutive unicast MAC addresses of the node to be awakened.

This sequence can be located anywhere in the magic packet payload. The magic packet is formed with a standard Ethernet header, optional padding, and CRC.

22.6.2 IP and higher layers frame format

The following sections use the term datagram to describe the protocol specific data unit that is found within the payload section of its container entity.

For example, an IP datagram specifies the payload section of an Ethernet frame. A TCP datagram specifies the payload section within an IP datagram.

22.6.2.1 Ethernet types

IP datagrams are carried in the payload section of an Ethernet frame. The Ethernet frame type/length field discriminates several datagram types.

The following table lists the types of interest:

Table 22-7. Ethernet type value examples

Type	Description
0x8100	VLAN-tagged frame. The actual type is found 4 octets later in the frame.
0x0800	IPv4
0x0806	ARP
0x86DD	IPv6

22.6.2.2 IPv4 datagram format

The following figure shows the IP Version 4 (IPv4) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words. The first byte sent/received is the leftmost byte of the first word (in other words, version/IHL field).

The IP header can contain further options, which are always padded if necessary to guarantee the payload following the header is aligned to a 32-bit boundary.

The IP header is immediately followed by the payload, which can contain further protocol headers (for example, TCP or UDP, as indicated by the protocol field value). The complete IP datagram is transported in the payload section of an Ethernet frame.

Table 22-8. IPv4 header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Version	IHL	TOS		Length			
Fragment ID				Flags	Fragment offset		
TTL		Protocol		Header checksum			
Source address							
Destination address							
Options							

Table 22-9. IPv4 header fields

Field name	Description
Version	4-bit IP version information. 0x4 for IPv4 frames.
IHL	4-bit Internet header length information. Determines number of 32-bit words found within the IP header. If no options are present, the default value is 0x5.
TOS	Type of service/DiffServ field.
Length	Total length of the datagram in bytes, including all octets of header and payload.
Fragment ID, flags, fragment offset	Fields used for IP fragmentation.

Table continues on the next page...

Table 22-9. IPv4 header fields (continued)

Field name	Description
TTL	Time-to-live. In effect, is decremented at each router arrival. If zero, datagram must be discarded.
Protocol	Identifier of protocol that follows in the datagram.
Header checksum	Checksum of IP header. For computational purposes, this field's value is zero.
Source address	Source IP address.
Destination address	Destination IP address.

22.6.2.3 IPv6 datagram format

The following figure shows the IP version 6 (IPv6) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words and has a fixed length of ten words (40 bytes). The next header field identifies the type of the header that follows the IPv6 header. It is defined similar to the protocol identifier within IPv4, with new definitions for identifying extension headers. These headers can be inserted between the IPv6 header and the protocol header, which will shift the protocol header accordingly.The accelerator currently only supports IPv6 without extension headers (in other words, the next header specifies TCP, UDP, or IMCP).

The first byte sent/received is the leftmost byte of the first word (in other words, version/ traffic class fields).

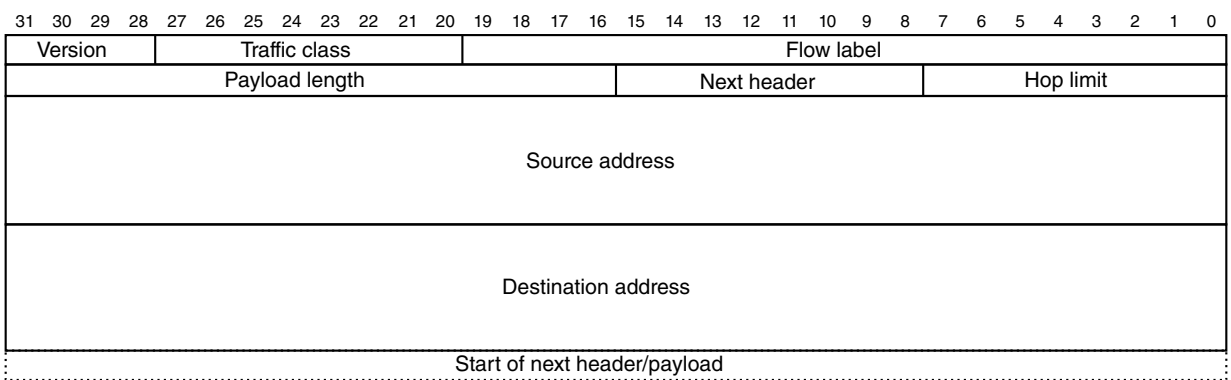

Figure 22-4. IPv6 header format

Table 22-10. IPv6 header fields

Field name	Description
Version	4-bit IP version information. 0x6 for all IPv6 frames.
Traffic class	8-bit field defining the traffic class.
Flow label	20-bit flow label identifying frames of the same flow.
Payload length	16-bit length of the datagram payload in bytes. It includes all octets following the IPv6 header.

Table continues on the next page...

Table 22-10. IPv6 header fields (continued)

Field name	Description
Next header	Identifies the header that follows the IPv6 header. This can be the protocol header or any IPv6 defined extension header.
Hop limit	Hop counter, decremented by one by each station that forwards the frame. If hop limit is 0 the frame must be discarded.
Source address	128-bit IPv6 source address.
Destination address	128-bit IPv6 destination address.

22.6.2.4 Internet Control Message Protocol (ICMP) datagram format

An internet control message protocol (ICMP) is found following the IP header, if the protocol identifier is 1. The ICMP datagram has a four-octet header followed by additional message data.

Table 22-11. ICMP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Type		Code		Checksum			
ICMP message data							

Table 22-12. IP header fields

Field name	Description
Type	8-bit type information
Code	8-bit code that is related to the message type
Checksum	16-bit one's complement checksum over the complete ICMP datagram

22.6.2.5 User Datagram Protocol (UDP) datagram format

A user datagram protocol header is found after the IP header, when the protocol identifier is 17.

The payload of the datagram is after the UDP header. The header byte order follows the conventions given for the IP header above.

Table 22-13. UDP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source port				Destination port			
Length				Checksum			

Table 22-14. UDP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Length	Length of user data which immediately follows the header, including the UDP header (that is, minimum value is 8)
Checksum	Checksum over the complete datagram and some IP header information

22.6.2.6 TCP datagram format

A TCP header is found following the IP header, when the protocol identifier has a value of 6.

The TCP payload immediately follows the TCP header.

Table 22-15. TCP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source port				Destination port			
Sequence number							
Acknowledgement number							
Offset	Reserved		Flags	Window			
Checksum				Urgent pointer			
Options							

Table 22-16. TCP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Sequence number	Transmit sequence number
Ack. number	Receive sequence number
Offset	Data offset, which is number of 32-bit words within TCP header — if no options selected, defaults to value of 5
Flags	URG, ACK, PSH, RST, SYN, FIN flags
Window	TCP receive window size information
Checksum	Checksum over the complete datagram (TCP header and data) and IP header information
Options	Additional 32-bit words for protocol options

22.6.3 IEEE 1588 message formats

The following sections describe the IEEE 1588 message formats.

22.6.3.1 Transport encapsulation

The precision time protocol (PTP) datagrams are encapsulated in Ethernet frames using the UDP/IP transport mechanism, or optionally, with the newer 1588v2 directly in Ethernet frames (layer 2).

Typically, multicast addresses are used to allow efficient distribution of the synchronization messages.

22.6.3.1.1 UDP/IP

The 1588 messages (v1 and v2) can be transported using UDP/IP multicast messages.

Table 22-17 shows IP multicast groups defined for PTP. The table also shows their respective MAC layer multicast address mapping according to RFC 1112 (last three octets of IP follow the fixed value of 01-00-5E).

Table 22-17. UDP/IP multicast domains

Name	IP Address	MAC Address mapping
DefaultPTPdomain	224.0.1.129	01-00-5E-00-01-81
AlternatePTPdomain1	224.0.1.130	01-00-5E-00-01-82
AlternatePTPdomain2	224.0.1.131	01-00-5E-00-01-83
AlternatePTPdomain3	224.0.1.132	01-00-5E-00-01-84

Table 22-18. UDP port numbers

Message type	UDP port	Note
Event	319	Used for SYNC and DELAY_REQUEST messages
General	320	All other messages (for example, follow-up, delay-response)

22.6.3.1.2 Native Ethernet (PTPv2)

In addition to using UDP/IP frames, IEEE 1588v2 defines a native Ethernet frame format that uses ethertype = 0x88F7. The payload of the Ethernet frame immediately contains the PTP datagram, starting with the PTPv2 header.

Besides others, version 2 adds a peer delay mechanism to allow delay measurements between individual point-to-point links along a path over multiple nodes. The following multicast domains are also defined in PTPv2.

Table 22-19. PTPv2 multicast domains

Name	MAC address
Normal messages	01-1B-19-00-00-00
Peer delay messages	01-80-C2-00-00-0E

22.6.3.2 PTP header

All PTP frames contain a common header that determines the protocol version and the type of message, which defines the remaining content of the message.

All multi-octet fields are transmitted in big-endian order (the most significant byte is transmitted/received first).

The last four bits of versionPTP are at the same position (second byte) for PTPv1 and PTPv2 headers. This allows accurate identification by inspecting the first two bytes of the message.

22.6.3.2.1 PTPv1 header

Table 22-20. Common PTPv1 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0

7	—	Reserved

22.6.4 MAC receive

The MAC receive engine performs the following tasks:

- Check frame framing
- Remove frame preamble and frame SFD field
- Discard frame based on frame destination address field
- Terminate pause frames
- Check frame length
- Remove payload padding if it exists

- Calculate and verify CRC-32
- Write received frames in the core receive FIFO

If the MAC is programmed to operate in half-duplex mode, it will also check if the frame is received with a collision.

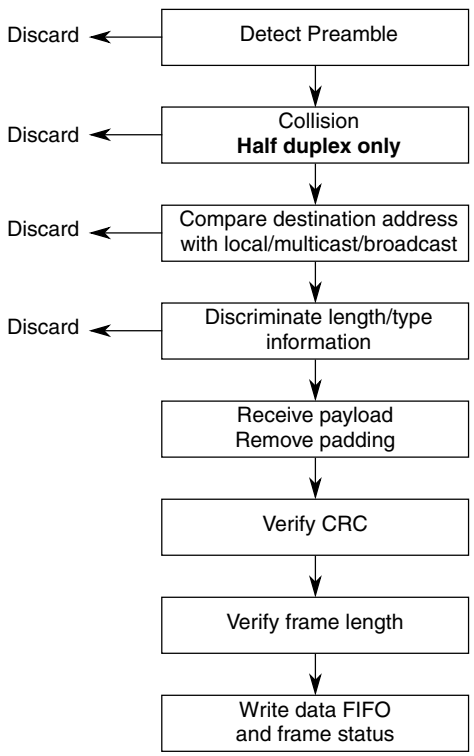

Figure 22-5. MAC receive flow

22.6.4.1 Collision detection in half-duplex mode

If the packet is received with a collision detected during reception of the first 64 bytes, the packet is discarded (if frame size was less than ~14 octets) or transmitted to the user application with an error and RxBD[CE] set.

22.6.4.2 Preamble processing

The IEEE 802.3 standard allows a maximum size of 56 bits (seven bytes) for the preamble, while the MAC core allows any preamble length, including zero length preamble.

The MAC core checks for the start frame delimiter (SFD) byte. If the next byte of the preamble, which is different from 0x55, is not 0xD5, the frame is discarded.

Although the IEEE specification dictates that the inner-packet gap should be at least 96 bits, the MAC core is designed to accept frames separated by only 64 10/100-Mbit/s operation (MII) bits.

The MAC core removes the preamble and SFD bytes.

22.6.4.3 MAC address check

The destination address bit 0 differentiates between multicast and unicast addresses.

- If bit 0 is 0, the MAC address is an individual (unicast) address.
- If bit 0 is 1, the MAC address defines a group (multicast) address.
- If all 48 bits of the MAC address are set, it indicates a broadcast address.

22.6.4.3.1 Unicast address check

If a unicast address is received, the destination MAC address is compared to the node MAC address programmed by the host in the PADDR1/2 registers.

If the destination address matches any of the programmed MAC addresses, the frame is accepted.

If Promiscuous mode is enabled (RCR[PROM] = 1) no address checking is performed and all unicast frames are accepted.

22.6.4.3.2 Multicast and unicast address resolution

The hash table algorithm used in the group and individual hash filtering operates as follows.

- The 48-bit destination address is mapped into one of 64 bits, represented by 64 bits in ENET*n*_GAUR/GALR (group address hash match) or ENET*n*_IAUR/IALR (individual address hash match).
- This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63.
- The msb of the CRC result selects ENET*n*_GAUR (msb = 1) or ENET*n*_GALR (msb = 0).
- The five lsbs of the hash result select the bit within the selected register.
- If the CRC generator selects a bit set in the hash table, the frame is accepted; else, it is rejected.

For example, if eight group addresses are stored in the hash table and random group addresses are received, the hash table prevents roughly 56/64 (or 87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The user must initialize the hash table registers. Use this CRC32 polynomial to compute the hash:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x^{1} + 1$

If Promiscuous mode is enabled (ENET*n*_RCR[PROM] = 1) all unicast and multicast frames are accepted regardless of ENET*n*_GAUR/GALR and ENET*n*_IAUR/IALR settings.

22.6.4.3.3 Broadcast address reject

All broadcast frames are accepted if BC_REJ is cleared or ENET*n*_RCR[PROM] is set. If PROM is cleared when ENET*n*_RCR[BC_REJ] is set, all broadcast frames are rejected.

Table 22-25. Broadcast address reject programming

PROM	BC_REJ	Broadcast frames
0	0	Accepted
0	1	Rejected
1	0	Accepted
1	1	Accepted

22.6.4.3.4 Miss-bit implementation

For higher layer filtering purposes, RxBD[M] indicates an address miss when the MAC operates in promiscuous mode and accepts a frame that would otherwise be rejected.

If a group/individual hash or exact match does not occur and Promiscuous mode is enabled (RCR[PROM] = 1), the frame is accepted and the M bit is set in the buffer descriptor; otherwise, the frame is rejected.

This means the status bit is set in any of the following conditions during Promiscuous mode:

- A broadcast frame is received when BC_REJ is set

- A unicast is received that does not match either:
  - Node address (PALR[PADDR1] and PAUR[PADDR2])
  - Hash table for unicast (IAUR[IADDR1] and IALR[IADDR2])
- A multicast is received that does not match the GAUR[GADDR1] and GALR[GADDR2] hash table entries

22.6.4.4 Frame length/type verification: payload length check

If the length/type is less than 0x600 and NLC is set, the MAC checks the payload length and reports any error in the frame status word and interrupt bit PLR.

If the length/type is greater than or equal to 0x600, the MAC interprets the field as a type and no payload length check is performed.

The length check is performed on VLAN and stacked VLAN frames. If a padded frame is received, no length check can be performed due to the extended frame payload because padded frames can never have a payload length error.

22.6.4.5 Frame length/type verification: frame length check

When the receive frame length exceeds MAX_FL bytes, the BABR interrupt is generated and the RxBD[LG] bit is set.

The frame is not truncated unless the frame length exceeds the value programmed in ENET*n*_FTRL[TRUNC_FL]. If the frame is truncated, RxBD[TR] is set. In addition, a truncated frame always has the CRC error indication set (RxBD[CR]).

22.6.4.6 VLAN frames processing

VLAN frames have a length/type field set to 0x8100 immediately followed by a 16-Bit VLAN control information field.

VLAN-tagged frames are received as normal frames because the VLAN tag is not interpreted by the MAC function, and are pushed complete with the VLAN tag to the user application. If the length/type field of the VLAN-tagged frame, which is found four octets later in the frame, is less than 42, the padding is removed. In addition, the frame status word (RxBD[NO]) indicates that the current frame is VLAN tagged.

22.6.4.7 Pause frame termination

The receive engine terminates pause frames and does not transfer them to the receive FIFO. The quanta is extracted and sent to the MAC transmit path via a small internal clock rate decoupling asynchronous FIFO.

The quanta is written only if a correct CRC and frame length are detected by the control state machine. If not, the quanta is discarded and the MAC transmit path is not paused.

Good pause frames are ignored if ENET*n*_RCR[FCE] is cleared and are forwarded to the client interface when ENET*n*_RCR[PAUFWD] is set.

22.6.4.8 CRC check

The CRC-32 field is checked and forwarded to the core FIFO interface if ENET*n*_RCR[CRCFWD] is cleared and ENET*n*_RCR[PADEN] is set.

When CRCFWD is set (regardless of PADEN), the CRC-32 field is checked and terminated (not transmitted to the FIFO).

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x^{1} + 1$

The 32 bits of the CRC value are placed in the frame check sequence (FCS) field with the x^{31} term as right-most bit of the first octet. The CRC bits are thus received in the following order: x^{31}, x^{30},..., x^{1}, x^{0}.

If a CRC error is detected, the frame is marked invalid and RxBD[CR] is set.

22.6.4.9 Frame padding removal

When a frame is received with a payload length field set to less than 46 (42 for VLAN-tagged frames and 38 for frames with stacked VLANs), the zero padding can be removed before the frame is written into the data FIFO depending on the setting of ENET*n*_RCR[PADEN].

Note

If a frame is received with excess padding (in other words, the length field is set as mentioned above, but the frame has more than 64 octets) and padding removal is enabled, then the

padding is removed as normal and no error is reported if the frame is otherwise correct (for example: good CRC, less than maximum length, and no other error).

22.6.5 MAC transmit

Frame transmission starts when the transmit FIFO holds enough data.

After a transfer starts, the MAC transmit function performs the following tasks:

- Generates preamble and SFD field before frame transmission
- Generates XOFF pause frames if the receive FIFO reports a congestion or if ENET*n*_TCR[TFC_PAUSE] is set with ENET*n*_OPD[PAUSE_DUR] set to a non-zero value
- Generates XON pause frames if the receive FIFO congestion condition is cleared or if TFC_PAUSE is set with PAUSE_DUR cleared
- Suspends Ethernet frame transfer (XOFF) if a non-zero pause quanta is received from the MAC receive path
- Adds padding to the frame if required
- Calculates and appends CRC-32 to the transmitted frame
- Sends the frame with correct inter-packet gap (IPG) (deferring)

When the MAC is configured to operate in half-duplex mode, the following additional tasks are performed:

- Collision detection
- Frame retransmit after back-off timer expires

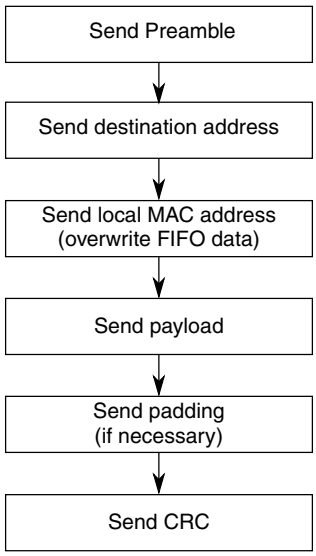

Figure 22-6. Frame transmit overview

22.6.5.1 Frame payload padding

The IEEE specification defines a minimum frame length of 64 bytes.

If the frame sent to the MAC from the user application has a size smaller than 60 bytes, the MAC automatically adds padding bytes (0x00) to comply with the Ethernet minimum frame length specification. Transmit padding is always performed and cannot be disabled.

If the MAC is not allowed to append a CRC (TxBD[TC] = 1), the user application is responsible for providing frames with a minimum length of 64 octets.

22.6.5.2 MAC address insertion

On each frame received from the core transmit FIFO interface, the source MAC address is either:

- Replaced by the address programmed in the PADDR1/2 fields (ENET*n*_TCR[ADDINS] = 1)
- Transparently forwarded to the Ethernet line (ENET*n*_TCR[ADDINS] = 0)

22.6.5.3 CRC-32 generation

The CRC-32 field is optionally generated and appended at the end of a frame.

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x^{1} + 1$

The 32 bits of the CRC value are placed in the FCS field so that the x^{31} term is the right-most bit of the first octet. The CRC bits are thus transmitted in the following order: x^{31}, x^{30},..., x^{1}, x^{0}.

22.6.5.4 Inter-packet gap (IPG)

In full-duplex mode, after frame transmission and before transmission of a new frame, an IPG (programmed in ENET*n*_TIPG) is maintained. The minimum IPG can be programmed between 8 and 26 byte-times (64 and 208 bit-times).

In half-duplex mode, the core constantly monitors the line. Actual transmission of the data onto the network occurs only if it has been idle for a 96-bit time period, and any back-off time requirements have been satisfied. In accordance with the standard, the core begins to measure the IPG from CRS de-assertion.

22.6.5.5 Collision detection and handling — half-duplex operation only

A collision occurs on a half-duplex network when concurrent transmissions from two or more nodes take place. During transmission, the core monitors the line condition and detects a collision when the PHY device asserts COL.

When the core detects a collision while transmitting, it stops transmission of the data and transmits a 32-bit jam pattern. If the collision is detected during the preamble or the SFD transmission, the jam pattern is transmitted after completing the SFD, which results in a minimum 96-bit fragment. The jam pattern is a fixed pattern that is not compared to the actual frame CRC, and has a very low probability (0.532) of having a jam pattern identical to the CRC.

If a collision occurs before transmission of 64 bytes (including preamble and SFD), the MAC core waits for the backoff period and retransmits the packet data (stored in a 64-byte re-transmit buffer) that has already been sent on the line. The backoff period is generated from a pseudo-random process (truncated binary exponential backoff).

If a collision occurs after transmission of 64 bytes (including preamble and SFD), the MAC discards the remainder of the frame, optionally sets the LC interrupt bit, and sets TxBD[LCE].

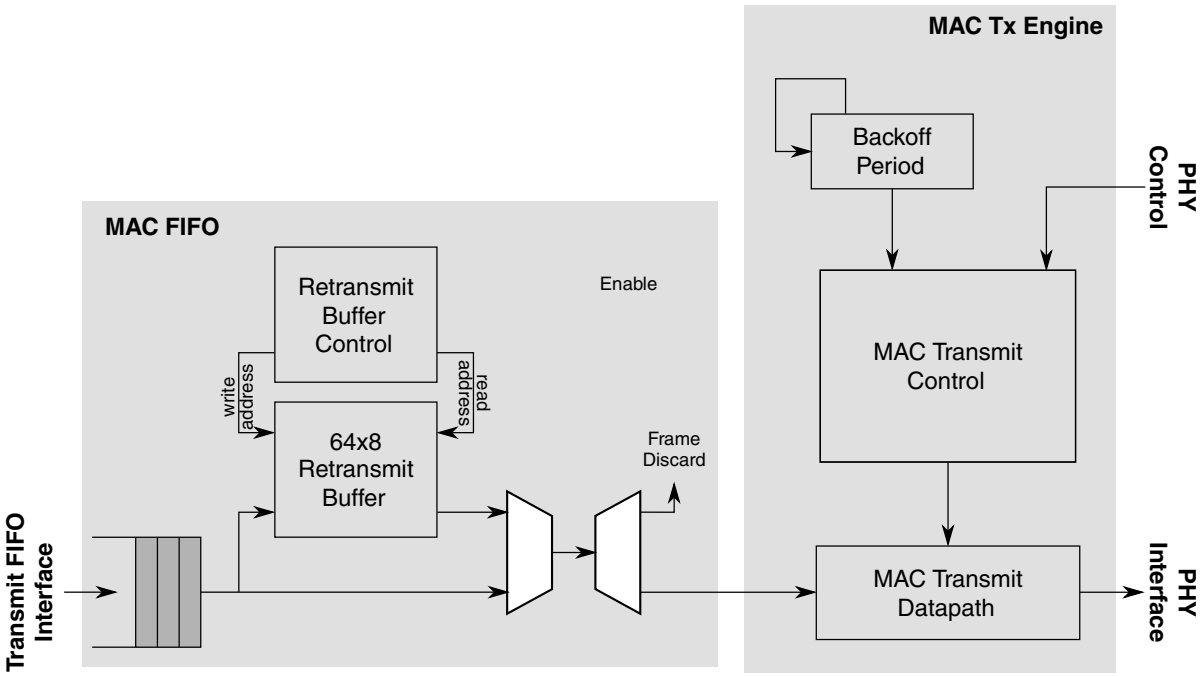

Figure 22-7. Packet re-transmit overview

The backoff time is represented by an integer multiple of slot times. One slot is equal to a 512-bit time period. The number of the delay slot times, before the n^{th} re-transmission attempt, is chosen as a uniformly-distributed random integer in the range:

- $0 < r < 2^k$
- $k = \min(n, N)$; where n is the number of retransmissions and $N = 10$

For example, after the first collision, the backoff period is 0 or 1 slot time. If a collision occurs on the first retransmission, the backoff period is 0, 1, 2, or 3, and so on.

The maximum backoff time (in 512-bit time slots) is limited by N = 10 as specified in the IEEE 802.3 standard.

If a collision occurs after 16 consecutive retransmissions, the core reports an excessive collision condition (ENET*n*_EIR[RL] interrupt field and TxBD[EE]) and discards the current packet from the FIFO.

In networks violating the standard requirements, a collision may occur after transmission of the first 64 bytes. In this case, the core stops the current packet transmission and discards the rest of the packet from the transmit FIFO. The core resumes transmission with the next packet available in the core transmit FIFO.

warning

Ethernet PHYs that support the SQE Test, or "heartbeat,"
feature must disable this feature. When this feature is enabled,

the PHY asserts the collision signal after a frame is transmitted to indicate to the ENET that the PHY's collision logic is working. This may cause data corruption in the next frame from the ENET. This corrupted frame contains up to 21 zero bytes which start somewhere within the MAC destination address field. The ENET, however, will still generate a good FCS (CRC-32) but with corrupted data.

22.6.6 Full-duplex flow control operation

Three conditions are handled by the core's flow control engine:

- Remote device congestion — The remote device connected to the same Ethernet segment as the core reports congestion and requests that the core stop sending data.
- Core FIFO congestion — When the core's receive FIFO reaches a user-programmable threshold (RX section empty), the core sends a pause frame back to the remote device requesting the data transfer to stop.
- Local device congestion — Any device connected to the core can request (typically, via the host processor) the remote device to stop transmitting data.

22.6.6.1 Remote device congestion

When the MAC transmit control gets a valid pause quanta from the receive path and if ENET*n*_RCR[FCE] is set, the MAC transmit logic:

- Completes the transfer of the current frame.
- Stops sending data for the amount of time specified by the pause quanta in 512 bit time increments.
- Sets ENET*n*_TCR[RFC_PAUSE].

Frame transfer resumes when the time specified by the quanta expires and if no new quanta value is received, or if a new pause frame with a quanta value set to 0x0000 is received. The MAC also resets RFC_PAUSE to zero.

If ENET*n*_RCR[FCE] cleared, the MAC ignores received pause frames.

Optionally and independent of ENET*n*_RCR[FCE], pause frames are forwarded to the client interface if PAUFWD is set.

22.6.6.2 Local device/FIFO congestion

The MAC transmit engine generates pause frames when the local receive FIFO is not able to receive more than a pre-defined number of words (FIFO programmable threshold) or when pause frame generation is requested by the local host processor.

- To generate a pause frame, the host processor sets ENET*n*_TCR[TFC_PAUSE]. A single pause frame is generated when the current frame transfer is completed and TFC_PAUSE is automatically cleared. Optionally, an interrupt is generated.
- An XOFF pause frame is generated when the receive FIFO asserts its section empty flag (internal). An XOFF pause frame is generated automatically, when the current frame transfer completes.
- An XON pause frame is generated when the receive FIFO deasserts its section empty flag (internal). An XON pause frame is generated automatically, when the current frame transfer completes.

When an XOFF pause frame is generated, the pause quanta (payload byte P1 and P2) is filled with the value programmed in ENET*n*_OPD[PAUSE_DUR].

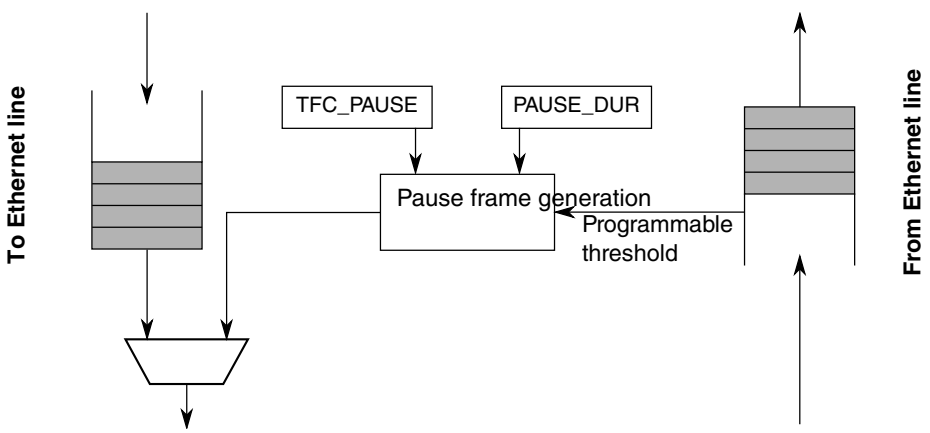

Figure 22-8. Pause frame generation overview

Note

Although the flow control mechanism should prevent any FIFO overflow on the MAC core receive path, the core receive FIFO is protected. When an overflow is detected on the receive FIFO, the current frame is truncated with an error indication set in the frame status word. The frame should subsequently be discarded by the user application.

22.6.7 Magic packet detection

Magic packet detection wakes a node that is put in power-down mode by the node management agent. Magic packet detection is supported only if the MAC is configured in sleep mode.

22.6.7.1 Sleep mode

To put the MAC in Sleep mode, set ENET*n*_ECR[SLEEP]. At the same time ENET*n*_ECR[MAGICEN] should also be set to enable magic packet detection.

In addition, when the processor is in Stop mode, Sleep mode is entered, without affecting the ENET*n*_ECR register bits.

When the MAC is in Sleep mode:

- The transmit logic is disabled.
- The FIFO receive/transmit functions are disabled.
- The receive logic is kept in Normal mode, but it ignores all traffic from the line except magic packets. They are detected so that a remote agent can wake the node.

22.6.7.2 Magic packet detection

The core is designed to detect magic packets (see Magic packets) with the destination address set to:

- Any multicast address
- The broadcast address
- The unicast address programmed in PADDR1/2

When a magic packet is detected, EIR[WAKEUP] is set and none of the statistic registers are incremented.

22.6.7.3 Wakeup

When a magic packet is detected, indicated by ENET*n*_EIR[WAKEUP], ENET*n*_ECR[SLEEP] should be cleared to resume normal operation of the MAC. Clearing the SLEEP bit automatically masks ENET*n*_ECR[MAGICEN], disabling magic packet detection.

22.6.8 IP accelerator functions

The following sections describe the IP accelerator functions.

22.6.8.1 Checksum calculation

The IP and ICMP, TCP, UDP checksums are calculated with one's complement arithmetic summing up 16-bit values.

- For ICMP, the checksum is calculated over the complete ICMP datagram, in other words without IP header.
- For TCP and UDP, the checksums contain the header and data sections and values from the IP header, which can be seen as a pseudo-header that is not actually present in the data stream.

Table 22-26. IPv4 pseudo-header for checksum calculation

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source address							
Destination address							
Zero		Protocol		TCP/UDP length			

Table 22-27. IPv6 pseudo-header for checksum calculation

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source address							
Destination address							
TCP/UDP length							
Zero						Next header	

The TCP/UDP length value is the length of the TCP or UDP datagram, which is equal to the payload of an IP datagram. It is derived by subtracting the IP header length from the complete IP datagram length that is given in the IP header (IPv4), or directly taken from the IP header (IPv6). The protocol field is the corresponding value from the IP header. The Zero fields are all zeroes.

For IPv6, the complete 128-bit addresses are considered. The next header value identifies the upper layer protocol as either TCP or UDP. It may differ from the next header value of the IPv6 header if extension headers are inserted before the protocol header.

The checksum calculation uses 16-bit words in network byte order: The first byte sent/received is the MSB, and the second byte sent/received is the LSB of the 16-bit value to add to the checksum. If the frame ends on an odd number of bytes, a zero byte is appended for checksum calculation only, and is not actually transmitted.

22.6.8.2 Additional padding processing

According to IEEE 802.3, any Ethernet frame must have a minimum length of 64 octets.

The MAC usually removes padding on receive when a frame with length information is received. Because IP frames have a type value instead of length, the MAC does not remove padding for short IP frames, as it is not aware of the frame contents.

The IP accelerator function can be configured to remove the Ethernet padding bytes that might follow the IP datagram.

On transmit, the MAC automatically adds padding as necessary to fill any frame to a 64-byte length.

22.6.8.3 32-bit Ethernet payload alignment

The data FIFOs allow inserting two additional arbitrary bytes in front of a frame. This extends the 14-byte Ethernet header to a 16-byte header, which leads to alignment of the Ethernet payload, following the Ethernet header, on a 32-bit boundary.

This function can be enabled for transmit and receive independently with the corresponding SHIFT16 bits in the ENET*n*_TACC and ENET*n*_RACC registers.

When enabled, the valid frame data is arranged as shown in Table 22-28.

Table 22-28. 64-bit interface data structure with SHIFT16 enabled

63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0	

Table continues on the next page...

Table 22-28. 64-bit interface data structure with SHIFT16 enabled (continued)

Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	Any value	Any value
Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	Byte 7	Byte 6
...							

22.6.8.3.1 Receive processing

When ENET*n*_RACC[SHIFT16] is set, each frame is received with two additional bytes in front of the frame.

The user application must ignore these first two bytes and find the first byte of the frame in bits 23–16 of the first word from the RX FIFO.

Note

SHIFT16 must be set during initialization and kept set during the complete operation, because it influences the FIFO write behavior.

22.6.8.3.2 Transmit processing

When ENET*n*_TACC[SHIFT16] is set, the first two bytes of the first word written (bits 15–0) are discarded immediately by the FIFO write logic.

The SHIFT16 bit can be enabled/disabled for each frame individually if required, but can be changed only between frames.

22.6.8.4 Received frame discard

Because the receive FIFO must be operated in store and forward mode (ENET*n*_RSFL cleared), received frames can be discarded based on the following errors:

- The MAC function receives the frame with an error:
  - The frame has an invalid payload length
  - Frame length is greater than MAX_FL
  - Frame received with a CRC-32 error
  - Frame truncated due to receive FIFO overflow
  - Frame is corrupted as PHY signaled an error (RX_ERR asserted during reception)

- An IP frame is detected and the IP header checksum is wrong
- An IP frame with a valid IP header and a valid IP header checksum is detected, the protocol is known but the protocol-specific checksum is wrong

If one of the errors occurs and the IP accelerator function is configured to discard frames (ENET*n*_RACC), the frame is automatically discarded. Statistics are maintained normally and are not affected by this discard function.

22.6.8.5 IPv4 fragments

When an IPv4 IP fragment frame is received, only the IP header is inspected and its checksum verified. 32-bit alignment operates the same way on fragments as it does on normal IP frames, as specified above.

The IP fragment frame payload is not inspected for any protocol headers. As such, a protocol header would only exist in the very first fragment. To assist in protocol-specific checksum verification, the one's-complement sum is calculated on the IP payload (all bytes following the IP header) and provided with the frame status word.

The frame fragment status field (RxBD[FRAG]) is set to indicate a fragment reception, and the one's-complement sum of the IP payload is available in RxBD[Payload checksum].

Note

After all fragments have been received and reassembled, the application software can take advantage of the payload checksum delivered with the frame's status word to calculate the protocol-specific checksum of the datagram.

For example, if a TCP payload is delivered by multiple IP fragments, the application software can calculate the pseudo-header checksum value from the first fragment, and add the payload checksums delivered with the status for all fragments to verify the TCP datagram checksum.

22.6.8.6 IPv6 support

The following sections describe the IPv6 support.

22.6.8.6.1 Receive processing

An Ethernet frame of type 0x86DD identifies an IP Version 6 frame (IPv6) frame. If an IPv6 frame is received, the first IP header is inspected (first ten words), which is available in every IPv6 frame.

If the receive SHIFT16 function is enabled, the IP header is aligned on a 32-bit boundary allowing more efficient processing (see 32-bit Ethernet payload alignment).

For TCP and UDP datagrams, the pseudo-header checksum calculation is performed and verified.

To assist in protocol-specific checksum verification, the one's-complement sum is always calculated on the IP payload (all bytes following the IP header) and provided with the frame status word. For example, if extension headers were present, their sums can be subtracted in software from the checksum to isolate the TCP/UDP datagram checksum, if required.

22.6.8.6.2 Transmit processing

For IPv6 transmission, the SHIFT16 function is supported to process 32-bit aligned datagrams.

IPv6 has no IP header checksum; therefore, the IP checksum insertion configuration is ignored.

The protocol checksum is inserted only if the next header of the IP header is a known protocol (TCP, UDP, or ICMP). If a known protocol is detected, the checksum over all bytes following the IP header is calculated and inserted in the correct position.

The pseudo-header checksum calculation is performed for TCP and UDP datagrams accordingly.

22.6.9 Resets and stop controls

The following sections describe the resets and stop controls.

22.6.9.1 Hardware reset

To reset the Ethernet module, set ENET*n*_ECR[RESET].

22.6.9.2 Soft reset

When ENET*n*_ECR[ETHER_EN] is cleared during operation, the following occurs:

- uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.
- A currently ongoing transmit is terminated by asserting TXER to the PHY.
- A currently ongoing transmit FIFO write from the application is terminated by stopping the write to the FIFO, and all further data from the application is ignored. All subsequent writes are ignored until re-enabled.
- A currently ongoing receive FIFO read is terminated. The RxBD has arbitrary values in this case.

22.6.9.3 Hardware freeze

When the processor enters debug mode and ECR[DBGEN] is set, the MAC enters a freeze state where it stops all transmit and receive activities gracefully.

The following happens when the MAC enters hardware freeze:

- A currently ongoing receive transaction on the receive application interface is completed as normal. No further frames are read from the FIFO.
- A currently ongoing transmit transaction on the transmit application interface is completed as normal (in other words, until writing end-of-packet (EOP)).
- A currently ongoing frame receive is completed normally, after which no further frames are accepted from the MII.
- A currently ongoing frame transmit is completed normally, after which no further frames are transmitted.

22.6.9.4 Graceful stop

During a graceful stop, any currently ongoing transactions are completed normally and no further frames are accepted. The MAC can resume from a graceful stop without the need for a reset (for example, clearing ETHER_EN is not required).

The following conditions lead to a graceful stop of the MAC transmit or receive datapaths.

22.6.9.4.1 Graceful transmit stop (GTS)

When gracefully stopped, the MAC is no longer reading frame data from the transmit FIFO and has completed any ongoing transmission.

In any of the following conditions, the transmit datapath stops after an ongoing frame transmission has been completed normally.

- ENET*n*_TCR[GTS] is set by software.
- ENET*n*_TCR[TFC_PAUSE] is set by software requesting a pause frame transmission. The status (and register bit) is cleared after the pause frame has been sent.
- A pause frame was received stopping the transmitter. The stopped situation is terminated when the pause timer expires or a pause frame with zero quanta is received.
- MAC is placed in Sleep mode by software or the processor entering Stop mode (see Sleep mode).
- The MAC is in Hardware Freeze mode.

When the transmitter has reached its stopped state, the following events occur:

- The GRA interrupt is asserted, when transitioned into stopped.
- In Hardware Freeze mode, the GRA interrupt does not wait for the application write completion and asserts when the transmit state machine (in other words, line side of TX FIFO) reaches its stopped state.

22.6.9.4.2 Graceful receive stop (GRS)

When gracefully stopped, the MAC is no longer writing frames into the receive FIFO.

The receive datapath stops after any ongoing frame reception has been completed normally, if any of the following conditions occur:

- MAC is placed in Sleep mode either by the software or the processor is in Stop mode). The MAC continues to receive frames and search for magic packets if enabled (see Magic packet detection). However, no frames are written into the receive FIFO, and therefore are not forwarded to the application.
- The MAC is in Hardware Freeze mode. The MAC does not accept any frames from the MII.

When the receive datapath is stopped, the following events occur:

- If the RX is in the stopped state, RCR[GRS] is set
- The GRA interrupt is asserted when the transmitter and receiver are stopped
- Any ongoing receive transaction to the application (RX FIFO read) continues normally until the frame end of package (EOP) is reached. After this, the following occurs:
  - When Sleep mode is active, all further frames are discarded, flushing the RX FIFO
  - In Hardware Freeze mode, no further frames are delivered to the application and they stay in the receive FIFO.

Note

The assertion of GRS does not wait for an ongoing FIFO read transaction on the application side of the FIFO (FIFO read).

22.6.9.4.3 Graceful stop interrupt (GRA)

The graceful stopped interrupt (GRA) is asserted for the following conditions:

- In Sleep mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- In Hardware Freeze mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- The MAC transmit datapath is stopped for any other condition (GTS, TFC_PAUSE, pause received).

The GRA interrupt is triggered only once when the stopped state is entered. If the interrupt is cleared while the stop condition persists, no further interrupt is triggered.

22.6.10 IEEE 1588 functions

To allow for IEEE 1588 or similar time synchronization protocol implementations, the MAC is combined with a time-stamping module to support precise time-stamping of incoming and outgoing frames. Set ENET*n*_ECR[EN1588] to enable 1588 support.

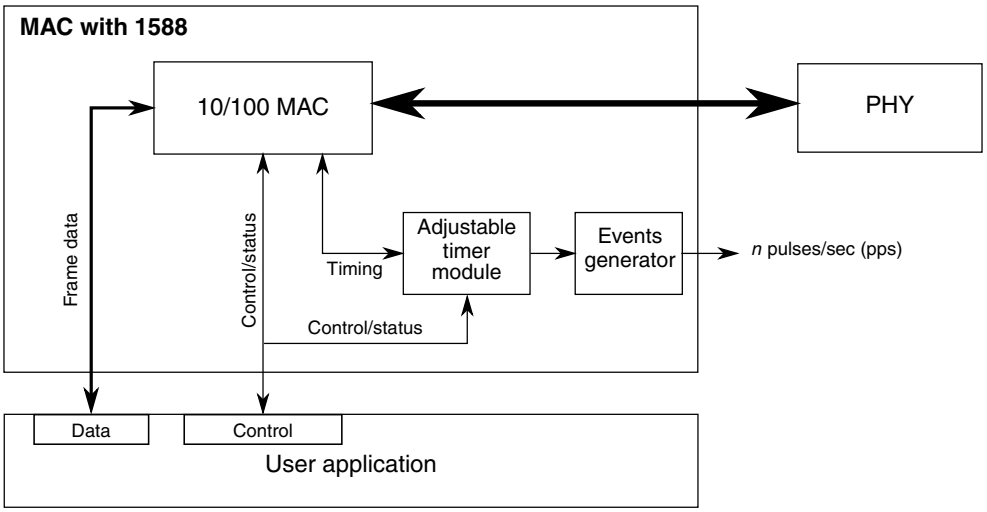

Figure 22-9. IEEE 1588 functions overview

22.6.10.1 Adjustable timer module

The adjustable timer module (TSM) implements the free-running counter (FRC), which generates the timestamps. The FRC operates with the time-stamping clock, which can be set to any value depending on your system requirements.

Through dedicated correction logic, the timer can be adjusted to allow synchronization to a remote master and provide a synchronized timing reference to the local system. The timer can be configured to cause an interrupt after a fixed time period, to allow synchronization of software timers or perform other synchronized system functions.

The timer is typically used to implement a period of one second; hence, its value ranges from 0 to (1×10^9)-1. The period event can trigger an interrupt, and software can maintain the seconds and hours time values as necessary.

22.6.10.1.1 Adjustable timer implementation

The adjustable timer consists of a programmable counter/accumulator and a correction counter. The periods of both counters and their increment rates are freely configurable, allowing very fine tuning of the timer.

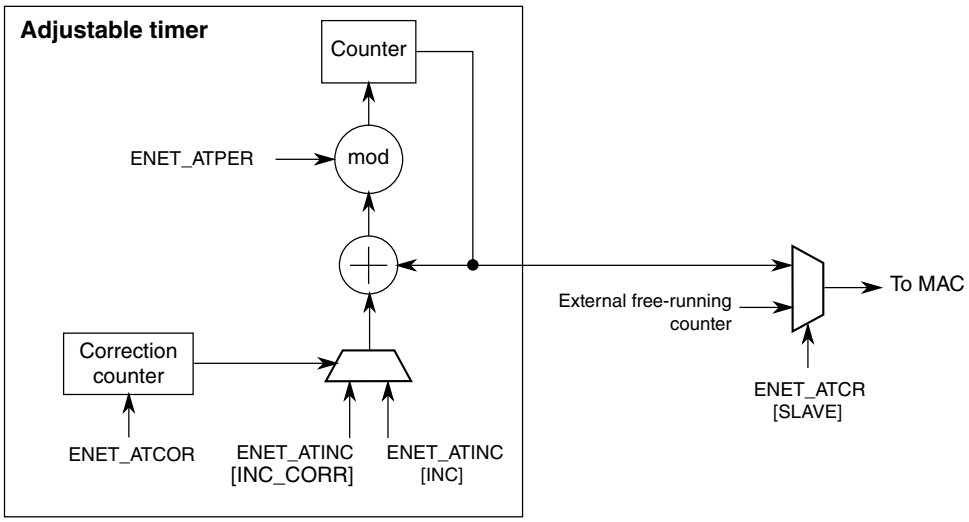

Figure 22-10. Adjustable timer implementation detail

The counter produces the current time. During each time-stamping clock cycle, a constant value is added to the current time as programmed in ENET*n*_ATINC. The value depends on the chosen time-stamping clock frequency. For example, if it operates at 125 MHz, setting the increment to eight represents 8 ns.

The period, configured in ENET*n*_ATPER, defines the modulo when the counter wraps. In a typical implementation, the period is set to 1×10^9 so that the counter wraps every second, and hence all timestamps represent the absolute nanoseconds within the one second period. When the period is reached, the counter wraps to start again respecting the period modulo. This means it does not necessarily start from zero, but instead the counter is loaded with the value (Current + Inc $-(1 \times 10^9)$), assuming the period is set to 1×10^9.

The correction counter operates fully independently, and increments by one with each time-stamping clock cycle. When it reaches the value configured in ENET*n*_ATCOR, it restarts and instructs the timer once to increment by the correction value, instead of the normal value.

The normal and correction increments are configured in ENET*n*_ATINC. To speed up the timer, set the correction increment more than the normal increment value. To slow down the timer, set the correction increment less than the normal increment value.

The correction counter only defines the distance of the corrective actions, not the amount. This allows very fine corrections and low jitter (in the range of 1 ns) independent of the chosen clock frequency.

By enabling slave mode (ENET*n*_ATCR[SLAVE] = 1), the timer is ignored and the current time is externally provided from one of the external modules. See the Chip Configuration details for which clock source is used. This is useful if multiple modules

within the system must operate from a single timer. When slave mode is enabled, you still must set ENET*n*_ATINC[INC] to the value of the master, since it is used for internal comparisons.

22.6.10.2 Transmit timestamping

Only 1588 event frames need to be time-stamped on transmit. The client application (for example, the MAC driver) should detect 1588 event frames and set TxBD[TS] together with the frame.

If TxBD[TS] is set, the MAC records the timestamp for the frame in ENET*n*_ATSTMP. ENET*n*_EIR[TS_AVAIL] is set to indicate that a new timestamp is available.

Software implements a handshaking procedure by setting TxBD[TS] when it transmits the frame for which a timestamp is needed, and then waits for ENET*n*_EIR[TS_AVAIL] to determine when the timestamp is available. The timestamp is then read from ENET*n*_ATSTMP. This is done for all event frames. Other frames do not use TxBD[TS] and, therefore, do not interfere with the timestamp capture.

22.6.10.3 Receive timestamping

When a frame is received, the MAC latches the value of the timer when the frame's start of frame delimiter (SFD) field is detected, and provides the captured timestamp on RxBD[1588 timestamp]. This is done for all received frames.

22.6.10.4 Time synchronization

The adjustable timer module is available to synchronize the local clock of a node to a remote master. It implements a free running 32-bit counter, and also contains an additional correction counter.

The correction counter increases or decreases the rate of the free running counter, enabling very fine granular changes of the timer for synchronization, yet adding only very low jitter when performing corrections.

The application software implements, in a slave scenario, the required control algorithm, setting the correction to compensate for local oscillator drifts and locking the timer to the remote master clock on the network.

The timer and all timestamp-related information should be configured to show the true nanoseconds value of a second (in other words, the timer is configured to have a period of one second). Hence, the values range from 0 to (1×10^9)–1. In this application, the seconds counter is implemented in software using an interrupt function that is executed when the nanoseconds counter wraps at 1×10^9.

22.6.10.5 Input Capture and Output Compare

The Input Capture Output Compare block can be used to provide precise hardware timing for input and output events.

22.6.10.5.1 Input capture

The TCCR*n* capture registers latch the time value when the corresponding external event occurs. An event can be a rising-, falling-, or either-edge of one of the 1588_TMR*n* signals. An event will cause the corresponding TCSR*n*[TF] timer flag to be set, indicating that an input capture has occurred. If the corresponding interrupt is enabled with the TCSR*n*[TIE] field, an interrupt can be generated.

22.6.10.5.2 Output compare

The TCCR*n* compare registers are loaded with the time at which the corresponding event should occur. When the ENET free-running counter value matches the output compare reference value in the TCCR*n* register, the corresponding flag, TCSR*n*[TF], is set, indicating that an output compare has occurred. The corresponding interrupt, if enabled by TCSR*n*[TIE], will be generated.The corresponding 1588_TMR*n* output signal will be asserted according to TCSR*n*[TMODE].

22.6.10.5.3 DMA requests

A DMA request can be enabled by setting TCSR*n*[TDRE]. The corresponding DMA request is generated when the TCSR*n*[TF] timer flag is set. When the DMA has completed, the corresponding TCSRn[TF] flag is cleared.

22.6.11 FIFO thresholds

The core FIFO thresholds are fully programmable to dynamically change the FIFO operation.

For example, store and forward transfer can be enabled by a simple change in the FIFO threshold registers.

The thresholds are defined in 64-bit words.

The receive and transmit FIFOs both have a depth of 256 words.

22.6.11.1 Receive FIFO

Four programmable thresholds are available, which can be set to any value to control the core operation as follows.

Table 22-29. Receive FIFO thresholds definition

Register	Description
ENET*n*_RSFL [RX_SECTION_FULL]	When the FIFO level reaches the ENET*n*_RSFL value, the MAC status signal is asserted to indicate that data is available in the receive FIFO (cut-through operation). Once asserted, if the FIFO empties below the threshold set with ENET*n*_RAEM and if the end-of-frame is not yet stored in the FIFO, the status signal is deasserted again. If a frame has a size smaller than the threshold (in other words, an end-of-frame is available for the frame), the status is also asserted. To enable store and forward on the receive path, clear ENET*n*_RSFL. The MAC status signal is asserted only when a complete frame is stored in the receive FIFO. When programming a non-zero value to ENET*n*_RSFL (cut-through operation) it should be greater than ENET*n*_RAEM.
ENET*n*_RAEM [RX_ALMOST_EMPTY]	When the FIFO level reaches the ENET*n*_RAEM value, and the end-of-frame has not been received, the core receive read control stops the FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. Set ENET*n*_RAEM to a minimum of six.
ENET*n*_RAFL [RX_ALMOST_FULL]	When the FIFO level approaches the maximum and there is no more space remaining for at least ENETn_RAFL number of words, the MAC control logic stops writing data in the FIFO and truncates the receive frame to avoid FIFO overflow. The corresponding error status is set when the frame is delivered to the application. Set ENET*n*_RAFL to a minimum of 4.
ENET*n*_RSEM [RX_SECTION_EMPTY]	When the FIFO level reaches the ENET*n*_RSEM value, an indication is sent to the MAC transmit logic, which generates an XOFF pause frame. This indicates FIFO congestion to the remote Ethernet client. When the FIFO level goes below the value programmed in ENET*n*_RSEM, an indication is sent to the MAC transmit logic, which generates an XON pause frame. This indicates the FIFO congestion is cleared to the remote Ethernet client. Clearing ENET*n*_RSEM disables any pause frame generation.

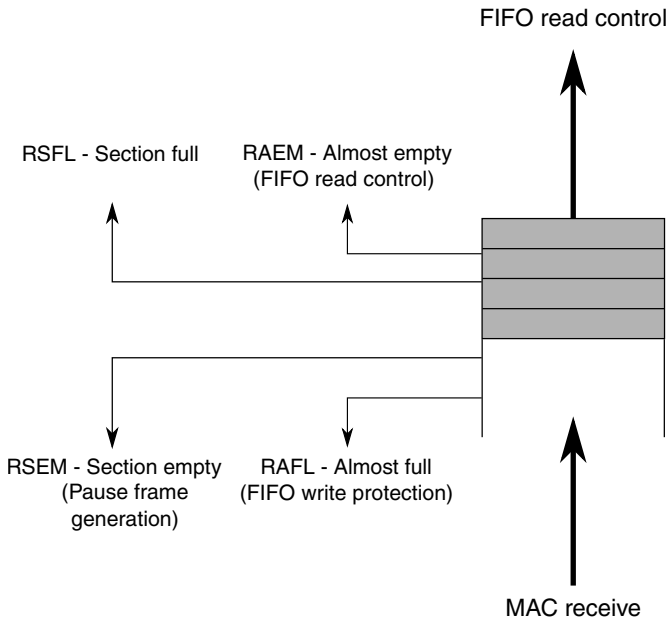

Figure 22-11. Receive FIFO overview

22.6.11.2 Transmit FIFO

Four programmable thresholds are available which control the core operation as described below.

Table 22-30. Transmit FIFO thresholds definition

Register	Description
ENET*n*_TAEM [TX_ALMOST _EMPTY]	When the FIFO level reaches the ENET*n*_TAEM value and no end-of-frame is available for the frame, the MAC transmit logic avoids a FIFO underflow by stopping FIFO reads and transmitting the Ethernet frame with an MII error indication. Set ENET*n*_TAEM to a minimum of 4.
ENET*n*_TAFL [TX_ALMOST _FULL]	When the FIFO level approaches the maximum, so that there is no more space for at least ENET*n*_TAFL number of words, the MAC deasserts its control signal to the application. If the application does not react on this signal, the FIFO write control logic avoids FIFO overflow by truncating the current frame and setting the error status. As a result, the frame is transmitted with an MII error indication. Set ENET*n*_TAFL to a minimum of 4. Larger values allow more latency for the application to react on the MAC control signal deassertion, before the frame is truncated. A typical setting is 8, which offers 3–4 clock cycles of latency to the application to react on the MAC control signal deassertion.
ENET*n*_TSEM [TX_SECTION _EMPTY]	When the FIFO level reaches the ENET*n*_TSEM value, a MAC status signal is deasserted to indicate that the transmit FIFO is getting full. This gives the ENET module an indication to slow or stop its write transaction to avoid a buffer overflow. This is a pure indication function to the application. It has no effect within the MAC. When ENET*n*_TSEM is 0, the signal is never deasserted.
ENET*n*_TFWR	When the FIFO level reaches the ENET*n*_TFWR value and when STRFWD is cleared, the MAC transmit control logic starts frame transmission before the end-of-frame is available in the FIFO (cut-through operation).

Table 22-30. Transmit FIFO thresholds definition

Register	Description
	If a complete frame has a size smaller than the ENET*n*_TFWR threshold, the MAC also transmits the frame to the line. To enable store and forward on the transmit path, set STRFWD. In this case, the MAC starts to transmit data only when a complete frame is stored in the transmit FIFO.

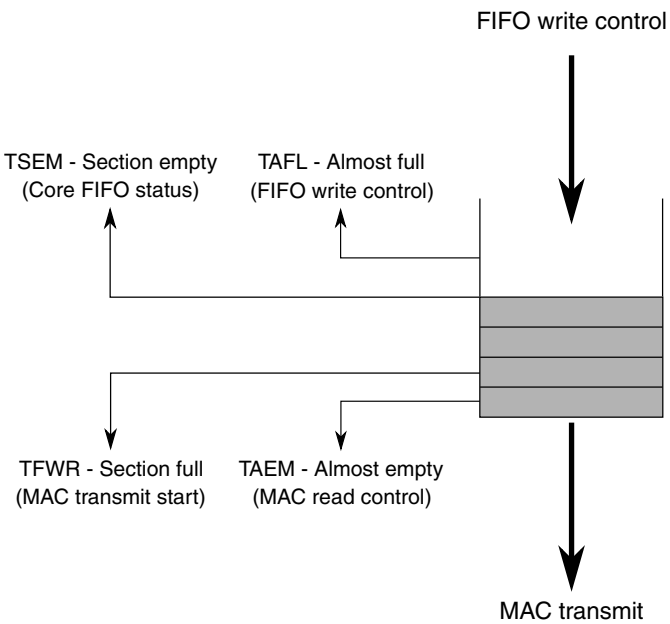

Figure 22-12. Transmit FIFO overview

22.6.12 Loopback options

The core implements external and internal loopback options, which are controlled by the ENET*n*_RCR register fields found here.

The core implements external and internal loopback options, which are controlled by the following ENET*n*_RCR register fields:

Table 22-31. Loopback options

Register field	Description
LOOP	Internal MII loopback. The MAC transmit is returned to the MAC receive. No data is transmitted to the external interfaces. In MII internal loopback, MII_TXCLK and MII_RXCLK must be provided with a clock signal (2.5 MHz for 10 Mbit/s, and 25 MHz for 100 Mbit/s))

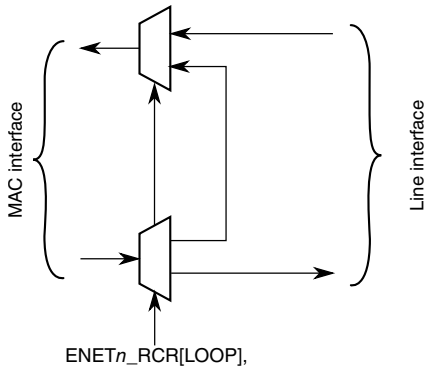

Figure 22-13. Loopback options

22.6.13 Legacy buffer descriptors

To support the Ethernet controller on previous Freescale devices, legacy FEC buffer descriptors are available. To enable legacy support, clear ENET*n*_ECR[1588EN].

NOTE

- The legacy buffer descriptor tables show the byte order for little-endian chips. DBSWP must be set to 1 after reset to enable little-endian mode.

22.6.13.1 Legacy receive buffer descriptor

The following table shows the legacy FEC receive buffer descriptor. Table 22-35 contains the descriptions for each field.

Table 22-32. Legacy FEC receive buffer descriptor (RxBD)

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Offset + 4	Tx Data Buffer Pointer — low halfword															
Offset + 6	Tx Data Buffer Pointer — high halfword															

1. This field is not supported by the uDMA.

22.6.14 Enhanced buffer descriptors

This section provides a description of the enhanced operation of the driver/uDMA via the buffer descriptors.

It is followed by a detailed description of the receive and transmit descriptor fields. To enable the enhanced features, set ENET*n*_ECR[1588EN].

NOTE

The enhanced buffer descriptor tables show the byte order for little-endian chips. DBSWP must be set to 1 after reset to enable little-endian mode.

22.6.14.1 Enhanced receive buffer descriptor

The following table shows the enhanced uDMA receive buffer descriptor. Table 22-35 contains the descriptions for each field.

Table 22-34. Enhanced uDMA receive buffer descriptor (RxBD)

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 22-35. Receive buffer descriptor field definitions

Word	Field	Description
Offset + 0	15–0 Data Length	Data length. Written by the MAC. Data length is the number of octets written by the MAC into this BD's data buffer if L is cleared (the value is equal to EMRBR), or the length of the frame including CRC if L is set. It is written by the MAC once as the BD is closed.
Offset + 2	15 E	Empty. Written by the MAC (= 0) and user (= 1). 0 The data buffer associated with this BD is filled with received data, or data reception has aborted due to an error condition. The status and length fields have been updated as required. 1 The data buffer associated with this BD is empty, or reception is currently in progress.
Offset + 2	14 RO1	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 2	13 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location. 1 The next buffer descriptor is found at the location defined in ENET*n*_RDSR.
Offset + 2	12 RO2	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 2	11 L	Last in frame. Written by the uDMA. 0 The buffer is not the last in a frame. 1 The buffer is the last in a frame.
Offset + 2	10–9	Reserved, must be cleared.
Offset + 2	8 M	Miss. Written by the MAC. This field is set by the MAC for frames accepted in promiscuous mode, but flagged as a miss by the internal address recognition. Therefore, while in promiscuous mode, you can use the this field to quickly determine whether the frame was destined to this station. This field is valid only if the L and PROM bits are set. 0 The frame was received because of an address recognition hit. 1 The frame was received because of promiscuous mode.

Table continues on the next page...

Table 22-35. Receive buffer descriptor field definitions (continued)

Word	Field	Description
		The information needed for this field comes from the promiscuous_miss(ff_rx_err_stat[26]) sideband signal.
Offset + 2	7 BC	Set if the DA is broadcast (FFFF_FFFF_FFFF).
Offset + 2	6 MC	Set if the DA is multicast and not BC.
Offset + 2	5 LG	Receive frame length violation. Written by the MAC. A frame length greater than RCR[MAX_FL] was recognized. This field is valid only if the L field is set. The receive data is not altered in any way unless the length exceeds TRUNC_FL bytes.
Offset + 2	4 NO	Receive non-octet aligned frame. Written by the MAC. A frame that contained a number of bits not divisible by 8 was received, and the CRC check that occurred at the preceding byte boundary generated an error or a PHY error occurred. This field is valid only if the L field is set. If this field is set, the CR field is not set.
Offset + 2	3	Reserved, must be cleared.
Offset + 2	2 CR	Receive CRC or frame error. Written by the MAC. This frame contains a PHY or CRC error and is an integral number of octets in length. This field is valid only if the L field is set.
Offset + 2	1 OV	Overrun. Written by the MAC. A receive FIFO overrun occurred during frame reception. If this field is set, the other status fields, M, LG, NO, and CR, lose their normal meaning and are zero. This field is valid only if the L field is set.
Offset + 2	0 TR	Set if the receive frame is truncated (frame length >TRUNC_FL). If the TR field is set, the frame must be discarded and the other error fields must be ignored because they may be incorrect.
Offset + 4	15–0 Data buffer pointer low	Receive data buffer pointer, low halfword
0ffset + 6	15–0 Data buffer pointer high	Receive data buffer pointer, high halfword[1]
Offset + 8	15–13 VPCP	VLAN priority code point. This field is written by the uDMA to indicate the frame priority level. Valid values are from 0 (best effort) to 7 (highest). This value can be used to prioritize different classes of traffic (e.g., voice, video, data). This field is only valid if the L field is set.
Offset + 8	12–6	Reserved, must be cleared.
Offset + 8	5 ICE	IP header checksum error. This is an accelerator option. This field is written by the uDMA. Set when either a non-IP frame is received or the IP header checksum was invalid. An IP frame with less than 3 bytes of payload is considered to be an invalid IP frame. This field is only valid if the L field is set.
Offset + 8	4 PCR	Protocol checksum error. This is an accelerator option. This field is written by the uDMA. Set when the checksum of the protocol is invalid or an unknown protocol is found and checksumming could not be performed. This field is only valid if the L field is set.
Offset + 8	3	Reserved, must be cleared.
Offset + 8	2 VLAN	VLAN. This is an accelerator option. This field is written by the uDMA. It means that the frame has a VLAN tag. This field is valid only if the L field is set.

Table continues on the next page...

Table 22-35. Receive buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 8	1 IPV6	IPV6 Frame. This field is written by the uDMA. This field indicates that the frame has an IPv6 frame type. If this field is not set it means that an IPv4 or other protocol frame was received. This field is valid only if the L field is set.
Offset + 8	0 FRAG	IPv4 Fragment.This is an accelerator option.This field is written by the uDMA. It indicates that the frame is an IPv4 fragment frame. This field is only valid when the L field is set.
Offset + A	15 ME	MAC error. This field is written by the uDMA. This field means that the frame stored in the system memory was received with an error (typically, a receive FIFO overflow). This field is only valid when the L field is set.
Offset + A	14–11	Reserved, must be cleared.
Offset + A	10 PE	PHY Error. This field is written by the uDMA. Set to "1"when the frame was received with an Error character on the PHY interface. The frame is invalid. This field is valid only when the L field is set.
Offset + A	9 CE	Collision. This field is written by the uDMA. Set when the frame was received with a collision detected during reception. The frame is invalid and sent to the user application. This field is valid only when the L field is set.
Offset + A	8 UC	Unicast. This field is written by the uDMA, and means that the frame is unicast. This field is valid regardless of whether the L field is set.
Offset + A	7 INT	Generate RXB/RXF interrupt. This field is set by the user to indicate that the uDMA is to generate an interrupt on the *dma_int_rxb* / *dma_int_rxfevent*.
Offset + A	6–0	Reserved, must be cleared.
Offset + C	15–0 Payload checksum	Internet payload checksum. This is an accelerator option. It is the one's complement sum of the payload section of the IP frame. The sum is calculated over all data following the IP header until the end of the IP payload. This field is valid only when the L field is set.
Offset + E	15–11 Header length	Header length. This is an accelerator option. This field is written by the uDMA. This field is the sum of 32-bit words found within the IP and its following protocol headers. If an IP datagram with an unknown protocol is found, then the value is the length of the IP header. If no IP frame or an erroneous IP header is found, the value is 0. The following values are minimum values if no header options exist in the respective headers: • ICMP/IP: 6 (5 IP header, 1 ICMP header) • UDP/IP: 7 (5 IP header, 2 UDP header) • TCP/IP: 10 (5 IP header, 5 TCP header) This field is only valid if the L field is set.
Offset + E	10–8	Reserved, must be cleared.
Offset + E	7–0 Protocol type	Protocol type. This is an accelerator option. The 8-bit protocol field found within the IP header of the frame. It is valid only when ICE is cleared. This field is valid only when the L field is set.
Offset + 10	15–0	Reserved, must be cleared.
Offset + 12	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	14–0	Reserved, must be cleared.
Offset + 14	15–0	This value is written by the uDMA. It is only valid if the L field is set.
Offset + 16		

Table continues on the next page...

Table 22-35. Receive buffer descriptor field definitions (continued)

Word	Field	Description
	1588 timestamp	
Offset + 18 – Offset + 1E	15–0	Reserved, must be cleared.

1. The receive buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 64. The buffer must reside in memory external to the MAC. The Ethernet controller never modifies this value.

22.6.14.2 Enhanced transmit buffer descriptor

Table 22-36. Enhanced transmit buffer descriptor (TxBD)

	Byte 1								Byte 0

Table 22-37. Enhanced transmit buffer descriptor field definitions

Word	Field	Description
Offset + 0	15–0 Data Length	Data length, written by user. Data length is the number of octets the MAC should transmit from this BD's data buffer. It is never modified by the MAC.
Offset + 2	15 R	Ready. Written by the MAC and you.

Table continues on the next page...

Table 22-37. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
		0 The data buffer associated with this BD is not ready for transmission. You are free to manipulate this BD or its associated data buffer. The MAC clears this field after the buffer has been transmitted or after an error condition is encountered. 1 The data buffer, prepared for transmission by you, has not been transmitted or currently transmits. You may write no fields of this BD after this field is set.
Offset + 2	14 TO1	Transmit software ownership. This field is reserved for software use. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	13 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location 1 The next buffer descriptor is found at the location defined in ETDSR.
Offset + 2	12 TO2	Transmit software ownership. This field is reserved for use by software. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	11 L	Last in frame. Written by user. 0 The buffer is not the last in the transmit frame 1 The buffer is the last in the transmit frame
Offset + 2	10 TC	Transmit CRC. Written by user, and valid only when L is set. 0 End transmission immediately after the last data byte 1 Transmit the CRC sequence after the last data byte This field is valid only when the L field is set.
Offset + 2	9 ABC	Append bad CRC. **Note:** This field is not supported by the uDMA and is ignored.
Offset + 2	8–0	Reserved, must be cleared.
Offset + 4	15–0 Data buffer pointer low	Tx data buffer pointer, low halfword
Offset + 6	15–0 Data buffer pointer high	Tx data buffer pointer, high halfword. The buffer must reside in memory external to the MAC. This value is never modified by the Ethernet controller. **NOTE:** For optimal performance, make the transmit buffer pointer evenly divisible by 64.
Offset + 8	15 TXE	Transmit error occurred. This field is written by the uDMA. This field indicates that there was a transmit error of some sort reported with the frame. Effectively this field is an OR of the other error fields including UE, EE, FE, LCE, OE, and TSE. This field is valid only when the L field is set.
Offset + 8	14	Reserved, must be cleared.
Offset + 8	13 UE	Underflow error. This field is written by the uDMA. This field indicates that the MAC reported an underflow error on transmit. This field is valid only when the L field is set.
Offset + 8	12 EE	Excess Collision error. This field is written by the uDMA. This field indicates that the MAC reported an excess collision error on transmit. This field is valid only when the L field is set.

Table continues on the next page...

Table 22-37. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 8	11 FE	Frame with error. This field is written by the uDMA. This field indicates that the MAC reported that the uDMA reported an error when providing the packet. This field is valid only when the L field is set.
Offset + 8	10 LCE	Late collision error. This field is written by the uDMA. This field indicates that the MAC reported that there was a Late Collision on transmit. This field is valid only when the L field is set.
Offset + 8	9 OE	Overflow error. This field is written by the uDMA. This field indicates that the MAC reported that there was a FIFO overflow condition on transmit. This field is only valid when the L field is set.
Offset + 8	8 TSE	Timestamp error. This field is written by the uDMA. This field indicates that the MAC reported a different frame type then a timestamp frame. This field is valid only when the L field is set.
Offset + 8	7–0	Reserved, must be cleared.
Offset + A	15	Reserved, must be cleared.
Offset + A	14 INT	Generate interrupt flags. This field is written by the user. This field is valid regardless of the L field and must be the same for all EBD for a given frame. The uDMA does not update this value.
Offset + A	13 TS	Timestamp. This field is written by the user. This indicates that the uDMA is to generate a timestamp frame to the MAC. This field is valid regardless of the L field and must be the same for all EBD for the given frame. The uDMA does not update this value.
Offset + A	12 PINS	Insert protocol specific checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the protocol checksum and overwrites the corresponding checksum field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	11 IINS	Insert IP header checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the IP header checksum and overwrites the corresponding header field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	10–0	Reserved, must be cleared.
Offset + C	15–0	Reserved, must be cleared.
Offset + E	15–0	Reserved, must be cleared.
Offset + 10	15–0	Reserved, must be cleared.
Offset + 12	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	14–0	Reserved, must be cleared.
Offset + 14	15–0 1588 timestamp	This value is written by the uDMA . It is valid only when the L field is set.
Offset + 16		
Offset + 18–Offset + 1E	15–0	Reserved, must be cleared.

22.6.15 Client FIFO application interface

The FIFO interface is completely asynchronous from the Ethernet line, and the transmit and receive interface can operate at a different clock rate.

All transfers to/from the user application are handled independently of the core operation, and the core provides a simple interface to user applications based on a two-signal handshake.

22.6.15.1 Data structure description

The data structure defined in the following tables for the FIFO interface must be respected to ensure proper data transmission on the Ethernet line. Byte 0 is sent to and received from the line first.

Table 22-38. FIFO interface data structure

	63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0
Word 0	Byte 7	Byte 6	Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0
Word 1	Byte 15	Byte 14	Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8
...	...							

The size of a frame on the FIFO interface may not be a modulo of 64-bit.

The user application may not care about the Ethernet frame formats in full detail. It needs to provide and receive an Ethernet frame with the following structure:

- Ethernet MAC destination address
- Ethernet MAC source address
- Optional 802.1q VLAN tag (VLAN type and info field)
- Ethernet length/type field
- Payload

Frames on the FIFO interface do not contain preamble and SFD fields, which are inserted and discarded by the MAC on transmit and receive, respectively.

- On receive, CRC and frame padding can be stripped or passed through transparently.
- On transmit, padding and CRC can be provided by the user application, or appended automatically by the MAC independently for each frame. No size restrictions apply.

Note

On transmit, if ENET*n*_TCR[ADDINS] is set, bytes 6–11 of each frame can be set to any value, since the MAC overwrites the bytes with the MAC address programmed in the ENET*n*_PAUR and ENET*n*_PALR registers.

Table 22-39. FIFO interface frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–13	Length/type field
14–N	Payload data

VLAN-tagged frames are supported on both transmit and receive, and implement additional information (VLAN type and info).

Table 22-40. FIFO interface VLAN frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–15	VLAN tag and info
16–17	Length/type field
18–N	Payload data

Note

The standard defines that the LSB of the MAC address is sent/received first, while for all the other header fields — in other words, length/type, VLAN tag, VLAN info, and pause quanta — the MSB is sent/received first.

22.6.15.2 Data structure examples

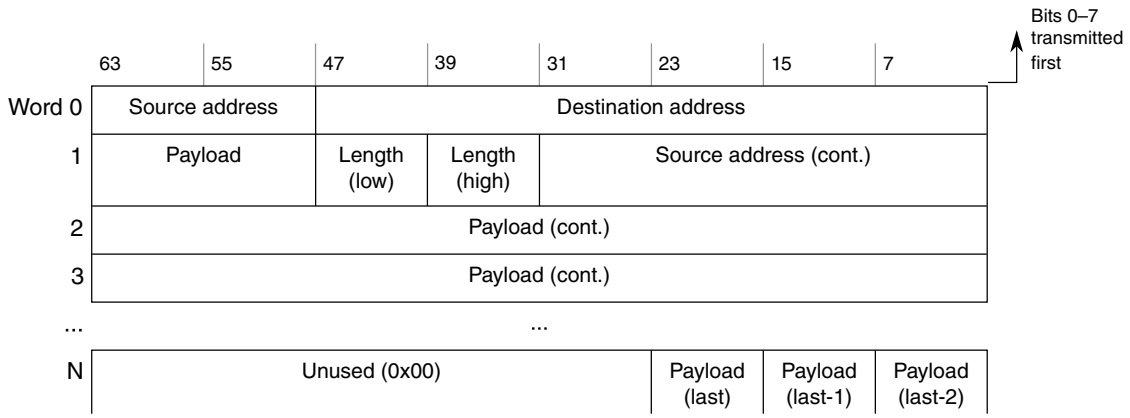

Figure 22-14. Normal Ethernet frame 64-bit mapping example

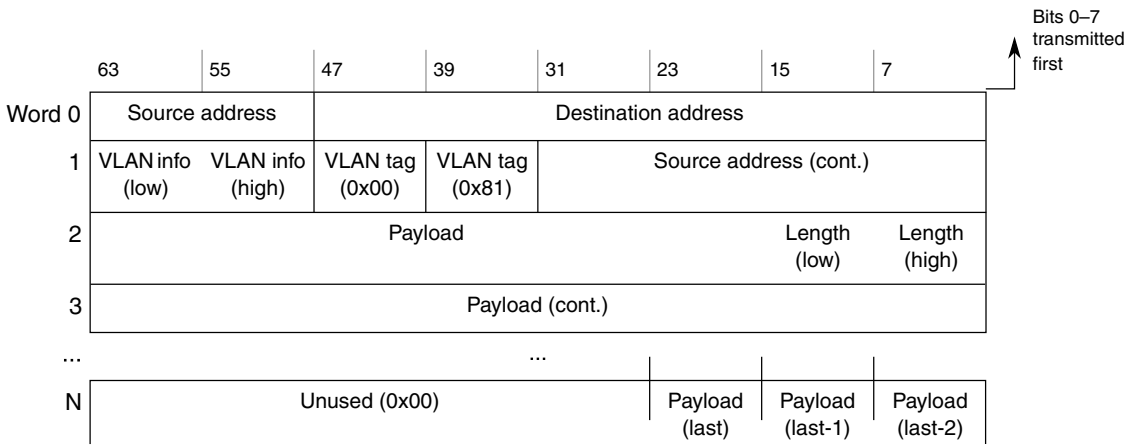

Figure 22-15. VLAN-tagged frame 64-bit mapping example

If CRC forwarding is enabled (CRCFWD = 0), the last four valid octets of the frame contain the FCS field. The non-significant bytes of the last word can have any value.

22.6.15.3 Frame status

A MAC layer status word and an accelerator status word is available in the receive buffer descriptor.

See Enhanced buffer descriptors for details.

The status is available with each frame with the last data of the frame.

If the frame status contains a MAC layer error (for example, CRC or length error), RxBD[ME] is also set with the last data of the frame.

22.6.16 FIFO protection

The following sections describe the FIFO protection mechanisms.

22.6.16.1 Transmit FIFO underflow

During a frame transfer, when the transmit FIFO reaches the almost empty threshold with no end-of-frame indication stored in the FIFO, the MAC logic:

- Stops reading data from the FIFO
- Asserts the MII error signal (MII_TXER) (1 in Figure 22-16) to indicate that the fragment already transferred is not valid
- Deasserts the MII transmit enable signal (MII_TXEN) to terminate the frame transfer (2)

After an underflow, when the application completes the frame transfer (3), the MAC transmit logic discards any new data available in the FIFO until the end of packet is reached (4) and sets the enhanced TxBD[UE] field.

The MAC starts to transfer data on the MII interface when the application sends a new frame with a start of frame indication (5).

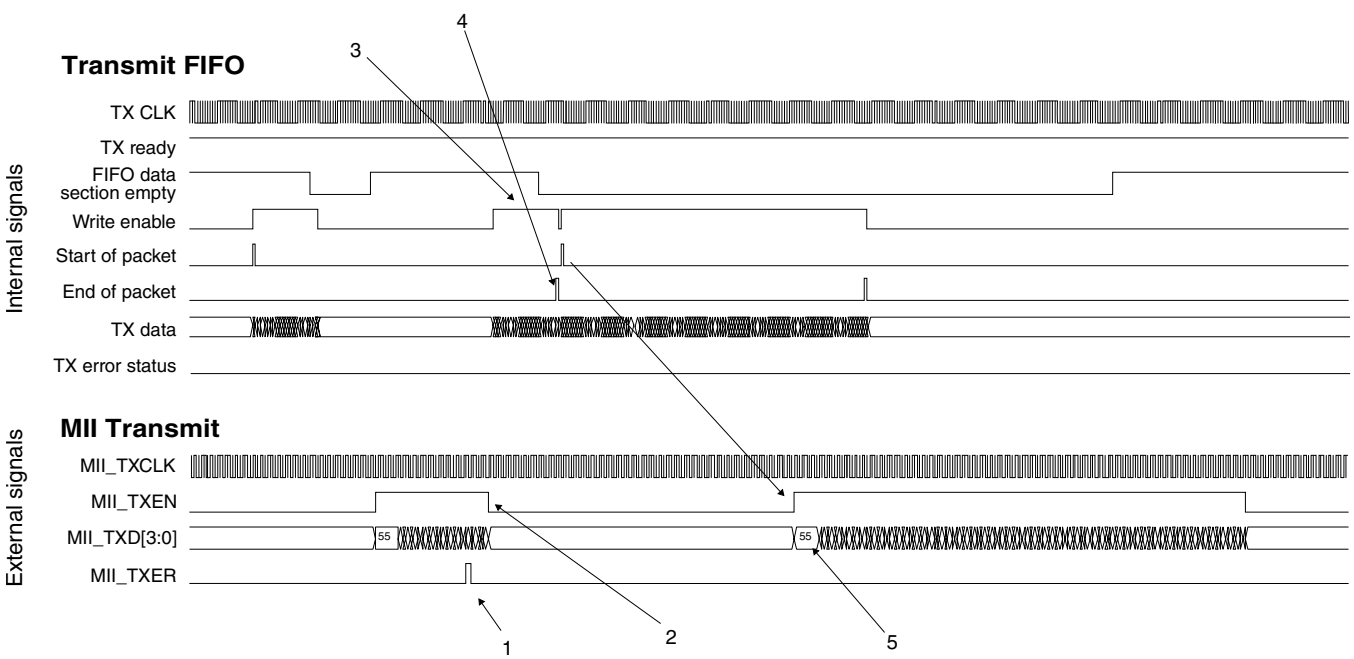

Figure 22-16. Transmit FIFO underflow protection

22.6.16.2 Transmit FIFO overflow

On the transmit path, when the FIFO reaches the programmable almost full threshold, the internal MAC ready signal is deasserted. The application should stop sending new data.

However, if the application keeps sending data, the transmit FIFO overflows, corrupting contents that were previously stored. The core logic sets the enhanced TxBD[OE] field for the next frame transmitted to indicate this overflow occurence.

Note

Overflow is a fatal error and must be addressed by resetting the core or clearing ENET*n*_ECR[ETHER_EN], to clear the FIFOs and prepare for normal operation again.

22.6.16.3 Receive FIFO overflow

During a frame reception, if the client application is not able to receive data (1), the MAC receive control truncates the incoming frame when the FIFO reaches the programmable almost-full threshold to avoid an overflow.

The frame is subsequently received on the FIFO interface with an error indication (enhanced RxBD[ME] field set together with receive end-of-packet) (2) with the truncation error status field set (3).

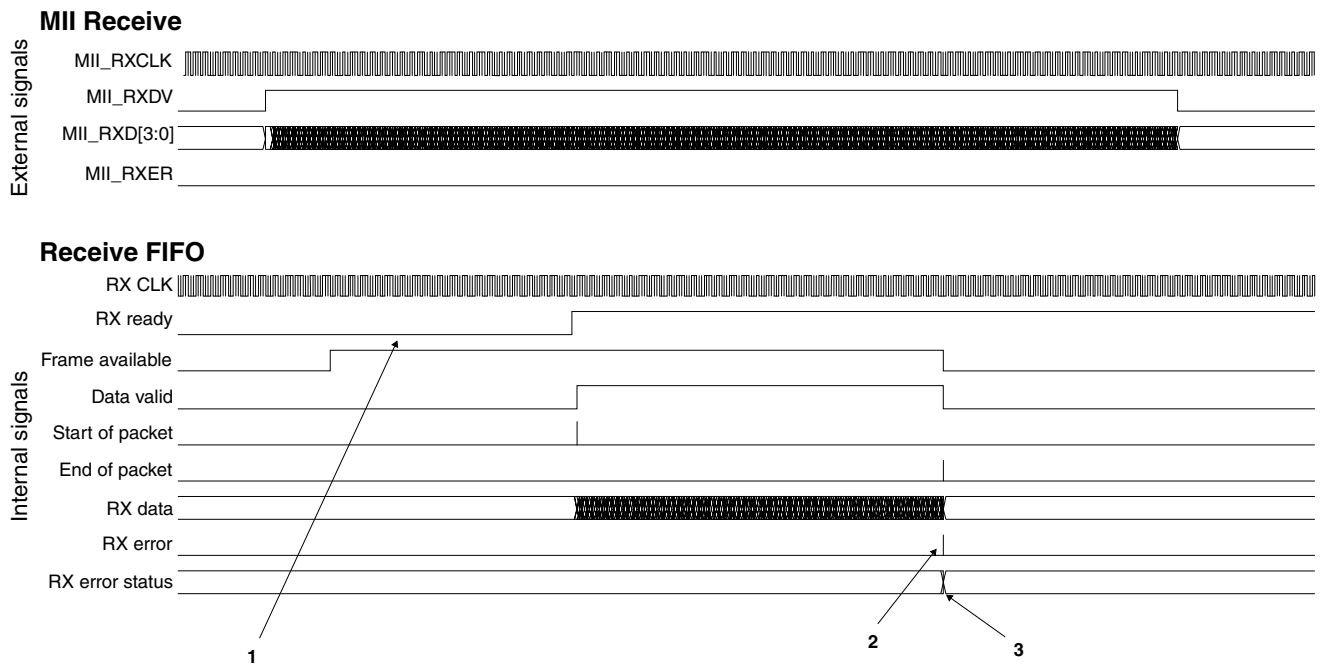

Figure 22-17. Receive FIFO overflow protection

22.6.17 PHY management interface

The MDIO interface is a two-wire management interface. The MDIO management interface implements a standardized method to access the PHY device management registers.

The core implements a master MDIO interface, which can be connected to up to 32 PHY devices.

22.6.17.1 MDIO clause 22 frame format

The core MDIO master controller communicates with the slave (PHY device) using frames that are defined in the following table.

A complete frame has a length of 64 bits made up of an optional 32-bit preamble, 14-bit command, 2-bit bus direction change, and 16-bit data. Each bit is transferred on the rising edge of the MDIO clock (MDC signal). The MDIO data signal is tri-stated between frames.

The core PHY management interface supports the standard MDIO specification (IEEE 802.3 Clause 22).

Table 22-41. MDIO clause 22 frame structure

ST	OP	PHYADR	REGADR	TA	DATA

Table 22-42. MDIO frame field descriptions

Field	Description
ST (2 bits)	Start indication field, programmed with ENET*n*_MMFR[ST] and equal to 01 for Standard MDIO (Clause 22).
OP (2 bits)	Opcode defines type of operation. Programmed with ENET*n*_MMFR[OP]. 01 Write operation 10 Read operation
PHYADR (5 bits)	Five-bit PHY device address, programmed with ENET*n*_MMFR[PA]. Up to 32 devices can be addressed.
REGADR (5 bits)	Five-bit register address, programmed with ENET*n*_MMFR[RA]. Each PHY can implement up to 32 registers.
TA (2 bits)	Turnaround time, programmed with ENET*n*_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
Data	Data, set by ENET*n*_MMFR[DATA]. Written to or read from the PHY

Table 22-42. MDIO frame field descriptions

Field	Description
(16 bits)	

22.6.17.2 MDIO clause 45 frame format

The extended MDIO frame structure defined in IEEE 802.3 Clause 45 introduces indirect addressing. First, a write transaction to an address register is done, followed by a write or read transaction which will put the 16-bit data in the register or retrieve the register contents respectively. A preamble of 32 bits of logical ones is sent prior to every transaction. The MDIO data signal is tri-stated between frames.

The extended MDIO defines four transactions, which are determined by the two-bit opcode field.

Table 22-43. MDIO clause 45 frame structure

ST	OP	PRTAD	DEVAD	TA	ADDR/DATA

All bits are transmitted from left to right (Preamble bits first) and all fields have their Most-Significant bit sent first (leftmost in above table). The complete frame has a length of 64 bits (32-bit preamble, 14-bit command, 2-bit bus direction change, 16-bit data). Each bit is transferred with the rising edge of the MDIO clock (MDC).

The fields and transactions are summarized in the following tables.

Table 22-44. MDIO clause 45 frame field descriptions

Field	Description
ST	Start indication. Indicates the end of the preamble and start of the frame. This value is 00 for extended MDIO (Clause 45) frames.
OP	Opcode defines if a read or write operation is performed and is programmed with ENET*n*_MMFR[OP]. See Table 22-45 for more information. 00 Address write 01 Write operation 10 Read inc. operation 11 Read operation
PRTAD	The port address specifies a MDIO port. Each Port can have up to 32 devices which each can have a separate set of registers.
DEVAD	Device address. Up to 32 devices can be addressed (within a port).
TA	Turnaround time, programmed with ENET*n*_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.

Table continues on the next page...

Table 22-44. MDIO clause 45 frame field descriptions (continued)

Field	Description
ADDR/DATA	16-bit address (for address write) or data, set by ENET*n*_MMFR[DATA], written to or read from the PHY.

Table 22-45. MDIO Clause 45 Transactions

Transaction Type	Description
Address	A write transaction to the internal address register of the device/port. The data section of the frame contains the value to be stored in the device's internal address "pointer" register for further transactions.
Write	Data write to a register. The 16 bit data will be written to the register identified by the device-internal address.
Read	Data is read from the register identified by the device-internal address.
Read inc.	Read with address postincrement. The register identified by the device-internal address is read. After this, the device-internal address is incremented. If the address register is all '1' (0xFFFF) no increment is done (i.e. increment does not wrap around).

22.6.17.3 MDIO clock generation

The MDC clock is generated from the internal bus clock (i.e., IPS bus clock) divided by the value programmed in ENET*n*_MSCR[MII_SPEED].

22.6.17.4 MDIO operation

To perform an MDIO access, set the MDIO command register (ENET*n*_MMFR) according to the description provided in MII Management Frame Register (ENETn_MMFR).

To check when the programmed access completes, read the ENET*n*_EIR[MII] field.

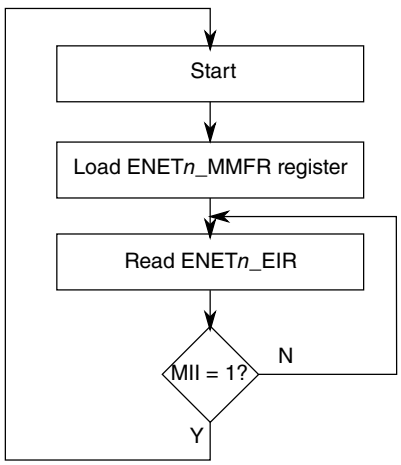

Figure 22-18. MDIO access overview

22.6.18 Ethernet interfaces

The following Ethernet interfaces are implemented:

- Fast Ethernet MII (Media Independent Interface)
- RMII 10/100 using interface converters/gaskets

The following table shows how to configure ENET registers to select each interface.

Mode	ECR[SPEED]	RCR[RMII_10T]	RCR[RMII_MODE]
MII - 10 Mbit/s	0	—	0
MII - 100 Mbit/s	0	—	0
RMII - 10 Mbit/s	0	1	1
RMII - 100 Mbit/s	0	0	1

22.6.18.1 RMII interface

In RMII receive mode, for normal reception following assertion of CRS_DV, RXD[1:0] is 00 until the receiver determines that the receive event has a proper start-of-stream delimiter (SSD).

The preamble appears (RXD[1:0]=01) and the MACs begin capturing data following detection of SFD.

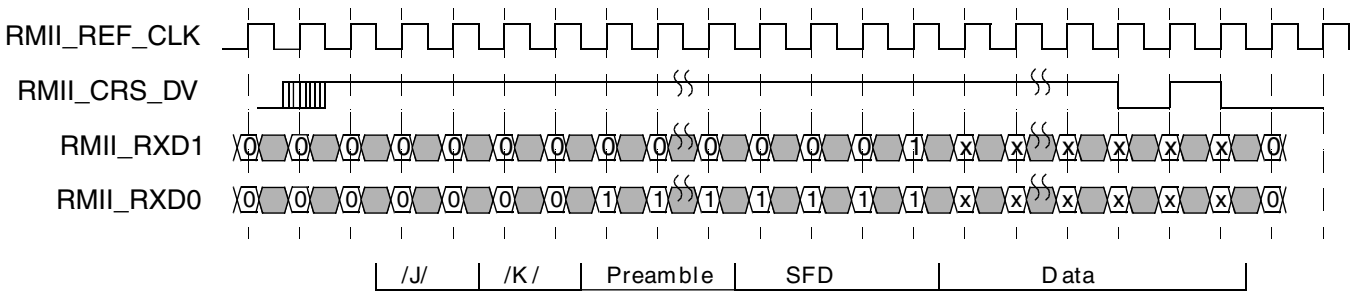

Figure 22-19. RMII receive operation

If a false carrier is detected (bad SSD), then RXD[1:0] is 10 until the end of the receive event. This is a unique pattern since a false carrier can only occur at the beginning of a packet where the preamble is decoded (RXD[1:0] = 01).

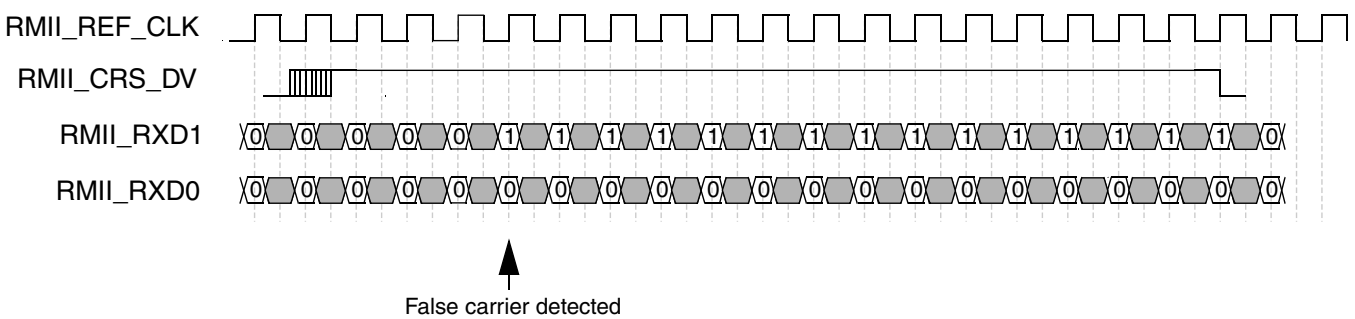

Figure 22-20. RMII receive operation with false carrier

In RMII transmit mode, TXD[1:0] provides valid data for each REF_CLK period while TXEN is asserted.

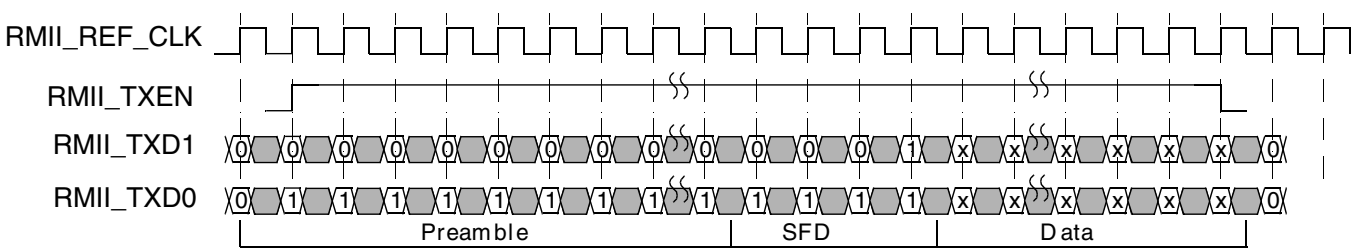

Figure 22-21. RMII transmit operation

22.6.18.2 MII Interface — transmit

On transmit, all data transfers are synchronous to MII_TXCLK rising edge. The MII data enable signal MII_TXEN is asserted to indicate the start of a new frame, and remains asserted until the last byte of the frame is present on the MII_TXD[3:0] bus.

Between frames, MII_TXEN remains deasserted.

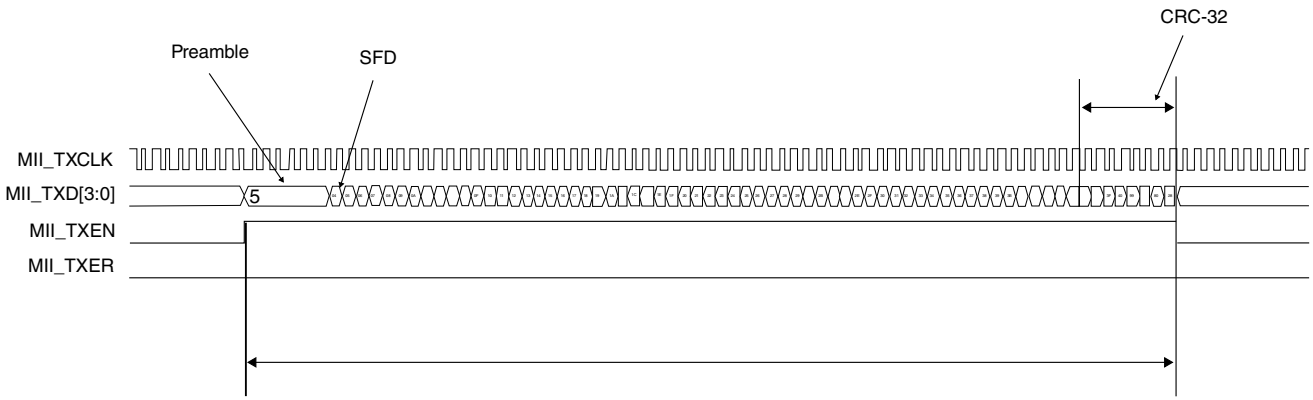

Figure 22-22. MII transmit operation

If a frame is received on the FIFO interface with an error (for example, RxBD[ME] set) the frame is subsequently transmitted with the MII_TXER error signal for one clock cycle at any time during the packet transfer.

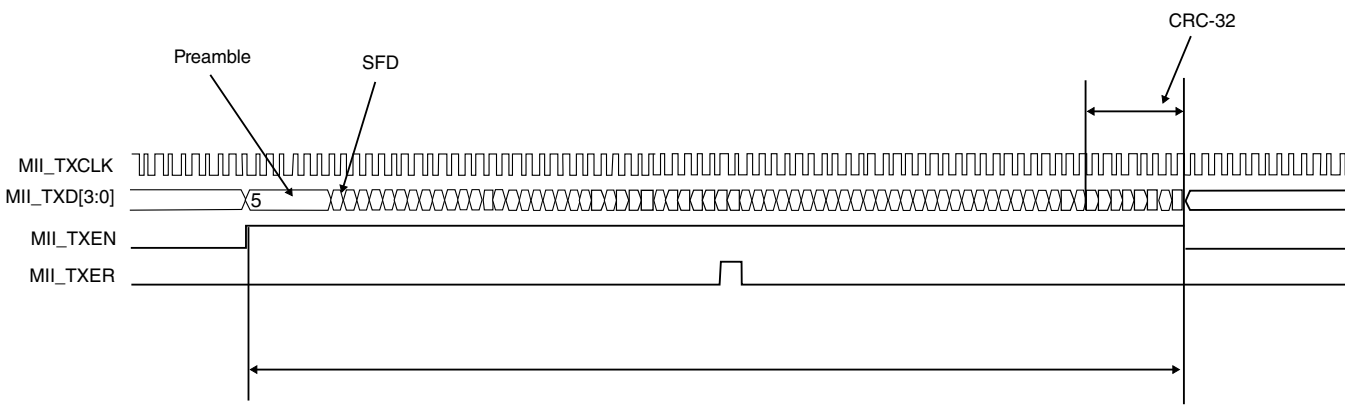

Figure 22-23. MII transmit operation — errored frame

22.6.18.2.1 Transmit with collision — half-duplex

When a collision is detected during a frame transmission (MII_COL asserted), the MAC stops the current transmission, sends a 32-bit jam pattern, and re-transmits the current frame.

(See Collision detection in half-duplex mode for details)

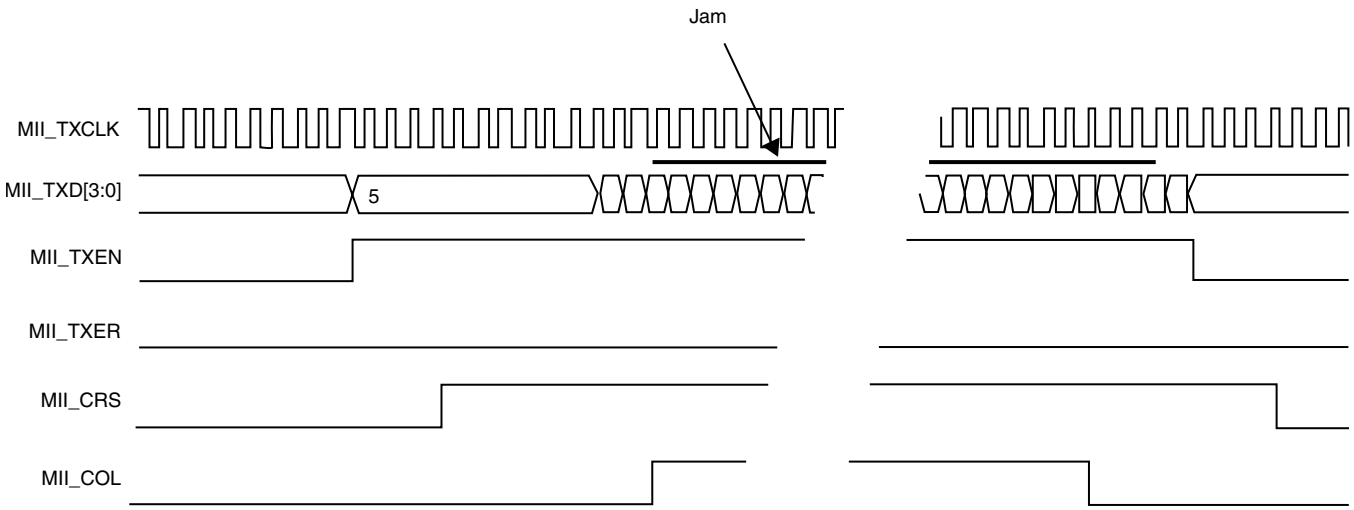

Figure 22-24. MII transmit operation — transmission with collision

22.6.18.3 MII interface — receive

On receive, all signals are sampled on the MII_RXCLK rising edge. The MII data enable signal, MII_RXDV, is asserted by the PHY to indicate the start of a new frame and remains asserted until the last byte of the frame is present on MII_RXD[3:0] bus.

Between frames, MII_RXDV remains deasserted.

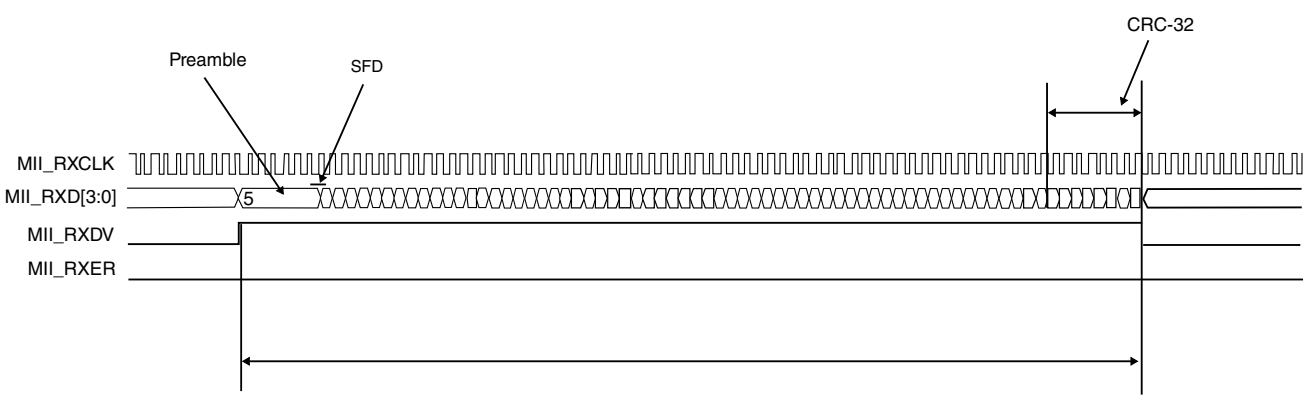

Figure 22-25. MII receive operation

If the PHY detects an error on the frame received from the line, the PHY asserts the MII error signal, MII_RXER, for at least one clock cycle at any time during the packet transfer.

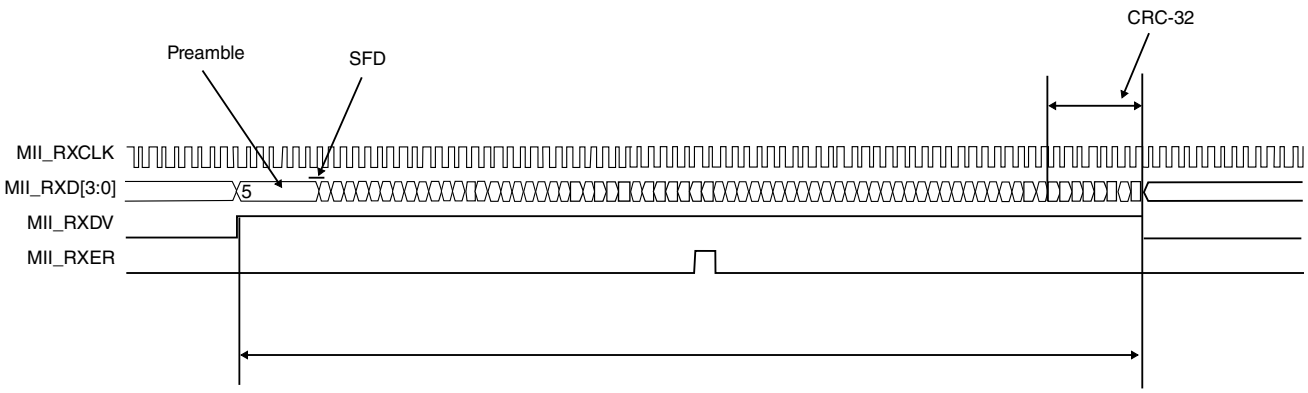

Figure 22-26. MII receive operation — errored frame

A frame received on the MII interface with a PHY error indication is subsequently transferred on the FIFO interface with RxBD[ME] set.

22.6.19 Interrupt coalescence

The purpose of the interrupt coalescing is to reduce the number of interrupts generated by the MAC so as to reduce the CPU loading.

To facilitate this interrupt coalescing, these registers are available with the same control and configuration fields.

- Transmit Interrupt Coalescing Register (ENET_TXIC)
- Receive Interrupt Coalescing Register (ENET_RXIC)

When coalescing is enabled by asserting the corresponding ICEN field and such interrupt is also enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt when the threshold number of frames is reached (defined by ICFT) or when the threshold timer expires (defined by ICTT).

When coalescing is disabled by de-asserting ICEN, but interrupt is enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt as they are received without using coalescing. Interrupt coalescing is done for each transmit and receive queue/class independently.

22.6.19.1 Interrupt coalescence setup

Interrupt coalescence supports both legacy and enhanced BDs. The following guidelines are recommended when setting up interrupt coalescence.

- When the MAC is configured for enhanced (IEEE 1588) mode, that is, enhanced BDs:
  - Set the INT bit in the enhanced received buffer descriptor to one.
  - Set the INT bit in the enhanced transmit buffer descriptor(s) to one.
- Clear the TXB and RXB fields in the EIMR register.

22.6.19.2 Updating the frame count threshold on-the-fly

To update the ICFT field in the RXIC and TXIC registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

NOTE

When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new threshold value to the ICFT field.
3. Set ICEN to one.

NOTE

The ICFT field can be updated on-the-fly without disabling the ICEN field. The hardware interrupt will continue and there is a possibility that an interrupt will occur depending on the state of the hardware counter and the previous ICFT value.

22.6.19.3 Updating the timer threshold on-the-fly

To update the ICTT field in the RXIC and TXIC registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

NOTE

When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new timer value to the ICTT field.
3. Set ICEN to one.

Chapter 23
Enhanced Periodic Interrupt Timer (EPIT)

23.1 Overview

EPIT is a 32-bit set-and-forget timer that is capable of providing precise interrupts at regular intervals with minimal processor intervention. EPIT begins counting after it is enabled by software.

The following figure shows the EPIT block diagram.

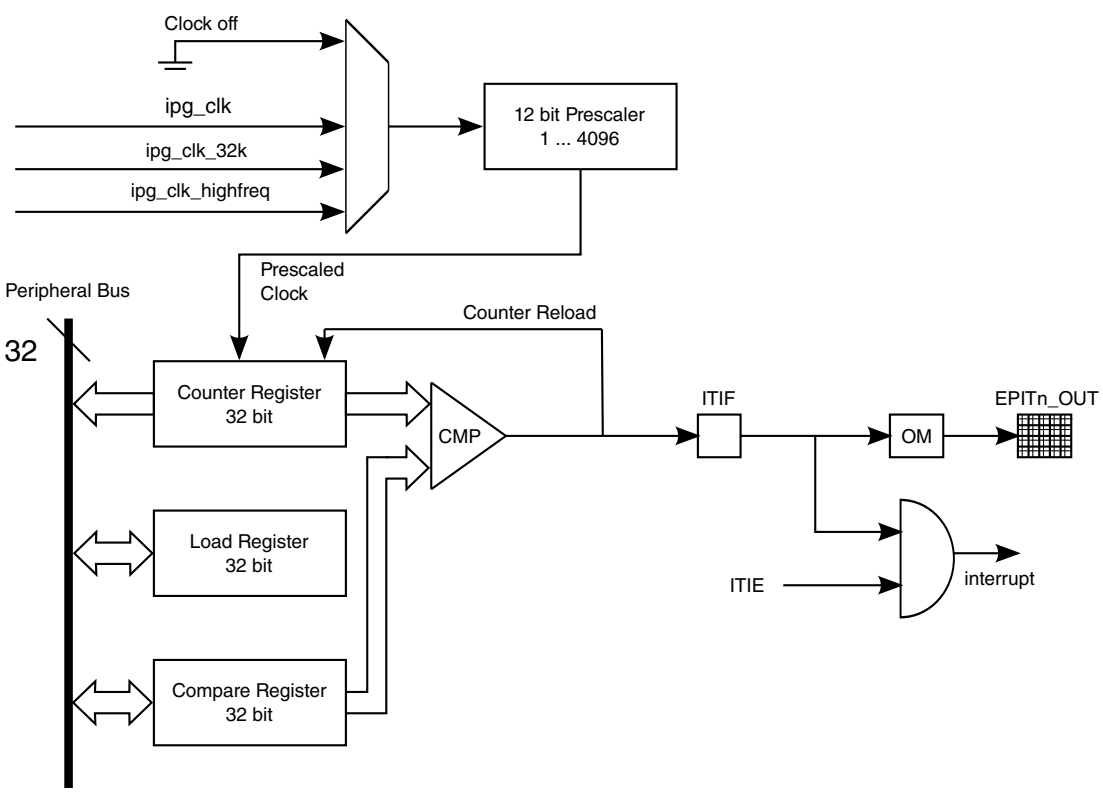

Figure 23-1. EPIT block diagram

23.1.1 EPIT features

EPIT has the following key features:

- 32-bit down counter with clock source selection
- 12-bit prescaler for division of input clock frequency
- Counter value that can be programmed on the fly
- Can be programmed to be active during low-power and debug modes
- Interrupt generation when counter reaches the compare value

23.1.2 EPIT modes and operations

EPIT supports the following modes: set-and-forget and free running. See the following sections for more information.

- Operating in set-and-forget mode
- Operating in free-running mode

See Operations for a description of the operations that EPIT supports.

23.2 External signals

The following table describes EPIT's I/O signals.

Table 23-1. EPIT External Signals

Signal	Description	Pad	Mode	Direction
EPIT1_OUT	Indicate the occurrence of EPIT1 output compare event through a specified transition.	UART3_RX_DATA	ALT8	O
		JTAG_TMS	ALT8	O
EPIT2_OUT	Indicate the occurrence of EPIT2 output compare event through a specified transition.	UART3_CTS_B	ALT8	O
		JTAG_TDO	ALT8	O

23.3 Clocks

The table found here describes the clock sources for EPIT.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 23-2. EPIT Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

The clock that feeds the prescaler can be selected from among the following sources:

- **High-frequency reference clock (ipg_clk_highfreq)**

  This clock is provided by the Clock Control Module (CCM). This clock remains on during low-power mode when the peripheral clock is turned off, allowing EPIT to use this clock in low-power mode. In normal mode, the CCM synchronizes this clock to ahb_clk; in low-power mode, CCM switches to an unsynchronized version.

- **Low-frequency reference clock (ipg_clk_32k)**

  This 32 kHz reference clock is provided by the CCM. This clock remains on in low-power mode when the peripheral clock is turned off, so EPIT can use this clock during low-power mode. In normal mode, the CCM synchronizes this clock to ahb_clk; in low-power mode, CCM switches to an unsynchronized version. This clock is derived from the external 32 kHz crystal.

- **Peripheral clock (ipg_clk)**

  This is the peripheral clock (PER Clock) which is provided (and optionally gated) by the CCM. This clock is typically used in normal operations. In low-power modes, if the EPIT is programmed to be disabled (via STOPEN or WAITEN), then the peripheral clock can be switched off.

The clock input source is determined by the CLKSRC field in the control register. The clock input to the prescaler can also be disabled by setting CLKSRC to 0b00. **This field value should only be changed after first disabling the EPIT by clearing the EN bit in the EPIT_EPITCR**. For other programming requirements that apply while changing clock source, refer section Change of Clock Source.

The PRESCALER field in the control register is used to select the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value between 1 and 4096. A change in the value of the PRESCALER field is immediately reflected on its output clock frequency. The following figure shows the timing for a change in the prescaler value.

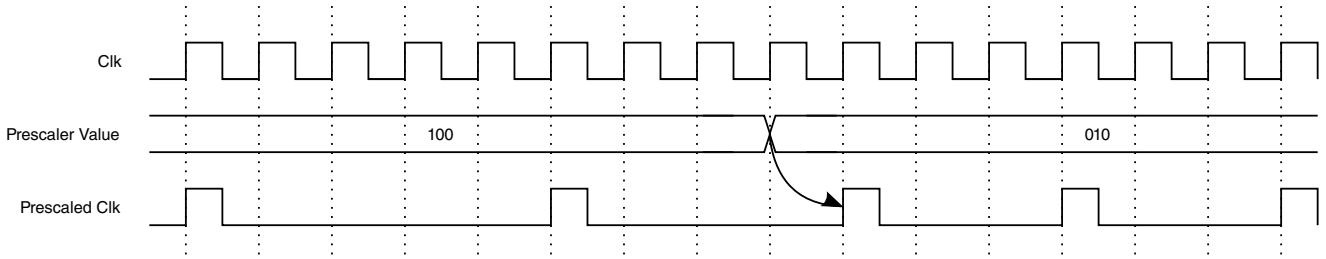

Figure 23-2. Prescaler Value Change Diagram

23.4 Functional Description

This section provides a complete functional description of the block.

23.4.1 Operating modes

EPIT can operate in either set-and-forget or free-running mode. Use EPIT_CR[RLD] to select the desired mode.

23.4.1.1 Operating in set-and-forget mode

To select this mode of operation, set the RLD bit in the control register (EPIT_CR).

In this mode, the counter obtains its data from the load register (EPIT_LR); it cannot be written to directly from the block data bus. Whenever the counter reaches zero, the value in EPIT_LR is loaded into the counter. This value is then decremented to zero.

To directly initialize the counter instead of waiting for the count to reach zero, set the EPIT counter overwrite enable bit (EPIT_CR[IOVW]) and write to EPIT_LR with the required initialization value.

23.4.1.2 Operating in free-running mode

To select this mode of operation, clear the RLD bit.

In this mode, the counter rolls over from 0000 0000h to FFFF FFFFh without reloading from the modulus register. After rolling over, the counter continues counting down.

To directly initalize the counter, set the EPIT counter overwrite enable bit (EPIT_EPITCL[IOVW]) and write to EPIT_EPITLR with the required initialization value.

23.4.2 Operations

EPIT has a single 32-bit down counter, which starts counting when the block is enabled by software.

The start value of the counter is loaded from the EPIT load register, which can be written to at any time by the processor. The value in the compare register determines the time that the interrupt occurs.

When EPIT is disabled (EN = 0), both the main counter and the prescaler counter freeze their count at their current count values. When EPIT is re-enabled (EN = 1), the ENMOD bit, which is a RW bit, decides the counter value:

- If ENMOD is set, the main counter is loaded with the load value (If RLD = 1)/ FFFF FFFFh (If RLD = 0) and the prescaler counter is reset (000h).
- If ENMOD is cleared, both main counter and prescaler counter restart counting from their frozen values.

If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both the main counter and the prescaler counter start counting from their frozen values regardless of the ENMOD bit.

A hardware reset resets all EPIT registers to their respective reset values. There is a software reset which has the same effect on all registers except for the EN, ENMOD, STOPEN and WAITEN bits in the control register. The state of these bits are not affected by software reset. A software reset can be asserted even when the EPIT is disabled.

23.4.3 Compare Event

When the programmed value of EPIT_EPITCMPR matches the value in EPIT_EPITCNR a compare status flag is set, and an interrupt is generated if the OCIEN bit is set in the control register.

The compare output pin is set, cleared, toggled, or not affected at all depending on the setting of the output mode (OM) bits in the control register. If an interrupt is required at rollover (when the counter value reaches 0x0000_0000 and the new value is loaded) then the compare register value should be set equal to the load register value in set-and-forget mode, or equal to 0xFFFF_FFFF in free-running mode.

The following figure shows the timing for a compare event and interrupt.

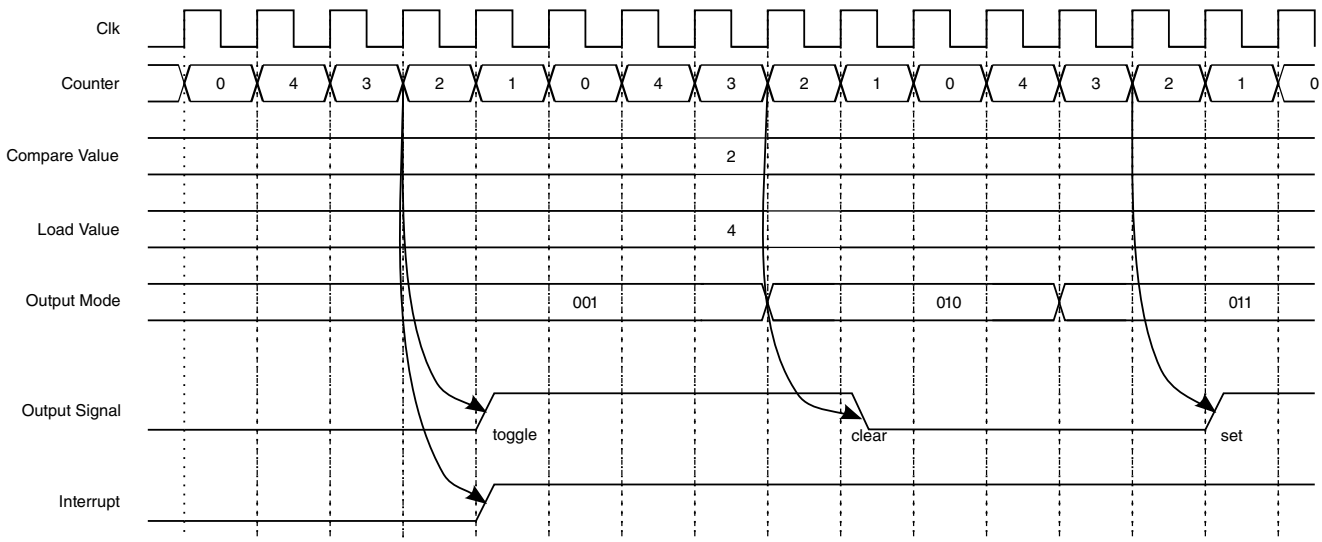

Figure 23-3. Compare Event and Interrupt Timing Diagram

EPIT will generate a compare event in the next count if the EPITx_CNR from the previous count equals the new EPITx_CMPR configured before re-enabling the EPIT in the next count. Even in case a new start counter value was updated in EPITx_LR before re-enabling the EPIT for the next round. To avoid this, configure the EPITx_CMPR to previous EPITx_CNR+1. Or, in set and forget mode, configure EPITx_LR with IOVW=1, before disabling EPIT. Also can do an extra disable/enable iteration to clear OCIF and update EPITx_CNR.

23.4.3.1 Counter Value Overwrite

The EPIT counter value can be overwritten to acquire a desired value at any point of time. The procedure for this is to set the IOVW bit in the control register and then write the desired value into the load register.

This results in the load register acquiring that value and also the counter being overwritten with it. If the EPIT is running the counter resumes counting from the overwritten value.

23.4.3.2 Low-Power Mode Behavior

The EPIT timer's behavior in low-power modes depends on which clock source is being used.

If the selected clock source is available and the corresponding low-power enable bit is set, then the EPIT continues to function in the low-power mode. If the EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), then main counter and the prescaler counter freeze at the current count values when the EPIT enters low-power mode. When the EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit.

23.4.3.3 Debug Mode Behavior

In debug mode, the user has the option to run or halt the EPIT timers. If the DBGEN bit is reset in the EPIT Control Register, the timer is halted.

When debug mode is exited, the timer operation reverts to what it was prior to entering debug mode.

23.5 Initialization/ Application Information

23.5.1 Change of Clock Source

The CLKSRC field in EPIT_EPITCR determines the clock source. This field value should be changed only after disabling the EPIT (EN = 0).

Below is the software sequence which must be followed while changing clock source.

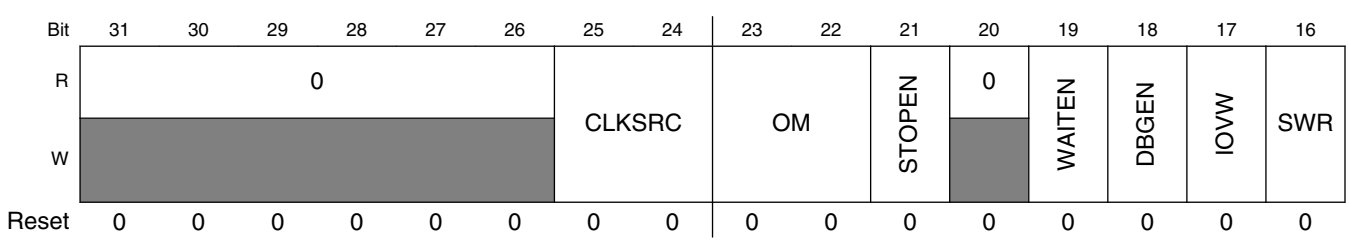
1. Disable the EPIT - set EN=0 in EPIT_EPITCR.
2. Disable EPIT ouput - program OM=00 in the EPIT_EPITCR.
3. Disable EPIT interrupts.
4. Program CLKSRC to desired clock source in EPIT_EPITCR.
5. Clear the EPIT status register (EPIT_EPITSR), that is, write "1" to clear (w1c).
6. Set ENMOD= 1 in the EPIT_EPITCR, to bring the EPIT Counter to defined state (EPIT_EPITLR value or 0xFFFF_FFFF).
7. Enable EPIT - set (EN=1) in the EPIT_EPITCR
8. Enable the EPIT interrupts.

23.6 EPIT Memory Map/Register Definition

The EPIT includes five user-accessible 32-bit registers. The following table summarizes these registers and their addresses.

Peripheral bus write access to the EPIT control register (EPITCR) and the EPIT load register (EPITLR) results in one cycle of wait state, while other valid peripheral bus accesses are with 0 wait state.

EPIT memory map



Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20D_0000	Control register (EPIT1_CR)	32	R/W	0000_0000h	23.6.1/1020
20D_0004	Status register (EPIT1_SR)	32	R/W	0000_0000h	23.6.2/1023
20D_0008	Load register (EPIT1_LR)	32	R/W	FFFF_FFFFh	23.6.3/1023
20D_000C	Compare register (EPIT1_CMPR)	32	R/W	0000_0000h	23.6.4/1024
20D_0010	Counter register (EPIT1_CNR)	32	R	FFFF_FFFFh	23.6.5/1024
20D_4000	Control register (EPIT2_CR)	32	R/W	0000_0000h	23.6.1/1020
20D_4004	Status register (EPIT2_SR)	32	R/W	0000_0000h	23.6.2/1023
20D_4008	Load register (EPIT2_LR)	32	R/W	FFFF_FFFFh	23.6.3/1023
20D_400C	Compare register (EPIT2_CMPR)	32	R/W	0000_0000h	23.6.4/1024
20D_4010	Counter register (EPIT2_CNR)	32	R	FFFF_FFFFh	23.6.5/1024

23.6.1 Control register (EPITx_CR)

The EPIT control register (EPIT_CR) is used to configure the operating settings of the EPIT. It contains the clock division prescaler value and also the interrupt enable bit. Additionally, it contains other control bits which are described below.

Peripheral Bus Write access to EPIT Control Register (EPIT_CR) results in one cycle of the wait state, while other valid peripheral bus accesses are with 0 wait state.

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	PRESCALAR												RLD	OCIEN	ENMOD	EN
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPITx_CR field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 CLKSRC	Select clock source These bits determine which clock input is to be selected for running the counter. This field value should only be changed when the EPIT is disabled by clearing the EN bit in this register. For other programming requirements while changing clock source, refer to Change of Clock Source. 00 Clock is off 01 Peripheral clock 10 High-frequency reference clock 11 Low-frequency reference clock
23–22 OM	EPIT output mode.This bit field determines the mode of EPIT output on the output pin. 00 EPIT output is disconnected from pad 01 Toggle output pin 10 Clear output pin 11 Set output pin
21 STOPEN	EPIT stop mode enable. This read/write control bit enables the operation of the EPIT during stop mode. This bit is reset by a hardware reset and unaffected by software reset. 0 EPIT is disabled in stop mode 1 EPIT is enabled in stop mode
20 Reserved	This read-only field is reserved and always has the value 0.
19 WAITEN	This read/write control bit enables the operation of the EPIT during wait mode. This bit is reset by a hardware reset. A software reset does not affect this bit. 0 EPIT is disabled in wait mode 1 EPIT is enabled in wait mode
18 DBGEN	This bit is used to keep the EPIT functional in debug mode. When this bit is cleared, the input clock is gated off in debug mode.This bit is reset by hardware reset. A software reset does not affect this bit. 0 Inactive in debug mode 1 Active in debug mode
17 IOVW	EPIT counter overwrite enable. This bit controls the counter data when the modulus register is written. When this bit is set, all writes to the load register overwrites the counter contents and the counter starts subsequently counting down from the programmed value. 0 Write to load register does not result in counter value being overwritten. 1 Write to load register results in immediate overwriting of counter value.

Table continues on the next page...

EPITx_CR field descriptions (continued)

Field	Description
16 SWR	Software reset. The EPIT is reset when this bit is set to 1. It is a self clearing bit. This bit is set when the block is in reset state and is cleared when the reset procedure is over. Setting this bit resets all the registers to their reset values, except for the EN, ENMOD, STOPEN, WAITEN and DBGEN bits in this control register 0 EPIT is out of reset 1 EPIT is undergoing reset
15–4 PRESCALAR	Counter clock prescaler value. This bit field determines the prescaler value by which the clock is divided before it goes to the counter 0x000 Divide by 1 0x001 Divide by 2... 0xFFF Divide by 4096
3 RLD	Counter reload control. This bit is cleared by hardware reset. It decides the counter functionality, whether to run in free-running mode or set-and-forget mode. 0 When the counter reaches zero it rolls over to 0xFFFF_FFFF (free-running mode) 1 When the counter reaches zero it reloads from the modulus register (set-and-forget mode)
2 OCIEN	Output compare interrupt enable. This bit enables the generation of interrupt on occurrence of compare event. 0 Compare interrupt disabled 1 Compare interrupt enabled
1 ENMOD	EPIT enable mode. When EPIT is disabled (EN=0), both main counter and prescaler counter freeze their count at current count values. ENMOD bit is a r/w bit that determines the counter value when the EPIT is enabled again by setting EN bit. If ENMOD bit is set, then main counter is loaded with the load value (If RLD=1)/ 0xFFFF_FFFF (If RLD=0) and prescaler counter is reset, when EPIT is enabled (EN=1). If ENMOD is programmed to 0 then both main counter and prescaler counter restart counting from their frozen values when EPIT is enabled (EN=1). If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT/ DEBUG), then both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit. This bit is reset by a hardware reset. A software reset does not affect this bit. 0 Counter starts counting from the value it had when it was disabled. 1 Counter starts count from load value (RLD=1) or 0xFFFF_FFFF (If RLD=0)
0 EN	This bit enables the EPIT. EPIT counter and prescaler value when EPIT is enabled (EN = 1), is dependent upon ENMOD and RLD bit as described for ENMOD bit. It is recommended that all registers be properly programmed before setting this bit. This bit is reset by a hardware reset. A software reset does not affect this bit. 0 EPIT is disabled 1 EPIT is enabled

23.6.2 Status register (EPITx_SR)

The EPIT status register (EPIT_SR) has a single status bit for the output compare event. The bit is a write 1 to clear bit.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0															OCIF
W																w1c
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPITx_SR field descriptions

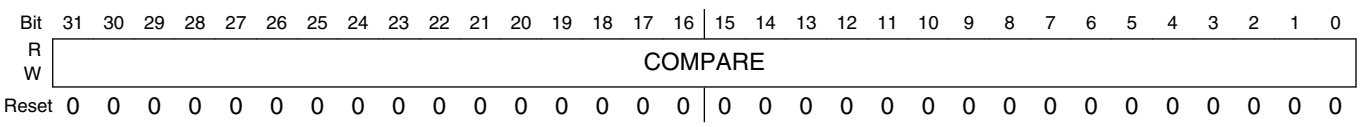
Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 OCIF	Output compare interrupt flag. This bit is the interrupt flag that is set when the content of counter equals the content of the compare register (EPIT_CMPR). The bit is a write 1 to clear bit. 0 Compare event has not occurred 1 Compare event occurred

23.6.3 Load register (EPITx_LR)

The EPIT load register (EPIT_LR) contains the value that is to be loaded into the counter when EPIT counter reaches zero if the RLD bit in EPIT_CR is set. If the IOVW bit in the EPIT_CR is set then a write to this register overwrites the value of the EPIT counter register in addition to updating this registers value. This overwrite feature is active even if the RLD bit is not set.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	LOAD																															
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1



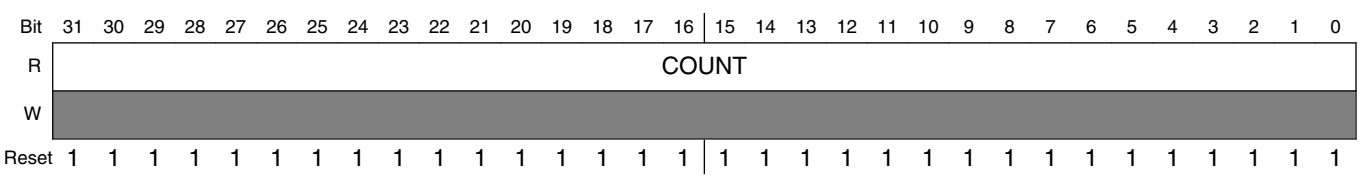
EPITx_LR field descriptions

Field	Description
LOAD	Load value. Value that is loaded into the counter at the start of each count cycle.

23.6.4 Compare register (EPITx_CMPR)

The EPIT compare register (EPIT_CMPR) holds the value that determines when a compare event is generated.

Address: Base address + Ch offset



EPITx_CMPR field descriptions

Field	Description
COMPARE	Compare Value. When the counter value equals this bit field value a compare event is generated.

23.6.5 Counter register (EPITx_CNR)

The EPIT counter register (EPIT_CNR) contains the current count value and can be read at any time without disturbing the counter. This is a read-only register and any attempt to write into it generates a transfer error. But if the IOVW bit in EPIT_CR is set, the value of this register can be overwritten with a write to EPIT_LR. This change is reflected when this register is subsequently read.

Address: Base address + 10h offset

EPITx_CNR field descriptions

Field	Description
COUNT	Counter value. This contains the current value of the counter.

Chapter 24
Flexible Controller Area Network (FLEXCAN)

24.1 Overview

The Flexible Controller Area Network (FLEXCAN) module is a communication controller implementing the CAN protocol according to the CAN 2.0B protocol specification.

The CAN protocol was primarily designed to be used as a vehicle serial data bus meeting the specific requirements of this field: real-time processing, reliable operation in the EMI environment of a vehicle, cost-effectiveness and required bandwidth. The FLEXCAN module is a full implementation of the CAN protocol specification, which supports both standard and extended message frames. 64 Message Buffers are supported.

24.1.1 Block Diagram

A general block diagram is shown in the figure below,which describes the main sub-blocks implemented in the FLEXCAN module, including the associated memory for storing Mailboxes, Rx Global Mask Registers, Rx Individual Mask Registers, Rx FIFO and Rx FIFO ID Filters.

Support for 64 Mailboxes and 6-deep Rx FIFO is provided. The functions of the sub-modules are described in subsequent sections.

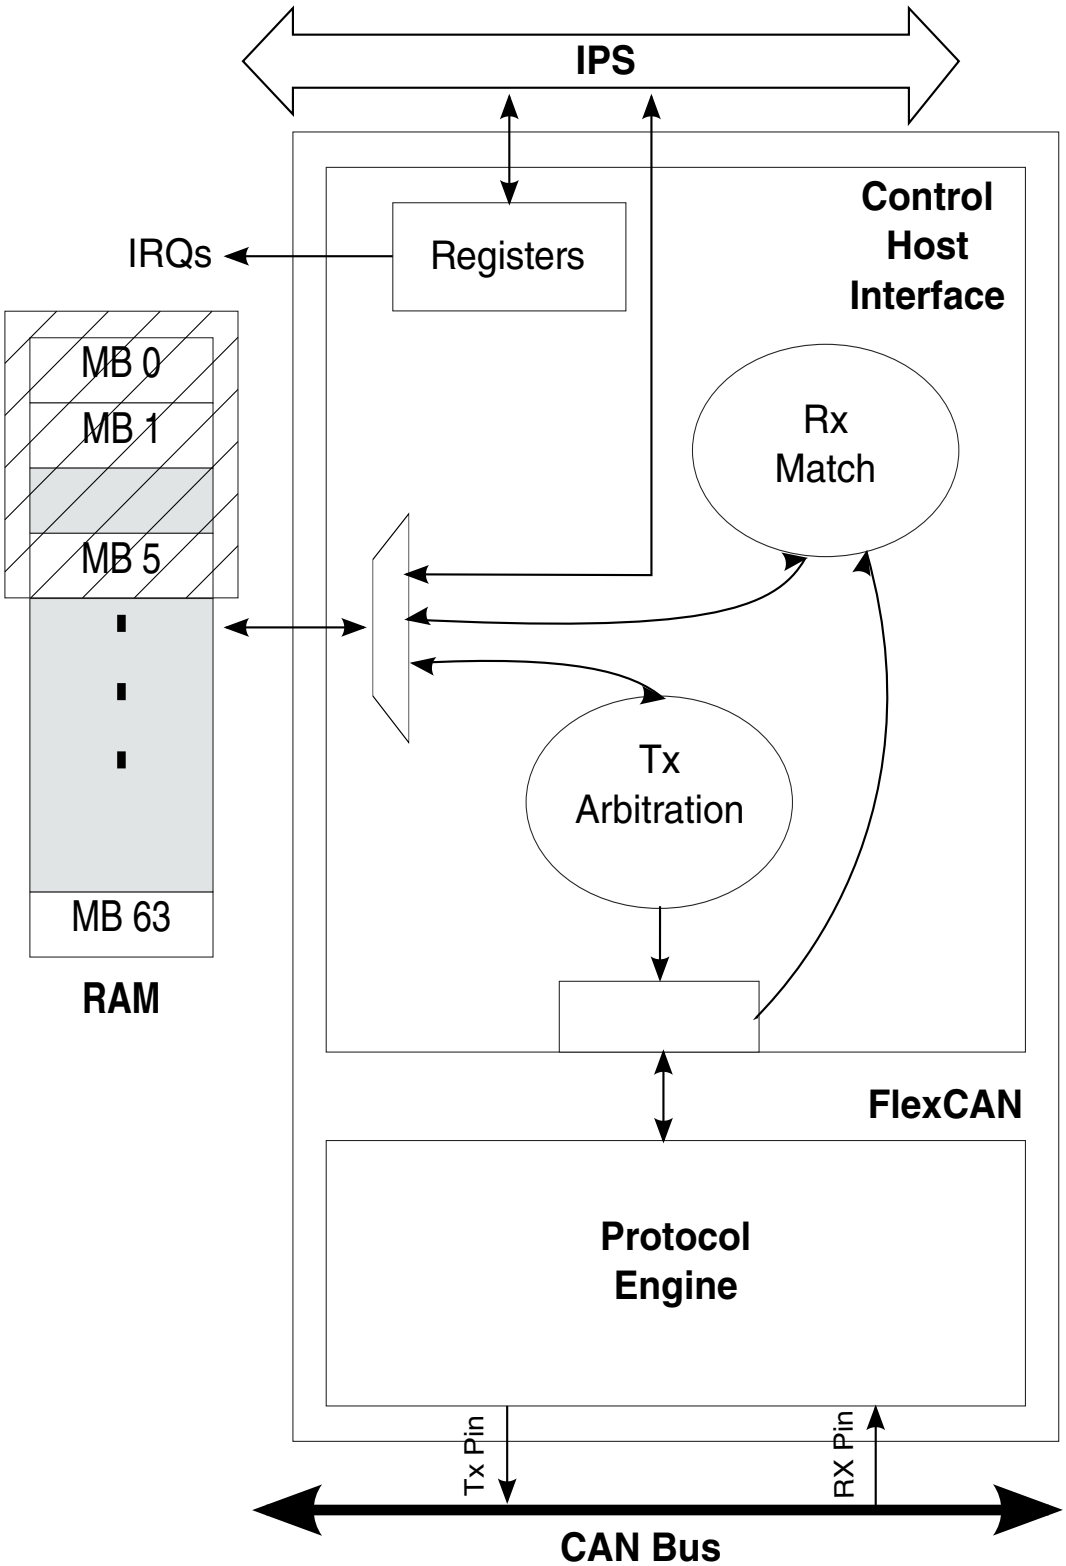


Figure 24-1. FLEXCAN Block Diagram

24.1.2 FLEXCAN Module Features

The FLEXCAN module includes these distinctive legacy features:

- Version 2.0B
  - Standard data and remote frames
  - Extended data and remote frames
  - Zero to eight bytes data length
  - Programmable bit rate up to 1 Mb/sec
  - Content-related addressing
- Flexible Mailboxes of eight bytes data length
- Each Mailbox is configurable as Rx or Tx, all supporting standard and extended messages
- Individual Rx Mask Registers per Mailbox
- Full featured Rx FIFO with storage capacity for 6 frames and internal pointer handling
- Transmission abort capability
- Powerful Rx FIFO ID filtering, capable of matching incoming IDs against either 128 extended, 256 standard or 512 partial (8 bits) IDs, with up to 32 individual masking capability
- 100% backwards compatibility with previous FLEXCAN version
- Unused structures space can be used as general purpose RAM space
- Listen only mode capability
- Programmable loop-back mode supporting self-test operation
- Programmable transmission priority scheme: lowest ID, lowest buffer number or highest priority
- Time Stamp based on 16-bit free-running timer
- Global network time, synchronized by a specific message
- Maskable interrupts independent of the transmission medium (an external transceiver is assumed)
- Short latency time due to an arbitration scheme for high-priority messages
- Low power modes, with programmable wake up on bus activity
- Configurable Glitch filter width to filter the noise on CAN bus when waking up
- Remote request frames may be handled automatically or by software.
- ID filter configuration in Normal Mode
- CAN bit time settings and configuration bits can only be written in Freeze Mode
- Tx mailbox status (Lowest priority buffer or empty buffer)
- SYNC bit status to inform that the module is synchronous with CAN bus
- CRC status for transmitted message
- Selectable priority between Mailboxes and Rx FIFO during matching process

24.1.3 Modes of Operation

The FLEXCAN module has four functional modes: Normal Mode (User and Supervisor), Freeze Mode, Listen-Only Mode and Loop-Back Mode. There are also two low power modes: Disable Mode and Stop Mode.

- Normal Mode (User or Supervisor):

In Normal Mode, the module operates receiving and/or transmitting message frames, errors are handled normally and all the CAN Protocol functions are enabled. User and Supervisor Modes differ in the access to some restricted control registers.

- Freeze Mode:

It is enabled when the FRZ bit in the MCR Register is asserted. If enabled, Freeze Mode is entered when the HALT bit in MCR is set or when Debug Mode is requested at MCU level and the FRZ_ACK bit in the MCR Register is asserted by the FlexCAN . In this mode, no transmission or reception of frames is done and synchronicity to the CAN bus is lost. See Freeze Mode for more information.

- Listen-Only Mode:

The module enters this mode when the LOM bit in the Control Register is asserted. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.

- Loop-Back Mode:

The module enters this mode when the LPB bit in the Control Register is asserted. In this mode, FLEXCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is internally fed back to the receiver input. The FLEXCAN_RX input pin is ignored and the FLEXCAN_TX output goes to the recessive state (logic '1'). FLEXCAN behaves as it normally does when transmitting and treats its own transmitted message as a message received from a remote node. In this mode, FLEXCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field to ensure proper reception of its own message. Both transmit and receive interrupts are generated.

- Module Disable Mode:

This low power mode is entered when the MDIS bit in the MCR Register is asserted and the LPM_ACK is asserted by the FlexCAN. When disabled, the module requests to disable the clocks to the CAN Protocol Engine and Controller Host Interface sub-modules. Exit from this mode is done by negating the MDIS bit in the MCR Register. See Module Disable Mode for more information.

- Stop Mode:

This low power mode is entered when Stop Mode is requested at ARM level and the LPM_ACK bit in the MCR Register is asserted by the FlexCAN. When in Stop Mode, the module puts itself in an inactive state and then informs the ARM that the clocks can be shut down globally. Exit from this mode happens when the Stop Mode request is removed or when activity is detected on the CAN bus and the Self Wake Up mechanism is enabled. See Stop Mode for more information.

24.2 External Signals

The FLEXCAN module has two I/O signals.

Table 24-1. FLEXCAN External Signals

Signal	Description	Pad	Mode	Direction
FLEXCAN1_RX	FLEXCAN receive pin. This pin is the receive pin from the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	ENET1_RX_DATA1	ALT4	I
		LCD_DATA09	ALT8	
		SD1_DATA1	ALT3	
		UART3_RTS_B	ALT2	
FLEXCAN1_TX	FLEXCAN transmit pin. This pin is the transmit pin to the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	ENET1_RX_DATA0	ALT4	O
		LCD_DATA08	ALT8	
		SD1_DATA0	ALT3	
		UART3_CTS_B	ALT2	
FLEXCAN2_RX	FLEXCAN receive pin. This pin is the receive pin from the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	ENET1_TX_DATA0	ALT4	I
		LCD_DATA11	ALT8	
		SD1_DATA3	ALT3	
		UART2_RTS_B	ALT2	
FLEXCAN2_TX	FLEXCAN transmit pin. This pin is the transmit pin to the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	ENET1_RX_EN	ALT4	O
		LCD_DATA10	ALT8	
		SD1_DATA2	ALT3	
		UART2_CTS_B	ALT2	

24.3 Clocks

The table found here describes the clock sources for FLEXCAN.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 24-2. FLEXCAN Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_chi	ipg_clk_root	CHI clock
ipg_clk_pe	can_clk_root	Protocol Engine clock
ipg_clk_pe_nogate	can_clk_root	Protocol Engine clock (no gating)
ipg_clk_s	ipg_clk_root	Peripheral access clock
mem_ram_CLK	ipg_clk_root	RAM clock

24.4 Message Buffer Structure

Message Buffer Address: Base + 0x0080-0x047C

The Message Buffer structure used by the FLEXCAN module is represented in the figure found here.

Both Extended and Standard Frames (29-bit Identifier and 11-bit Identifier, respectively) used in the CAN specification are represented.

Table 24-3. Message Buffer Structure

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x0					CODE					SRR	IDE	RTR	DLC				TIME STAMP															
0x4	PRIO				ID Standard												ID Extended															
0x8	DATA BYTE 0								DATA BYTE 1								DATA BYTE 2								DATA BYTE 3							
0xC	DATA BYTE 4								DATA BYTE 5								DATA BYTE 6								DATA BYTE 7							

CODE - Message Buffer Code

This 4-bit field can be accessed (read or write) by the CPU and by the FLEXCAN module itself, as part of the message buffer matching and arbitration process. The encoding is shown in the following tables. See Functional Description for additional information.

Table 24-4. Message Buffer Code for Rx buffers

CODE Description	Rx Code BEFORE receive New Frame	SRV[1]	Rx Code AFTER successful reception[2]	RRS[3]	Comment
0b0000: INACTIVE- MB is not active.	INACTIVE	-	-	-	MB does not participate in the matching process.
0b0100: EMPTY - MB is active and empty.	EMPTY	-	FULL	-	When a frame is received successfully (after move-in process. Refer to Move-in for details), the CODE field is automatically updated to FULL.
0b0010: FULL - MB is full.	FULL	Yes	FULL	-	The act of reading the C/S word followed by unlocking the MB (SRV) does not make the code return to EMPTY. It remains FULL. If a new frame is moved to the MB after the MB was serviced, the code still remains FULL. Refer to Matching Process for matching details related to FULL code.
		No	OVERRUN	-	If the MB is FULL and a new frame is moved to this MB before the CPU services it, the CODE field is automatically updated to OVERRUN. Refer to Matching Process for details about overrun behavior.
0b0110: OVERRUN - MB is being overwritten into a full buffer.	OVERRUN	Yes	FULL	-	If the CODE field indicates OVERRUN and CPU has serviced the MB, when a new frame is moved to the MB, the code returns to FULL.
		No	OVERRUN	-	If the CODE field already indicates OVERRUN, and another new frame must be moved, the MB will be overwritten again, and the code will remain OVERRUN. Refer to Matching Process for details about overrun behavior.
0b1010: RANSWER[4] - A frame was configured to recognize a Remote Request Frame and transmit a Response Frame in return.	RANSWER	-	TANSWER(0b1110)	0	A Remote Answer was configured to recognize a remote request frame received, after that a MB is set to transmit a response frame. The code is automatically changed to TANSWER (0b1110). Refer to Matching Process for details. If CTRL2[RRS] is negated, transmit a response frame whenever a remote request frame with the same ID is received.
			-	1	This code is ignored during matching and arbitration process. Refer to Matching Process for details.

Table continues on the next page...

Table 24-4. Message Buffer Code for Rx buffers (continued)

CODE Description	Rx Code BEFORE receive New Frame	SRV[1]	Rx Code AFTER successful reception[2]	RRS[3]	Comment
CODE[0]=1b1: BUSY - FlexCAN is updating the contents of the MB. The CPU must not access the MB.	BUSY[5]	-	FULL	-	Indicates that the MB is being updated, it will be negated automatically and does not interfere on the next CODE.
			OVERRUN	-	

1. SRV: Serviced MB. MB was read and unlocked by reading TIMER or other MB.
2. A frame is considered successful reception after the frame to be moved to MB (move-in process). Refer to Move-in for details)
3. Remote Request Stored bit from CTRL2 register. Refer to CTRL2 for details.
4. Code 4'b1010 is not considered as a Tx and a MB with this code should not to be aborted.
5. Note that for Tx MBs, the BUSY bit should be ignored upon read, except when AEN bit is set in the MCR register. If this bit is asserted, the corresponding MB does not participate in the matching process.

Table 24-5. Message Buffer Code for Tx buffers

CODE Description	Tx Code BEFORE tx frame	MB RTR	Tx Code AFTER successful transmission	Comment
0b1000: INACTIVE - MB is not active	INACTIVE	-	-	MB does not participate in the arbitration process.
0b1001: ABORT - MB is aborted	ABORT	-	-	MB does not participate in the arbitration process. .
0b1100: DATA - MB is a Tx Data Frame (MB RTR must be 0)	DATA	0	INACTIVE	Transmit data frame unconditionally once. After transmission, the MB automatically returns to the INACTIVE state.
0b1100: REMOTE - MB is a Tx Remote Request Frame (MB RTR must be 1)	REMOTE	1	EMPTY	Transmit remote request frame unconditionally once. After transmission, the MB automatically becomes an Rx Empty MB with the same ID.
0b1110: TANSWER - MB is a Tx Response Frame from an incoming Remote Request Frame	TANSWER	-	RANSWER	This is an intermediate code that is automatically written to the MB by the CHI as a result of match to a remote request frame. The remote response frame will be transmitted unconditionally once and then the code will automatically return to RANSWER (0b1010). The CPU can also write this code with the same effect. The remote response frame can be either a data frame or another remote request frame depending on the RTR bit value. Refer to Matching Process and Arbitration process for details.

SRR - Substitute Remote Request

Fixed recessive bit, used only in extended format. It must be set to '1' by the user for transmission (Tx Buffers) and will be stored with the value received on the CAN bus for Rx receiving buffers. It can be received as either recessive or dominant. If FLEXCAN receives this bit as dominant, then it is interpreted as arbitration loss.

1= Recessive value is compulsory for transmission in Extended Format frames

0= Dominant is not a valid value for transmission in Extended Format frames

IDE - ID Extended Bit

This bit identifies whether the frame format is standard or extended. It is also used as part of the reception filter.

1= Frame format is extended

0= Frame format is standard

RTR - Remote Transmission Request

This bit affects the behavior of Remote Frames and is part of the reception filter. Refer to the tables above and RRS bit in Control 2 Register (FLEXCAN_CTRL2) for additional details.

If FLEXCAN transmits this bit as '1' (recessive) and receives it as '0' (dominant), it is interpreted as arbitration loss. If this bit is transmitted as '0' (dominant), then if it is received as '1' (recessive), the FLEXCAN module treats it as bit error. If the value received matches the value transmitted, it is considered as a successful bit transmission.

1= Indicates the current MB has a Remote Frame to be transmitted if MB is Tx. If the MB is Rx then incoming Remote Request Frames may be stored.

0= Indicates the current MB has a Data Frame to be transmitted. In Rx MB it may be considered in matching processes.

DLC - Length of Data in Bytes

This 4-bit field is the length (in bytes) of the Rx or Tx data, which is located in offset 0x08 through 0x0F of the MB space (see the first table above). In reception, this field is written by the FLEXCAN module, copied from the DLC (Data Length Code) field of the received frame. In transmission, this field is written by the ARM and corresponds to the DLC field value of the frame to be transmitted. When RTR=1, the Frame to be transmitted is a Remote Frame and does not include the data field, regardless of the Length field. The DLC field indicates which DATA BYTEs are valid as shown in the table below.

TIME STAMP - Free-Running Counter Time Stamp

This 16-bit field is a copy of the Free-Running Timer, captured for Tx and Rx frames at the time when the beginning of the Identifier field appears on the CAN bus.

PRIO - Local priority

This 3-bit field is only used when MCR[LPRIO_EN] bit is asserted and it only makes sense for Tx mailboxes. These bits are not transmitted. They are appended to the regular ID to define the transmission priority. See Arbitration process.

ID - Frame Identifier

In Standard Frame format, only the 11 most significant bits (28 to 18) are used for frame identification in both receive and transmit cases. The 18 least significant bits are ignored. In Extended Frame format, all bits are used for frame identification in both receive and transmit cases.

DATA BYTE 0-7 - Data Field

Up to eight bytes can be used for a data frame.

For Rx frames, the data is stored as it is received from the CAN bus. DATA BYTE (n) is valid only if *n* is less than DLC as shown in the table below.

For Tx frames, the CPU prepares the data field to be transmitted within the frame.

Table 24-6. DATA BYTEs validity

DLC	Valid DATA BYTEs
0	none
1	DATA BYTE 0
2	DATA BYTE 0-1
3	DATA BYTE 0-2
4	DATA BYTE 0-3
5	DATA BYTE 0-4
6	DATA BYTE 0-5
7	DATA BYTE 0-6
8	DATA BYTE 0-7

24.5 Rx FIFO Structure

When the MCR[RFEN] bit is set, the memory area from $80 to $DC (which is normally occupied by MBs 0 to 5) is used by the reception FIFO engine.

The region 0x80-0x8C contains the output of the FIFO which must be read by the CPU as a Message Buffer. This output contains the oldest message received and not read yet. The region 0x90-0xDC is reserved for internal use of the FIFO engine.

An additional memory area, that starts at 0xE0 and may extend up to 0x2DC (normally occupied by MBs 6 up to 37) depending on the CTRL2[RFFN] field setting, contains the ID Filter Table (configurable from 8 to 128 memory positions) that specifies filtering criteria for accepting frames into the FIFO.Table 24-7 shows the Rx FIFO data structure.

Each ID Filter Table Element occupies an entire 32-bit word and can be compounded by one, two or four Identifier Acceptance Filters (IDAF) depending on the MCR[IDAM] field setting. Table 24-8, Table 24-9 and Table 24-10 show the IDAF indexation. Table 24-11 show the three different formats that the IDAF can assume, depending on the MCR[IDAM] field setting. Note that all elements of the table must have the same format. See Rx FIFO for more information.

Out of reset, the ID Filter Table flexible memory area defaults to 0xE0 and only extends to 0xFC, which corresponds to MBs 6 to 7 for RFFN=0.

Table 24-11. Identifier Acceptance Filter Format A,B and C

	(Std/Ext = 31-24)	(Std/Ext = 23-16)	(Std/Ext = 15-8)	(Std/Ext = 7-0)

RTR - Remote Frame

This bit specifies whether Remote Request Frames are accepted into the FIFO if they match the target ID in Formats A and B. If Format C is chosen the acceptance does not depend on whether the frame is a Remote Request Frame or not.

1= Remote Frames can be accepted and data frames are rejected

0= Remote Frames are rejected and data frames can be accepted

IDE - Extended Frame

Specifies if either Extended or Standard Format frames are accepted into the FIFO if they match the target ID in Formats A and B. If Format C is chosen the acceptance does not depend on whether the frame is of the Extended or Standard Format.

1= Extended frames can be accepted and standard frames are rejected

0= Extended frames are rejected and standard frames can be accepted

RXIDA - Rx Frame Identifier (Format A)

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), only the 11 most significant bits (29 to 19) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all bits are used.

RXIDB_0, RXIDB_1 - Rx Frame Identifier (Format B)

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), the 11 most significant bits (29 to 19 and 13 to 3) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all 14 bits of the field are compared with the 14 most significant bits of the Identifier of the incoming frame. The 15 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

RXIDC_0, RXIDC_1, RXIDC_2, RXIDC_3 - Rx Frame Identifier (Format C)

Specifies an ID to be used as acceptance criteria for the FIFO. In both Standard Format and Extended Format, all 8 bits of the field are compared to the 8 most significant bits of the Identifier of the incoming frame. The 3 least significant bits of the Identifier of an incoming Standard Format frame and the 21 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

24.6 Functional Description

This section provides a complete functional description of the block.

24.6.1 Functional Overview

The FLEXCAN module is a CAN protocol engine with a very flexible mailbox system for transmitting and receiving CAN frames.

The mailbox system consists of a set of 64 Message Buffers (MB) that store configuration and control data, time stamp, message ID and data (see Message Buffer Structure). The memory corresponding to the first 38 MBs can be configured to support a FIFO reception scheme with a powerful ID filtering mechanism, capable of checking incoming frames against a table of IDs (up to 128 extended IDs or 256 standard IDs or 512 8-bit ID slices), with individual mask register for up to 32 ID Filter Table elements. Simultaneous reception through FIFO and mailbox is supported. For mailbox reception, a *matching* algorithm makes it possible to store received frames only into MBs that have the same ID. A masking scheme makes it possible to match the ID programmed on the MB with a range of Identifiers on received CAN frames. For transmission, an *arbitration* algorithm decides the prioritization of MBs to be transmitted based on the message ID (optionally augmented by 3 local priority bits) or the MB ordering.

Before proceeding with the functional description, an important concept must be explained. A Message Buffer is said to be "active" at a given time if it can participate in both the Matching and Arbitration processes. An Rx MB with a 0b0000 code is inactive (refer to Table 24-4). Similarly, a Tx MB with a 0b1000 or 0b1001 code is also inactive (refer to Table 24-5).

24.6.2 Transmit Process

In order to transmit a CAN frame, the CPU must prepare a Message Buffer for transmission by executing the procedure found here.

1. Check if the respective interruption bit is set and clear it.
2. If the MB is active (transmission pending), write the ABORT code (0b1001) to the CODE field of the Control and Status word to request an abortion of the transmission. Wait for the corresponding IFLAG to be asserted by polling the IFLAG register or by the interrupt request if enabled by the respective IMASK. Then read back the CODE field to check if the transmission was aborted or transmitted (see

Transmission Abort Mechanism). If backwards compatibility is desired (MCR[AEN] bit negated), just write the INACTIVE code (0b1000) to the CODE field to inactivate the MB but then the pending frame may be transmitted without notification (see Message Buffer Inactivation).

3. Write the ID word.
4. Write the data bytes.
5. Write the DLC, Control and Code fields of the Control and Status word to activate the MB.

Once the MB is activated, it will participate into the arbitration process and eventually be transmitted according to its priority.

At the end of the successful transmission, the value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the MB's Time Stamp field, the CODE field in the Control and Status word is updated, the CRC Register is updated, a status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit. The new CODE field after transmission depends on the code that was used to activate the MB in step four (see Table 24-4 and Table 24-5 in Message Buffer Structure)

When the Abort feature is enabled (MCR[AEN] bit is asserted), after the Interrupt Flag is asserted for a Mailbox configured as transmit buffer, the Mailbox is blocked, therefore the CPU is not able to update it until it negates the Interrupt Flag. It means that the CPU must clear the corresponding IFLAG before starting to prepare this MB for a new transmission or reception.

24.6.3 Arbitration process

The arbitration process scans the Mailboxes searching the Tx one that holds the message to be sent in the next opportunity. This Mailbox is called the *arbitration winner*.

The scan starts from the lowest Mailbox number and runs toward the higher ones.

The arbitration process is triggered in the following events:

- From the CRC field of the CAN frame. The start point depends on the CTRL2[TASD] field value. See Control 2 Register (FLEXCAN_CTRL2) for details.
- During the error delimiter field of the CAN frame
- During the Overload Delimiter field of a CAN frame.
- When the winner is inactivated and the CAN bus has still not reached the first bit of the Intermission field.
- When ARM write to the C/S word of a winner MB and the CAN bus has still not reached the first bit of the Intermission field.

- When CHI is in Idle state and ARM writes to the C/S word of any MB.
- When FlexCAN exits Bus Off state
- Upon leaving Freeze Mode or Low Power Mode

If the arbitration process does not manage to evaluate all Mailboxes before the CAN bus has reached the first bit of the Intermission field the temporary arbitration winner is invalidated and the FlexCAN will not compete for the CAN bus in the next opportunity.

The arbitration process selects the winner among the active Tx Mailboxes at the end of the scan according to both CTRL1[LBUF] and MCR[LPRIO_EN] bits settings.

24.6.3.1 Lowest Mailbox number first

If CTRL1[LBUF] bit is asserted the first (lowest number) active Tx Mailbox found is the arbitration winner. MCR[LPRIO_EN] bit has no effect when CTRL1[LBUF] is asserted.

24.6.3.2 Highest Mailbox priority first

If CTRL1[LBUF] bit is negated then the arbitration process searches the active Tx Mailbox with the highest priority, and this Mailbox would have a higher probability to win the arbitration on CAN bus.

The sequence of bits considered for this arbitration is called the *arbitration value* of the Mailbox. The highest priority Tx Mailbox is the one that has the least arbitration value among all Tx Mailboxes.

If two or more Mailboxes have equivalent arbitration values the lowest Mailbox number is the arbitration winner.

The composition of the arbitration value depends on MCR[LPRIO_EN] bit setting.

24.6.3.2.1 Local Priority disabled

If MCR[LPRIO_EN] bit is negated the arbitration value is built in the exact sequence of bits as they would be transmitted in a CAN frame (see Table 24-12) in such a way that the Local Priority is disabled.

Table 24-12. Composition of the arbitration value when Local Priority is disabled

Format	Mailbox Arbitration Value (32 bits)				
Standard (IDE = 0)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)

Table continues on the next page...

Table 24-12. Composition of the arbitration value when Local Priority is disabled (continued)

Extended (IDE = 1)	Extended ID[28:18] (11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0] (18 bits)	RTR (1 bit)

24.6.3.2.2 Local Priority enabled

If Local Priority is desired MCR[LPRIO_EN] must be asserted.

In this case the Mailbox PRIO field is included at the very left of the arbitration value (see the table below).

Table 24-13. Composition of the arbitration value when Local Priority is enabled

Format	Mailbox Arbitration Value (35 bits)					
Standard (IDE = 0)	PRIO (3 bits)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	PRIO (3 bits)	Extended ID[28:18](11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0] (18 bits)	RTR (1 bit)

As the PRIO field is the most significant part of the arbitration value Mailboxes with low PRIO values have higher priority than Mailboxes with high PRIO values regardless the rest of their arbitration values.

Note that the PRIO field is not part of the frame on the CAN bus. Its purpose is only to affect the internal arbitration process.

Once the arbitration winner is found, its content is copied to a hidden auxiliary MB called Tx Serial Message Buffer (Tx SMB), which has the same structure as a normal MB but is not user accessible. This operation is called "move-out" and after it is done, write access to the corresponding MB is blocked (if the AEN bit in MCR is asserted). The write access is released in the following events:

- After the MB is transmitted
- FlexCAN enters in Freeze Mode or Bus Off
- FlexCAN loses the bus arbitration or there is an error during the transmission

At the first opportunity window on the CAN bus, the message on the Tx SMB is transmitted according to the CAN protocol rules. FlexCAN transmits up to eight data bytes, even if the DLC (Data Length Code) field value is greater than that.

Arbitration process can be triggered in the following situations:

- During Rx and Tx frames from CAN CRC field to end of frame. Arbitration start point depends on instantiation parameters NUMBER_OF_MB and TASD. Additionally, TASD value may be changed (see Control 2 Register (FLEXCAN_CTRL2)) to optimize the arbitration start point.
- During CAN Bus Off state from TX_ERR_CNT=124 to 128. Arbitration start point depends on instantiation parameters NUMBER_OF_MB and TASD. Additionally, TASD value may be changed (see Control 2 Register (FLEXCAN_CTRL2)) to optimize the arbitration start point.
- During C/S write by CPU in Bus Idle. First C/S write starts arbitration process and a second C/S write during this same arbitration restarts the process. If other C/S writes are performed, Tx arbitration process is pending. If there is no arbitration winner after arbitration process has finished, then TX arbitration machine begins a new arbitration process.
- Arbitration winner deactivation during a valid arbitration window.
- Upon Leave Freeze Mode. If there is a re-synchronization during WaitForBusIdle arbitration process is restarted.

Arbitration process stops in the following situation:

- All Mailboxes were scanned.
- A Tx active Mailbox is found in case of Lowest Buffer feature enabled.
- Arbitration winner inactivation or abort during any arbitration process.
- There was not enough time to finish Tx arbitration process. For instance, a deactivation was performed near the end of frame). In this case arbitration process is pending.
- Error or Overload flag in the bus.
- Low Power or Freeze Mode request in Idle state

Arbitration is considered pending as described below:

- It was not possible to finish arbitration process in time.
- C/S write during arbitration if write is performed in a MB which number is lower than the Tx arbitration pointer.
- Any C/S write if there is no Tx Arbitration process in progress.
- Rx Match has just updated a Rx Code to Tx Code.
- Entering Bus off state.

C/S write during arbitration has the following effect:

- If C/S write is performed in the arbitration winner, a new process is restarted immediately.
- C/S write during arbitration if write is performed in a MB which number is higher than the Tx arbitration pointer.

24.6.4 Receive Process

To be able to receive CAN frames into a Mailbox, the CPU must prepare it for reception by executing the steps listed here.

1. If the Mailbox is active (either Tx or Rx) inactivate the Mailbox (see Message Buffer Inactivation), preferably with a *safe inactivation* (see Transmission Abort Mechanism);
2. Write the ID word;
3. Write the EMPTY code (0b0100) to the CODE field of the Control and Status word to activate the Mailbox.

Once the Mailbox is activated in the third step, it will be able to receive frames that match the programmed filter. At the end of a successful reception, the Mailbox is updated by the *move-in process* (see Move-in) as follows:

1. The received Data field (8 bytes at most) is stored;
2. The received Identifier field is stored;
3. The value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the Mailbox Time Stamp field;
4. The received SRR, IDE, RTR and DLC fields are stored;
5. The CODE field in the Control and Status word is updated. (see Table 24-4 and Table 24-5 in Section Message Buffer Structure)
6. A status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit.

The recommended way for the CPU servicing (read) the frame received in a Mailbox is using the following procedure:

1. Read the Control and Status word of that Mailbox;
2. Check if the BUSY bit is deasserted, indicating that the Mailbox is locked. Repeat step 1) while it is asserted. See Message Buffer Lock Mechanism;
3. Read the contents of the Mailbox. Once Mailbox is locked now, its contents won't be modified by FlexCAN Move-in processes. See Move-in;
4. Acknowledge the proper flag at IFLAG registers;
5. Read the Free Running Timer. It is optional but recommended to unlock Mailbox as soon as possible and make it available for reception.

The CPU should synchronize to frame reception by the status flag bit for the specific Mailbox in one of the IFLAG Registers and not by the CODE field of that Mailbox. Polling the CODE field does not work because once a frame was received and the CPU services the Mailbox (by reading the C/S word followed by unlocking the Mailbox), the

CODE field will not return to EMPTY. It will remain FULL. If the CPU tries to workaround this behavior by writing to the C/S word to force an EMPTY code after reading the Mailbox without a prior *safe inactivation*, a newly received message matching the filter of that Mailbox may be lost.

In summary: never do polling by reading directly the C/S word of the Mailboxes. Instead, read the IFLAG registers.

Note that the received frame's Identifier field is always stored in the matching Mailbox, thus the contents of the ID field in a Mailbox may change if the match was due to masking. Note also that FlexCAN does receive frames transmitted by itself if there exists a matching Rx Mailbox, provided the MCR[SRX_DIS] bit is not asserted. If MCR[SRX_DIS] bit is asserted, FlexCAN will not store messages transmitted by itself in any MB, even if it contains a matching MB, and no interrupt flag or interrupt signal will be generated due to the frame reception.

To be able to receive CAN messages through the Rx FIFO, the CPU must enable and configure the Rx FIFO during Freeze Mode (see Rx FIFO). Upon receiving the Frames Available in Rx FIFO interrupt (see Interrupt Masks 1 Register (FLEXCAN_IMASK1), bit IFLAG[BUF5I] - Frames available in Rx FIFO), the CPU should service the received frame using the following procedure:

1. Read the Control and Status word (optional - needed only if a mask was used for IDE and RTR bits);
2. Read the ID field (optional - needed only if a mask was used);
3. Read the Data field;
4. Read the RXFIR register (optional);
5. Clear the Frames Available in Rx FIFO interrupt by writing 1 to IFLAG[BUF5I] bit (mandatory - releases the MB and allows the CPU to read the next Rx FIFO entry)

24.6.5 Matching Process

The matching process scans the MB memory looking for Rx MBs programmed with the same ID as the one received from the CAN bus.

If the FIFO is enabled, the priority of scanning can be selected between Mailboxes and FIFO filters. In any case, the matching starts from the lowest number Message Buffer toward the higher ones. If no match is found within the first structure then the other is scanned subsequently. In the event that the FIFO is full, the matching algorithm will always look for a matching MB outside the FIFO region.

As the frame is being received, it is stored in a hidden auxiliary MB called Rx Serial Message Buffer (Rx SMB).

The matching process start point depends on the following conditions:

- if the received frame is a remote frame, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field equal to zero, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field different than zero, the start point is the DATA field of the frame;

If a matching ID is found in the FIFO table or in one of the Mailboxes, the contents of the SMB will be transferred to the FIFO or to the matched Mailbox by the move-in process. If any CAN protocol error is detected then no match results will be transferred to the FIFO or to the matched Mailbox at the end of reception.

The matching process scans all matching elements of both Rx FIFO (if enabled) and active Rx Mailboxes (CODE is EMPTY, FULL, OVERRUN or RANSWER) in search of a successful comparison with the matching elements of the Rx SMB that is receiving the frame on the CAN bus. The SMB has the same structure of a Mailbox. The reception structures (Rx FIFO or Mailboxes) associated with the matching elements that had a successful comparison are the *matched structures* . The *matching winner* is selected at the end of the scan among those matched structures and depends on conditions described ahead. Please, refer to the following table for details.

Table 24-14. Matching architecture

Structure	SMB[RTR]	CTRL2[RRS]	CTRL2[EACEN]	MB[IDE]	MB[RTR]	MB[ID][1]	MB[CODE]
Mailbox	0	-	0	cmp[2]	no_cmp[3]	cmp_msk[4]	EMPTY or FULL or OVERRUN
Mailbox	0	-	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	0	-	cmp	no_cmp	cmp	RANSWER
Mailbox	1	1	0	cmp	no_cmp	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	1	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
FIFO[5]	-	-	-	cmp_msk	cmp_msk	cmp_msk	-

1. For Mailbox structure, If SMB[IDE] is asserted, the ID is 29 bits (ID Standard + ID Extended). In case of SMB[IDE] to be negated, the ID is only 11 bits (ID Standard). Please, refer to Message Buffer Structure for ID details. For FIFO structure, the ID depends on IDAM. Please, refer to Rx FIFO Structure for IDAM details.
2. cmp: Compares the SMB contents with the MB contents regardless the masks.
3. no_cmp: The SMB contents are not compared with the MB contents.
4. cmp_msk: Compares the SMB contents with MB contents taking into account the masks.

5. SMB[IDE] and SMB[RTR] are not taken into account when IDAM is type C.

A reception structure is *free-to-receive* when any of the following conditions is satisfied:

- the CODE field of the Mailbox is EMPTY;
- the CODE field of the Mailbox is either FULL or OVERRUN and it has already been serviced (the C/S word was read by the ARM and unlocked as described in Message Buffer Lock Mechanism);
- the CODE field of the Mailbox is either FULL or OVERRUN and an inactivation is performed. (see Message Buffer Inactivation)
- the Rx FIFO is not full.

The scan order for Mailboxes and Rx FIFO is from the matching element with lowest number to the higher ones.

The matching winner search for Mailboxes is affected by the MCR[IRMQ] bit. If it is negated the matching winner is the first matched Mailbox regardless if it is free-to-receive or not. If it is asserted, the matching winner is selected according to the priority below:

1. the first free-to-receive matched Mailbox;
2. the last non free-to-receive matched Mailbox.

It is possible to select the priority of scan between Mailboxes and Rx FIFO by the CTRL2[MRP] bit.

If the selected priority is Rx FIFO first:

- if the Rx FIFO is a matched structure and is free-to-receive then the Rx FIFO is the matching winner regardless of the scan for Mailboxes;
- otherwise (the Rx FIFO is not a matched structure or is not free-to-receive), then the matching winner is searched among Mailboxes as described above.

If the selected priority is Mailboxes first:

- if a free-to-receive matched Mailbox is found, it is the matching winner regardless the scan for Rx FIFO;
- if no matched Mailbox is found, then the matching winner is searched in the scan for the Rx FIFO;
- if both conditions above are not satisfied and a non free-to-receive matched Mailbox is found then the matching winner determination is conditioned by the MCR[IRMQ] bit:
  - if MCR[IRMQ] bit is negated the matching winner is the first matched Mailbox;
  - if MCR[IRMQ] bit is asserted the matching winner is the Rx FIFO if it is a free-to-receive matched structure, otherwise the matching winner is the last non free-to-receive matched Mailbox.

Please, refer to the table below for a summary of matching possibilities.

If a non-safe Mailbox inactivation (see Message Buffer Inactivation) occurs during matching process and the Mailbox inactivated is the temporary matching winner then the temporary matching winner is invalidated. The matching elements scan is not stopped nor restarted, it continues normally. The consequence is that the current matching process works as if the matching elements compared before the inactivation did not exist, therefore a message may be lost.

Suppose, for example, that the FIFO is disabled, IRMQ is enabled and there are two MBs with the same ID, and FlexCAN starts receiving messages with that ID. Let us say that these MBs are the second and the fifth in the array. When the first message arrives, the matching algorithm will find the first match in MB number 2. The code of this MB is EMPTY, so the message is stored there. When the second message arrives, the matching algorithm will find MB number 2 again, but it is not "free-to-receive", so it will keep looking and find MB number 5 and store the message there. If yet another message with the same ID arrives, the matching algorithm finds out that there are no matching MBs that are "free-to-receive", so it decides to overwrite the last matched MB, which is number 5. In doing so, it sets the CODE field of the MB to indicate OVERRUN.

Table 24-15. Matching Possibilities and Resulting Reception Structures

RFEN	IRMQ	MRP	Matched in MB	Matched in FIFO	Reception Structure	Description
No FIFO, only MB, match is always MB first						
0	0	X[1]	None[2]	-[3]	None	Frame lost by no match
0	0	X	Free[4]	-	FirstMB	
0	1	X	None	-	None	Frame lost by no match
0	1	X	Free	-	FirstMB	
0	1	X	NotFree	-	LastMB	Overrun
FIFO enabled, no match in FIFO is as if FIFO does not exist						
1	0	X	None	None[5]	None	Frame lost by no match
1	0	X	Free	None	FirstMB	
1	1	X	None	None	None	Frame lost by no match
1	1	X	Free	None	FirstMB	
1	1	X	NotFree	None	LastMB	Overrun
FIFO enabled, Queue disabled						
1	0	0	X	NotFull[6]	FIFO	
1	0	0	None	Full[7]	None	Frame lost by FIFO full (FIFO Overflow)
1	0	0	Free	Full	FirstMB	
1	0	0	NotFree	Full	FirstMB	
1	0	1	None	NotFull	FIFO	
1	0	1	None	Full	None	Frame lost by FIFO full (FIFO Overflow)

Table continues on the next page...

Table 24-15. Matching Possibilities and Resulting Reception Structures (continued)

RFEN	IRMQ	MRP	Matched in MB	Matched in FIFO	Reception Structure	Description
1	0	1	Free	X	FirstMB	
1	0	1	NotFree	X	FirtsMB	Overrun
FIFO enabled, Queue enabled						
1	1	0	X	NotFull	FIFO	
1	1	0	None	Full	None	Frame lost by FIFO full (FIFO Overflow)
1	1	0	Free	Full	FirstMB	
1	1	0	NotFree	Full	LastMB	Overrun
1	1	1	None	NotFull	FIFO	
1	1	1	Free	X	FirstMB	
1	1	1	NotFree	NotFull	FIFO	
1	1	1	NotFree	Full	LastMB	Overrun

1. It is a don't care condition.
2. Matched in MB "None" means that the frame has not matched any MB (free-to-receive or non-free-to-receive).
3. It is a forbidden condition.
4. Matched in MB "Free" means that the frame matched at least one MB free-to-receive regardless it has matched MBs non-free-to-receive.
5. Matched in FIFO "None" means that the frame has not matched any filter in FIFO. It is as the FIFO didn't exist (CTRL2[RFEN]=0).
6. Matched in FIFO "NotFull" means that the frame has matched a FIFO filter and has empty slots to receive it.
7. Matched in FIFO "Full" means that the frame has matched a FIFO filter but couldn't store it because it has no empty slots to receive it.

The ability to match the same ID in more than one MB can be exploited to implement a reception queue (in addition to the full featured FIFO) to allow more time for ARM to service the MBs. By programming more than one MB with the same ID, received messages will be queued into the MBs. ARM can examine the Time Stamp field of the MBs to determine the order in which the messages arrived.

Matching to a range of IDs is possible by using ID Acceptance Masks. FlexCAN supports individual masking per MB. Please refer to Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK) . During the matching algorithm, if a mask bit is asserted, then the corresponding ID bit is compared. If the mask bit is negated, the corresponding ID bit is "don't care". Please note that the Individual Mask Registers are implemented in RAM, so they are not initialized out of reset. Also, they can only be programmed while the module is in Freeze Mode , otherwise they are blocked by hardware.

FlexCAN also supports an alternate masking scheme with only four mask registers (RGXMASK, RX14MASK, RX15MASK and RXFGMASK) for backward compatibility. This alternate masking scheme is enabled when the IRMQ bit in the MCR Register is negated.

24.6.6 Move Process

There are two types of move process, namely move-in and move-out.

24.6.6.1 Move-in

The move-in process is the copy of a message received by an Rx SMB to a Rx Mailbox or FIFO that has matched it. If the move destination is the Rx FIFO, attributes of the message are also copied to the RXFIR FIFO. Each Rx SMB has its own move-in process, but only one is performed at a given time as described ahead.

The move-in starts only when the message held by the Rx SMB has a corresponding matching winner (see Matching Process) and all of the following conditions are true:

- the CAN bus has reached or let past either:
  - the second bit of Intermission field next to the frame that carried the message that is in the Rx SMB;
  - the first bit of an overload frame next to the frame that carried the message that is in the Rx SMB;
- there is no ongoing matching process;
- the destination Mailbox is not locked by ARM;
- there is no ongoing move-in process from another Rx SMB. If more than one move-in processes are to be started at the same time both are performed and the newest substitutes the oldest.

The term *pending move-in* is used throughout the document and stands for a move-to-be that still does not satisfy all of the aforementioned conditions.

The move-in is cancelled and the Rx SMB is able to receive another message if any of the following conditions is satisfied:

- the destination Mailbox is inactivated after the CAN bus has reached the first bit of Intermission field next to the frame that carried the message and its matching process has finished;
- there is a previous pending move-in to the same destination Mailbox.
- the Rx SMB is receiving a frame transmitted by the FlexCAN itself and the self-reception is disabled;
- any CAN protocol error is detected.

Note that the pending move-in is not cancelled if the module enters in Freeze or Low Power Mode. It only stays on hold waiting for exiting Low Power Mode and to be unlocked. If an MB is unlocked during Freeze Mode, the move-in happens immediately.

The move-in process consists of the following steps:

1. if the message is destined to the Rx FIFO, push IDHIT into the RXFIR FIFO;
2. reads the words DATA0-3 and DATA4-7 from the Rx SMB;
3. writes it in the words DATA0-3 and DATA4-7 of the Rx Mailbox;
4. reads the words Control/Status and ID from the Rx SMB;
5. writes it in the words Control/Status and ID of the Rx Mailbox, updating the CODE field according to Table 24-4.

The move-in process is not atomic, in such a way that it is immediately cancelled by the inactivation of the destination Mailbox (see Message Buffer Inactivation) and in this case the Mailbox may be left partially updated, thus incoherent. The exception is if the move-in destination is an Rx FIFO Message Buffer, then the process cannot be cancelled.

The BUSY Bit (least significant bit of the CODE field) of the destination Message Buffer is asserted while the move-in is being performed in such a way that ARM beware that the Message Buffer content is temporarily incoherent.

24.6.6.2 Move-out

The move-out process is the copy of the content from a Tx Mailbox to the Tx SMB when a message for transmission is available (see Arbitration process).

The move-out occurs in the following conditions:

- the first bit of Intermission field;
- during Bus off field when TX Error Counter is in the 124 to 128 range;
- during BusIdle field
- during Wait For Bus Idle field

The move-out process is not atomic. Only ARM has priority to access the memory concurrently out of BusIdle state. In BusIdle, the move-out has the lowest priority to the concurrent memory accesses.

24.6.7 Data Coherence

In order to maintain data coherency and FlexCAN proper operation, the ARM must obey the rules described in

Any form of ARM accessing an MB structure within FlexCAN other than those specified may cause FlexCAN to behave in an unpredictable way.

24.6.7.1 Transmission Abort Mechanism

The abort mechanism provides a safe way to request the abortion of a pending transmission. A feedback mechanism is provided to inform ARM if the transmission was aborted or if the frame could not be aborted and was transmitted instead.

In order to abort a transmission, ARM must write a specific abort code (0b1001) to the CODE field of the Control and Status word. The active MBs configured as transmission must be aborted first and then they may be updated. If the abort code is written to a Mailbox that is currently being transmitted, or to a Mailbox that was already loaded into the SMB for transmission, the write operation is blocked and the MB is kept active, but the abort request is captured and kept pending until one of the following conditions are satisfied:

- The module loses the bus arbitration
- There is an error during the transmission
- The module is put into Freeze Mode
- The module enters in BusOff state
- There is an overload frame

If none of conditions above are reached, the MB is transmitted correctly, the interrupt flag is set in the IFLAG register and an interrupt to the ARM is generated (if enabled). The abort request is automatically cleared when the interrupt flag is set. In the other hand, if one of the above conditions is reached, the frame is not transmitted, therefore the abort code is written into the CODE field, the interrupt flag is set in the IFLAG and an interrupt is (optionally) generated to ARM.

If ARM writes the ABORT code before the transmission begins internally, then the write operation is not blocked, therefore the MB is updated and the interrupt flag is set. In this way ARM just needs to read the abort code to make sure the active MB was *safely inactivated* . Although the AEN bit is asserted and ARM wrote the abort code, in this case the MB is inactivated and not aborted, because the transmission did not start yet. One Mailbox is only aborted when the abort request is captured and kept pending until one of the previous conditions are satisfied.

The abort procedure can be summarized as follows:

1. ARM checks the corresponding IFLAG and clears it, if asserted.
2. ARM writes 0b1001 into the CODE field of the C/S word.
3. ARM waits for the corresponding IFLAG indicating that the frame was either transmitted or aborted.
4. ARM reads the CODE field to check if the frame was either transmitted (CODE=0b1000) or aborted (CODE=0b1001).

5. It is necessary to clear the corresponding IFLAG in order to allow the MB to be reconfigured.

24.6.7.2 Message Buffer Inactivation

Inactivation is a mechanism provided to protect the Mailbox against updates by the FlexCAN internal processes, thus allowing ARM to rely on Mailbox data coherence after having updated it, even in Normal Mode.

If a Mailbox is inactivated it does not participate neither in the arbitration nor in the matching process until it is reactivated. See Transmit Process and Receive Process for more detailed instruction on how to inactivate and reactivate a Mailbox.

In order to inactivate a Mailbox ARM must update its CODE field to INACTIVE (either 0b0000 or 0b1000).

As the user is not able to synchronize the CODE field update with the FlexCAN internal processes an inactivation can lead to undesirable results:

- a frame in the bus that matches the filtering of the inactivated Rx Mailbox may be lost without notice, even if there are other Mailboxes with the same filter;
- a frame containing the message within the inactivated Tx Mailbox may be transmitted without notice.

In order to eliminate such risk and perform a *safe inactivation* ARM must use the following mechanism along with the inactivation itself:

- for Tx Mailboxes, the Transmission Abort (see Transmission Abort Mechanism);

The inactivation automatically unlocks the Mailbox (see Message Buffer Lock Mechanism).

Message Buffers that are part of the Rx FIFO cannot be inactivated. There is no write protection on FIFO region by FlexCAN. ARM must keep the data coherence into FIFO region when RFEN is asserted.

24.6.7.3 Message Buffer Lock Mechanism

Besides MB inactivation, FlexCAN has another data coherence mechanism for the receive process. When ARM reads the Control and Status word of an Rx MB with codes FULL or OVERRUN, FlexCAN assumes that ARM wants to read the whole MB in an

atomic operation, and thus it sets an internal lock flag for that MB. The lock is released when ARM reads the Free Running Timer (global unlock operation), or when it reads the Control and Status word of another MB regardless of its code or when ARM writes into C/S word from locked MB. The MB locking is done to prevent a new frame to be written into the MB while ARM is reading it.

The locking mechanism only applies to Rx MBs that are not part of FIFO and have a code different than INACTIVE (0b0000) or EMPTY[1] (0b0100). Also, Tx MBs can not be locked.

Suppose, for example, that the FIFO is disabled and the second and the fifth MBs of the array are programmed with the same ID, and FlexCAN has already received and stored messages into these two MBs. Suppose now that the ARM decides to read MB number 5 and at the same time another message with the same ID is arriving. When ARM reads the Control and Status word of MB number 5, this MB is locked. The new message arrives and the matching algorithm finds out that there are no "free-to-receive" MBs, so it decides to override MB number 5. However, this MB is locked, so the new message can not be written there. It will remain in the SMB waiting for the MB to be unlocked, and only then will be written to the MB. If the MB is not unlocked in time and yet another new message with the same ID arrives, then the new message overwrites the one on the SMB and there will be no indication of lost messages either in the CODE field of the MB or in the Error and Status Register.

While the message is being moved-in from the SMB to the MB, the BUSY bit on the CODE field is asserted. If ARM reads the Control and Status word and finds out that the BUSY bit is set, it should defer accessing the MB until the BUSY bit is negated.

If the BUSY bit is asserted or if the MB is empty, then reading the Control and Status word does not lock the MB.

Inactivation takes precedence over locking. If ARM inactivates a locked Rx Mailbox, then its lock status is negated and the Mailbox is marked as invalid for the current matching round. Any pending message on the SMB will not be transferred anymore to the Mailbox.An MB is unlocked when ARM reads the Free Running Timer Register (see Free Running Timer Register (FLEXCAN_TIMER)), or the C/S word of another MB.

Lock and unlock mechanisms have the same functionality in both Normal and Freeze modes.

An unlock during Normal or Freeze mode results in the move-in of the pending message. However, the move-in is postponed if an unlock occurs during any of the low power modes (see in Modes of Operation specific information on Module Disable or Stop modes) and it will take place only when the module resumes to Normal or Freeze modes.

1. In previous FlexCAN versions, reading the C/S word locks the MB even if it is EMPTY. This behavior is maintained when the IRMQ bit is negated.

24.6.8 Rx FIFO

The receive-only FIFO is enabled by asserting the RFEN bit in the MCR.

The reset value of this bit is zero to maintain software backward compatibility with previous versions of the module that did not have the FIFO feature. The FIFO is 6-message deep, therefore when the FIFO is enabled, the memory region occupied by the first 6 Message Buffers is reserved for use of the FIFO engine (see Rx FIFO Structure). ARM can read the received messages sequentially, in the order they were received, by repeatedly reading a Message Buffer structure at the output of the FIFO.

The IFLAG[BUF5I] (Frames available in Rx FIFO) is asserted when there is at least one frame available to be read from the FIFO. An interrupt is generated if it is enabled by the corresponding mask bit. Upon receiving the interrupt, ARM can read the message (accessing the output of the FIFO as a Message Buffer) and the RXFIR register and then clear the interrupt. If there are more messages in the FIFO the act of clearing the interrupt updates the output of the FIFO with the next message and update the RXFIR with the attributes of that message, reissuing the interrupt to ARM. Otherwise, the flag remains negated. The output of the FIFO is only valid when the IFLAG[BUF5I] is asserted.

The IFLAG[BUF6I] (Rx FIFO Warning) is asserted when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. The flag remains asserted until ARM clears it.

The IFLAG[BUF7I] (Rx FIFO Overflow) is asserted when an incoming message was lost because the Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. The flag remains asserted until the ARM clears it.

Clearing one of those three flags does not affect the state of the other two.

An interrupt is generated if an IFLAG bit is asserted and the corresponding mask bit is asserted too.

A powerful filtering scheme is provided to accept only frames intended for the target application, thus reducing the interrupt servicing work load. The filtering criteria is specified by programming a table of up to 128 32-bit registers, according to CTRL2[RFFN] setting, that can be configured to one of the following formats (see also Rx FIFO Structure):

- Format A: 128 IDAFs (extended or standard IDs including IDE and RTR)
- Format B: 256 IDAFs (standard IDs or extended 14-bit ID slices including IDE and RTR)
- Format C: 512 IDAFs (standard or extended 8-bit ID slices)

Every frame available in the FIFO has a corresponding IDHIT (Identifier Acceptance Filter Hit Indicator) that can be read by accessing the RXFIR register. The RXFIR[IDHIT] field refers to the message at the output of the FIFO and is valid whilst the IFLAG[BUF5I] flag is asserted. The RXFIR register must be read only before clearing the flag, which guarantees that the information refers to the correct frame within the FIFO.

Up to thirty two elements of the ID Filter Table are individually affected by the Individual Mask Registers (RXIMR0 - RXIMR31), according to CTRL2[RFFN] setting (refer to Control 2 Register (FLEXCAN_CTRL2)), allowing very powerful filtering criteria to be defined. If the MCR[IRMQ] bit is negated (or if the RXIMR are not available for the particular MCU), then the FIFO ID Filter Table is affected by RXFGMASK.

24.6.9 CAN Protocol Related Features

24.6.9.1 Remote Frames

Remote frame is a special kind of frame. The user can program a mailbox to be a Remote Request Frame by writing the mailbox as Transmit with the RTR bit set to '1'. After the remote request frame is transmitted successfully, the mailbox becomes a Receive Message Buffer, with the same ID as before.

When a remote request frame is received by FlexCAN, it can be treated in three ways, depending on Remote Request Storing (CTRL2[RRS]) and Rx FIFO Enable (MCR[RFEN]) bits:

- If RRS is negated the frame's ID is compared to the IDs of the Transmit Message Buffers with the CODE field 0b1010. If there is a matching ID, then this mailbox frame will be transmitted. Note that if the matching mailbox has the RTR bit set, then FlexCAN will transmit a remote frame as a response. The received remote request frame is not stored in a receive buffer. It is only used to trigger a transmission of a frame in response. The mask registers are not used in remote frame matching, and all ID bits (except RTR) of the incoming received frame should match. In the case that a remote request frame was received and matched a mailbox, this message buffer immediately enters the internal arbitration process, but is considered as normal Tx mailbox, with no higher priority. The data length of this frame is independent of the DLC field in the remote frame that initiated its transmission.
- If RRS is asserted the frame's ID is compared to the IDs of the receive mailboxes with the CODE field 0b0100, 0b0010 or 0b0110. If there is a matching ID, then this

mailbox will store the remote frame in the same fashion of a data frame. No automatic remote response frame will be generated. The mask registers are used in the matching process.

- If RFEN is asserted FlexCAN will not generate an automatic response for remote request frames that match the FIFO filtering criteria. If the remote frame matches one of the target IDs, it will be stored in the FIFO and presented to the ARM. Note that for filtering formats A and B, it is possible to select whether remote frames are accepted or not. For format C, remote frames are always accepted (if they match the ID).Remote Request Frames are considered as normal frames, and generate a FIFO overflow when a successful reception occurs and the FIFO is already full.

24.6.9.2 Overload Frames

FLEXCAN does transmit overload frames due to detection of following conditions on CAN bus:

- Detection of a dominant bit in the first/second bit of Intermission
- Detection of a dominant bit at the 7th bit (last) of End of Frame field (Rx frames)
- Detection of a dominant bit at the 8th bit (last) of Error Frame Delimiter or Overload Frame Delimiter

24.6.9.3 Time Stamp

The value of the Free Running Timer is sampled at the beginning of the Identifier field on the CAN bus, and is stored at the end of "move-in" in the TIME STAMP field, providing network behavior with respect to time.

Note that the Free Running Timer can be reset upon a specific frame reception, enabling network time synchronization. Refer to TSYN description in Control 1 Register (FLEXCAN_CTRL1).

24.6.9.4 Protocol Timing

The FLEXCAN module supports a variety of means to setup bit timing parameters that are required by the CAN protocol. The Control Register has various fields used to control bit timing parameters: PRESDIV, PROPSEG, PSEG1, PSEG2 and RJW. See Control 1 Register (FLEXCAN_CTRL1) .

The PRESDIV field controls a prescaler that generates the Serial Clock (Sclock), whose period defines the 'time quantum' used to compose the CAN waveform. A time quantum is the atomic unit of time handled by the CAN engine.

$$f_{Tq} = \frac{f_{CANCLK}}{(\text{Prescaler value})}$$

A bit time is subdivided into three segments[2] (reference Table 24-16):

- SYNC_SEG: This segment has a fixed length of one time quantum. Signal edges are expected to happen within this section
- Time Segment 1: This segment includes the Propagation Segment and the Phase Segment 1 of the CAN standard. It can be programmed by setting the PROPSEG and the PSEG1 fields of the CTRL Register so that their sum (plus 2) is in the range of 4 to 16 time quanta
- Time Segment 2: This segment represents the Phase Segment 2 of the CAN standard. It can be programmed by setting the PSEG2 field of the CTRL Register (plus 1) to be 2 to 8 time quanta long

$$\text{Bit Rate} = \frac{f_{Tq}}{(\text{number of Time Quanta})}$$

2. For further explanation of the underlying concepts please refer to ISO/DIS 11519-1, Section 10.3. Reference also the Bosch CAN 2.0A/B protocol specification dated September 1991 for bit timing.

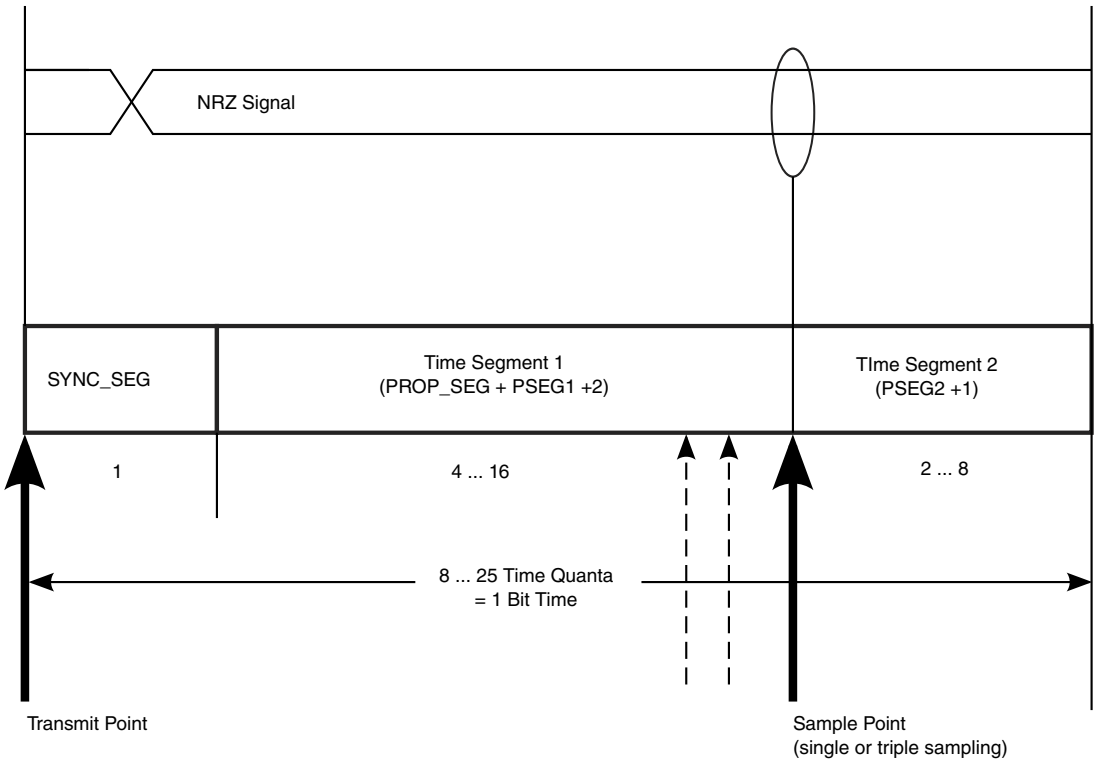

Figure 24-2. Segments within the Bit Time

Whenever CAN bit is used as a measure of duration (e.g. MCR[FRZ_ACK] and MCR[LPM_ACK] in Module Configuration Register (FLEXCAN_MCR)), the number of peripheral clocks in one CAN bit can be calculated as:

$$NCCP = \frac{f_{sys} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRESDIV + 1)}{f_{CANCLK}}$$

where:

NCCP is the number of peripheral clocks in one CAN bit;

f_{CANCLK} is the Protocol Engine (PE) Clock in Hz;

f_{SYS} is the frequency of operation of the system (CHI) clock, in Hz;

PSEG1 is the value in CTRL1[PSEG1] field;

PSEG2 is the value in CTRL1[PSEG2] field;

PROPSEG is the value in CTRL1[PROPSEG] field;

PRESDIV is the value in CTRL1[PRESDIV] field.

For example, 180 CAN bits = 180 x NCCP peripheral clock periods.

Figure 24-2 gives an overview of the CAN compliant segment settings and the related parameter values.

Table 24-16. Time Segment Syntax

Syntax	Description
SYNC_SEG	System expects transitions to occur on the bus during this period.
Transmit Point	A node in transmit mode transfers a new value to the CAN bus at this point.
Sample Point	A node samples the bus at this point. If the three samples per bit option is selected, then this point marks the position of the third sample.

Table 24-17. CAN Standard Compliant Bit Time Segment Settings

Time Segment 1	Time Segment 2	Re-synchronization Jump Width
5 .. 10	2	1 .. 2
4 .. 11	3	1 .. 3
5 .. 12	4	1 .. 4
6 .. 13	5	1 .. 4
7 .. 14	6	1 .. 4
8 .. 15	7	1 .. 4
9 .. 16	8	1 .. 4

24.6.9.5 Arbitration and Matching Timing

During normal reception and transmission of frames, the matching, arbitration, move-in and move-out processes are executed during certain time windows inside the CAN frame, as shown in the following figures.

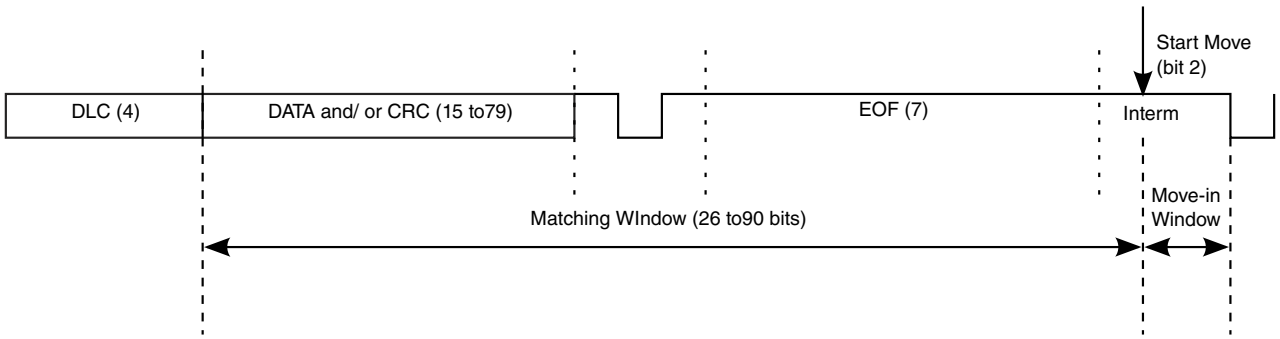

Figure 24-3. Matching and Move-In Time Windows

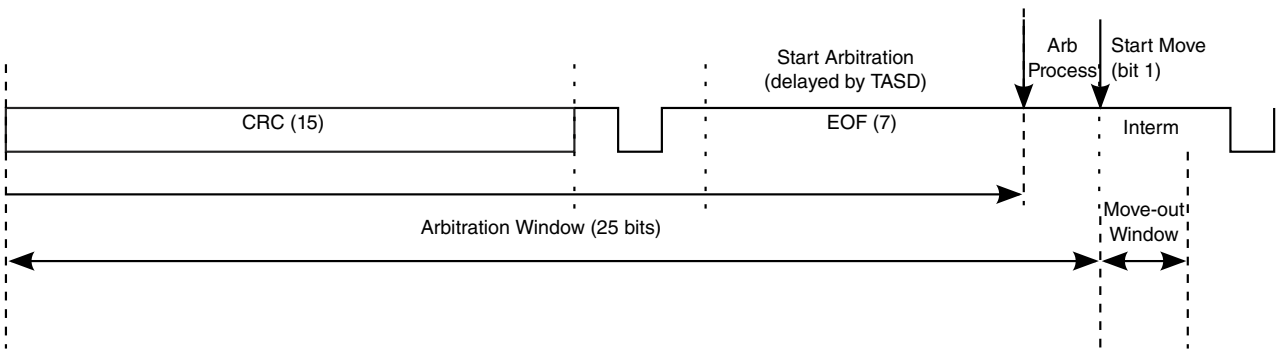

Figure 24-4. Arbitration and Move-Out Time Windows

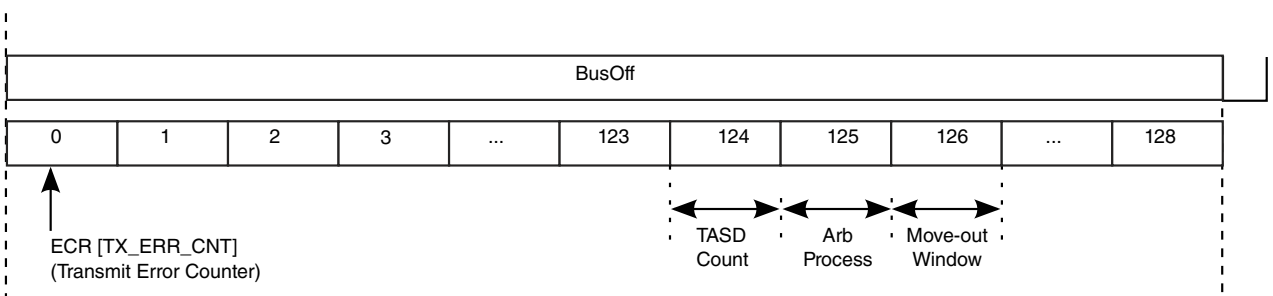

Figure 24-5. Arbitration at the end of Bus Off and Move-Out Time Windows

When doing matching and arbitration, FlexCAN needs to scan the whole Message Buffer memory during the available time window. In order to have sufficient time to do that, the following requirements must be observed:

- A valid CAN bit timing must be programmed, as indicated in Table 24-17
- The peripheral clock frequency can not be smaller than the oscillator clock frequency, i.e. the PLL can not be programmed to divide down the oscillator clock
- There must be a minimum ratio between the peripheral clock frequency and the CAN bit rate, as specified in the following table.

Table 24-18. Minimum Ratio Between Peripheral Clock Frequency and CAN Bit Rate

Number of Message Buffers	RFEN	Minimum Number of Peripheral Clocks per CAN bit
16 and 32	0	16
64	0	25
16	1	16
32	1	17
64	1	30

A direct consequence of the first requirement is that the minimum number of time quanta per CAN bit must be 8, so the oscillator clock frequency should be at least 8 times the CAN bit rate. The minimum frequency ratio specified in Table 24-18 can be achieved by choosing a high enough peripheral clock frequency when compared to the oscillator clock frequency, or by adjusting one or more of the bit timing parameters (PRESDIV, PROPSEG, PSEG1, PSEG2). As an example, taking the case of 64 MBs, if the oscillator and peripheral clock frequencies are equal and the CAN bit timing is programmed to have 8 time quanta per bit, then the prescaler factor (PRESDIV + 1) should be at least 2. For prescaler factor equal to one and CAN bit timing with 8 time quanta per bit, the ratio between peripheral and oscillator clock frequencies should be at least 2.

24.6.10 Modes of Operation Details

The FlexCAN module has four functional modes (Normal Mode, Freeze Mode, Listen-Only Mode and Loop-Back Mode) and two low power modes (Disable Mode and Stop Mode).

See in Modes of Operation an introductory description of all these modes of operation. The following sub-sections bring functional details on Freeze mode and the low power modes.

24.6.10.1 Freeze Mode

This mode is requested by ARM through the assertion of the HALT bit in the MCR Register or when the MCU is put into Debug Mode . In both cases it is also necessary that the FRZ bit is asserted in the MCR Register and the module is not in any of the low power modes (Disable, Stop). The acknowledgement is obtained through the assertion by the FlexCAN of FRZ_ACK bit in the same register. The ARM must only consider the FlexCAN in Freeze Mode when both request and acknowledgement conditions are satisfied.

When Freeze Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Intermission, Passive Error, Bus Off or Idle state
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores the FLEXCAN_RX input pin and drives the FLEXCAN_TX pin as recessive
- Stops the prescaler, thus halting all CAN protocol activities
- Grants write access to the Error Counters Register, which is read-only in other modes
- Sets the NOT_RDY and FRZ_ACK bits in MCR

After requesting Freeze Mode, the user must wait for the FRZ_ACK bit to be asserted in MCR before executing any other action, otherwise FlexCAN may operate in an unpredictable way. In Freeze mode, all memory mapped registers are accessible, except for CTRL1[CLK_SRC] bit that can be read but cannot be written.

Exiting Freeze Mode is done in one of the following ways:

- ARM negates the FRZ bit in the MCR Register
- The ARM is removed from Debug Mode and the HALT bit is negated

The FRZ_ACK bit is negated after protocol engine recognizes the negation of freeze request. Once out of Freeze Mode, FlexCAN tries to re-synchronize to the CAN bus by waiting for 11 consecutive recessive bits.

24.6.10.2 Module Disable Mode

This low power mode is normally used to temporarily disable a complete FlexCAN block, with no power consumption. It is requested by the ARM through the assertion of the MDIS bit in the MCR Register and the acknowledgement is obtained through the assertion by the FlexCAN of the LPM_ACK bit in the same register. The ARM must only consider the FlexCAN in Disable Mode when both request and acknowledgement conditions are satisfied.

If the module is disabled during Freeze Mode, it requests to disable the clocks to the PE and CHI sub-modules, sets the LPM_ACK bit and negates the FRZ_ACK bit. The ability to shut down the clocks depends on how FlexCAN is integrated into the MCU. If the module is disabled during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and then checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN_RX input pin and drives its FLEXCAN_TX pin as recessive

- May shut down the clocks to the PE and CHI sub-modules, depending on how FlexCAN is integrated into the MCU
- Sets the NOT_RDY and LPM_ACK bits in MCR

The Bus Interface Unit continues to operate, enabling the ARM to access memory mapped registers, except the Rx Mailboxes Global Mask Registers, the Rx Buffer 14 Mask Register, the Rx Buffer 15 Mask Register, the Rx FIFO Global Mask Register. The Rx FIFO Information Register, the Message Buffers, the Rx Individual Mask Registers, and the reserved words within RAM may not be accessed when the module is in Disable Mode depending on how FlexCAN RAM is integrated into the ARM. Exiting from this mode is done by negating the MDIS bit by ARM, which make FlexCAN requests to resume the clocks and negates the LPM_ACK bit after CAN protocol engine recognizes the negation of disable mode requested by ARM.

24.6.10.3 Stop Mode

This is a system low power mode in which system clocks can be stopped for maximum power savings.. To enter stop mode, the CPU should manually assert a global Stop Mode request (see the CAN1_STOP_REQ and CAN2_STOP_REQ bit in the register IOMUXC_GPR4)and check the acknowledgement asserted by the FlexCAN (see the CAN1_STOP_ACK and CAN2_STOP_ACK in the register IOMUXC_GPR4) . The CPU must only consider the FlexCAN in Stop Mode when both request and acknowledgement conditions are satisfied.

If FlexCAN receives the global Stop Mode request during Freeze Mode, it sets the LPM_ACK bit, negates the FRZ_ACK bit and then sends the Stop Acknowledge signal to the CPU, in order to shut down the clocks globally. If Stop Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish.Pending move-in is not taken in account
- Ignores its FLEXCAN_RX input pin and drives its FLEXCAN_TX pin as recessive
- Sets the NOT_RDY and LPM_ACK bits in MCR
- Sends a Stop Acknowledge signal to the CPU, so that it can shut down the clocks globally

Exiting Stop Mode is done in one of the following ways:

- ARM resuming the clocks and removing the Stop Mode request
- ARM resuming the clocks and Stop Mode request as a result of the Self Wake mechanism

In the Self Wake mechanism, if the SLF_WAK bit in MCR Register was set at the time FlexCAN entered Stop Mode, then upon detection of a recessive to dominant transition on the CAN bus, FlexCAN sets the WAK_INT bit in the ESR Register and, if enabled by the WAK_MSK bit in MCR, generates a Wake Up interrupt to the ARM. Upon receiving the interrupt, the ARM should resume the clocks and remove the Stop Mode request manually. FlexCAN will then wait for 11 consecutive recessive bits to synchronize to the CAN bus. As a consequence, it will not receive the frame that woke it up.

The sensitivity to CAN bus activity can be modified by applying a low-pass filter function to the FLEXCAN_RX input line while in Stop Mode. See the WAK_SRC bit in Module Configuration Register (FLEXCAN_MCR) . This feature can be used to protect FlexCAN from waking up due to short glitches on the CAN bus lines. Such glitches can result from electromagnetic interference within noisy environments, the glitch filter width can be set in Glitch Filter Width Register (FLEXCAN_GFWR).

24.6.11 Interrupts

The module can generate up to 70 interrupt sources (64 interrupts due to message buffers and 6 interrupts due to Ored interrupts from MBs, Bus Off, Error, Tx Warning, Rx Warning and Wake Up)).

The number of actual sources depends on the configured number of message buffers.

Each one of the message buffers can be an interrupt source, if its corresponding IMASK bit is set. There is no distinction between Tx and Rx interrupts for a particular buffer, under the assumption that the buffer is initialized for either transmission or reception. Each of the buffers has assigned a flag bit in the IFLAG Registers. The bit is set when the corresponding buffer completes a successful transmission/reception and is cleared when the ARM writes it to '1' (unless another interrupt is generated at the same time).

If the Rx FIFO is enabled (bit RFEN on MCR set), the interrupts corresponding to MBs 0 to 7 have a different behavior. Bit 7 of the IFLAG1 becomes the "FIFO Overflow" flag; bit 6 becomes the FIFO Warning flag, bit 5 becomes the "Frames Available in FIFO flag" and bits 4-0 are unused. See Interrupt Flags 1 Register (FLEXCAN_IFLAG1) for more information.

A combined interrupt for all MBs is also generated by an Or of all the interrupt sources from MBs. This interrupt gets generated when any of the Mailboxes or FIFO generates an interrupt. The ARM must read the IFLAG Registers to determine which MB or FIFO caused the interrupt.

The other 5 interrupt sources (Bus Off, Error, Tx Warning, Rx Warning and Wake Up generate interrupts like the MB ones, and can be read from both the Error and Status Register 1 and 2. The Bus Off, Error, Tx Warning and Rx Warning interrupt mask bits are located in the Control 1 Register and the Wake-Up interrupt mask bit is located in the MCR.

24.7 Initialization/Application Information

This section provide instructions for initializing the FLEXCAN module.

24.7.1 FLEXCAN Initialization Sequence

The FLEXCAN module may be reset in two ways:

- SOC level hard reset which resets all memory mapped registers asynchronously
- SOFT_RST bit in MCR, which resets some of the memory mapped registers synchronously

Soft reset is synchronous and has to follow an internal request/acknowledge procedure across clock domains. Therefore, it may take some time to fully propagate its effects. The SOFT_RST bit remains asserted while soft reset is pending, so software can poll this bit to know when the reset has completed. Also, soft reset can not be applied while clocks are shut down in any of the low power modes. The low power mode should be exited and the clocks resumed before applying soft reset.

After the module is enabled (MDIS bit negated), FLEXCAN automatically goes to Freeze Mode. In Freeze Mode, FLEXCAN is un-synchronized to the CAN bus, the HALT and FRZ bits in MCR Register are set, the internal state machines are disabled and the FRZ_ACK and NOT_RDY bits in the MCR Register are set. The FLEXCAN_TX pin is in recessive state and FLEXCAN does not initiate any transmission or reception of CAN frames. Note that the Message Buffers and the Rx Individual Mask Registers are not affected by reset, so they are not automatically initialized.

For any configuration change/initialization it is required that FLEXCAN is put into Freeze Mode. The following is a generic initialization sequence applicable to the FLEXCAN module:

- Initialize the Module Configuration Register
  - Enable the individual filtering per MB and reception queue features by setting the IRMQ bit
  - Enable the warning interrupts by setting the WRN_EN bit

    - If required, disable frame self reception by setting the SRX_DIS bit
    - Enable the FIFO by setting the RFEN bit
    - Enable the abort mechanism by setting the AEN bit
    - Enable the local priority feature by setting the LPRIO_EN bit
- Initialize the Control Register
    - Determine the bit timing parameters: PROPSEG, PSEG1, PSEG2, RJW
    - Determine the bit rate by programming the PRESDIV field
    - Determine the internal arbitration mode (LBUF bit)
- Initialize the Message Buffers
    - The Control and Status word of all Message Buffers must be initialized
    - If FIFO was enabled, the 8-entry ID table must be initialized
    - Other entries in each Message Buffer should be initialized as required
- Initialize the Rx Individual Mask Registers
- Set required interrupt mask bits in the IMASK Registers (for all MB interrupts), in CTRL Register (for Bus Off and Error interrupts) and in MCR Register for Wake-Up interrupt
- Negate the HALT bit in MCR

Starting with the last event, FLEXCAN attempts to synchronize to the CAN bus.

24.8 FLEXCAN Memory Map/Register Definition

The complete memory map for a FLEXCAN module with 64 MBs capability is shown in the following table. Each individual register is identified by its complete name and the corresponding mnemonic. The access type can be Supervisor (S) or Unrestricted (U). Most of the registers can be configured to have either Supervisor or Unrestricted access by programming the SUPV bit in the MCR Register. The MCR register allows only Supervisor access regardless the SUPV bit state.

The FLEXCAN module stores CAN messages for transmission and reception using a Mailboxes and Rx FIFO structure.

FLEXCAN memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
209_0000	Module Configuration Register (FLEXCAN1_MCR)	32	R/W	5980_000Fh	24.8.1/1068
209_0004	Control 1 Register (FLEXCAN1_CTRL1)	32	R/W	0000_0000h	24.8.2/1073

24.8.1 Module Configuration Register (FLEXCANx_MCR)

This register defines global system configurations, such as the module operation mode (e.g., low power) and maximum message buffer configuration.

Address: Base address + 0h offset

FLEXCANx_MCR field descriptions

Field	Description
31 MDIS	This bit controls whether FLEXCAN is enabled or not. When disabled, FLEXCAN shuts down the clocks to the CAN Protocol Interface and Message Buffer Management sub-modules. This is the only bit in MCR not affected by soft reset. See Module Disable Mode for more information. 1 Disable the FLEXCAN module 0 Enable the FLEXCAN module
30 FRZ	The FRZ bit specifies the FLEXCAN behavior when the HALT bit in the MCR Register is set or when Debug Mode is requested at ARM level. When FRZ is asserted, FLEXCAN is enabled to enter Freeze Mode. Negation of this bit field causes FLEXCAN to exit from Freeze Mode. 1 Enabled to enter Freeze Mode 0 Not enabled to enter Freeze Mode
29 RFEN	This bit controls whether the Rx FIFO feature is enabled or not. When RFEN is set, MBs 0 to 5 cannot be used for normal reception and transmission because the corresponding memory region (0x80-0xDC) is used by the FIFO engine as well as additional MBs (up to 32, depending on CTRL2[RFFN] setting) which are used as Rx FIFO ID Filter Table elements.RFEN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 24-18 (see Arbitration and Matching Timing).This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 FIFO enabled 0 FIFO not enabled
28 HALT	Assertion of this bit puts the FLEXCAN module into Freeze Mode. The ARM should clear it after initializing the Message Buffers and Control Register. No reception or transmission is performed by FLEXCAN before this bit is cleared. Freeze Mode can not be entered while FLEXCAN is in any of the low power modes.See Freeze Mode for more information 1 Enters Freeze Mode if the FRZ bit is asserted. 0 No Freeze Mode request.
27 NOT_RDY	This read-only bit indicates that FLEXCAN is either in Disable Mode, Stop Mode or Freeze Mode. It is negated once FLEXCAN has exited these modes. 1 FLEXCAN module is either in Disable Mode, Stop Mode or Freeze Mode 0 FLEXCAN module is either in Normal Mode, Listen-Only Mode or Loop-Back Mode
26 WAK_MSK	This bit enables the Wake Up Interrupt generation. 1 Wake Up Interrupt is enabled 0 Wake Up Interrupt is disabled
25 SOFT_RST	When this bit is asserted, FlexCAN resets its internal state machines and some of the memory mapped registers. The following registers are reset: MCR (except the MDIS bit), TIMER, ECR, ESR1, ESR2, IMASK1, IMASK2, IFLAG1, IFLAG2 and CRCR. Configuration registers that control the interface to the CAN bus are not affected by soft reset. The following registers are unaffected: CTRL1, CTRL2, RXIMR0_RXIMR63, RXGMASK, RX14MASK, RX15MASK, RXFGMASK, RXFIR and all Message Buffers The SOFT_RST bit can be asserted directly by the ARM when it writes to the MCR Register. It may take some time to fully propagate its effect. The SOFT_RST bit remains asserted while reset is pending, and is automatically negated when reset completes. Therefore, software can poll this bit to know when the soft reset has completed. Soft reset cannot be applied while clocks are shut down in any of the low power modes. The module should be first removed from low power mode, and then soft reset can be applied.

Table continues on the next page...

FLEXCANx_MCR field descriptions (continued)

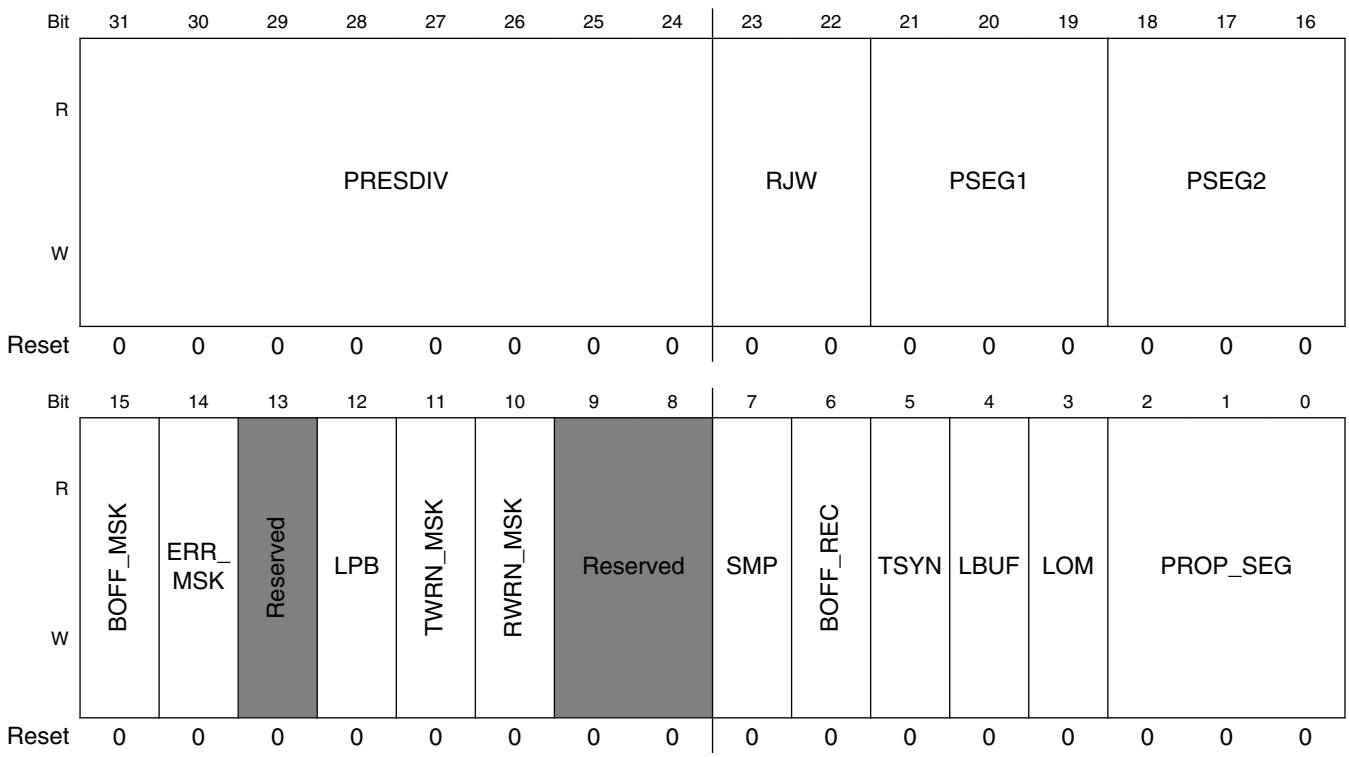
Field	Description
	1 Reset the registers 0 No reset request
24 FRZ_ACK	This read-only bit indicates that FLEXCAN is in Freeze Mode and its prescaler is stopped. The Freeze Mode request cannot be granted until current transmission or reception processes have finished. Therefore the software can poll the FRZ_ACK bit to know when FLEXCAN has actually entered Freeze Mode. If Freeze Mode request is negated, then this bit is negated once the FLEXCAN prescaler is running again. If Freeze Mode is requested while FLEXCAN is in any of the low power modes, then the FRZ_ACK bit will only be set when the low power mode is exited. See Freeze Mode for more information 1 FLEXCAN in Freeze Mode, prescaler stopped 0 FLEXCAN not in Freeze Mode, prescaler running
23 SUPV	This bit configures some of the FLEXCAN registers to be either in Supervisor or User Mode. Reset value of this bit is '1', so the affected registers start with Supervisor access allowance only. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 FlexCAN is in Supervisor Mode. Affected registers allow only Supervisor access. Unrestricted access behaves as though the access was done to an unimplemented register location 0 FlexCAN is in User Mode. Affected registers allow both Supervisor and Unrestricted accesses
22 SLF_WAK	This bit enables the Self Wake Up feature when FLEXCAN is in Stop Mode. If this bit had been asserted by the time FLEXCAN entered Stop Mode, then FLEXCAN will look for a recessive to dominant transition on the bus during these modes. If a transition from recessive to dominant is detected during Stop Mode, then FLEXCAN generates, if enabled to do so, a Wake Up interrupt to the ARM so that it can resume the clocks globally and FlexCAN can request to resume the clocks. This bit can not be written while the module is in Stop Mode. 1 FLEXCAN Self Wake Up feature is enabled 0 FLEXCAN Self Wake Up feature is disabled
21 WRN_EN	When asserted, this bit enables the generation of the TWRN_INT and RWRN_INT flags in the Error and Status Register. If WRN_EN is negated, the TWRN_INT and RWRN_INT flags will always be zero, independent of the values of the error counters, and no warning interrupt will ever be generated.This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 TWRN_INT and RWRN_INT bits are set when the respective error counter transition from <96 to ≥ 96. 0 TWRN_INT and RWRN_INT bits are zero, independent of the values in the error counters.
20 LPM_ACK	This read-only bit indicates that FLEXCAN is either in Disable Mode or Stop Mode. Either of these low power modes can not be entered until all current transmission or reception processes have finished, so the ARM can poll the LPM_ACK bit to know when FLEXCAN has actually entered low power mode. See Module Disable Mode, and Stop Mode for more information 1 FLEXCAN is either in Disable Mode, or Stop mode 0 FLEXCAN not in any of the low power modes
19 WAK_SRC	This bit defines whether the integrated low-pass filter is applied to protect the FLEXCAN_RX input from spurious wake up. See Stop Mode for more information. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 FLEXCAN uses the filtered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus 0 FLEXCAN uses the unfiltered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus.
18 -	This field is reserved. Reserved

Table continues on the next page...

FLEXCANx_MCR field descriptions (continued)

Field	Description
17 SRX_DIS	This bit defines whether FlexCAN is allowed to receive frames transmitted by itself. If this bit is asserted, frames transmitted by the module will not be stored in any MB, regardless if the MB is programmed with an ID that matches the transmitted frame, and no interrupt flag or interrupt signal will be generated due to the frame reception. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Self reception disabled 0 Self reception enabled
16 IRMQ	This bit indicates whether Rx matching process will be based either on individual masking and queue or on masking scheme with RXMGMASK, RX14MASK and RX15MASK, RXFGMASK. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Individual Rx masking and queue feature are enabled. 0 Individual Rx masking and queue feature are disabled.For backward compatibility, the reading of C/S word locks the MB even if it is EMPTY.
15–14 -	This field is reserved. Reserved
13 LPRIO_EN	This bit is provided for backwards compatibility reasons. It controls whether the local priority feature is enabled or not. It is used to extend the ID used during the arbitration process. With this extended ID concept, the arbitration process is done based on the full 32-bit word, but the actual transmitted ID still has 11-bit for standard frames and 29-bit for extended frames.This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Local Priority enabled 0 Local Priority disabled
12 AEN	This bit is supplied for backwards compatibility reasons. When asserted, it enables the Tx abort feature. This feature guarantees a safe procedure for aborting a pending transmission, so that no frame is sent in the CAN bus without notification. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.Write Abort code into Rx Mailboxes can cause unpredictable results when the MCR[AEN] is asserted. 1 Abort enabled 0 Abort disabled
11–10 -	This field is reserved. Reserved
9–8 IDAM	This 2-bit field identifies the format of the elements of the Rx FIFO filter table, as shown below. Note that all elements of the table are configured at the same time by this field (they are all the same format). See Rx FIFO Structure. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 00 Format A One full ID (standard or extended) per ID filter Table element. 01 Format B Two full standard IDs or two partial 14-bit extended IDs per ID filter Table element. 10 Format C Four partial 8-bit IDs (standard or extended) per ID filter Table element. 11 Format D All frames rejected.
7 -	This field is reserved. Reserved
MAXMB	This 7-bit field defines the number of the last Message Buffers that will take part in the matching and arbitration processes. The reset value (0x0F) is equivalent to 16 MB configuration. This field can only be written in Freeze Mode as it is blocked by hardware in other modes Number of the last MB = MAXMB.

Table continues on the next page...



FLEXCANx_MCR field descriptions (continued)

Field	Description
	NOTE: Additionally, the value of MAXMB must encompass the FIFO size defined by CTRL2[RFFN] MAXMB also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 24-18 (see Arbitration and Matching Timing).

24.8.2 Control 1 Register (FLEXCANx_CTRL1)

This register is defined for specific FLEXCAN control features related to the CAN bus, such as bit-rate, programmable sampling point within an Rx bit, Loop Back Mode, Listen Only Mode, Bus Off recovery behavior and interrupt enabling (Bus-Off, Error, Warning). It also determines the Division Factor for the clock prescaler.

Address: Base address + 4h offset

FLEXCANx_CTRL1 field descriptions

Field	Description
31–24 PRESDIV	This 8-bit field defines the ratio between the PE clock frequency and the Serial Clock (Sclock) frequency. The Sclock period defines the time quantum of the CAN protocol. For the reset value, the Sclock frequency is equal to the PE clock frequency. The Maximum value of this register is 0xFF, that gives a minimum Sclock frequency equal to the PE clock frequency divided by 256.For more information refer to Protocol Timing. This field can only be written in Freeze mode as it is blocked by hardware in other modes.

Table continues on the next page...

FLEXCANx_CTRL1 field descriptions (continued)

Field	Description
	Sclock frequency = CPI clock frequency / (PRESDIV+1)
23–22 RJW	This 2-bit field defines the maximum number of time quanta[1] that a bit time can be changed by one re-synchronization. The valid programmable values are 0-3. This field can only be written in Freeze mode as it is blocked by hardware in other modes Resync Jump Width = RJW + 1.
21–19 PSEG1	This 3-bit field defines the length of Phase Buffer Segment 1 in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Phase Buffer Segment 1 = (PSEG1 + 1) x Time-Quanta.
18–16 PSEG2	This 3-bit field defines the length of Phase Buffer Segment 2 in the bit time. The valid programmable values are 1-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Phase Buffer Segment 2 = (PSEG2 + 1) x Time-Quanta.
15 BOFF_MSK	This bit provides a mask for the Bus Off Interrupt. 1 Bus Off interrupt enabled 0 Bus Off interrupt disabled
14 ERR_MSK	This bit provides a mask for the Error Interrupt. 1 Error interrupt enabled 0 Error interrupt disabled
13 -	This field is reserved. Reserved
12 LPB	This bit configures FlexCAN to operate in Loop-Back Mode. In this mode, FlexCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is fed back internally to the receiver input. The FLEXCAN_RX input pin is ignored and the FLEXCAN_TX output goes to the recessive state (logic '1'). FlexCAN behaves as it normally does when transmitting, and treats its own transmitted message as a message received from a remote node. In this mode, FlexCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field, generating an internal acknowledge bit to ensure proper reception of its own message. Both transmit and receive interrupts are generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Loop Back enabled 0 Loop Back disabled
11 TWRN_MSK	This bit provides a mask for the Tx Warning Interrupt associated with the TWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted. 1 Tx Warning Interrupt enabled 0 Tx Warning Interrupt disabled
10 RWRN_MSK	This bit provides a mask for the Rx Warning Interrupt associated with the RWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted. 1 Rx Warning Interrupt enabled 0 Rx Warning Interrupt disabled
9–8 -	This field is reserved. Reserved
7 SMP	This bit defines the sampling mode of CAN bits at the FLEXCAN_RX. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.

Table continues on the next page...

FLEXCANx_CTRL1 field descriptions (continued)

Field	Description
	1 Three samples are used to determine the value of the received bit: the regular one (sample point) and 2 preceding samples, a majority rule is used 0 Just one sample is used to determine the bit value
6 BOFF_REC	This bit defines how FLEXCAN recovers from Bus Off state. If this bit is negated, automatic recovering from Bus Off state occurs according to the CAN Specification 2.0B. If the bit is asserted, automatic recovering from Bus Off is disabled and the module remains in Bus Off state until the bit is negated by the user. If the negation occurs before 128 sequences of 11 recessive bits are detected on the CAN bus, then Bus Off recovery happens as if the BOFF_REC bit had never been asserted. If the negation occurs after 128 sequences of 11 recessive bits occurred, then FLEXCAN will re-synchronize to the bus by waiting for 11 recessive bits before joining the bus. After negation, the BOFF_REC bit can be re-asserted again during Bus Off, but it will only be effective the next time the module enters Bus Off. If BOFF_REC was negated when the module entered Bus Off, asserting it during Bus Off will not be effective for the current Bus Off recovery. 1 Automatic recovering from Bus Off state disabled 0 Automatic recovering from Bus Off state enabled, according to CAN Spec 2.0 part B
5 TSYN	This bit enables a mechanism that resets the free-running timer each time a message is received in Message Buffer 0. This feature provides means to synchronize multiple FLEXCAN stations with a special "SYNC" message (i.e., global network time). If the RFEN bit in MCR is set (FIFO enabled), the first available Mailbox, according to CTRL2[RFFN] setting, is used for timer synchronization instead of MB0.This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Timer Sync feature enabled 0 Timer Sync feature disabled
4 LBUF	This bit defines the ordering mechanism for Message Buffer transmission. When asserted, the LPRIO_EN bit does not affect the priority arbitration.This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Lowest number buffer is transmitted first 0 Buffer with highest priority is transmitted first
3 LOM	This bit configures FLEXCAN to operate in Listen Only Mode. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message. Listen-Only Mode acknowledgement can be obtained by the state of ESR1[FLT_CONF] field which is Passive Error when Listen-Only Mode is entered. There can be some delay between the Listen-Only Mode request and acknowledge. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 FLEXCAN module operates in Listen Only Mode 0 Listen Only Mode is deactivated
PROP_SEG	This 3-bit field defines the length of the Propagation Segment in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Propagation Segment Time = (PROPSEG + 1) * Time-Quanta. Time-Quantum = one Sclock period.

1. One time quantum is equal to the Sclock period.

24.8.3 Free Running Timer Register (FLEXCANx_TIMER)

This register represents a 16-bit free running counter that can be read and written by the ARM. The timer starts from $0000 after Reset, counts linearly to $FFFF, and wraps around.

The timer is clocked by the FLEXCAN bit-clock (which defines the baud rate on the CAN bus). During a message transmission/reception, it increments by one for each bit that is received or transmitted. When there is no message on the bus, it counts using the previously programmed baud rate. During Freeze Mode, disable, and stop mode, the timer is not incremented.

The timer value is captured at the beginning of the identifier field of any frame on the CAN bus. This captured value is written into the Time Stamp entry in a message buffer after a successful reception or transmission of a message.

If bit CTRL1[TSYN] is asserted the Timer is reset whenever a message is received in the first available Mailbox, according to CTRL2[RFFN] setting.

ARM can write to this register anytime. However, if the write occurs at the same time that the Timer is being reset by a reception in the first Mailbox, then the write value is discarded.

Reading this register affects the Mailbox Unlocking procedure. For additional details, refer to Message Buffer Lock Mechanism.

Address: Base address + 8h offset

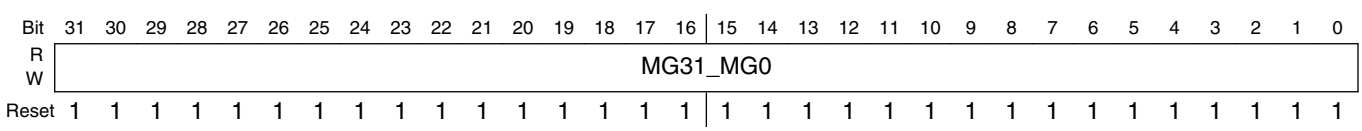
24.8.4 Rx Mailboxes Global Mask Register (FLEXCANx_RXMGMASK)

RXMGMASK is provided for legacy support. Asserting the MCR[IRMQ] bit causes the RXMGMASK Register to have no effect on the module operation.

RXMGMASK is used to mask the filter fields of all Rx MBs, excluding MBs 14-15, which have individual mask registers.



This register can only be written in Freeze mode as it is blocked by hardware in other modes.

Table 24-19. Rx Mailboxes Global Mask usage

SMB[RTR][1]	CTRL2[RRS]	CTRL2[EACEN]	Mailbox filter fields			
			MB[RTR]	MB[IDE]	MB[ID]	reserved
0	-	0	- Note[2]	- Note[3]	MG[28:0]	MG[31:29]
0	-	1	MG[31]	MG[30]	MG[28:0]	MG[29]
1	0	-	-	-	-	MG[31:0]
1	1	0	-	-	MG[28:0]	MG[31:29]
1	1	1	MG[31]	MG[30]	MG[28:0]	MG[29]

1. RTR bit of the Incoming Frame. It is saved into an auxiliary MB called Rx Serial Message Buffer (Rx SMB).
2. If CTRL2[EACEN] bit is negated the RTR bit of Mailbox is never compared with the RTR bit of the Incoming Frame (Rx SMB[RTR]).
3. If CTRL2[EACEN] bit is negated the IDE bit of Mailbox is always compared with the IDE bit of the Incoming Frame (Rx SMB[IDE]).

Address: Base address + 10h offset

FLEXCANx_RXMGMASK field descriptions

Field	Description
MG31_MG0	These bits mask the Mailbox filter bits as shown in the figure above. Note that the alignment with the ID word of the Mailbox is not perfect as the two most significant MG bits affect the fields RTR and IDE which are located in the Control and Status word of the Mailbox. Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK) shows in detail which MG bits mask each Mailbox filter field. 1 The corresponding bit in the filter is checked against the one received 0 the corresponding bit in the filter is "don't care"

24.8.5 Rx Buffer 14 Mask Register (FLEXCANx_RX14MASK)

RX14MASK is provided for legacy support, asserting the MCR[IRMQ] bit causes the RX14MASK to have no effect on the module operation.

RX14MASK is used to mask the filter fields of Message Buffer 14.

This register can only be programmed while the module is in Freeze Mode as it is blocked by hardware in other modes.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

FLEXCANx_RX14MASK field descriptions

Field	Description
RX14M31_ RX14M0	These bits mask Mailbox 14 filter bits in the same fashion as RXMGMASK masks other Mailboxes filters (see Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)) 1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"

24.8.6 Rx Buffer 15 Mask Register (FLEXCANx_RX15MASK)

RX15MASK is provided for legacy support, asserting the MCR[IRMQ] bit causes the RX15MASK Register to have no effect on the module operation.

RX15MASK is used to mask the filter fields of Message Buffer 15.

This register can only be programmed while the module is in Freeze Mode as it is blocked by hardware in other modes.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
RX15M31_ RX15M0	These bits mask Mailbox 15 filter bits in the same fashion as RXMGMASK masks other Mailboxes filters (see Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)). 1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"

24.8.7 Error Counter Register (FLEXCANx_ECR)

This register has 2 8-bit fields reflecting the value of two FLEXCAN error counters: Transmit Error Counter (Tx_Err_Counter field) and Receive Error Counter (Rx_Err_Counter field). The rules for increasing and decreasing these counters are described in the CAN protocol and are completely implemented in the FLEXCAN module. Both counters are read only except in Freeze Mode, where they can be written by the ARM.

FLEXCAN responds to any bus state as described in the protocol, e.g. transmit 'Error Active' or 'Error Passive' flag, delay its transmission start time ('Error Passive') and avoid any influence on the bus when in 'Bus Off' state. The following are the basic rules for FLEXCAN bus state transitions.

- If the value of Tx_Err_Counter or Rx_Err_Counter increases to be greater than or equal to 128, the FLT_CONF field in the Error and Status Register is updated to reflect 'Error Passive' state.
- If the FLEXCAN state is 'Error Passive', and either Tx_Err_Counter or Rx_Err_Counter decrements to a value less than or equal to 127 while the other already satisfies this condition, the FLT_CONF field in the Error and Status Register is updated to reflect 'Error Active' state.
- If the value of Tx_Err_Counter increases to be greater than 255, the FLT_CONF field in the Error and Status Register is updated to reflect 'Bus Off' state, and an interrupt may be issued. The value of Tx_Err_Counter is then reset to zero.
- If FLEXCAN is in 'Bus Off' state, then Tx_Err_Counter is cascaded together with another internal counter to count the 128th occurrences of 11 consecutive recessive bits on the bus. Hence, Tx_Err_Counter is reset to zero and counts in a manner where the internal counter counts 11 such bits and then wraps around while incrementing the Tx_Err_Counter. When Tx_Err_Counter reaches the value of 128, the FLT_CONF field in the Error and Status Register is updated to be 'Error Active' and both error counters are reset to zero. At any instance of dominant bit following a stream of less than 11 consecutive recessive bits, the internal counter resets itself to zero without affecting the Tx_Err_Counter value.
- If during system start-up, only one node is operating, then its Tx_Err_Counter increases in each message it is trying to transmit, as a result of acknowledge errors (indicated by the ACK_ERR bit in the Error and Status Register). After the transition to 'Error Passive' state, the Tx_Err_Counter does not increment anymore by acknowledge errors. Therefore the device never goes to the 'Bus Off' state.
- If the Rx_Err_Counter increases to a value greater than 127, it is not incremented further, even if more errors are detected while being a receiver. At the next

successful message reception, the counter is set to a value between 119 and 127 to resume to 'Error Active' state.

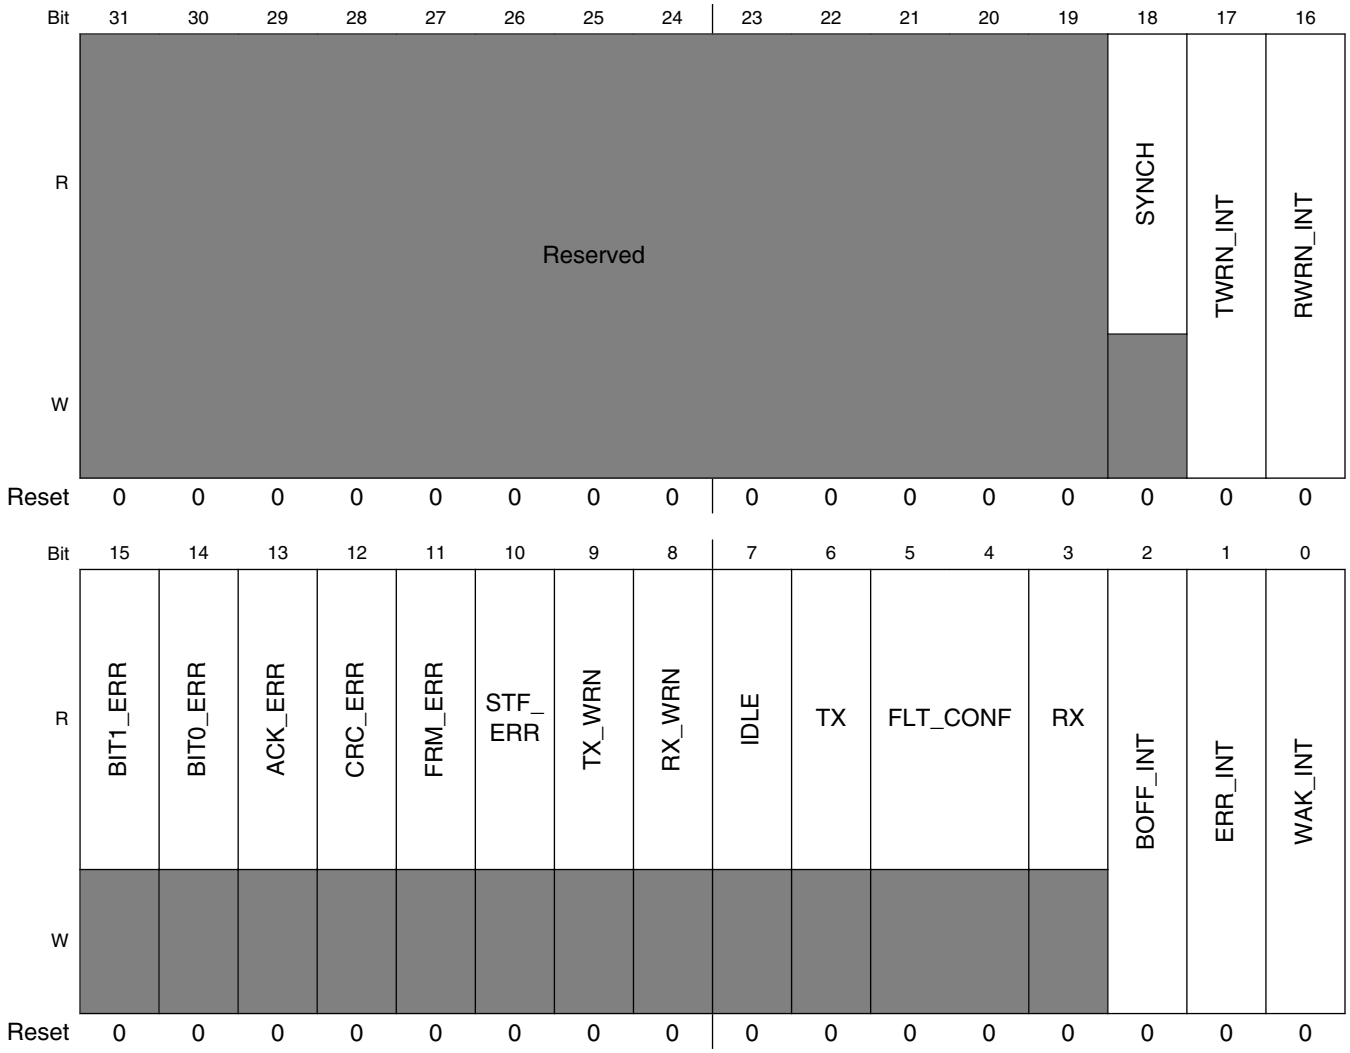
24.8.8 Error and Status 1 Register (FLEXCANx_ESR1)

This register reflects various error conditions, some general status of the device and it is the source of four interrupts to the ARM.



The ARM read action clears bits 15-10, therefore the reported *error conditions*(bits 15-10) are those that occurred since the last time the ARM read this register. Bits 9-3 are status bits.

Some bits in this register are read-only and some are not.

Table 24-20. FlexCAN State

SYNCH	IDLE	TX	RX	FlexCAN state
0	0	0	0	Not synchronized to CAN bus
1	1	x	x	Idle
1	0	1	0	Transmitting
1	0	0	1	Receiving
other combinations				Reserved

Address: Base address + 20h offset

FLEXCANx_ESR1 field descriptions

Field	Description
31–19 -	This field is reserved. Reserved
18 SYNCH	This read-only flag indicates whether the FlexCAN is synchronized to the CAN bus and able to participate in the communication process. It is set and cleared by the FlexCAN. Refer to Table 24-20 1 FlexCAN is synchronized to the CAN bus 0 FlexCAN is not synchronized to the CAN bus
17 TWRN_INT	If the WRN_EN bit in MCR is asserted, the TWRN_INT bit is set when the TX_WRN flag transition from '0' to '1', meaning that the Tx error counter reached 96. If the corresponding mask bit in the Control Register (TWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This flag is not generated during "Bus Off" state. This bit is not updated during Freeze mode. 1 The Tx error counter transition from < 96 to >= 96 0 No such occurrence

Table continues on the next page...

FLEXCANx_ESR1 field descriptions (continued)

Field	Description
16 RWRN_INT	If the WRN_EN bit in MCR is asserted, the RWRN_INT bit is set when the RX_WRN flag transition from '0' to '1', meaning that the Rx error counters reached 96. If the corresponding mask bit in the Control Register (RWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This bit is not updated during Freeze mode. 1 The Rx error counter transition from < 96 to >= 96 0 No such occurrence
15 BIT1_ERR	This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message. This bit is not set by a transmitter in case of arbitration field or ACK slot, or in case of a node sending a passive error flag that detects dominant bits. 1 At least one bit sent as recessive is received as dominant 0 No such occurrence
14 BIT0_ERR	This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message. 1 At least one bit sent as dominant is received as recessive 0 No such occurrence
13 ACK_ERR	This bit indicates that an Acknowledge Error has been detected by the transmitter node, i.e., a dominant bit has not been detected during the ACK SLOT. 1 An ACK error occurred since last read of this register 0 No such occurrence
12 CRC_ERR	This bit indicates that a CRC Error has been detected by the receiver node, i.e., the calculated CRC is different from the received. 1 A CRC error occurred since last read of this register. 0 No such occurrence
11 FRM_ERR	This bit indicates that a Form Error has been detected by the receiver node, i.e., a fixed-form bit field contains at least one illegal bit. 1 A Form Error occurred since last read of this register 0 No such occurrence
10 STF_ERR	This bit indicates that a Stuffing Error has been detected. 1 A Stuffing Error occurred since last read of this register. 0 No such occurrence.
9 TX_WRN	This bit indicates when repetitive errors are occurring during message transmission. 1 TX_Err_Counter ≥ 96 0 No such occurrence
8 RX_WRN	This bit indicates when repetitive errors are occurring during message reception. 1 Rx_Err_Counter ≥ 96 0 No such occurrence
7 IDLE	This bit indicates when CAN bus is in IDLE state.Refer to Table 24-20.

Table continues on the next page...

FLEXCANx_ESR1 field descriptions (continued)

Field	Description
	1 CAN bus is now IDLE 0 No such occurrence
6 TX	This bit indicates if FLEXCAN is transmitting a message.Refer to Table 24-20. 1 FLEXCAN is transmitting a message 0 FLEXCAN is receiving a message
5–4 FLT_CONF	If the LOM bit in the Control Register is asserted, after some delay that depends on the CAN bit timing the FLT_CONF field will indicate "Error Passive". The very same delay affects the way how FLT_CONF reflects an update to ECR register by the ARM. It may be necessary up to one CAN bit time to get them coherent again. Since the Control Register is not affected by soft reset, the FLT_CONF field will not be affected by soft reset if the LOM bit is asserted. This 2-bit field indicates the Confinement State of the FLEXCAN module, as shown in below: 00 Error Active 01 Error Passive 1x Bus off
3 RX	This bit indicates if FlexCAN is receiving a message. Refer to Table 24-20. 1 FLEXCAN is transmitting a message 0 FLEXCAN is receiving a message
2 BOFF_INT	This bit is set when FLEXCAN enters 'Bus Off' state. If the corresponding mask bit in the Control Register (BOFF_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect. 1 FLEXCAN module entered 'Bus Off' state 0 No such occurrence
1 ERR_INT	This bit indicates that at least one of the Error Bits (bits 15-10) is set. If the corresponding mask bit in the Control Register (ERR_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'.Writing '0' has no effect. 1 Indicates setting of any Error Bit in the Error and Status Register 0 No such occurrence
0 WAK_INT	When FLEXCAN is Stop Mode and a recessive to dominant transition is detected on the CAN bus and if the WAK_MSK bit in the MCR Register is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When SLF_WAK is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the SLF_WAK is set again. Writing '0' has no effect 1 Indicates a recessive to dominant transition received on the CAN bus when the FLEXCAN module is in Stop Mode 0 No such occurrence

24.8.9 Interrupt Masks 2 Register (FLEXCANx_IMASK2)

This register allows any number of a range of 32 Message Buffer Interrupts to be enabled or disabled. It contains one interrupt mask bit per buffer, enabling the ARM to determine which buffer generates an interrupt after a successful transmission or reception (i.e. when the corresponding IFLAG2 bit is set).

Address: Base address + 24h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

FLEXCANx_IMASK1 field descriptions

Field	Description
BUF31M_BUF0M	Each bit enables or disables the respective FLEXCAN Message Buffer (MB0 to MB31) Interrupt. Setting or clearing a bit in the IMASK1 Register can assert or negate an interrupt request, if the corresponding IFLAG1 bit is set

FLEXCANx_IMASK1 field descriptions (continued)

Field	Description
	1 The corresponding buffer Interrupt is enabled 0 The corresponding buffer Interrupt is disabled

24.8.11 Interrupt Flags 2 Register (FLEXCANx_IFLAG2)

This register defines the flags for 32 Message Buffer interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG2 bit. If the corresponding IMASK2 bit is set, an interrupt will be generated. The interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect.Before updating MCR[MAXMB] field, ARM must treat the IFLAG2 bits which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

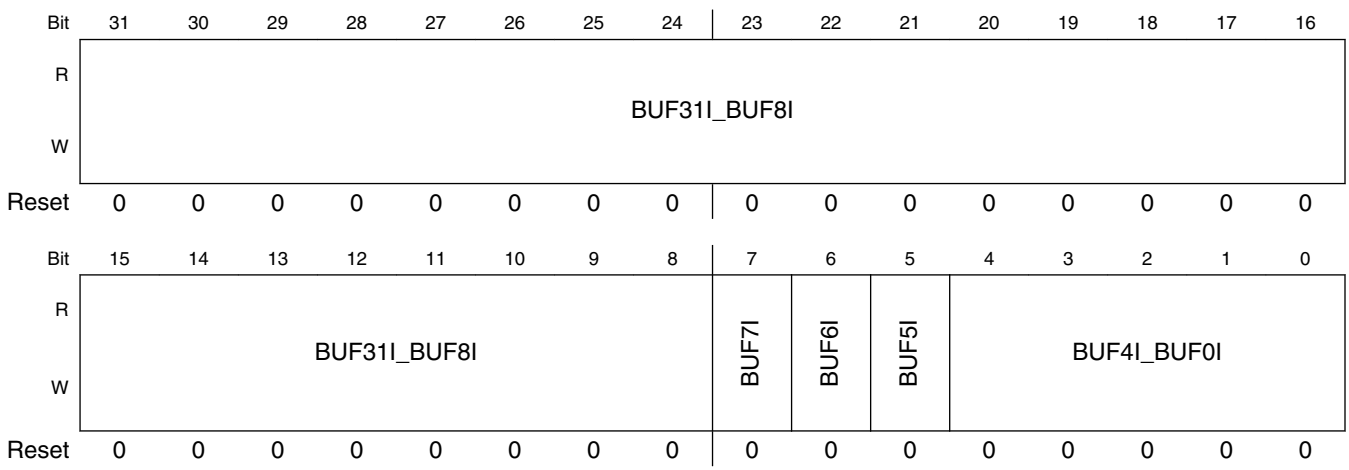
Address: Base address + 2Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	BUF63I_BUF32I																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FLEXCANx_IFLAG2 field descriptions

Field	Description
BUF63I_BUF32I	Each bit flags the respective FLEXCAN Message Buffer (MB32 to MB63) interrupt. 1 The corresponding buffer has successfully completed transmission or reception 0 No such occurrence

24.8.12 Interrupt Flags 1 Register (FLEXCANx_IFLAG1)



This register defines the flags for 32 Message Buffer interrupts and FIFO interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG1 bit. If the corresponding IMASK1 bit is set, an interrupt will be generated. The Interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect.

When the RFEN bit in the MCR is set (Rx FIFO enabled), the function of the 8 least significant interrupt flags (BUF7I - BUF0I) is changed to support the FIFO operation. BUF7I, BUF6I and BUF5I indicate operating conditions of the FIFO, while BUF4I to BUF0I are not used. Before enabling the RFEN, ARM must service the IFLAGS asserted

in the Rx FIFO region (see Rx FIFO). Otherwise, these IFLAGS will mistakenly show the related MBs now belonging to FIFO as having contents to be serviced. When the RFEN is negated, the FIFO flags must be cleared. The same care must be taken when a RFFN value is selected extending Rx FIFO filters beyond MB7 (see Control 2 Register (FLEXCAN_CTRL2)). For example, when RFFN is 0x8, the MB0-23 range is occupied by Rx FIFO filters and related IFLAGS must be cleared.

Before updating MCR[MAXMB] field, ARM must service the IFLAG1 which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

Address: Base address + 30h offset

FLEXCANx_IFLAG1 field descriptions

Field	Description
31–8 BUF31I_BUF8I	Each bit flags the respective FLEXCAN Message Buffer (MB8 to MB31) interrupt. 1 The corresponding MB has successfully completed transmission or reception 0 No such occurrence
7 BUF7I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB7. If the MCR[RFEN] bit is asserted, this flag indicates that a message was lost because Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 MB7 completed transmission/reception or FIFO overflow 0 No such occurrence
6 BUF6I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB6. If the MCR[RFEN] bit is asserted, this flag indicates when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. Note that if the flag is cleared while the number of unread messages is greater than 4 it will not assert again until the number of unread messages within the Rx FIFO is decreased to equal or less than 4. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.

Table continues on the next page...

FLEXCANx_IFLAG1 field descriptions (continued)

Field	Description
	1 MB6 completed transmission/reception or FIFO almost full 0 No such occurrence
5 BUF5I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB5. If the Rx FIFO is enabled, this flag indicates that at least one frame is available to be read from the Rx FIFO. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 MB5 completed transmission/reception or frames available in the FIFO 0 No such occurrence
BUF4I_BUF0I	If the Rx FIFO is not enabled, these bits flag the interrupts for MB0 to MB4. If the Rx FIFO is enabled, these flags are not used and must be considered as reserved locations. These flags are cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 Corresponding MB completed transmission/reception 0 No such occurrence

24.8.13 Control 2 Register (FLEXCANx_CTRL2)

This register contains control bits for CAN errors, FIFO features and mode selection.

Table 24-21. Rx FIFO Filters

RFFN[3:0]	Number of Rx FIFO filters	Message Buffers occupied by Rx FIFO and ID Filter Table	Remaining Available Mailboxes[1]	Rx FIFO ID Filter Table Elements Affected by Rx Individual Masks[2]	Rx FIFO ID Filter Table Elements Affected by Rx FIFO Global Mask[2]

0xF	128	MB 0-37	MB 38-63	Elements 0-31	Elements 32-127

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.
2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

Each group of eight filters occupies a memory space equivalent to two Message Buffers which means that the more filters are implemented the less Mailboxes will be available.

Considering that the Rx FIFO occupies the memory space originally reserved for MB0-5, RFFN should be programmed with a value corresponding to a number of filters not greater than the number of available memory words which can be calculated as follows:

$$(SETUP_MB - 6) \times 4$$

where SETUP_MB is MAXMB.

The number of remaining Mailboxes available will be:

$$SETUP_MB - 8 - (RFFN \times 2)$$

If the Number of Rx FIFO Filters programmed through RFFN exceeds the SETUP_MB value, the exceeding ones will not be functional.Unshaded regions in Table 24-22 indicate the valid combinations of MAXMB, RFEN and RFFN, shaded regions are not functional.

FLEXCANx_CTRL2 field descriptions

Field	Description
31 -	must be written as 0
30–29 -	This field is reserved. Reserved

Table continues on the next page...

FLEXCANx_CTRL2 field descriptions (continued)

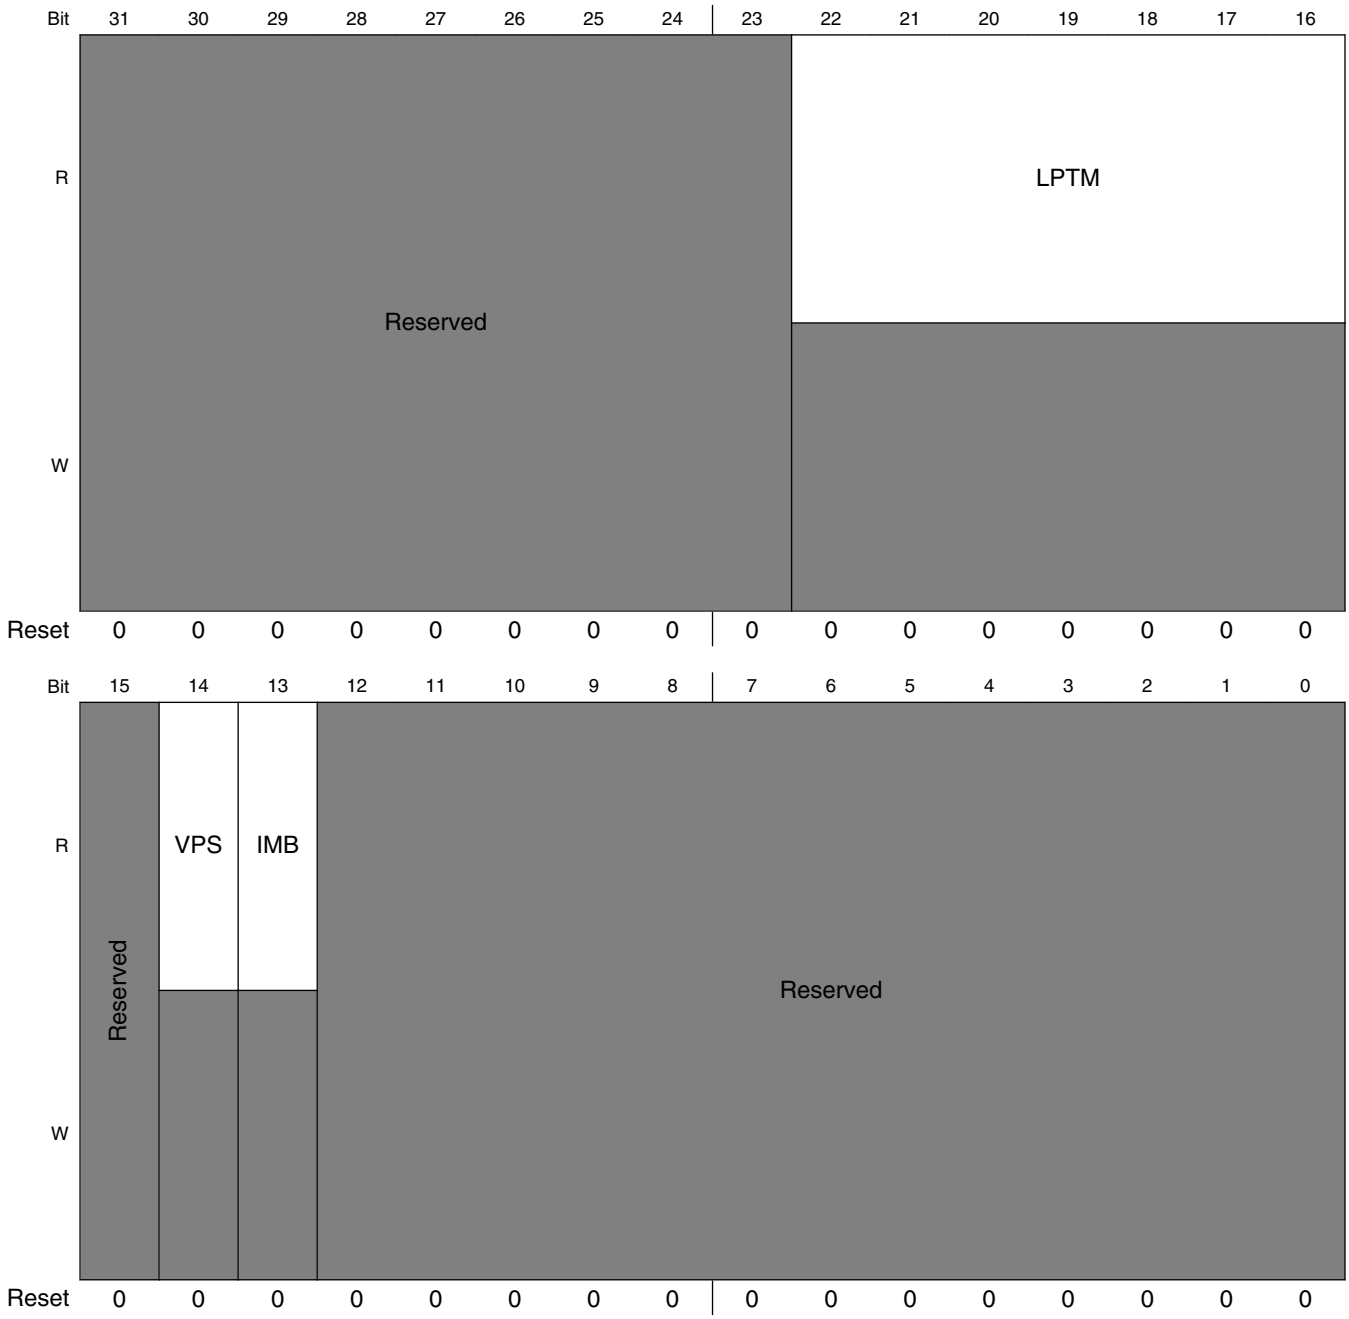
Field	Description
28 WRMFRZ	Enable unrestricted write access to FlexCAN memory in Freeze mode. This bit can only be written in Freeze mode and has no effect out of Freeze mode. 1 Enable unrestricted write access to FlexCAN memory 0 Keep the write access restricted in some regions of FlexCAN memory
27–24 RFFN	This 4-bit field defines the number of Rx FIFO filters according to Table 24-21. The maximum selectable number of filters is determined by the ARM. This field can only be written in Freeze mode as it is blocked by hardware in other modes. RFFN defines a number of Message Buffers occupied by Rx FIFO and ID Filter (see Table 24-21) that **may not exceed** the number of available Mailboxes present in module, defined by MCR[MAXMB].Default RFFN value is 0x0, which leads to a total of 8 Rx FIFO filters, occupies the first 8 Message Buffers (MB 0-7) and makes available the next Message Buffers (MB 8-63) for Mailboxes. As a second example, when RFFN is set to 0xD, there will be 112 Rx FIFO filters, located in MB 0-33, and MB 34-63 are available for Mailboxes. Notice that, in this case, individual masks (RXIMR) will just cover Rx FIFO filters in 0-31 range, and filters 32-111 will use RXFGMASK. In case of reducing the number of last Message Buffers, MCR[MAXMB] (see Module Configuration Register (FLEXCAN_MCR)) can be adjusted by the application to minimum of 33, in order to give room to the Rx FIFO and its ID Filter Table defined by RFFN. On the contrary, if the application sets MCR[MAXMB] to 16, for instance, the maximum RFFN is limited to 0x4. RFFN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 24-18 (see Arbitration and Matching Timing).
23–19 TASD	This 5-bit field indicates how many CAN bits the Tx arbitration process start point can be delayed from the first bit of CRC field on CAN bus. This field can only be written in Freeze mode as it is blocked by hardware in other modes. This field is useful to optimize the transmit performance based on factors such as: peripheral/serial clock ratio, CAN bit timing and number of MBs. The duration of an arbitration process, in terms of CAN bits, is directly proportional to the number of available MBs and CAN baud rate and inversely proportional to the peripheral clock frequency. The optimal arbitration timing is that in which the last MB is scanned right before the first bit of the Intermission field of a CAN frame. Therefore, if there are few MBs and the system/serial clock ratio is high and the CAN baud rate is low then the arbitration can be delayed and vice-versa. If TASD is 0 then the arbitration start is not delayed, thus ARM has less time to configure a Tx MB for the next arbitration, but more time is reserved for arbitration. In the other hand, if TASD is 24 then ARM can configure a Tx MB later and less time is reserved for arbitration. If too little time is reserved for arbitration the FlexCAN may be not able to find winner MBs in time to compete with other nodes for the CAN bus. If the arbitration ends too much time before the first bit of Intermission field then there is a chance that ARM reconfigure some Tx MBs and the winner MB is not the best to be transmitted. The reset value is different on various platforms, according to their peripheral clock frequency, number of MBs and target CAN baud rate. The optimal configuration for TASD can be calculated as:

Table continues on the next page...

FLEXCANx_CTRL2 field descriptions (continued)

Field	Description
	$$TASD = 25 - \left\{ \frac{f_{CANCLK} \times [MAXMB + 3 - (RFEN \times 8) - (RFEN \times RFFN \times 2)] \times 2}{f_{sys} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRESDIV + 1)} \right\}$$ where: f_{CANCLK} is the Protocol Engine (PE) Clock in Hz; PE clock is derrived from CAN_CLK_ROOT in CCM. See Clock Root Generator f_{SYS} is the peripheral clock in Hz; MAXMB is the value in CTRL1[MAXMB] field; RFEN is the value in CTRL1[RFEN] bit; RFFN is the value in CTRL2[RFFN] field; PSEG1 is the value in CTRL1[PSEG1] field; PSEG2 is the value in CTRL1[PSEG2] field; PROPSEG is the value in CTRL1[PROPSEG] field; PRESDIV is the value in CTRL1[PRESDIV] field. Please refer to Arbitration process and Protocol Timing for more details.
18 MRP	If this bit is set the matching process starts from the Mailboxes and if no match occurs the matching continues on the Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Matching starts from Mailboxes and continues on Rx FIFO 0 Matching starts from Rx FIFO and continues on Mailboxes
17 RRS	If this bit is asserted Remote Request Frame is submitted to a matching process and stored in the corresponding Message Buffer in the same fashion of a Data Frame. No automatic Remote Response Frame will be generated. If this bit is negated the Remote Request Frame is submitted to a matching process and an automatic Remote Response Frame is generated if a Message Buffer with CODE=0b1010 is found with the same ID. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Remote Request Frame is stored 0 Remote Response Frame is generated
16 EACEN	This bit controls the comparison of IDE and RTR bits within Rx Mailboxes filters with their corresponding bits in the incoming frame by the matching process. This bit does not affect matching for Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Enables the comparison of both Rx Mailbox filter's IDE and RTR bit with their corresponding bits within the incoming frame. Mask bits do apply. 0 Rx Mailbox filter's IDE bit is always compared and RTR is never compared despite mask bits.
-	This field is reserved.

Table continues on the next page...



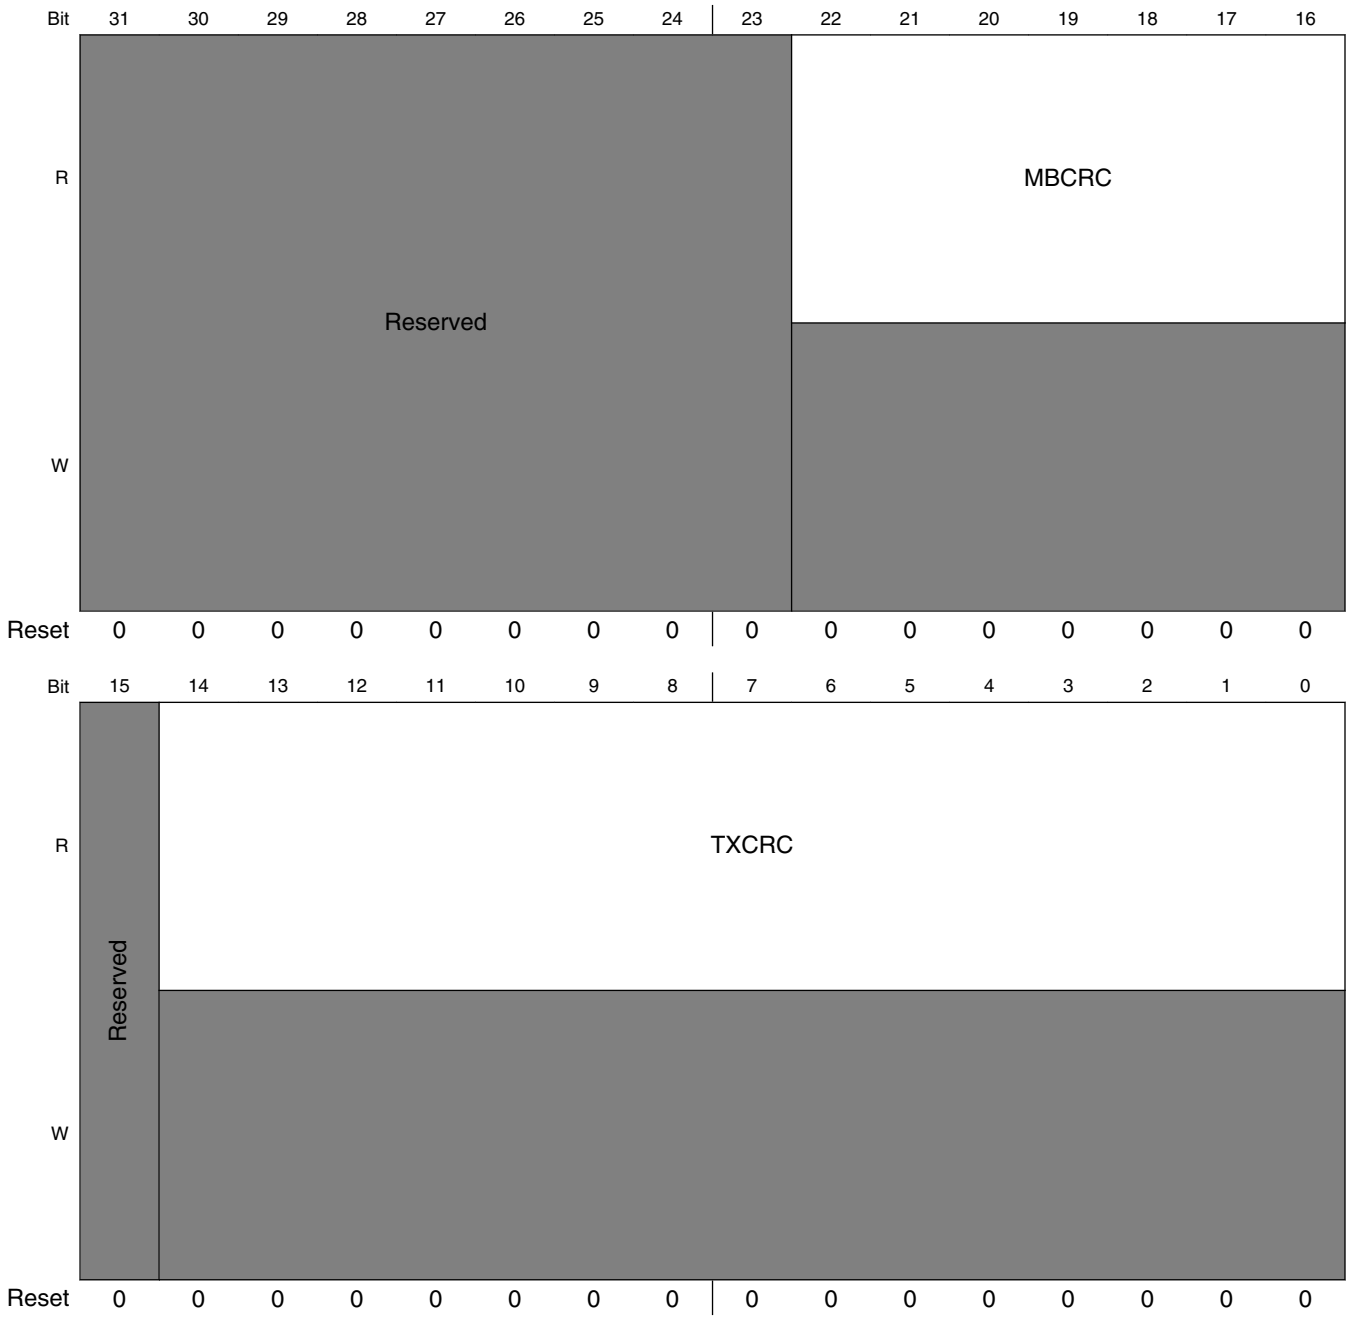
FLEXCANx_CTRL2 field descriptions (continued)

Field	Description
	Reserved

24.8.14 Error and Status 2 Register (FLEXCANx_ESR2)

This register reflects various interrupt flags and some general status.

Address: Base address + 38h offset



FLEXCANx_ESR2 field descriptions

Field	Description
31–23 -	This field is reserved. Reserved
22–16 LPTM	If ESR2[VPS] is asserted, his 7-bit field indicates the lowest number inactive Mailbox (refer to IMB bit description). If there is no inactive Mailbox then the Mailbox indicated depends on CTRL1[LBUF] bit value. If CTRL1[LBUF] bit is negated then the Mailbox indicated is the one which has the greatest arbitration value (see Highest Mailbox priority first). If CTRL1[LBUF] bit is asserted then the Mailbox indicated is the highest number active Tx Mailbox. If a Tx Mailbox is being transmitted it is not considered in LPTM calculation. If ESR2[IMB] is not asserted and a frame is transmitted successfully, LPTM is updated with its Mailbox number.
15 -	This field is reserved. Reserved
14 VPS	This bit indicates whether IMB and LPTM contents are currently valid or not. VPS is asserted upon every complete Tx arbitration process unless the ARM writes to Control and Status word of a Mailbox that has already been scanned (i.e. it is behind Tx Arbitration Pointer) during the Tx arbitration process. If there is no inactive Mailbox and only one Tx Mailbox which is being transmitted then VPS is not asserted. VPS is negated upon the start of every Tx arbitration process or upon a write to Control and Status word of any Mailbox.ESR2[VPS] is not affected by any ARM write into Control Status (C/S) of a MB which is blocked by abort mechanism. When MCR[AEN] is asserted, the abort code write in C/S of a MB that is been transmitted (pending abort), or any write attempt into a Tx MB with IFLAG set is blocked. 1 Contents of IMB and LPTM are valid 0 Contents of IMB and LPTM are invalid
13 IMB	If ESR2[VPS] is asserted, this bit indicates whether there is any inactive Mailbox (CODE field is either 0b1000 or 0b0000). This bit is asserted in the following cases: (1) During arbitration, if a LPTM is found and it is inactive. (2) If IMB is not asserted and a frame is transmitted successfully. (3) This bit is cleared in all start of arbitration (see Arbitration process). LPTM mechanism have the following behavior: if a MB is successfully transmitted and ESR2[IMB]=0 (no inactive Mailbox), then ESR2[VPS] and ESR2[IMB] are asserted and the index related to the MB just transmitted is loaded into ESR2[LPTM]. 1 If ESR2[VPS] is asserted, there is at least one inactive Mailbox. LPTM content is the number of the first one. 0 If ESR2[VPS] is asserted, the ESR2[LPTM] is not an inactive Mailbox.
-	This field is reserved. Reserved

24.8.15 CRC Register (FLEXCANx_CRCR)

This register provides information about the CRC of transmitted messages

Address: Base address + 44h offset

FLEXCANx_CRCR field descriptions

Field	Description
31–23 -	This field is reserved. Reserved
22–16 MBCRC	This field indicates the number of the Mailbox corresponding to the value in TXCRC field.
15 -	This field is reserved. Reserved
TXCRC	This field indicates the CRC value of the last message transmitted. This field is updated at the same time the Tx Interrupt Flag is asserted.

24.8.16 Rx FIFO Global Mask Register (FLEXCANx_RXFGMASK)

If Rx FIFO is enabled RXFGMASK is used to mask the Rx FIFO ID Filter Table elements that do not have a corresponding RXIMR according to CTRL2[RFFN] field setting.

This register can only be written in Freeze Mode as it is blocked by hardware in other modes.

Table 24-23. Rx FIFO Global Mask usage

Rx FIFO ID Filter Table Elements Format (MCR[IDAM])	Identifier Acceptance Filter fields					
	RTR	IDE	RXIDA	RXIDB	RXIDC	reserved
A	FGM[31]	FGM[30]	FGM[29:1]	-	-	FGM[0]
B	FGM[31] FGM[15]	FGM[30] FGM[14]	-	FGM[29:16] FGM[13:0] 1		-
C	-	-		-	FGM[31:24] FGM[23:16] FGM[15:8] FGM[7:0] 2	

1. If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
2. If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

Address: Base address + 48h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

FLEXCANx_RXFGMASK field descriptions

Field	Description
FGM31_FGM0	These bits mask the ID Filter Table elements bits in a perfect alignment.Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK) shows in detail which FGM bits mask each IDAF field. Clear this register has the effect of disabling the ID Filter. 1 The corresponding bit in the filter is checked 0 The corresponding bit in the filter is "don't care"

24.8.17 Rx FIFO Information Register (FLEXCANx_RXFIR)

RXFIR provides information on Rx FIFO.

This register is the port through which ARM accesses the output of the RXFIR FIFO located in RAM. The RXFIR FIFO is written by the FlexCAN whenever a new message is moved into the Rx FIFO as well as its output is updated whenever the output of the Rx FIFO is updated with the next message. Refer to Rx FIFO to find instructions on reading this register.

Address: Base address + 4Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

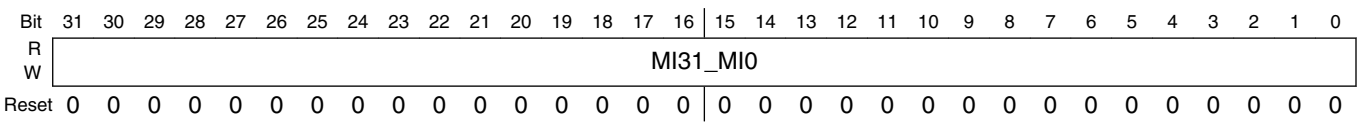
FLEXCANx_RXFIR field descriptions

Field	Description
31–9 -	This field is reserved. Reserved
IDHIT	This 9-bit field indicates which Identifier Acceptance Filter (see Rx FIFO Structure) was hit by the received message that is in the output of the Rx FIFO. (refer to Rx FIFO for details) If multiple filters match the incoming message ID then the first matching IDAF found (lowest number) by the matching process is indicated. This field is valid only while the IFLAG[BUF5I] is asserted.

24.8.18 Rx Individual Mask Registers (FLEXCANx_RXIMR0_RXIMR63)



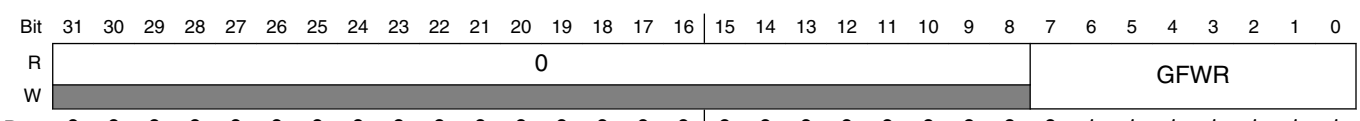
RXIMR are used as acceptance masks for ID filtering in Rx MBs and the Rx FIFO. If the Rx FIFO is not enabled, one mask register is provided for each available Mailbox, providing ID masking capability on a per Mailbox basis.

When the Rx FIFO is enabled (MCR[RFEN] bit is asserted), up to 32 Rx Individual Mask Registers can apply to the Rx FIFO ID Filter Table elements on a one-to-one correspondence depending on CTRL2[RFFN] setting. Refer to Control 2 Register (FLEXCAN_CTRL2) for details.

RXIMR can only be written by the ARM while the module is in Freeze Mode, otherwise they are blocked by hardware.

The Individual Rx Mask Registers are not affected by reset and must be explicitly initialized prior to any reception.

Address: Base address + 880h offset



FLEXCANx_RXIMR0_RXIMR63 field descriptions

Field	Description
MI31_MI0	These bits mask both Mailbox filter and Rx FIFO ID Filter Table element in distinct ways. For Mailbox filter refer to Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK). For Rx FIFO ID Filter Table element refer to Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK). 1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"

24.8.19 Glitch Filter Width Registers (FLEXCANx_GFWR)

The Glitch Filter just takes effects when FLEXCAN enters the STOP mode.

Address: Base address + 9E0h offset

FLEXCANx_GFWR field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
GFWR	It determines the Glitch Filter Width. The width will be divided from Oscillator clock by GFWR values. By default, it is 5.33 µs when the oscillator is 24 MHz. Filter Pulse Width = [(GFWR FIELD + 1) x (1 / Osc. Frequency)]

Chapter 25
General Power Controller (GPC)

25.1 Overview

The General Power Control (GPC) block includes the sub-blocks listed here.

- DVFS - Dynamic Voltage & Frequency Scaling load tracking for CPU
- CPU Power Gating Control (PGC)

Each sub-block has its own IP registers.

GPC determines wake-up irq for exiting STOP mode (with or without CPU power gating).

Figure 25-1. GPC Block Diagram

25.2 Clocks

The table found here describes the clock sources for GPC.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 25-1. GPC Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
pgc_clk	ipg_clk_root	PGC peripheral clock
sys_clk	ipg_clk_root	Module clock

25.3 DVFS overview

The DVFS allows simple dynamic voltage frequency scaling.

The frequency of the core clock domain and the voltage of the core power domain can be changed on the fly while all modules (including the MCU) continue their normal operation. The frequency of the core clock domain can be changed by temporally switching to an alternate PLL clock, or by changing the post dividers division factors.

The DVFS load tracking block allows hardware tracking on the core load and generate an interrupt when a frequency change is requested.

NOTE

DVFS is a monitor that only provides an interrupt when CPU load exceeds the predefined value and does not send any request to make a change of voltage and frequency. This can be done by the user in the CPU interrupt routine or SDMA routine.

Figure 25-2. DVFS_core diagram

25.3.1 Features

The DVFS load tracking block includes the following features:

- Configurable include/exclude of input signals:
  - per-core ARM standby signal (idle / non-idle)
  - 16 general purpose bits (common for all 4 tracking modules)
    - Configurable weight to each bit.
- Configurable generated clocks and averaging time slicing (respond time).
- Configurable panic mode respond logic (for frequency up).
- Programmable buffer for last 4, 8, 12, or 16 load tracking samples of core 0 (only).

25.4 DVFS output event/interrupt configuration

Event/interrupt will be always high as long as LBFL is '1' and is not cleared by SW. Unless DVFEV (always event) is asserted. Then the event/interrupt will be toggled up and down at every toggle of div_3_clk.

25.4.1 Interrupts

DVFS generates an interrupt that indicates that frequency and voltage update is needed. The user has to read the FSVAIM bits in order to know which change needs to be done.

25.4.2 DVFS Change Request Sequence Diagrams

The following figures describe the sequence on DVFS interrupt.

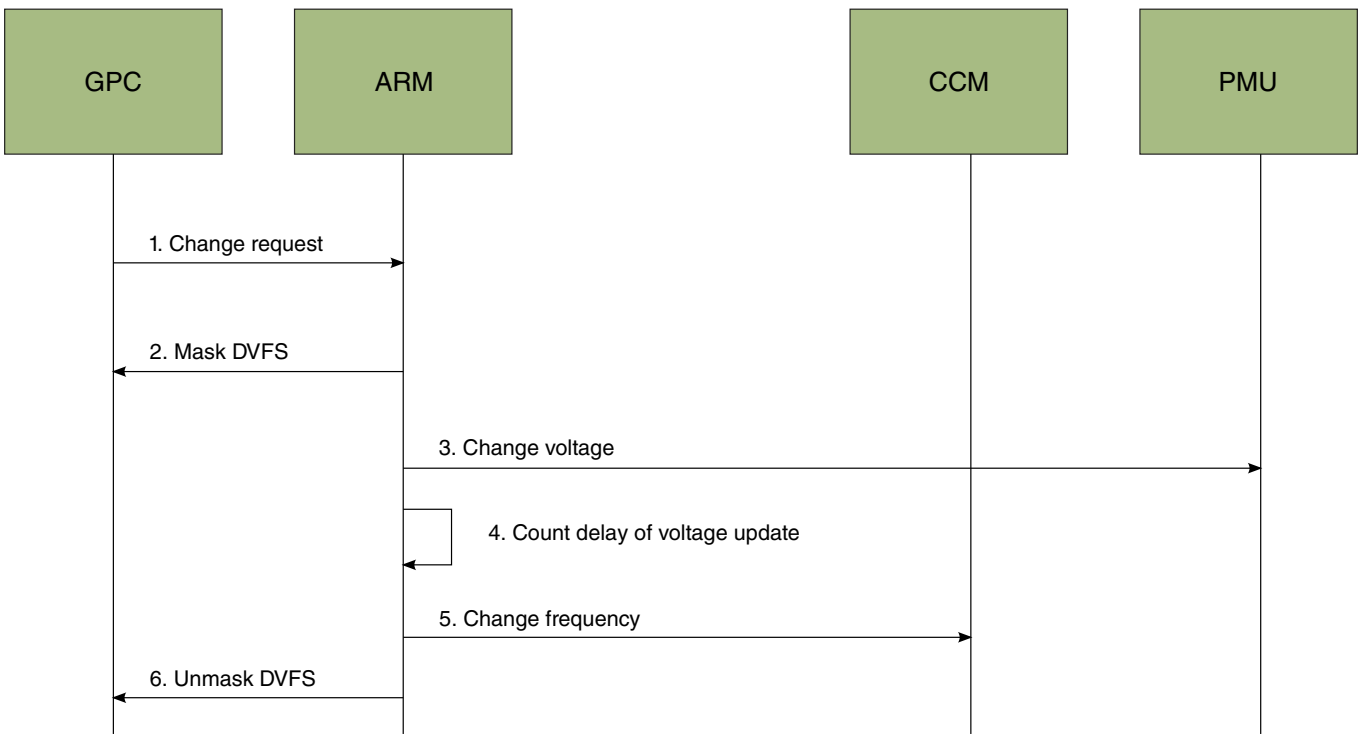


Figure 25-3. DVFS - frequency increase

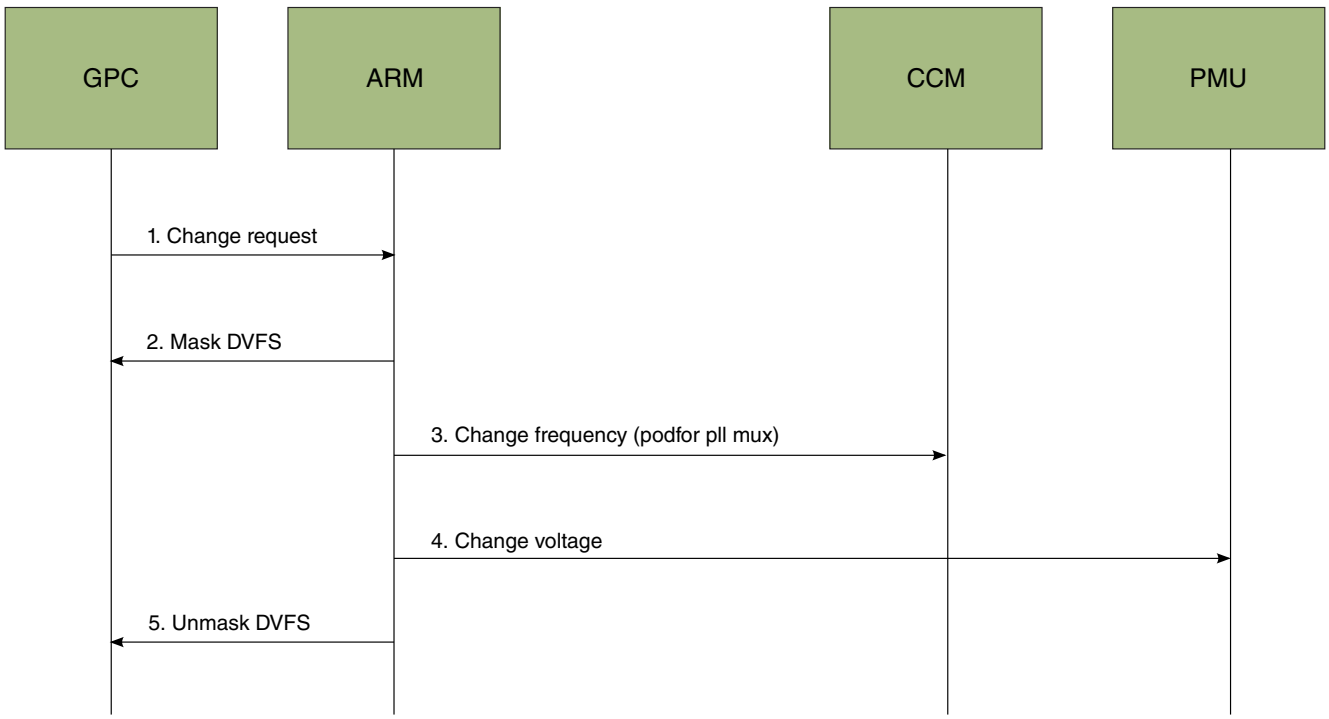

Figure 25-4. DVFS - frequency decrease

CPU DVFS frequency change can be performed in 2 ways:

- PLL inputs muxing update
- clock dividers update

25.5 Power Gating Control (PGC)

Power Gating (PGC) is applied to the ARM CPU only in STOP low power mode, after all essential CPU registers data are saved by ARM dormant procedure.

If any of the unmasked interrupts appears, CPU is powered up and clock restore request (exit from STOP mode) is sent to CCM.

PGC power down sequence:

- CCM sends power down request when the chip is about to enter stop mode. The user should define which modules will be powered down (PGCR registers of corresponding PGC module, bit 0).

PGC power up sequence:

- One of the power up irq is asserted.

- Power up request is asserted in GPC and in CCM.
- The Power Gated modules are powered up, according to PGC settings of appropriate module.

The Power Gated modules require reset after powering up. The next figure describes GPC-SRC handshake procedure for reset after power gating.

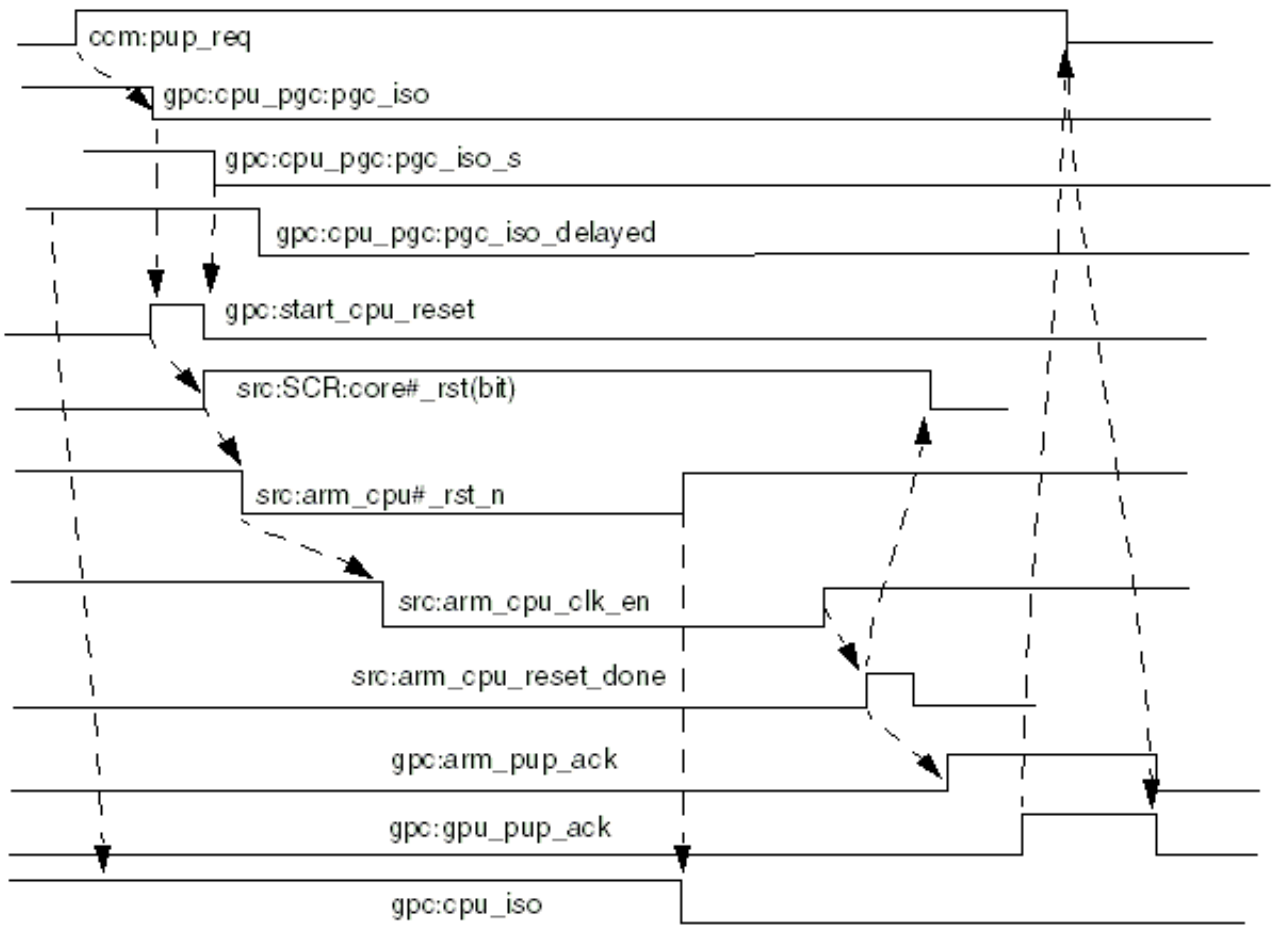

Figure 25-5. GPC-SRC handshake for reset after power gating

25.5.1 Overview

The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems.

The sequence timing is programmable using the PGC control registers. Figure 25-6 shows PGC as part of the SoC's overall power management scheme.

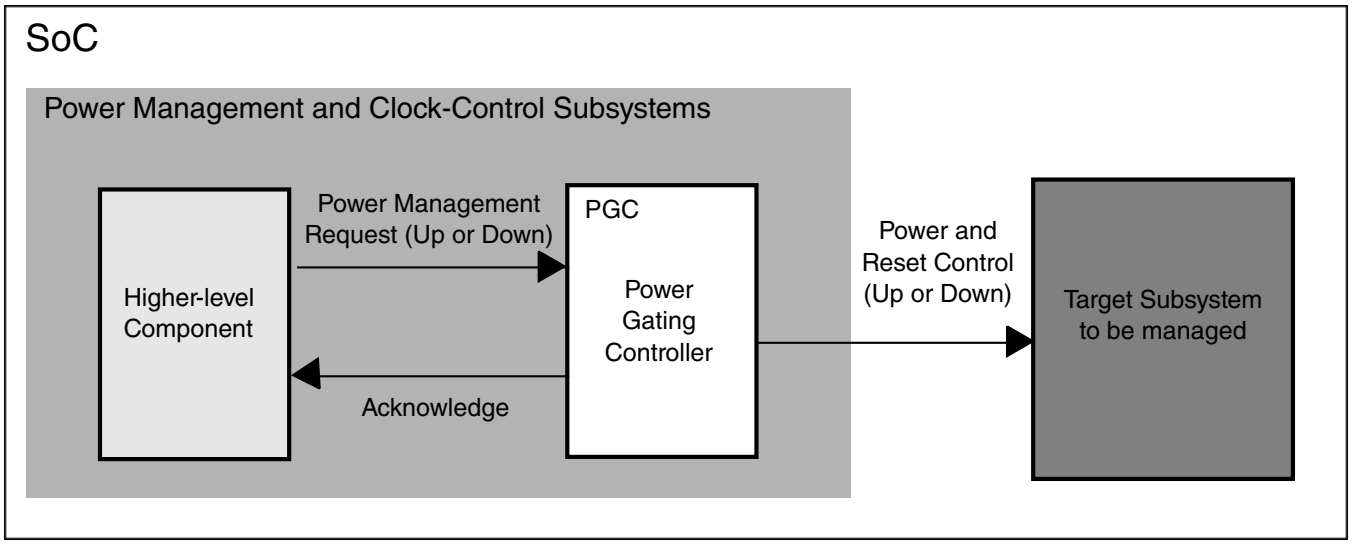

Figure 25-6. PGC Block Diagram

25.5.1.1 Features

Key features of the PGC include:

- Provides the ability to switch off power to a target subsystem.
- Generates power-up and power-down control sequences.
- Provides programmable registers to adjust the timing of the power control signals.

25.6 GPC Interrupt Controller (INTC)

The INTC (Interrupt Controller) detects an interrupt and generates the wakeup signal. It supports up to 128 interrupts.

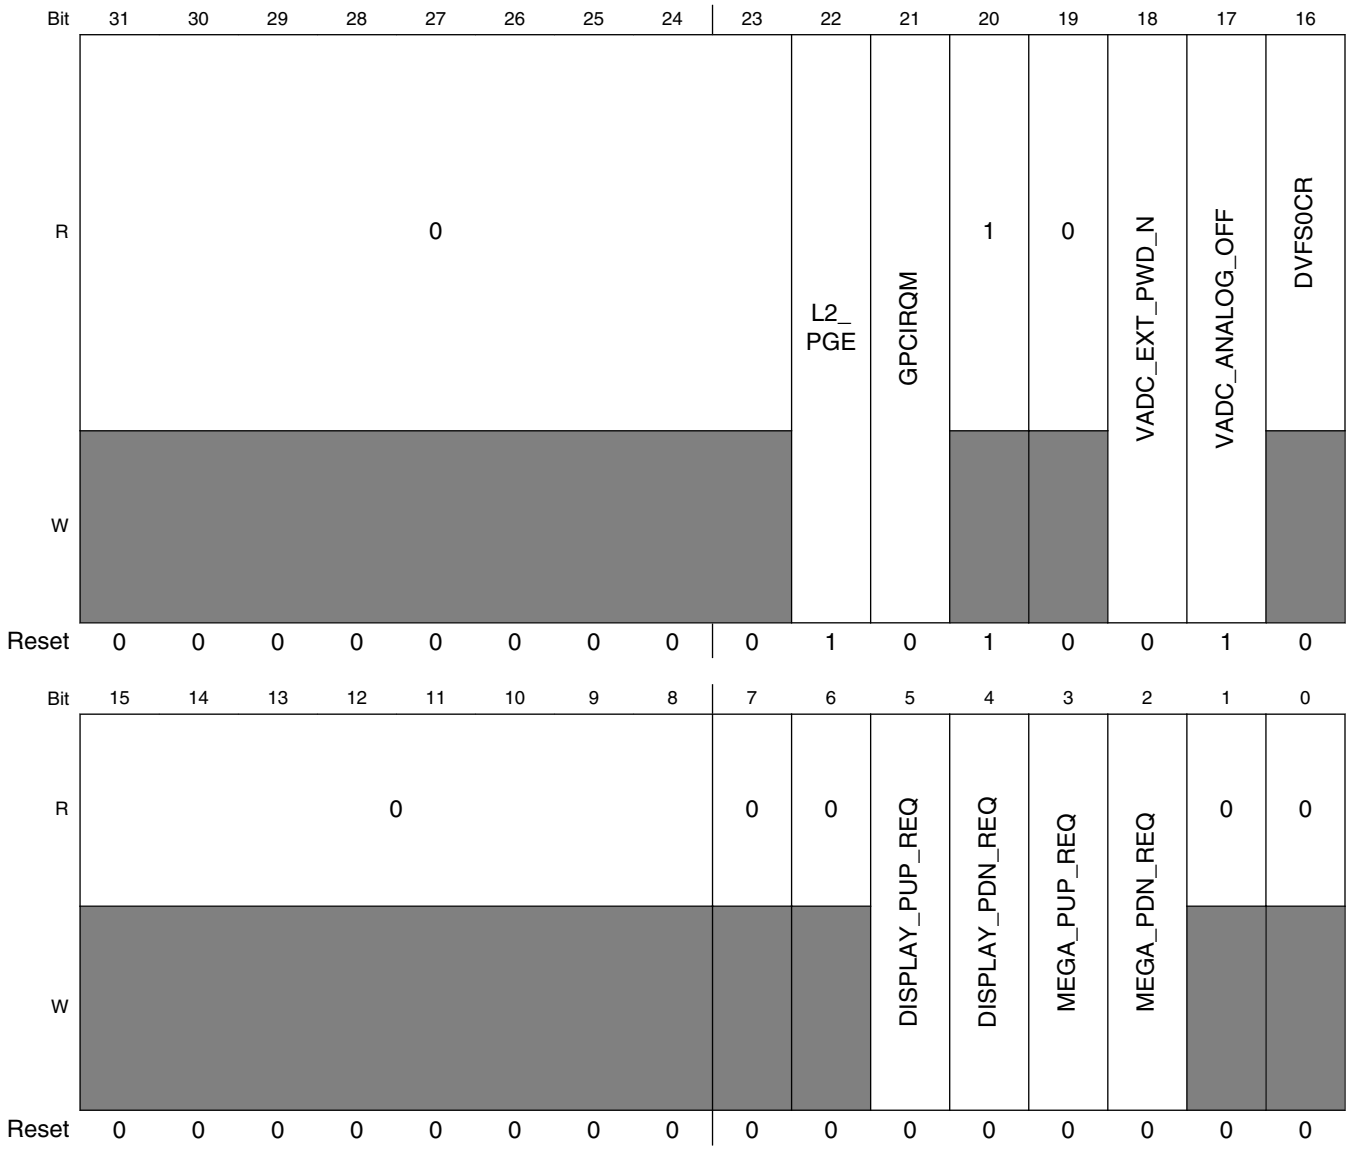
25.6.1 Interrupt Controller features

The features of the GPC INTC are listed below.

Features:

- Supports up to 128 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal
- 32-bits IP bus interface
- All registers are byte-accessible

25.7 GPC Memory Map/Register Definition



Detailed descriptions of each register can be found below.

GPC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

GPC_ISR4 field descriptions

Field	Description
ISR4	IRQ[159:128] status, read only

25.8 PGC Memory Map/Register Definition

The PGC registers can be accessed only in supervisor mode.

Attempts to access registers when not in supervisor mode or attempts to access an unimplemented address location might trigger a bus transfer error. (The hardware asserts the signal ips_xfr_err if the PGC has been integrated with resp_sel tied low.) In this case, software should take appropriate action (such as ignore the error, log the error, or initiate a soft reset).

All PGC registers are byte-accessible.

NOTE

The base address of each PGC module instantiation is specified in the GPC module. Absolute address values will be calculated by [GPC base address] + [PGC CPU/GPU/DISPLAY Offset].

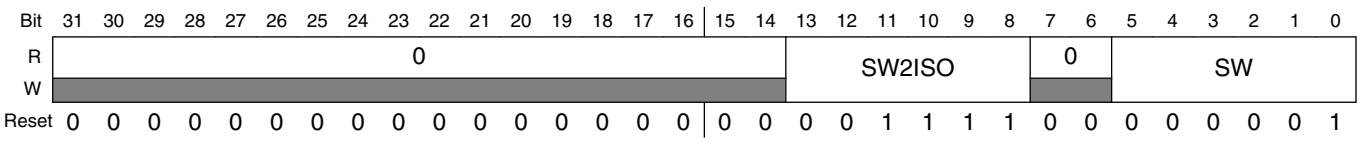
2AC	Power Gating Controller Status Register (PGC_CPU_SR)	32	R/W	0000_0000h	25.8.8/1120

25.8.1 PGC Control Register (PGC_MEGA_CTRL)

The PGCR enables the response to a power-down request.

Address: 0h base + 220h offset = 220h



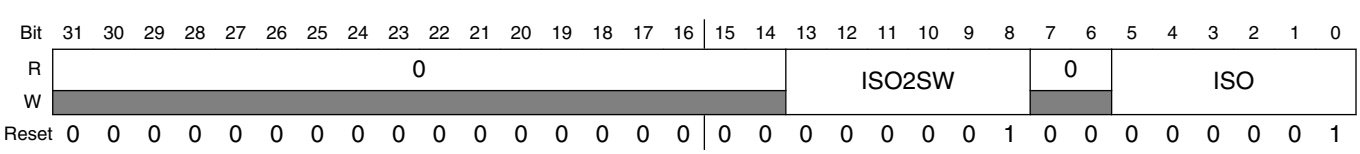
PGC_MEGA_CTRL field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PCR	Power Control **NOTE:** PCR must not change from power-down request (pdn_req) assertion until the target subsystem is completely powered up. 0 Do not switch off power even if pdn_req is asserted. 1 Switch off power when pdn_req is asserted.

25.8.2 Power Up Sequence Control Register (PGC_MEGA_PUPSCR)

The PUPSCR contains the power-up timing parameters.

Address: 0h base + 224h offset = 224h



PGC_MEGA_PUPSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SW2ISO	After asserting power toggle on/off signal (switch_b), the PGC waits a number of IPG clocks equal to the value of SW2ISO before negating isolation. **NOTE:** SW2ISO must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
SW	After a power-up request (pup_req assertion), the PGC waits a number of IPG clocks equal to the value of SW before asserting power toggle on/off signal (switch_b). **NOTE:** SW must not be programmed to zero. **NOTE:** The PGC clock is generated from the IPG_CLK_ROOT. for frequency configuration of the IPG_CLK_ROOT. See Clock Controller Module (CCM).

25.8.3 Pull Down Sequence Control Register (PGC_MEGA_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: 0h base + 228h offset = 228h

PGC_MEGA_PDNSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 ISO2SW	After asserting isolation, the PGC waits a number of IPG clocks equal to the value of ISO2SW before negating power toggle on/off signal (switch_b). **NOTE:** ISO2SW must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
ISO	After a power-down request (pdn_req assertion), the PGC waits a number of IPG clocks equal to the value of ISO before asserting isolation. **NOTE:** ISO must not be programmed to zero.

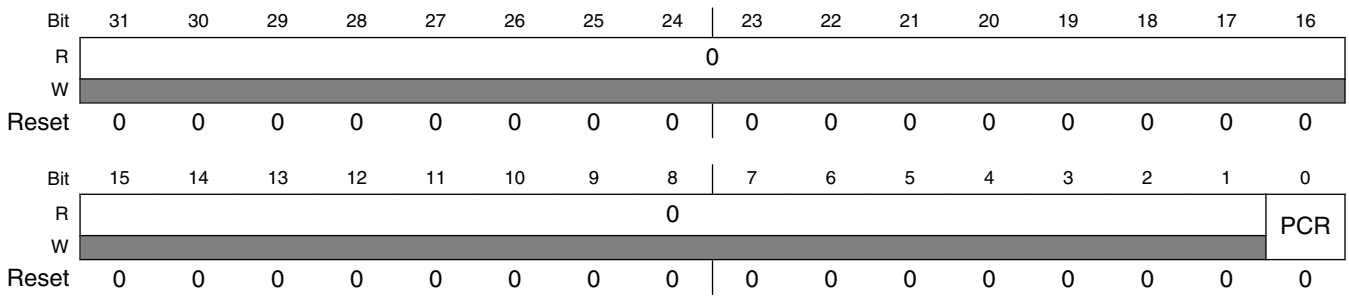
25.8.4 Power Gating Controller Status Register (PGC_MEGA_SR)

The PDNSCR contains the power-down timing parameters.

Address: 0h base + 22Ch offset = 22Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0															PSR
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



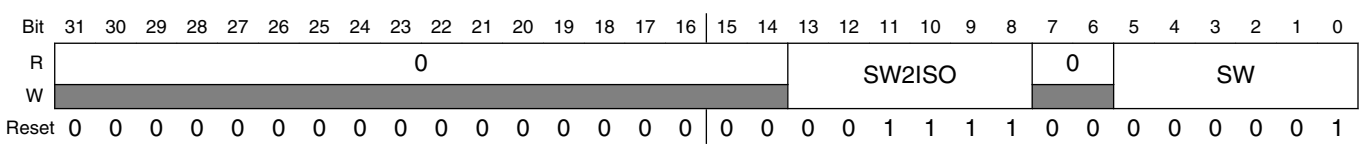
PGC_MEGA_SR field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PSR	Power status. When in functional (or software-controlled debug) mode, PGC hardware sets PSR as soon as any of the power control output changes its state to one. Write one to clear this bit. Software should clear this bit after power up; otherwise, PSR continues to reflect the power status of the initial power down. 0 The target subsystem was not powered down for the previous power-down request. 1 The target subsystem was powered down for the previous power-down request.

25.8.5 PGC Control Register (PGC_CPU_CTRL)

The PGCR enables the response to a power-down request.

Address: 0h base + 2A0h offset = 2A0h



PGC_CPU_CTRL field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PCR	Power Control **NOTE:** PCR must not change from power-down request (pdn_req) assertion until the target subsystem is completely powered up. 0 Do not switch off power even if pdn_req is asserted. 1 Switch off power when pdn_req is asserted.

25.8.6 Power Up Sequence Control Register (PGC_CPU_PUPSCR)

The PUPSCR contains the power-up timing parameters.

Address: 0h base + 2A4h offset = 2A4h

PGC_CPU_PUPSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.

13–8
SW2ISO
	There are two different silicon revisions: 1.0 and 1.1 (defined by USB_ANALOG_DIGPROG).
	• For silicon revision 1.0: PGC waits for 2048*SW2ISO cycles of IPG_CLK before negating isolation.
	• For silicon revision 1.1:
	  • SW[5] = 1: PGC waits for 64*SW2ISO cycles of IPG_CLK before negating isolation.
	  • SW[5] = 0: PGC waits for 2048*SW2ISO cycles of IPG_CLK before negating isolation.
	
	NOTE: SW2ISO must not be programmed to zero. The SW2ISO value should be chosen such that the delay before negating isolation is greater than the LDO ramp-up time.

7–6 Reserved	This read-only field is reserved and always has the value 0.

SW	There are two different silicon revisions: 1.0 and 1.1 (defined by USB_ANALOG_DIGPROG). When IPG_CLK frequency is slow down in low power mode, it can set SW[5] to speed up ARM wakeup time.
	• For silicon revision 1.0: PGC waits for 2048*SW[5:0] cycles of IPG_CLK to switch on ARM power after pup_reg is asserted.
	• For silicon revision 1.1:
	  • SW[5] = 1: PGC waits for 64*SW[4:0] cycles of IPG_CLK to switch on ARM power after pup_req is asserted.
	  • SW[5] = 0: PGC waits for 2048*SW[4:0] cycles of IPG_CLK to switch on ARM power after pup_req is asserted.
	
	NOTE: SW[4:0] can be programmed to zero.

25.8.7 Pull Down Sequence Control Register (PGC_CPU_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: 0h base + 2A8h offset = 2A8h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

19–12 -	This field is reserved. Reserved
11–6 WSW1	General purpose load tracking signal weight dvfs_w_sig[1]. This value is relevant during GPC1 counting period or when GPB1 is set.
WSW0	General purpose load tracking signal weight dvfs_w_sig[0]. This value is relevant during GPC0 counting period or when GPB0 is set.

25.9.5 DVFS general purpose bit 0 weight counter (DVFSC_DVFSGPC0)

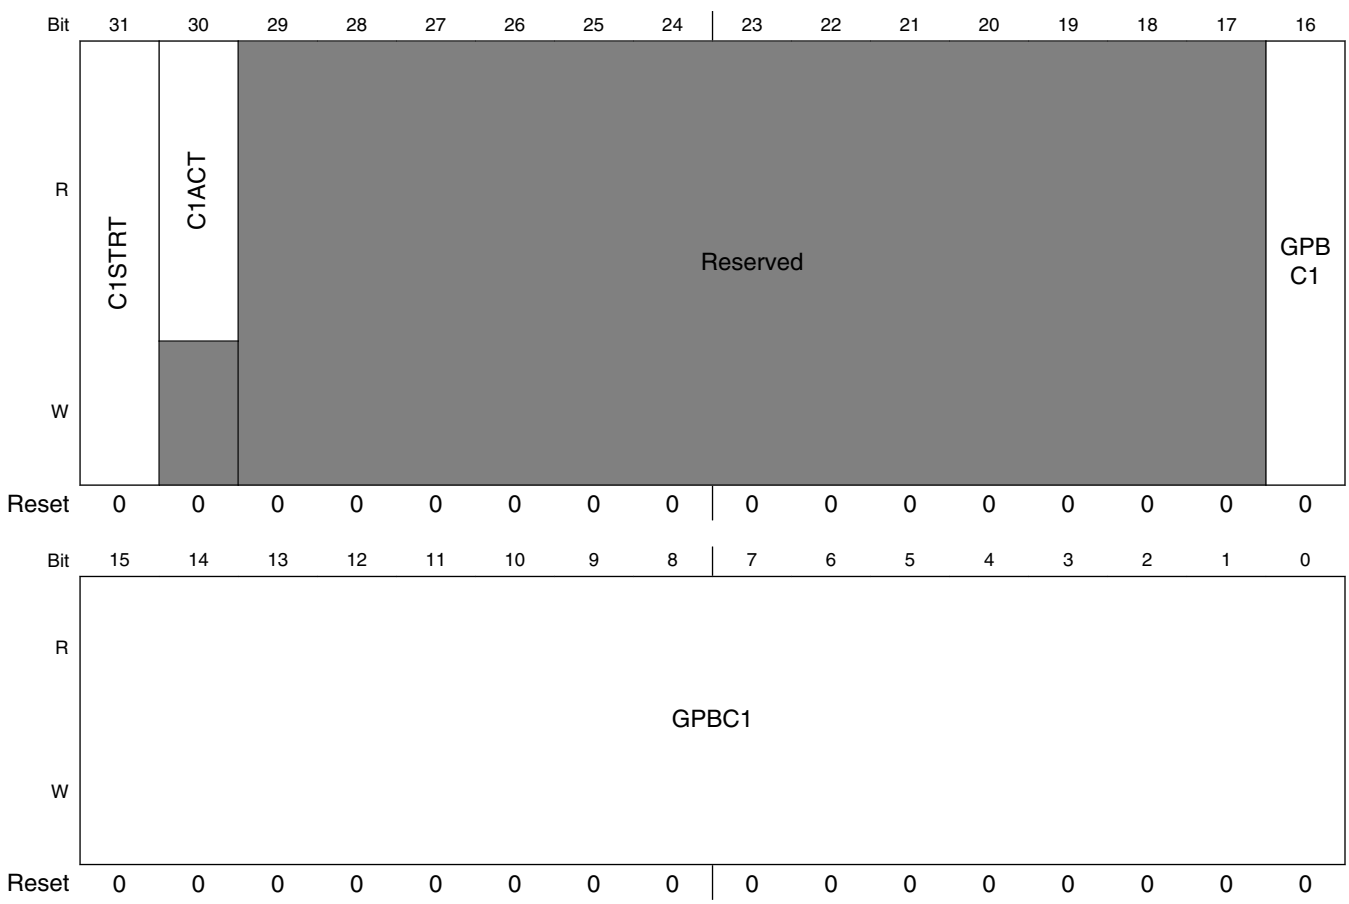
DVFS general purpose bits weight counter.

Address: 0h base + 10h offset = 10h

DVFSC_DVFSGPC0 field descriptions

Field	Description
31 C0STRT	C0STRT - Counter 0 start Setting of this bit will initialize down counting of the GPC0 value. Bit is self-cleared next cycle after setting. Any setting of this bit will re-start GPC0 counter to the GPC0 value. GPB0 bit disables (overrides) GPC0 counter - WSW0 weight is applicable continuously
30 C0ACT	C0ACT - Counter 0 active indicator

Table continues on the next page...



DVFSC_DVFSGPC0 field descriptions (continued)

Field	Description
	1 General Purpose bit0 counter didn't reach value of "0" - the WSW0 is provided to DVFS calculation 0 General Purpose bit0 counter reached value of "0" - the instead of WSW0, "0" (zero) is provided to DVFS calculation
29–17 -	This field is reserved. reserved
GPBC0	GPBC0 - General Purpose bits Counter 0 During period of this counter the GeP bit 0 will be set and WSW0 will be added to the calculations.

25.9.6 DVFS general purpose bit 1 weight counter (DVFSC_DVFSGPC1)

DVFS general purpose bits weight counter1.

Address: 0h base + 14h offset = 14h

DVFSC_DVFSGPC1 field descriptions

Field	Description
31 C1STRT	C1STRT - Counter 1start Setting of this bit will initialize down counting of the GPC1 value. Bit is self-cleared next cycle after setting. Any setting of this bit will re-start GPC1 counter to the GPC1 value. GPB1 bit disables (overrides) GPC1 counter - WSW1 weight is applicable continuously
30 C1ACT	C1ACT - Counter 1 active indicator 1 General Purpose bit1 counter didn't reach value of "0" - the WSW1 is provided to DVFS calculation 0 General Purpose bit1 counter reached value of "0" - the instead of WSW1, "0" (zero) is provided to DVFS calculation
29–17 -	This field is reserved. reserved
GPBC1	GPBC1 - General Purpose bits Counter 1 During period of this counter the GeP bit 1 will be set and WSW1 will be added to the calculations.

25.9.7 DVFS general purpose bits enables (DVFSC_DVFSGPBT)

Address: 0h base + 18h offset = 18h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

DVFSC_CNTR field descriptions

Field	Description
31–29 DIV3CK	DIV3CK - div_3_clk division ratio inside the DVFS module. According to the Table 25-2
28 DVFEV	Always give a DVFS event. 0 Do not give an event always. 1 Always give event.
27 LBMI	Load buffer full mask interrupt. This bit masks the generation of this interrupt. Load buffer full interrupt is masked (LBFL0 and LBFL1 bits still will be updated, but interrupt won't be generated) Load buffer full interrupt is enabled.
26 LBFL1	Load buffer 1 - full status bit. This bit indicates that log buffer registers are full. The bit is set to 1 automatically. An interrupt will be generated if LBMI bit is set to "0" Write '1' to clear. (write '0' leaves bit unchanged) 1 Load buffer0 is full. 0 Load buffer0 is not full.
25 LBFL0	Load buffer 0 - full status bit. This bit indicates that log buffer registers are full. The bit is set to 1 automatically. An interrupt will be generated if LBMI bit is set to "0" Write '1' to clear. (write '0' leaves bit unchanged) 1 Load buffer1 is full. 0 Load buffer1 is not full.
24 DVFIS	DVFS Interrupt select. These bits define destination of DVFS interrupts. 1 MCU interrupt will be generated for DVFS events. 0 SDMA interrupt will be generated for DVFS events.
23 PIRQS	PIRQS - Pattern IRQ Source * write '1' to clear. Writing '1' will clear interrupt if interrupt was from pattern 1 DVFS IRQ source was from pattern 0 DVFS IRQ source was not from pattern

Table continues on the next page...

DVFSC_CNTR field descriptions (continued)

Field	Description
22 FSVAIM	DVFS Frequency adjustment interrupt mask. This bit masks the DVFS frequency adjustment interrupt. FSVAI status bits will be still asserted in relevant cases. 1 interrupt is masked. 0 interrupt is enabled.
21–20 FSVAI[1:0]	FSVAI DVFS Frequency adjustment interrupt. These status bits indicate that the system frequency should be changed. 00 no interrupt 01 frequency should be increased. Low priority interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency). 10 frequency should be decreased. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MINF= 1 (lowest frequency). 11 frequency should be increased immediately. High priority interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency).
19 Reserved	This read-only field is reserved and always has the value 0.
18 MAXF	Maximum frequency reached. Interrupt will not be created in maximum frequency reached and frequency increase required. 1 max frequency reached 0 max frequency not reached
17 MINF	Minimum frequency reached. Interrupt will not be created in minimum frequency reached and frequency decrease required. 1 min frequency reached 0 min frequency not reached

Chapter 26
General Purpose Input/Output (GPIO)

26.1 Overview

The GPIO general-purpose input/output peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs.

When configured as an output, it is possible to write to an internal register to control the state driven on the output pin. When configured as an input, it is possible to detect the state of the input by reading the state of an internal register. In addition, the GPIO peripheral can produce CORE interrupts.

The GPIO is one of the blocks controlling the IOMUX of the chip.

Figure 26-1 shows the chip multiplexing scheme.

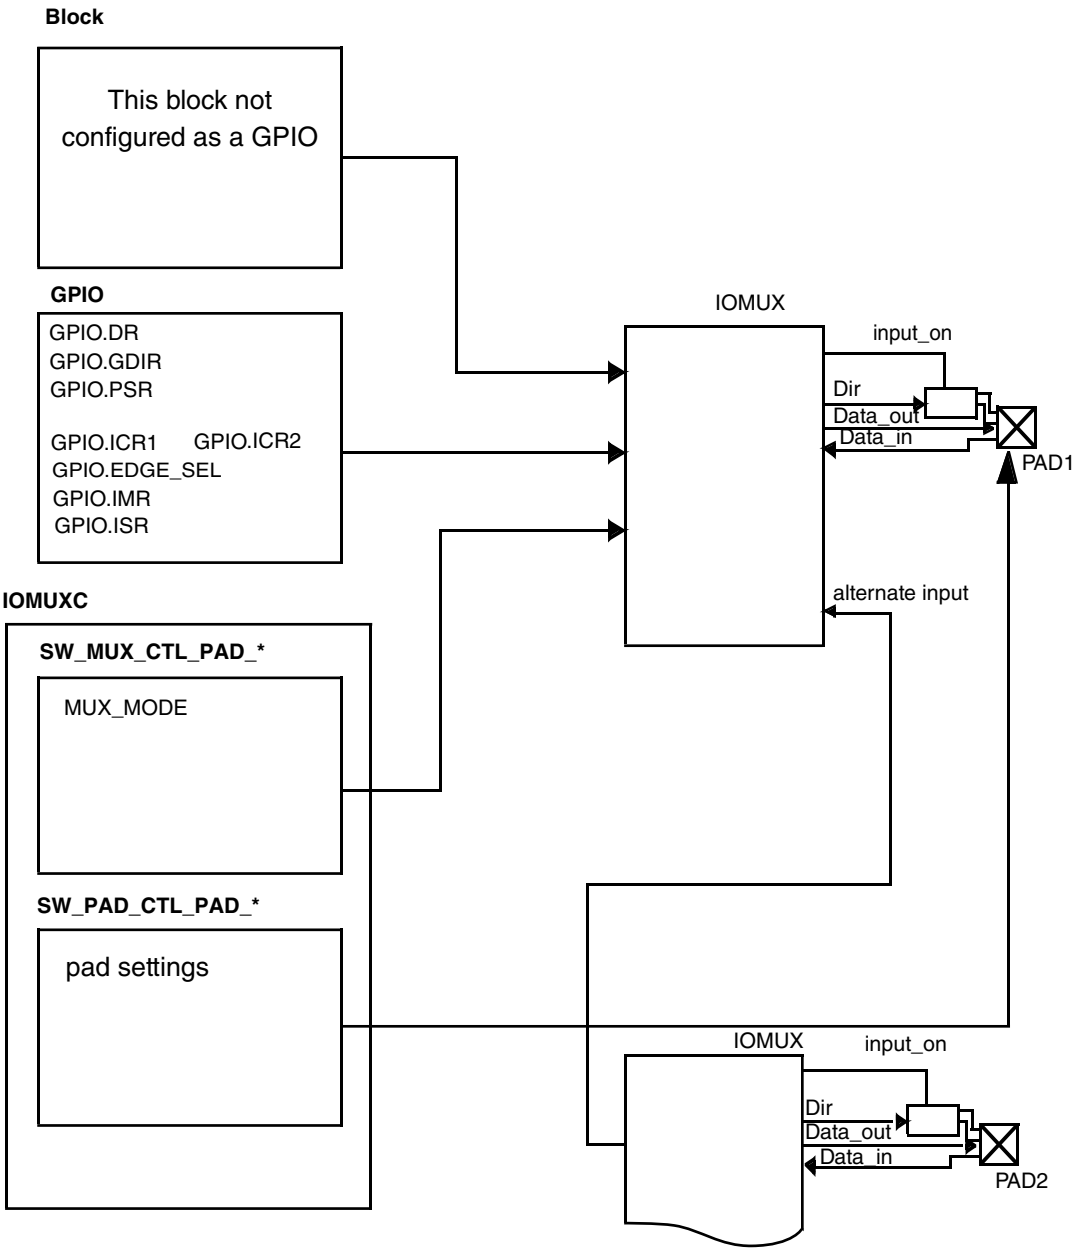

Figure 26-1. Chip IOMUX Scheme

The GPIO functionality is provided through eight registers, an edge-detect circuit, and interrupt generation logic.

The eight registers are:

- Data register (GPIO_DR)
- GPIO direction register (GPIO_GDIR)
- Pad sample register (GPIO_PSR)
- Interrupt control registers (GPIO_ICR1, GPIO_ICR2)

- Edge select register (GPIO_EDGE_SEL)
- Interrupt mask register (GPIO_IMR)
- Interrupt status register (GPIO_ISR)

These registers are described in detail in GPIO Memory Map/Register Definition.

Each GPIO input has a dedicated edge-detect circuit which can be configured through software to detect rising edges, falling edges, logic low-levels or logic high-levels on the input signals. The outputs of the edge detect circuits are optionally masked by setting the corresponding bit in the interrupt mask register (GPIO_IMR). These qualified outputs are OR'ed together to generate two one-bit interrupt lines:

- Combined interrupt indication for GPIOx signals 0 - 15
- Combined interrupt indication for GPIOx signals 16 - 31

In addition, GPIO1 provides visibility to each of its 8 low order interrupt sources (i.e. GPIO1 interrupt n, for n = 0 – 7). However, individual interrupt indications from other GPIOx are not available.

The GPIO edge detection is described further in Interrupt Control Unit.

The GPIO's overall functionality is described further in GPIO Functional Description.

26.1.1 Block Diagram

The GPIO subsystem contains 8 GPIO blocks which can generate and control up to 32 signals for general purpose.

A block diagram of the GPIO is shown in Figure 26-2 .

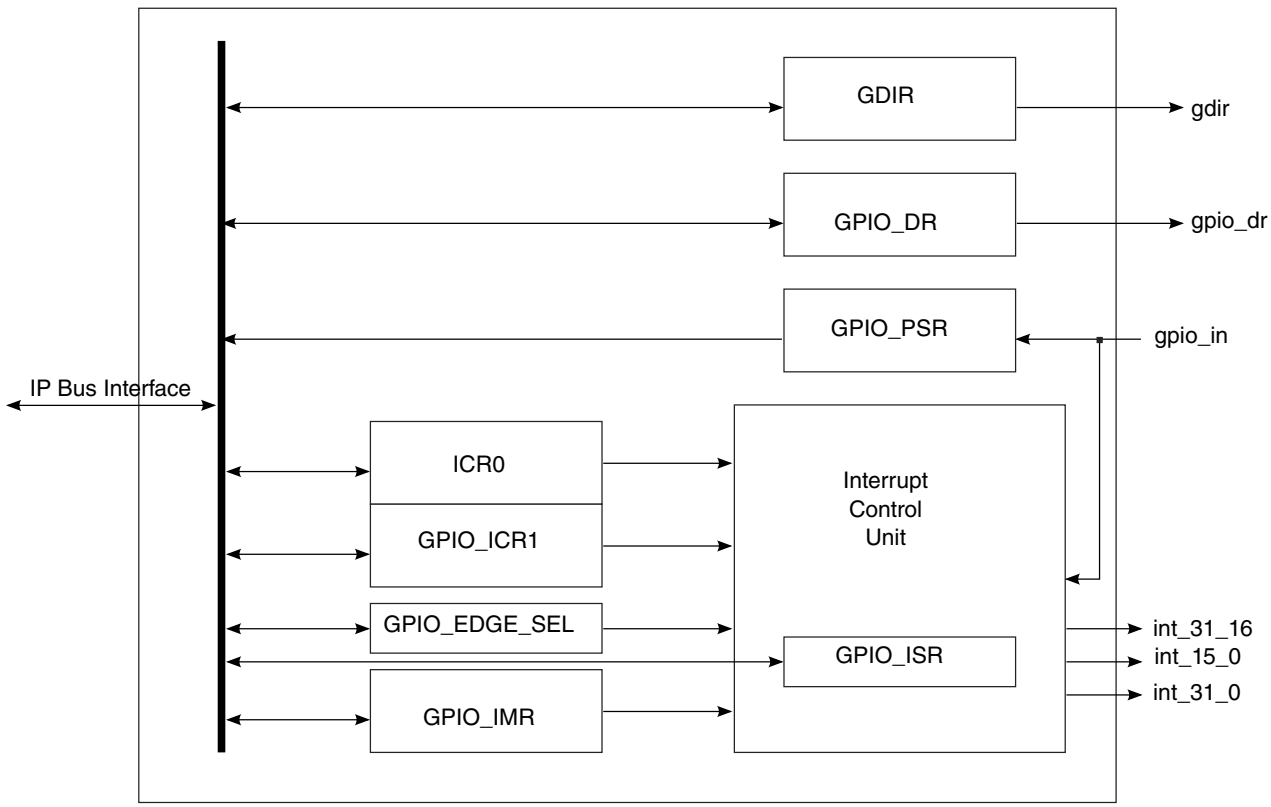

Figure 26-2. GPIO Block Diagram

26.1.2 Features

The GPIO includes the following features:

- General purpose input/output logic capabilities:
  - Drives specific data to output using the data register (GPIO_DR)
  - Controls the direction of the signal using the GPIO direction register (GPIO_GDIR)
  - Enables the core to sample the status of the corresponding inputs by reading the pad sample register (GPIO_PSR).
- GPIO interrupt capabilities:
  - Supports up to 32 interrupts

- Identifies interrupt edges
- Generates three active-high interrupts to the SoC interrupt controller

26.2 External Signals

The tables found here describe the external signals of GPIO.

Table 26-1. GPIO External Signals

26.3 Clocks

The table found here describes the clock sources for GPIO.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 26-2. GPIO Clocks

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

26.4 GPIO Functional Description

This section provides a complete functional description of the block.

26.4.1 GPIO Function

A GPIO signal can operate as a general-purpose input/output when the IOMUX is set to GPIO mode. Each GPIO signal may be independently configured as either an input or an output using the GPIO direction register (GPIO_GDIR).

When configured as an output (GPIO_GDIR bit = 1), the value in the data bit in the GPIO data register (GPIO_DR) is driven on the corresponding GPIO line. When a signal is configured as an input (GPIO_GDIR bit = 0), the state of the input can be read from the corresponding GPIO_PSR bit.

26.4.2 GPIO pad structure

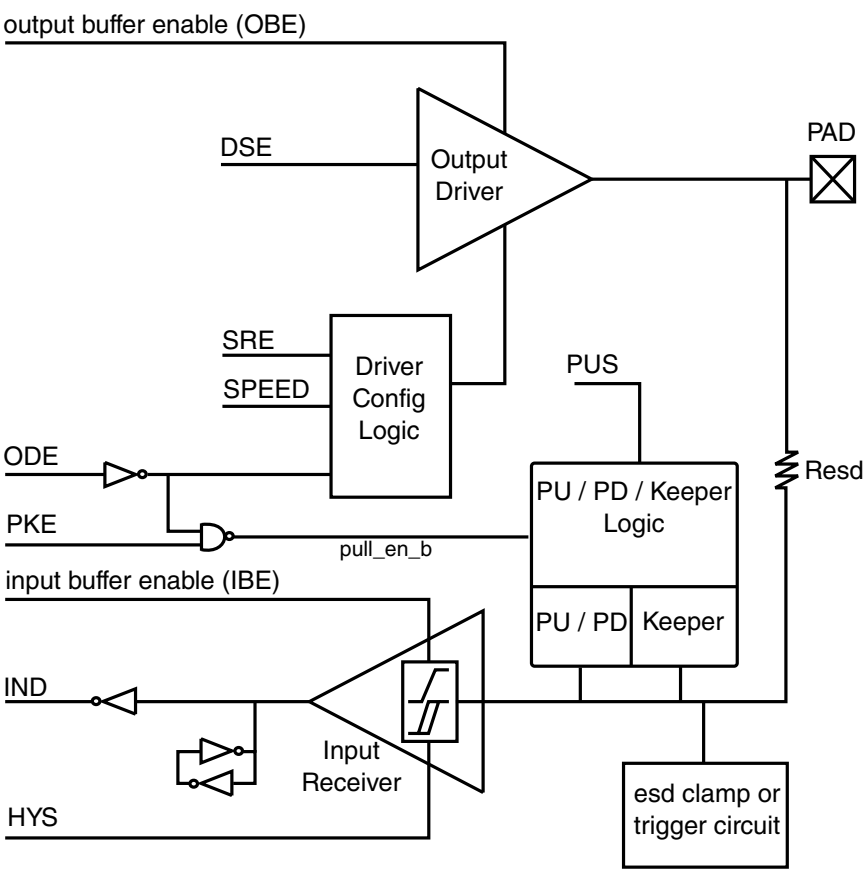

Figure 26-3. GPIO pad functional diagram

26.4.2.1 Input Driver

Input driver characteristics

- Selectable Schmitt trigger or CMOS input mode
- Keeper structure with buffer at the input receiver output to Core
- Receiver is tri-stated when I/O supply (OVDD) is powered down. (Keeper at receiver output keeps its previous state).

26.4.2.1.1 Schmitt trigger

The anti-jamming functionality of the Schmitt trigger is illustrated below.

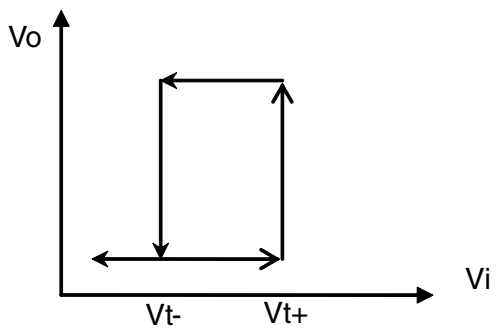

Figure 26-4. Schmitt trigger transfer characteristic

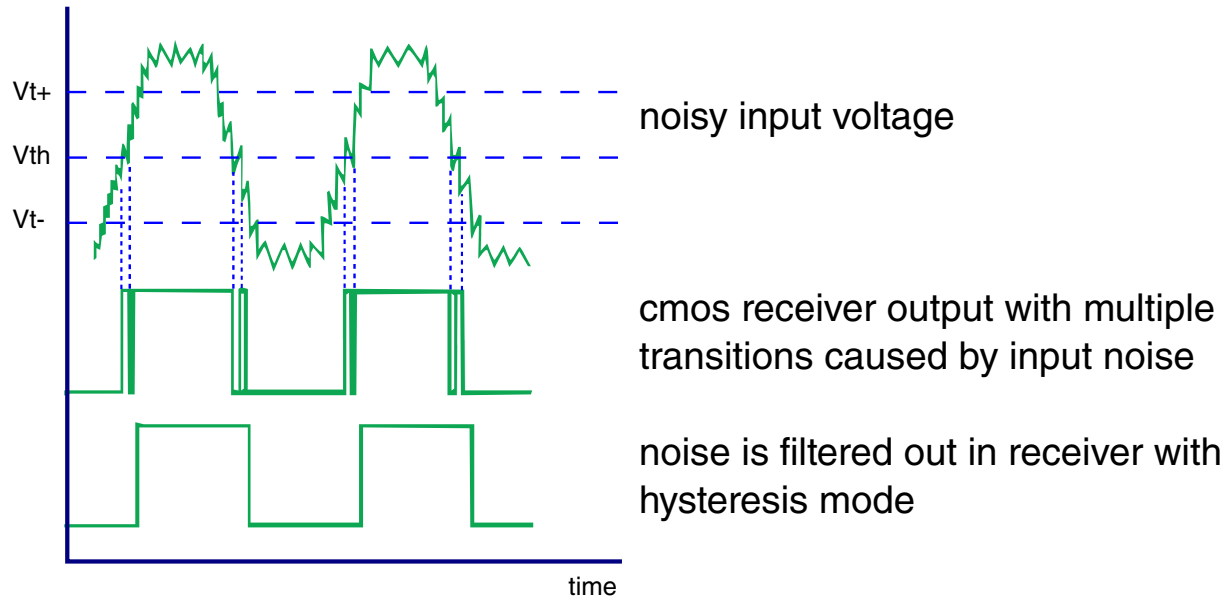

Figure 26-5. Receiver output in CMOS and hysteresis

26.4.2.1.2 Input keeper

A simple latch to hold the input value when OVDD is powered down, or the first inverter is tri-stated. Input buffer's keeper is always enabled for all the pads.

26.4.2.2 Output Driver

Output driver characteristics

- Selectable CMOS or open-drain output type
- Selectable pull-keeper enable signal to enable/disable the pull-up/down and output keeper
- Selectable pull-up resistors of 22K, 47K, 100K and a pull-down resistor of 100KOhm. Unsilicided P+ poly resistor is used to limit resistance variation to within +/- 20%.
- Pull-up, pull-down, and pad keeper are disabled in output mode.
- Seven drive strengths in each operating mode
- Additional 2-bit slew rate control to select between 50, 100, and 200 MHz IO cell operation range with reduced switching noise

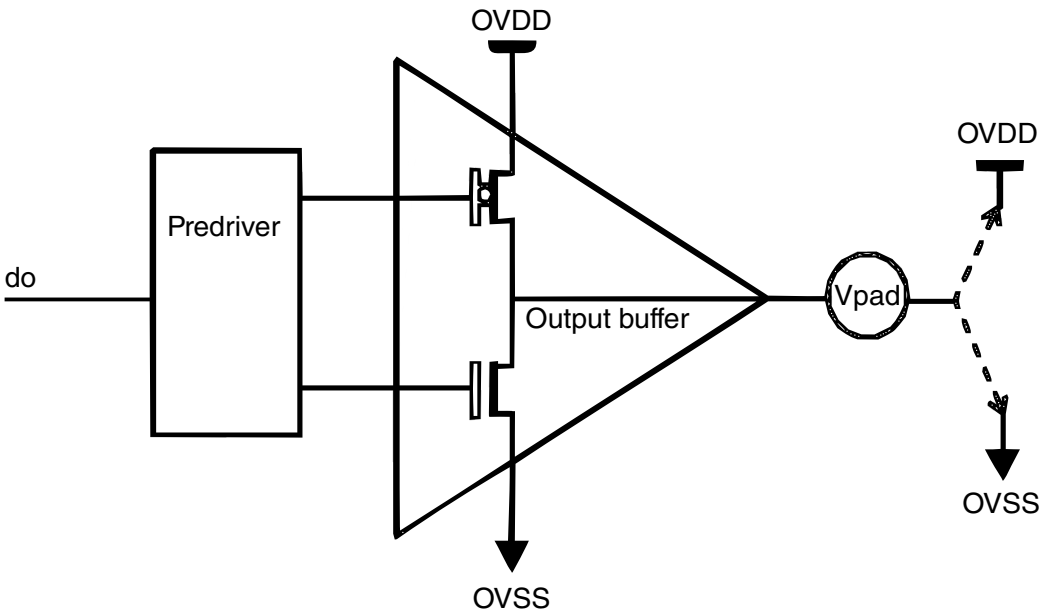

Figure 26-6. Output Driver Functional Diagram

26.4.2.2.1 Drive strength

Drive strength selection can be use to make the impedance matched and get better signal integrity.

26.4.2.2.2 Output keeper

A simple latch to hold the input value.

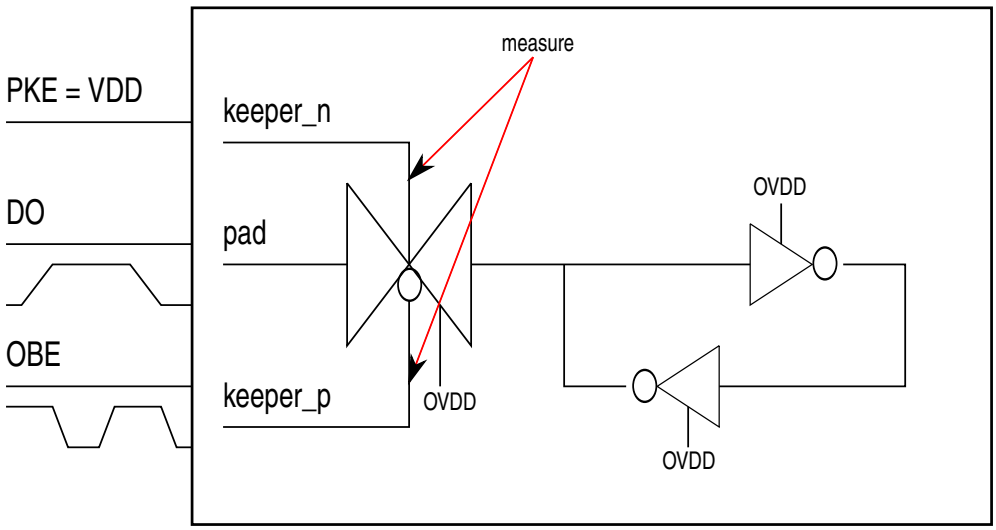

Figure 26-7. Keeper functional diagram

26.4.2.2.3 PU / PD / Keeper Logic

When Keeper is enabled, the pull-up and pull-down are disabled, and the output value of the pad depends on the Keeper. The output keeper is powered by OVDD. When the core VDD is powered down or the first inverter is tri-stated, the pad's state can be kept. Keeper and Pull can't be enabled together.

26.4.2.2.4 Open drain

Open drain is a circuit technique which allows multiple devices to communication over a single wire bi-directionally. Open drain drivers usually operate with an external or internal pull-up resistor that holds the signal line high until a device sinks enough current to pull the line low, usually used for a bus with multiple devices.

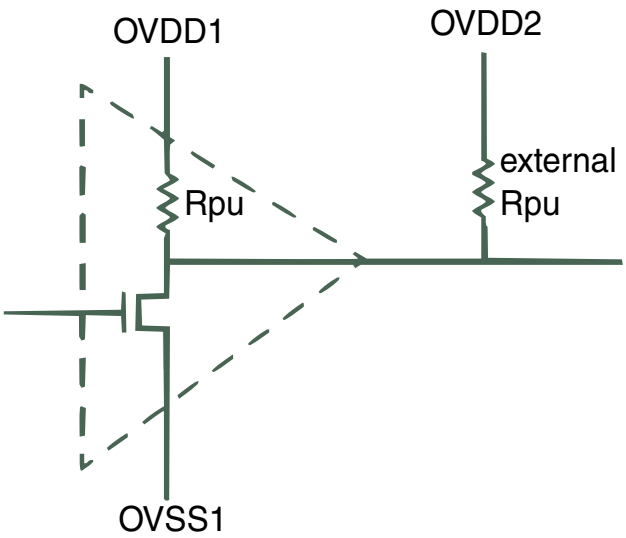

Figure 26-8. Output buffer in open drain mode

26.4.3 GPIO Programming

26.4.3.1 GPIO Read Mode

The programming sequence for reading input signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUX Controller (IOMUXC)).
2. Configure GPIO direction register to input (GPIO_GDIR[GDIR] set to 0b).
3. Read value from data reg*ister*/pad status register.

A pseudocode description to read [input3:input0] values is as follows:

```
// SET INPUTS TO GPIO MODE.
write sw_mux_ctl_<input0>_<input1>_<input2>_<input3>, 32'h00000000
// SET GDIR TO INPUT.
write GDIR[31:4,input3_bit, input2_bit, input1_bit, input0_bit,] 32'hxxxxxxx0
// READ INPUT VALUE FROM DR.
read DR
// READ INPUT VALUE FROM PSR.
read PSR
```

NOTE

While the GPIO direction is set to input (GPIO_GDIR = 0), a read access to GPIO_DR does not return GPIO_DR data. Instead, it returns the GPIO_PSR data, which is the corresponding input signal value.

26.4.3.2 GPIO Write Mode

The programming sequence for driving output signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUXC), also enable SION if need to read loopback pad value through PSR
2. Configure GPIO direction register to output (GPIO_GDIR[GDIR] set to 1b).
3. Write value to data register (GPIO_DR).

A pseudocode description to drive 4'b0101 on [output3:output0] is as follows:

```
// SET PADS TO GPIO MODE VIA IOMUX.
write sw_mux_ctl_pad_<output[0-3]>.mux_mode, <GPIO_MUX_MODE>
// Enable loopback so we can capture pad value into PSR in output mode
write sw_mux_ctl_pad_<output[0-3]>.sion, 1
// SET GDIR=1 TO OUTPUT BITS.
write GDIR[31:4,output3_bit,output2_bit, output1_bit, output0_bit,] 32'hxxxxxxxF
// WRITE OUTPUT VALUE=4'b0101 TO DR.
write DR, 32'hxxxxxxx5
// READ OUTPUT VALUE FROM PSR ONLY.
read_cmp PSR, 32'hxxxxxxx5
```

26.4.4 Interrupt Control Unit

In addition to the general-purpose input/output function, the edge-detect logic in the GPIO peripheral reflects whether a transition has occurred on a given GPIO signal that is configured as an input (GDIR bit = 0). The interrupt control registers (GPIO_ICR1 and GPIO_ICR2) may be used to independently configure the interrupt condition of each input signal (low-to-high transition, high-to-low transition, low, or high). For information about GPIO_ICR1 and GPIO_ICR2 settings, see GPIO Memory Map/Register Definition.

The interrupt control unit is built of 32 interrupt control subunits, where each subunit handles a single interrupt line.

26.5 GPIO Memory Map/Register Definition

There are eight 32-bit GPIO registers. All registers are accessible from the IP interface. Only 32-bit access is supported.

The GPIO memory map is shown in the following table.

GPIO memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
209_C000	GPIO data register (GPIO1_DR)	32	R/W	0000_0000h	26.5.1/1155
209_C004	GPIO direction register (GPIO1_GDIR)	32	R/W	0000_0000h	26.5.2/1156
209_C008	GPIO pad status register (GPIO1_PSR)	32	R	0000_0000h	26.5.3/1156
209_C00C	GPIO interrupt configuration register1 (GPIO1_ICR1)	32	R/W	0000_0000h	26.5.4/1157
209_C010	GPIO interrupt configuration register2 (GPIO1_ICR2)	32	R/W	0000_0000h	26.5.5/1161
209_C014	GPIO interrupt mask register (GPIO1_IMR)	32	R/W	0000_0000h	26.5.6/1164
209_C018	GPIO interrupt status register (GPIO1_ISR)	32	w1c	0000_0000h	26.5.7/1165
209_C01C	GPIO edge select register (GPIO1_EDGE_SEL)	32	R/W	0000_0000h	26.5.8/1166
20A_0000	GPIO data register (GPIO2_DR)	32	R/W	0000_0000h	26.5.1/1155
20A_0004	GPIO direction register (GPIO2_GDIR)	32	R/W	0000_0000h	26.5.2/1156
20A_0008	GPIO pad status register (GPIO2_PSR)	32	R	0000_0000h	26.5.3/1156
20A_000C	GPIO interrupt configuration register1 (GPIO2_ICR1)	32	R/W	0000_0000h	26.5.4/1157
20A_0010	GPIO interrupt configuration register2 (GPIO2_ICR2)	32	R/W	0000_0000h	26.5.5/1161
20A_0014	GPIO interrupt mask register (GPIO2_IMR)	32	R/W	0000_0000h	26.5.6/1164
20A_0018	GPIO interrupt status register (GPIO2_ISR)	32	w1c	0000_0000h	26.5.7/1165
20A_001C	GPIO edge select register (GPIO2_EDGE_SEL)	32	R/W	0000_0000h	26.5.8/1166
20A_4000	GPIO data register (GPIO3_DR)	32	R/W	0000_0000h	26.5.1/1155
20A_4004	GPIO direction register (GPIO3_GDIR)	32	R/W	0000_0000h	26.5.2/1156
20A_4008	GPIO pad status register (GPIO3_PSR)	32	R	0000_0000h	26.5.3/1156
20A_400C	GPIO interrupt configuration register1 (GPIO3_ICR1)	32	R/W	0000_0000h	26.5.4/1157
20A_4010	GPIO interrupt configuration register2 (GPIO3_ICR2)	32	R/W	0000_0000h	26.5.5/1161
20A_4014	GPIO interrupt mask register (GPIO3_IMR)	32	R/W	0000_0000h	26.5.6/1164
20A_4018	GPIO interrupt status register (GPIO3_ISR)	32	w1c	0000_0000h	26.5.7/1165
20A_401C	GPIO edge select register (GPIO3_EDGE_SEL)	32	R/W	0000_0000h	26.5.8/1166
20A_8000	GPIO data register (GPIO4_DR)	32	R/W	0000_0000h	26.5.1/1155
20A_8004	GPIO direction register (GPIO4_GDIR)	32	R/W	0000_0000h	26.5.2/1156
20A_8008	GPIO pad status register (GPIO4_PSR)	32	R	0000_0000h	26.5.3/1156
20A_800C	GPIO interrupt configuration register1 (GPIO4_ICR1)	32	R/W	0000_0000h	26.5.4/1157
20A_8010	GPIO interrupt configuration register2 (GPIO4_ICR2)	32	R/W	0000_0000h	26.5.5/1161
20A_8014	GPIO interrupt mask register (GPIO4_IMR)	32	R/W	0000_0000h	26.5.6/1164
20A_8018	GPIO interrupt status register (GPIO4_ISR)	32	w1c	0000_0000h	26.5.7/1165
20A_801C	GPIO edge select register (GPIO4_EDGE_SEL)	32	R/W	0000_0000h	26.5.8/1166
20A_C000	GPIO data register (GPIO5_DR)	32	R/W	0000_0000h	26.5.1/1155
20A_C004	GPIO direction register (GPIO5_GDIR)	32	R/W	0000_0000h	26.5.2/1156
20A_C008	GPIO pad status register (GPIO5_PSR)	32	R	0000_0000h	26.5.3/1156
20A_C00C	GPIO interrupt configuration register1 (GPIO5_ICR1)	32	R/W	0000_0000h	26.5.4/1157
20A_C010	GPIO interrupt configuration register2 (GPIO5_ICR2)	32	R/W	0000_0000h	26.5.5/1161
20A_C014	GPIO interrupt mask register (GPIO5_IMR)	32	R/W	0000_0000h	26.5.6/1164

26.5.1 GPIO data register (GPIOx_DR)

The 32-bit GPIO_DR register stores data that is ready to be driven to the output lines. If the IOMUXC is in GPIO mode and a given GPIO direction bit is set, then the corresponding DR bit is driven to the output. If a given GPIO direction bit is cleared, then a read of GPIO_DR reflects the value of the corresponding signal.Two wait states are required in read access for synchronization.

The results of a read of a DR bit depends on the IOMUXC input mode settings and the corresponding GDIR bit as follows:

- If GDIR[*n*] is set and IOMUXC input mode is GPIO, then reading DR[*n*] returns the contents of DR[*n*].
- If GDIR[*n*] is cleared and IOMUXC input mode is GPIO, then reading DR[*n*] returns the corresponding input signal's value.
- If GDIR[*n*] is set and IOMUXC input mode is not GPIO, then reading DR[*n*] returns the contents of DR[*n*].
- If GDIR[*n*] is cleared and IOMUXC input mode is not GPIO, then reading DR[*n*] always returns zero.

Address: Base address + 0h offset

GPIOx_DR field descriptions

Field	Description
DR	Data bits. This register defines the value of the GPIO output when the signal is configured as an output (GDIR[n]=1). Writes to this register are stored in a register. Reading GPIO_DR returns the value stored in the register if the signal is configured as an output (GDIR[n]=1), or the input signal's value if configured as an input (GDIR[n]=0). **NOTE:** The I/O multiplexer must be configured to GPIO mode for the GPIO_DR value to connect with the signal. Reading the data register with the input path disabled always returns a zero value.

26.5.2 GPIO direction register (GPIOx_GDIR)

GPIO_GDIR functions as direction control when the IOMUXC is in GPIO mode. Each bit specifies the direction of a one-bit signal. The mapping of each DIR bit to a corresponding SoC signal is determined by the SoC's pin assignment and the IOMUX table. For more details consult the IOMUXC chapter.

Address: Base address + 4h offset

GPIOx_GDIR field descriptions

Field	Description
GDIR	GPIO direction bits. Bit n of this register defines the direction of the GPIO[n] signal. **NOTE:** GPIO_GDIR affects only the direction of the I/O signal when the corresponding bit in the I/O MUX is configured for GPIO. 0 **INPUT** — GPIO is configured as input. 1 **OUTPUT** — GPIO is configured as output.

26.5.3 GPIO pad status register (GPIOx_PSR)

GPIO_PSR is a read-only register. Each bit stores the value of the corresponding input signal (as configured in the IOMUX). This register is clocked with the ipg_clk_s clock, meaning that the input signal is sampled only when accessing this location. Two wait states are required any time this register is accessed for synchronization.

Address: Base address + 8h offset

5–4 ICR18	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 18. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00 **LOW_LEVEL** — Interrupt n is low-level sensitive. 01 **HIGH_LEVEL** — Interrupt n is high-level sensitive. 10 **RISING_EDGE** — Interrupt n is rising-edge sensitive. 11 **FALLING_EDGE** — Interrupt n is falling-edge sensitive.
3–2 ICR17	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 17. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00 **LOW_LEVEL** — Interrupt n is low-level sensitive. 01 **HIGH_LEVEL** — Interrupt n is high-level sensitive. 10 **RISING_EDGE** — Interrupt n is rising-edge sensitive. 11 **FALLING_EDGE** — Interrupt n is falling-edge sensitive.
ICR16	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 16. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00 **LOW_LEVEL** — Interrupt n is low-level sensitive. 01 **HIGH_LEVEL** — Interrupt n is high-level sensitive. 10 **RISING_EDGE** — Interrupt n is rising-edge sensitive. 11 **FALLING_EDGE** — Interrupt n is falling-edge sensitive.

26.5.6 GPIO interrupt mask register (GPIOx_IMR)

GPIO_IMR contains masking bits for each interrupt line.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	IMR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPIOx_IMR field descriptions

Field	Description
IMR	Interrupt Mask bits. This register is used to enable or disable the interrupt function on each of the 32 GPIO signals.

GPIOx_IMR field descriptions (continued)

Field	Description
	Settings: Bit IMR[n] (n=0...31) controls interrupt n as follows: 0 **UNMASKED** — Interrupt n is disabled. 1 **MASKED** — Interrupt n is enabled.

26.5.7 GPIO interrupt status register (GPIOx_ISR)

The GPIO_ISR functions as an interrupt status indicator. Each bit indicates whether an interrupt condition has been met for the corresponding input signal. When an interrupt condition is met (as determined by the corresponding interrupt condition register field), the corresponding bit in this register is set. Two wait states are required in read access for synchronization. One wait state is required for reset.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ISR																															
W	w1c																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPIOx_ISR field descriptions

Field	Description
ISR	Interrupt status bits - Bit n of this register is asserted (active high) when the active condition (as determined by the corresponding ICR bit) is detected on the GPIO input and is waiting for service. The value of this register is independent of the value in GPIO_IMR. When the active condition has been detected, the corresponding bit remains set until cleared by software. Status flags are cleared by writing a 1 to the corresponding bit position.

26.5.8 GPIO edge select register (GPIOx_EDGE_SEL)

GPIO_EDGE_SEL may be used to override the ICR registers' configuration. If the GPIO_EDGE_SEL bit is set, then a rising edge or falling edge in the corresponding signal generates an interrupt. This register provides backward compatibility. On reset all bits are cleared (ICR is not overridden).

Address: Base address + 1Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	GPIO_EDGE_SEL																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPIOx_EDGE_SEL field descriptions

Field	Description
GPIO_EDGE_SEL	Edge select. When GPIO_EDGE_SEL[*n*] is set, the GPIO disregards the ICR[*n*] setting, and detects any edge on the corresponding input signal.

Chapter 27
General Purpose Media Interface (GPMI)

27.1 Overview

The GPMI controller is a flexible interface to supporting up to four NAND flash chip selects.

- ONFI 2.2, DDR Mode, Samsung / Toshiba Toggle NAND protocol compatible.
- Fully configurable address and command behavior, providing support for future devices not yet specified.

The GPMI resides on the APBH. The GPMI also provides an interface to the BCH module to allow direct parity processing.

Registers are clocked on the HCLK domain. The I/O and pin timing are clocked on a dedicated GPMICLK domain. GPMICLK can be set to maximize I/O performance.

The following figure shows a block diagram of the GPMI controller.

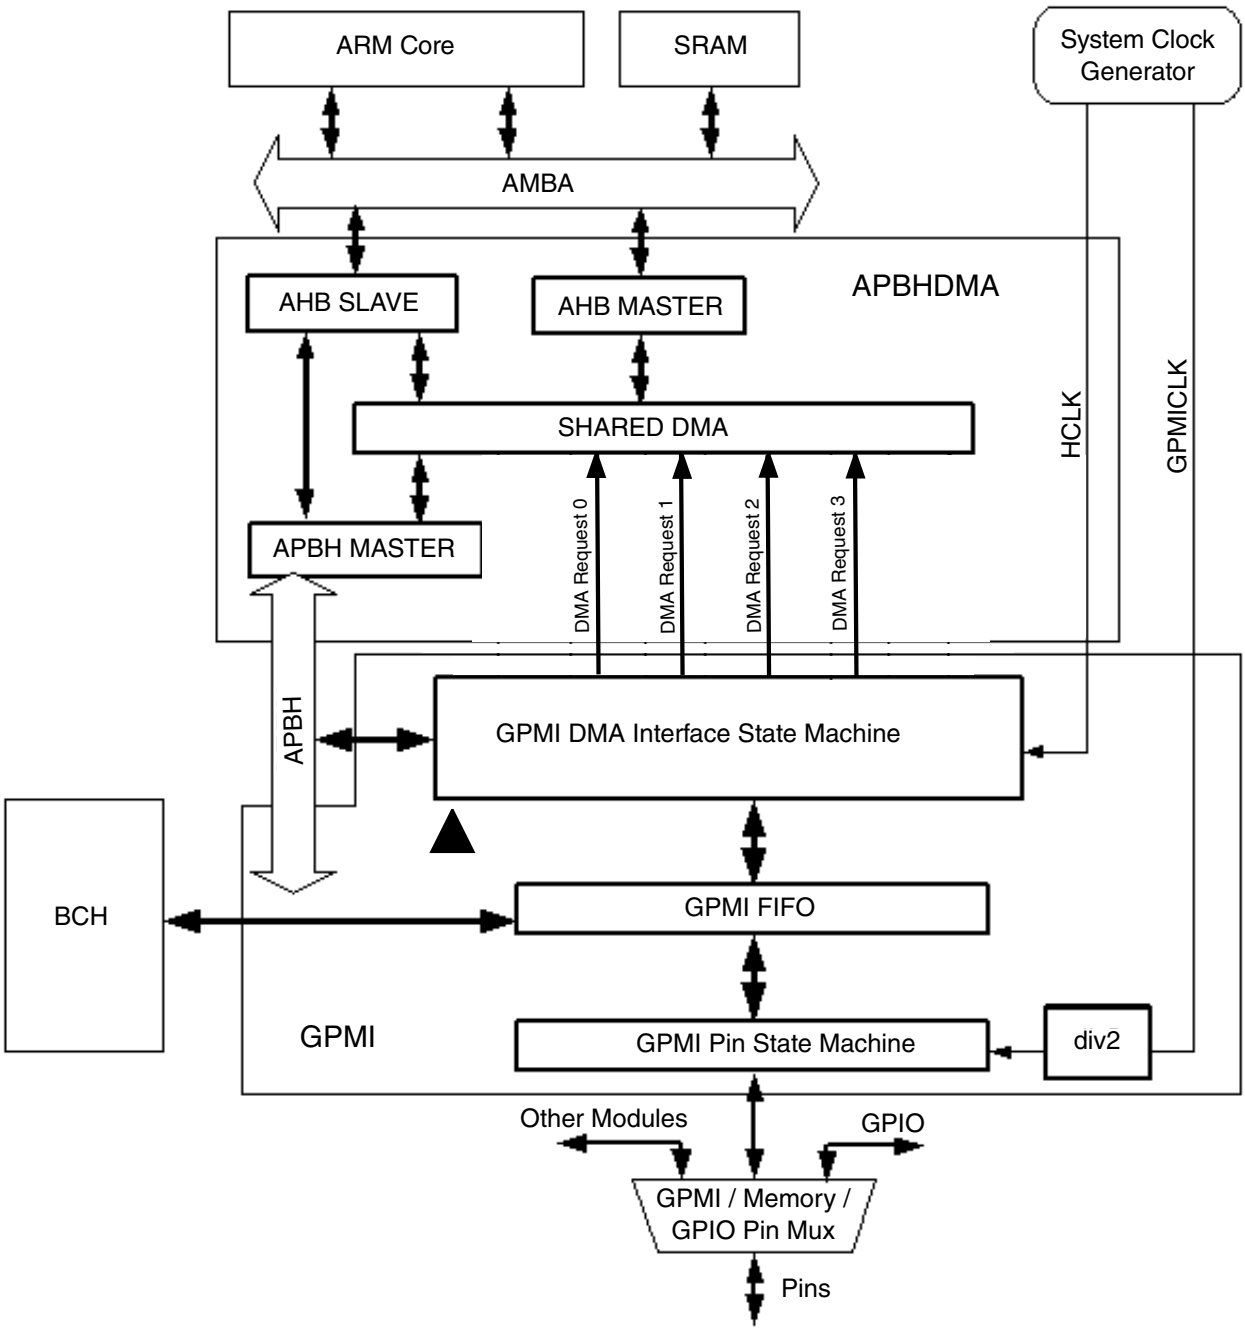

Figure 27-1. General-Purpose Media Interface Controller Block Diagram

27.2 External Signals

The table found here describes the external signals of GPMI.

Table 27-1. GPMI External Signals

Signal	Description	Pad	Mode	Direction
NAND_ALE	Address latch enable signal	NAND_ALE	ALT0	O
NAND_CE0_B	Chip enable signal	NAND_CE0_B	ALT0	O
NAND_CE1_B	Chip enable signal	NAND_CE1_B	ALT0	O
NAND_CE2_B	Chip enable signal	CSI_MCLK	ALT2	O
NAND_CE3_B	Chip enable signal	CSI_PIXCLK	ALT2	O
NAND_CLE	Command latch enable signal	NAND_CLE	ALT0	O
NAND_DATA00	Data signal	NAND_DATA00	ALT0	IO
NAND_DATA01	Data signal	NAND_DATA01	ALT0	IO
NAND_DATA02	Data signal	NAND_DATA02	ALT0	IO
NAND_DATA03	Data signal	NAND_DATA03	ALT0	IO
NAND_DATA04	Data signal	NAND_DATA04	ALT0	IO
NAND_DATA05	Data signal	NAND_DATA05	ALT0	IO
NAND_DATA06	Data signal	NAND_DATA06	ALT0	IO
NAND_DATA07	Data signal	NAND_DATA07	ALT0	IO
NAND_DQS	DQS signal	NAND_DQS	ALT0	IO
NAND_READY_B	Ready signal	NAND_READY_B	ALT0	IO
NAND_RE_B	Read enable signal	NAND_RE_B	ALT0	O
NAND_WE_B	Write enable signal	NAND_WE_B	ALT0	O
NAND_WP_B	Wait polarity signal	NAND_WP_B	ALT0	O

27.3 Clocks

The table found here describes the clock sources for GPMI.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 27-2. GPMI Clocks

Clock name	Clock Root	Description
bch_input_apb_clk		BCH to APBH input clock
gpmi_bch_input_bch_clk		BCH input clock
gpmi_bch_input_gpmi_io_clk		GPMI IO input clock
gpmi_input_apb_clk		GPMI to APBH clock

27.4 GPMI NAND Mode

The general-purpose media interface has several features to efficiently support NAND:

- Individual chip select pins and ganged ready/busy pin for up to four NANDs.
- Individual state machine and DMA channel for each chip select.
- Special command modes work with DMA controller to perform all normal NAND functions without CPU intervention.
- Configurable timing based on a dedicated clock allows optimal balance of high NAND performance and low system power.

GPMI and DMA have been designed to handle complex multi-page operations without CPU intervention. The DMA uses a linked descriptor function with branching capability to automatically handle all of the operations needed to read/write multiple pages:

- **Data/Register Read/Write**-The GPMI can be programmed to read or write multiple cycles to the NAND address, command or data registers.
- **Wait for NAND Ready**-The GPMI's Wait-for-Ready mode can monitor the ready/busy signal of a single NAND flash and signal the DMA when the device has become ready. It also has a time-out counter and can indicate to the DMA that a time-out error has occurred. The DMAs can conditionally branch to a different descriptor in the case of an error.
- **Check Status**-The Read-and-Compare mode allows the GPMI to check NAND status against a reference. If an error is found, the GPMI can instruct the DMA to branch to an alternate descriptor, which attempts to fix the problem or asserts a CPU IRQ.

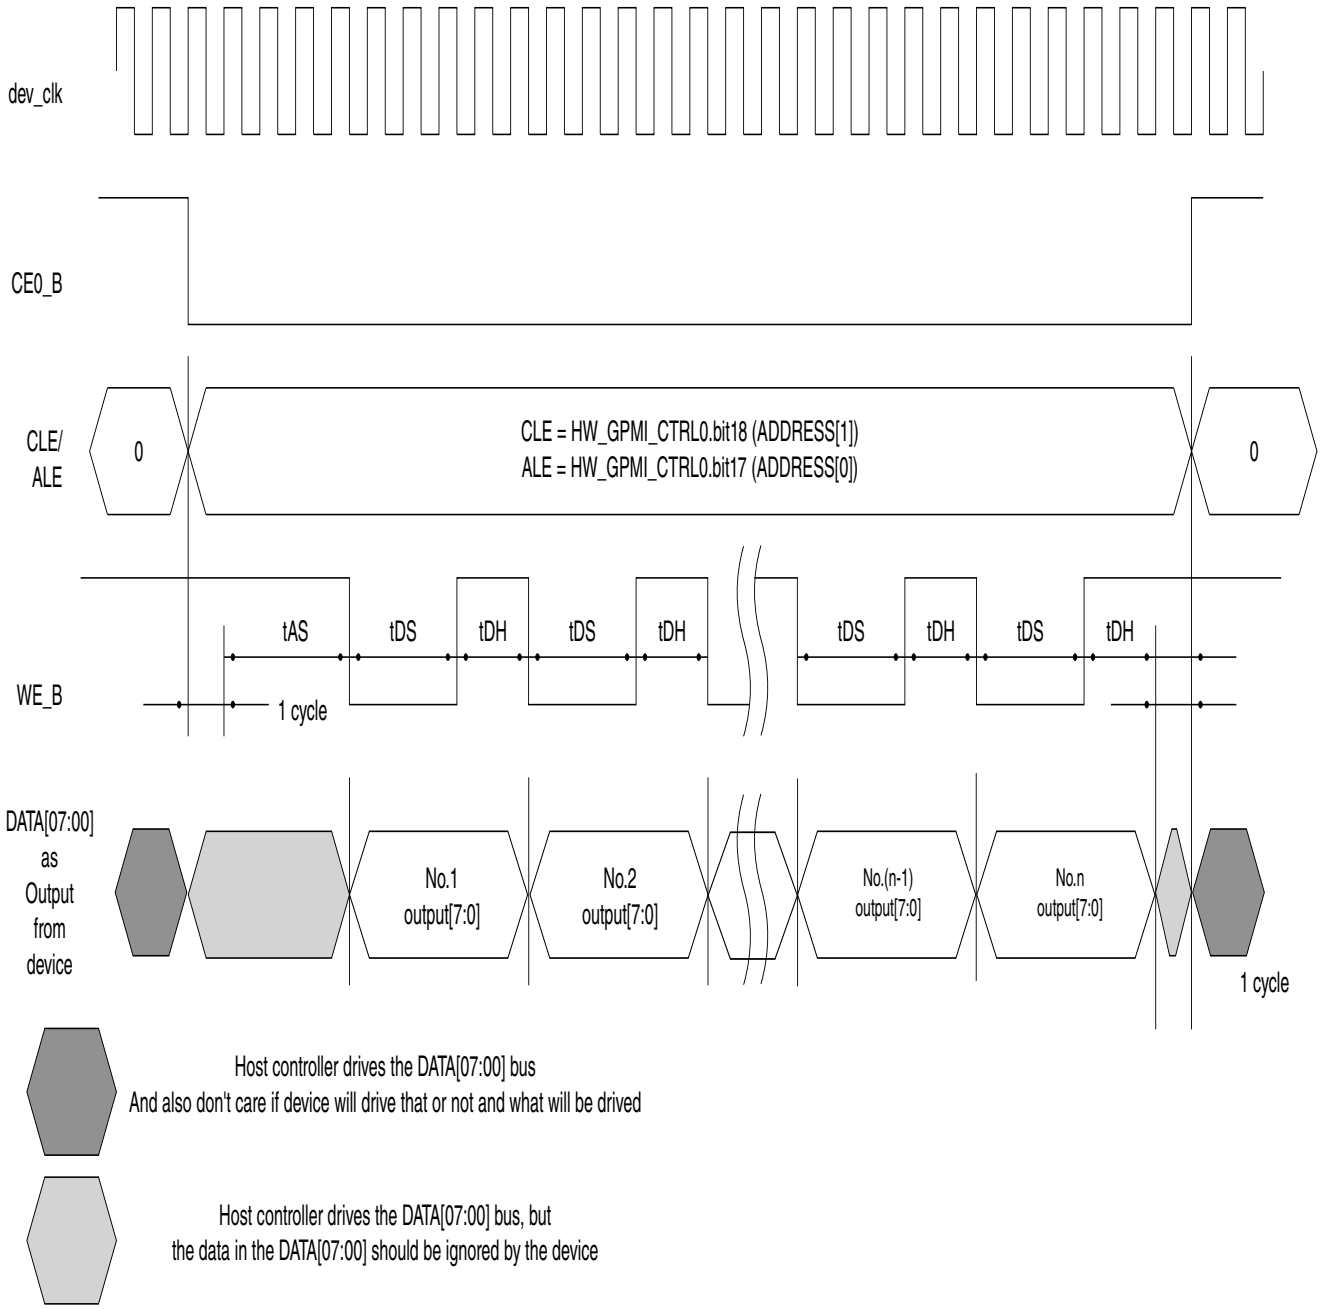
27.4.1 Multiple NAND Support

The GPMI supports up to four NAND chip selects, with ganged ready/busy pins.

Since they share a data bus and control lines, the GPMI can only actively communicate with a single NAND at a time. However, all NANDs can concurrently perform internal read, write, or erase operations. With fast NAND flash and software support for concurrent NAND operations, this architecture allows the total throughput to approach the data bus speed, which can be as high as 50 MB/s (8-bit bus running at 50 MHz single clock edge) in asynchronous mode and 200MB/s (8-bit bus running at 100MHz both clock edges) in Source Synchronous mode.

There are two options for controlling the four NAND chip selects via the DMA interface. The first option is the one to one mapping, where the each DMA channel is tied to its own NAND chip select. For example DMA channel 'n' accesses only NAND attached to chip select 'n'. The second option is the decoupled mode where a DMA channel can access any or all NAND chip selects connected to the GPMI. A DMA channel will signify the NAND chip select it wants to access by writing its chip select value in the GPMI_CTRL0[CS] field and setting the GPMI_CTRL1[DECOUPLE_CS] to 1. This option is useful if software chooses to use only one DMA channel to access all the attached NAND devices.

27.4.2 GPMI NAND Timing and Clocking



The dedicated clock, GPMICLK, is used as a timing reference for NAND flash I/O. Since various NANDs have different timing requirements, GPMICLK may need to be adjusted for each application.

While the actual pin timings are limited by the NAND chips used and the I/O pad configuration, the GPMI can support data bus speeds of up to 200 MHz x 8 bits. The actual read/write strobe timing parameters are adjusted as indicated in the register descriptions in Memory Map.

27.4.3 Basic NAND Timing

27.4.3.1 NAND Asynchronous Timing

Figure 27-3 and illustrates the operation of the output (from host to device) timing parameters in NAND ONFI asynchronous mode.

- tAS is configurable by programming HW_GPMI_TIMING0 Address_Setup: in this example, Address_Setup = 4, tAS is equal to 4 dev_clk cycles.
- tDS is configurable by programming HW_GPMI_TIMING0 Data_Setup; in this example, Data_Setup = 3, tDS is equal to 3 dev_clk cycles
- tDH is configuarble by programming HW_GPMI_TIMING0 Data_Hold: in this example, Data_Hold = 2, tDH is equal to 2 dev_clk cycles
- tAS/tDS/tDH will extend, if the output data is not ready in device fifo.

Figure 27-2. Asynchronous Mode Basic Write Timing Diagram (command write, address write, or data write

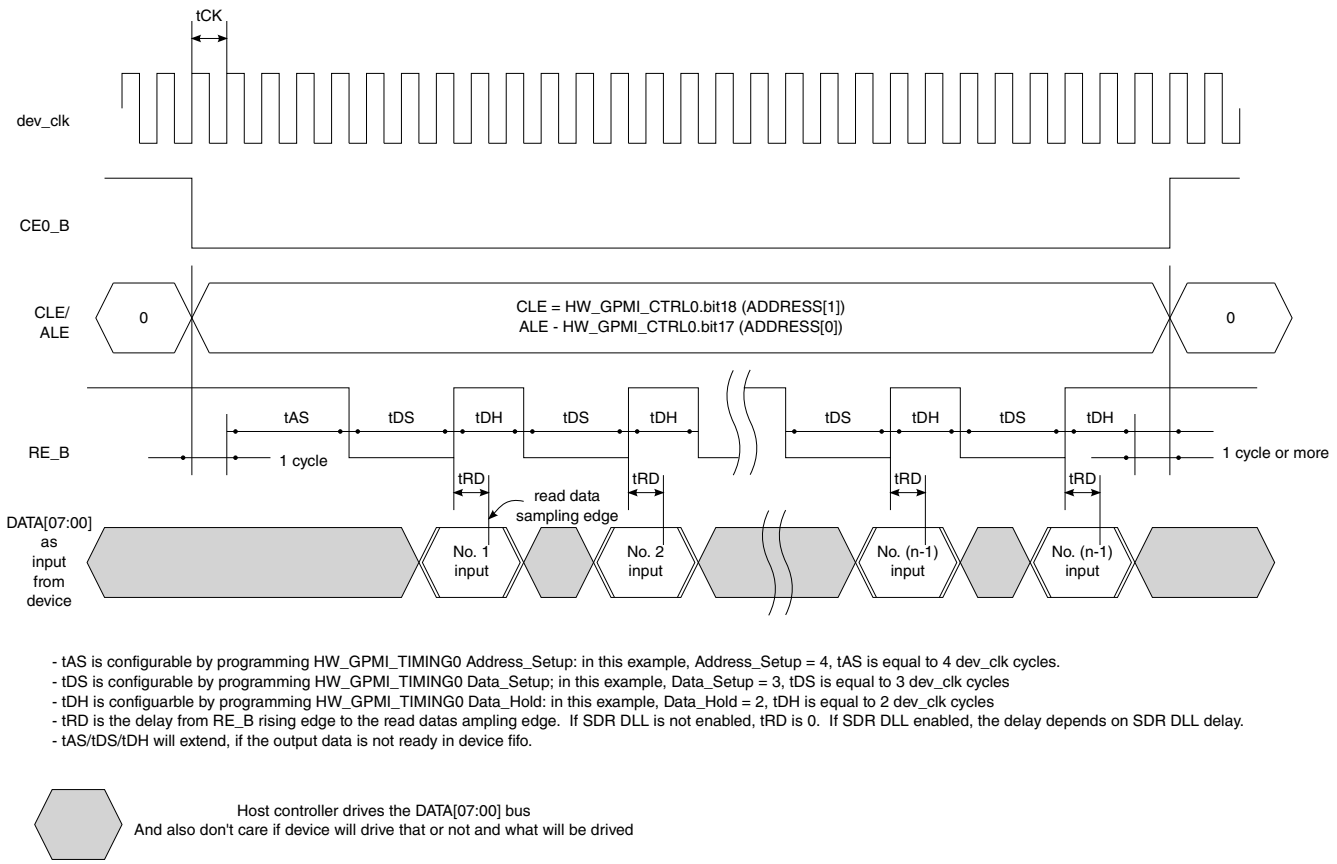


Figure 27-3. ONFI Asynchronous Mode Basic Read Timing Diagram (data read)

27.4.3.2 NAND Asynchronous EDO Mode Timing

In high-speed NANDS, the read data may not be valid until after the read strobe (NAND_RE_B) deasserts. This is the case when the minimum tDS is programmed to achieve higher bandwidth.

The GPMI implements a feedback read strobe to sample the read data. The feedback read strobe can be delayed to support fast nand EDO (Extended Data Out) timing where the read strobe may deassert before the read data is valid, and read data is valid for some time after read strobe.

Nand EDO timings is applied typically for read cycle frequency above 33 MHz. See Figure 27-4.

The GPMI provides control over the amount of delay applied to the feedback read strobe. This delay depends on the maximum read access time (tREA) of the nand and the read pulse width (tRP) used to access the nand. tRP is specified by

GPMI_TIMING0[DATA_SETUP] register. When (tREA + 4ns) is less than tRP, no delay is required to sample to nand read data. (The 4ns provides adequate data setup time for the GPMI.) In this case set GPMI_CTRL1[HALF_PERIOD] = 0; GPMI_CTRL1[RDN_DELAY] = 0; GPMI_CTRL1[DLL_ENABLE] = 0.

When (tREA + 4ns) is greater than or equal to tRP, a delay of the feedback read strobe is required to sample to nand read data. This delay is equal to the difference between these two timings:

DELAY = tREA + 4ns - tRP.

Since the GPMI delay chain is limited to ns maximum, if DELAY > ns then increase tRP by increasing the value of GPMI_TIMING0[DATA_SETUP] until DELAY is less than or equal to ns.

The GPMI programming for this DELAY depends on the GPMICLK period. The GPMI DLL will not function properly if the GPMICLK period is greater than ns: disable the DLL if this is the case. If the GPMICLK period is greater than ns (and not greater than ns), set the GPMI_CTRL1[HALF_PERIOD]=1; This will cause the DLL reference period (RP) to be one-half of the GPMICLK period. If the GPMICLK period is ns or less then set the GPMI_CTRL1[HALF_PERIOD]=0; This will cause the DLL reference period (RP) to be equal to the GPMICLK period. DELAY is a multiple (0 to 1.875) of RP.

The GPMI_CTRL1[RDN_DELAY] is encoded as a 1-bit integer and 3-bit fraction delay factor. DELAY is a multiple of the delay factor and the reference period. See table below for details.

Table 27-3. RDN DELAY

HW_GPMI_CTRL1[RDN_DELAY]	Delay Factor
0	0.000
1	0.125
2	0.250
3	0.375
4	0.500
5	0.625
6	0.750
7	0.875
8	1.000
9	1.125
10	1.250
11	1.375
12	1.500

Table continues on the next page...

Table 27-3. RDN DELAY (continued)

HW_GPMI_CTRL1[RDN_DELAY]	Delay Factor
13	1.625
14	1.750
15	1.875

DELAY = DelayFactor x RP or DELAY = GPMI_CTRL1[RDN_DELAY] x 0.125 x RP.

Use this equation to calculate the value for GPMI_CTRL1[RDN_DELAY]. Then set GPMI_CTRL1[DLL_ENABLE]=1.

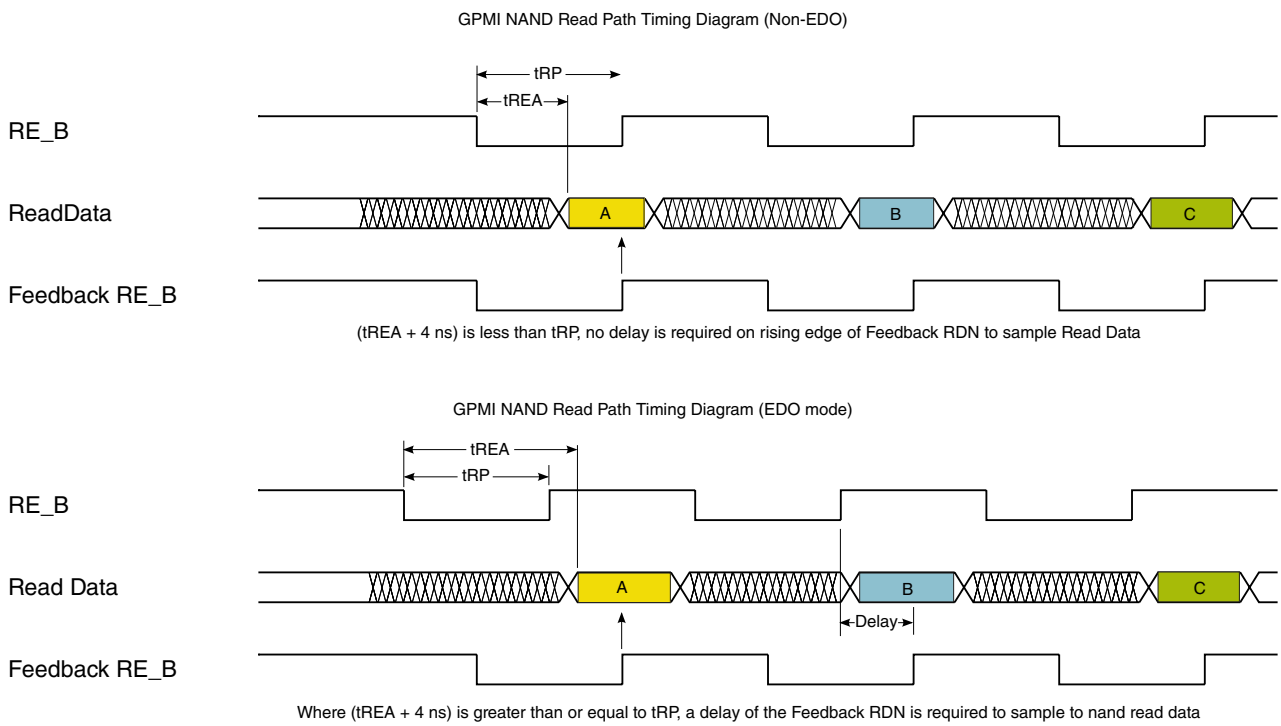

Figure 27-4. NAND Read Path Timing

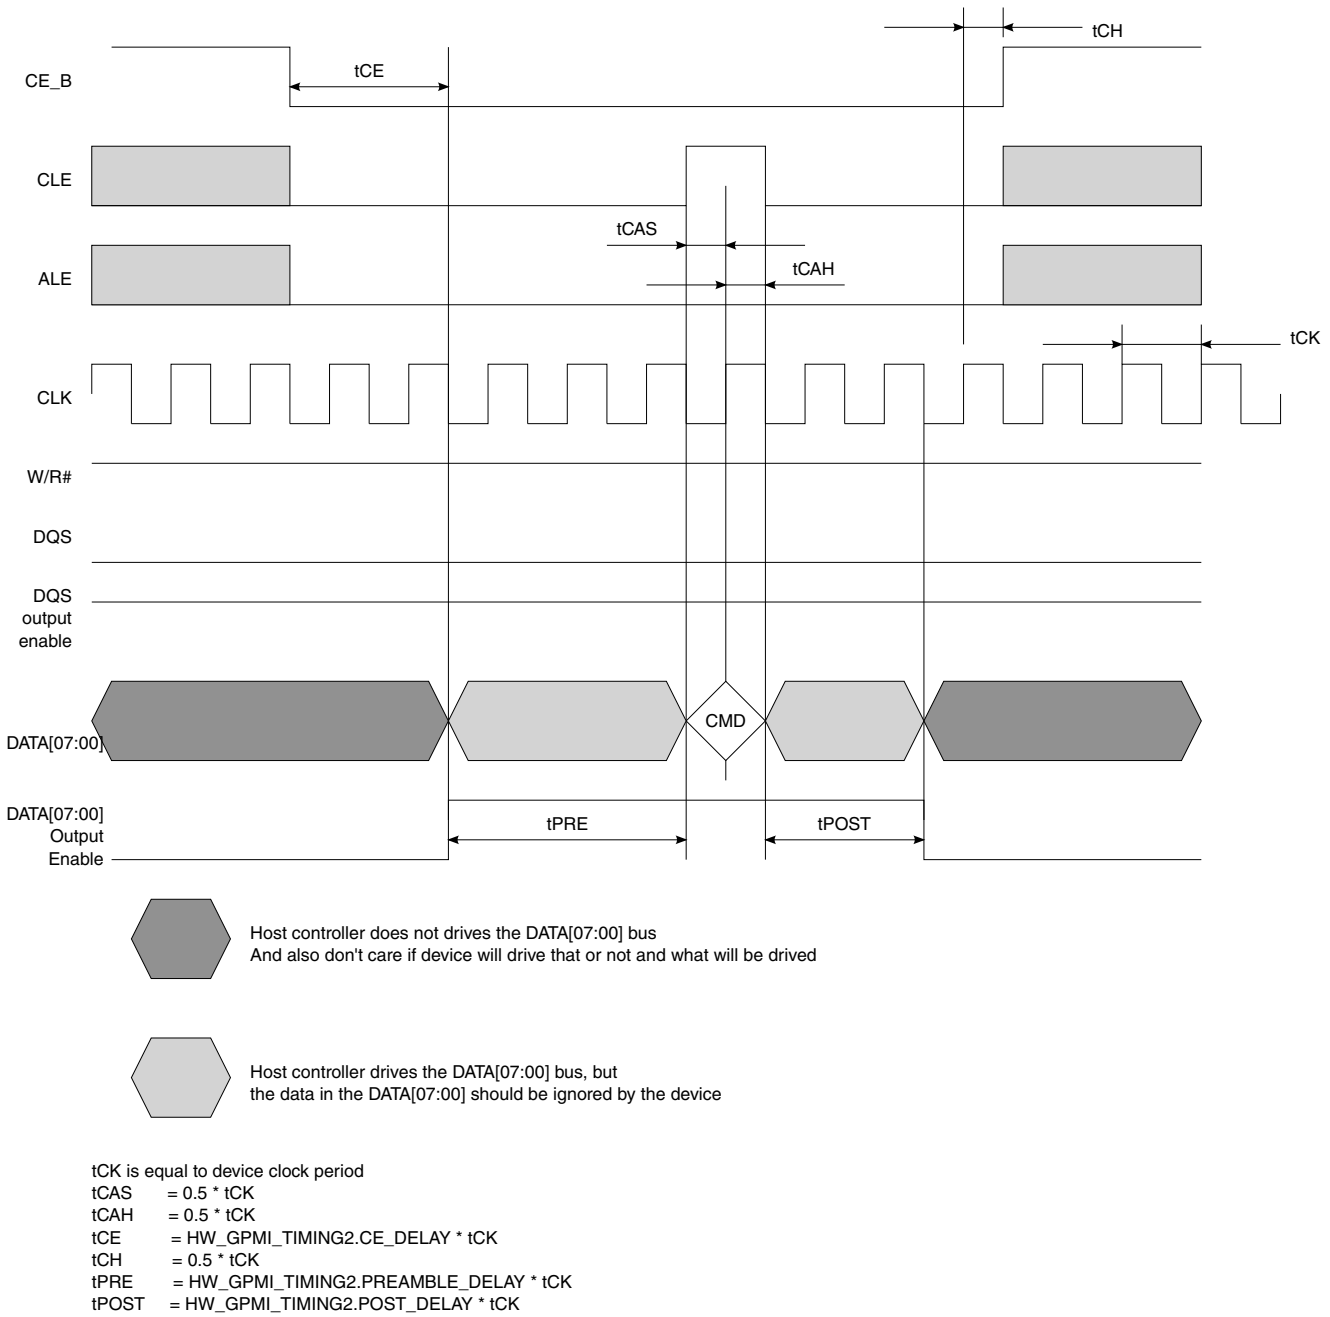
For example, a NAND with tREAmax = 20 ns, tRPmin = 12 ns, and tRCmin = 25 ns (read cycle time) may be programmed as follows:

- GPMICLK clock frequency: Consider 480/6 = 80 MHz which is 12.5 ns clock period. This is too close to the minimum NAND spec if we program the data setup and hold to 1 GPMICLK cycle. Consider 480/7=68.57 MHz which is 14.58 ns clock period. With data setup and hold set to 1, we have a tRP of 14.58ns and a tRC of 29.16 ns (good margins).

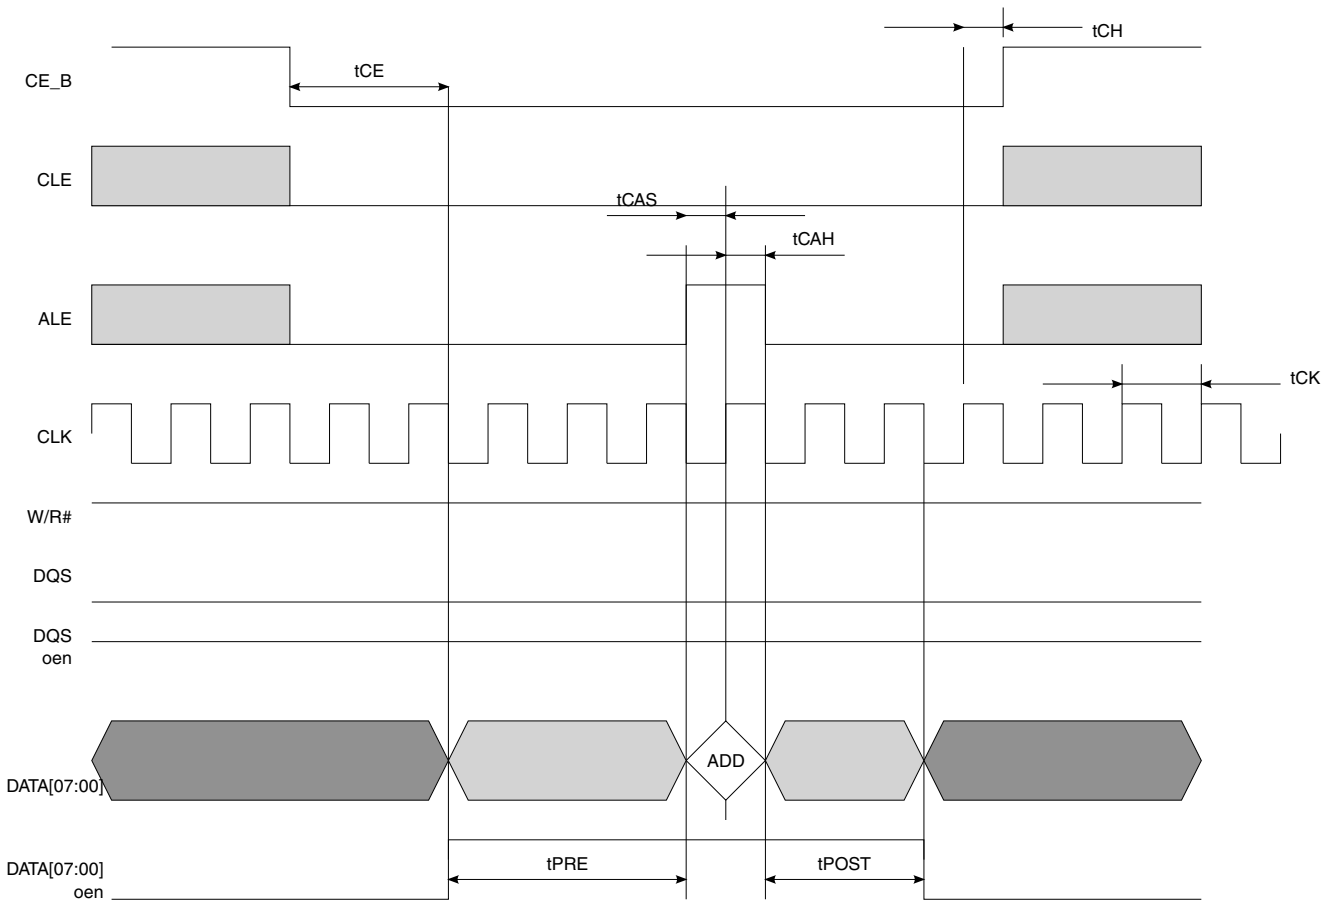
- Since (tREA +4ns) is greater than tRP, required DELAY = tREA + 4ns - tRP = 20 + 4 - 14.58ns = 9.42 ns.
- GPMI_CTRL1[HALF_PERIOD] =, since GPMICLK period is ns. So RP=GPMICLK period = ns.
- DELAY = GPMI_CTRL1[RDN_DELAY] x 0.125 x RP. 9.42 ns = GPMI_CTRL1[RDN_DELAY] x 0.125 x ns. GPMI_CTRL1[RDN_DELAY] =



NOTE

It is recommended that the drive strength of NAND_RE_B and NAND_WE_B output pins be set to 8 mA. This will reduce the transition time under heavy loads. Low transition times will be important when NAND interface read and write cycle times are below 30 ns. The other GPMI pins may remain at 4 mA, since their frequency is only up to half that of NAND_RE_B and NAND_WE_B.

27.4.3.3 NAND ONFI Source Synchronous Mode Timing



NOTE

In the following figures, CLK shares the same pin as WE_B in Async Mode. And W/R# shares the same pin as RE_B in Async Mode.

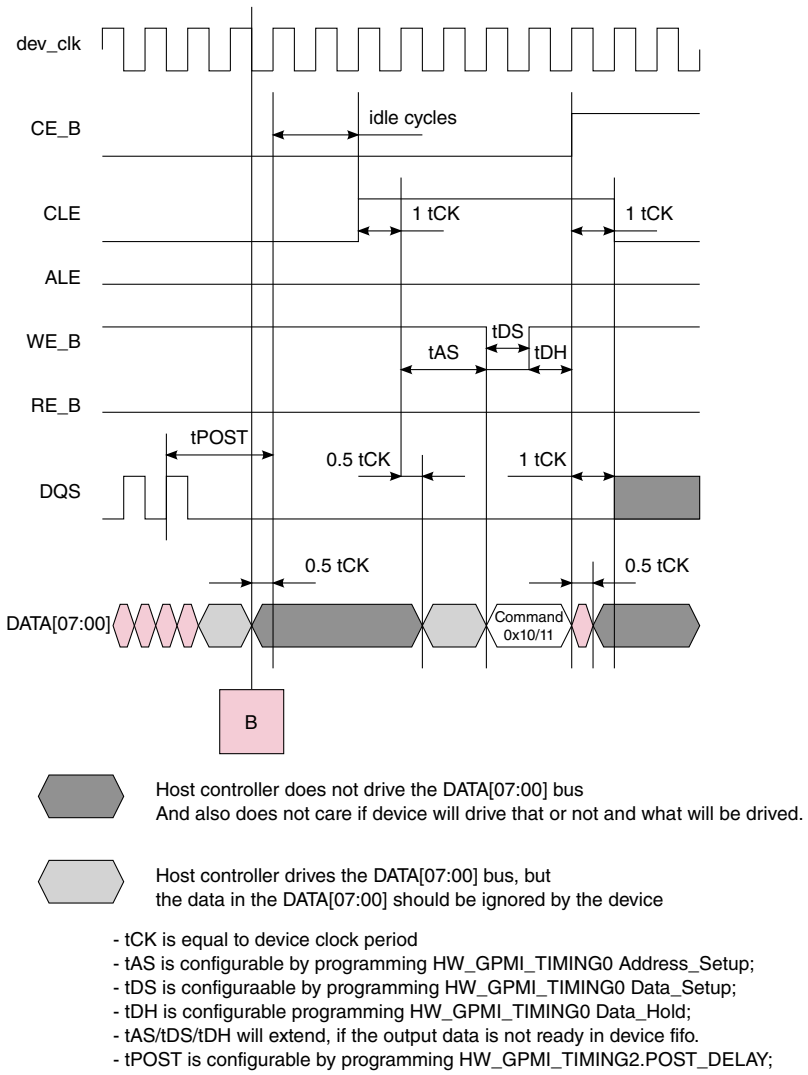

Figure 27-17. Toggle Mode Program Timing Diagram (C)

27.4.4 Hardware BCH Interface

The GPMI provides an interface to the BCH module. This reduces the SOC bus traffic and the software involvement.

.

When BCH ECC is enable, parity information is inserted on-the-fly during writes to 8-bit NAND devices. The BCH will supply payload and parity to the GPMI to write to the NAND. During NAND reads, parity is checked and ECC processing is performed after each read block. In this case the GPMI reads the NAND device and redirects the data and parity to the BCH module for ECC processing.

To program the BCH for NAND writes, remove the soft reset and clock gates from BCH_CTRL[SFTRST] and BCH_CTRL[CLKGATE]. The bulk of BCH programming is actually applied to the GPMI via PIO operations embedded in its DMA command structures. This has a subtle implication when writing to the GPMI ECC registers: access to the these registers must be written in progressive register order. Thus, to write to the GPMI_ECCCOUNT register, write first (in order) to registers GPMI_CTRL0, GPMI_COMPARE, and GPMI_ECCCTRL before writing to GPMI_ECCCOUNT. These additional register writes need to be accounted for in the CMDWORDS field of the respective DMA channel command register.

Note that the GPMI_PAYLOAD and GPMI_AUXILIARY pointers need to be word-aligned for proper ECC operation. If those pointers are non-word-aligned, then the BCH engine will not operate properly and could possibly corrupt system memory in the adjoining memory regions.

27.5 Behavior During Reset

A soft reset (SFTRST) can take multiple clock periods to complete, so do NOT set CLKGATE when setting SFTRST. The reset process gates the clocks automatically.

27.6 GPMI Memory Map/Register Definition

The following registers provide control for programmable elements of the GPMI module.

NOTE

All ATA or UDMA features are not supported for the chip.

GPMI memory map

27.6.1 GPMI Control Register 0 Description (GPMI_CTRL0*n*)

The GPMI control register 0 specifies the GPMI transaction to perform for the current command chain item.

Address: 180_6000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	SFTRST	CLKGATE	RUN	DEV_IRQ_EN	LOCK_CS	UDMA	COMMAND_MODE		WORD_LENGTH	CS			ADDRESS			ADDRESS_INCREMENT
Reset	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	XFER_COUNT															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_CTRL0*n* field descriptions

Field	Description
31 SFTRST	Set to zero for normal operation. When this bit is set to one (default), then the entire block is held in its reset state. This will not work if the CLKGATE bit is already set to '1'. CLKGATE must be cleared to '0' before issuing a soft reset. Also the GPMICLK must be running for this to work properly. RUN = 0x0 Allow GPMI to operate normally. RESET = 0x1 Hold GPMI in reset.
30 CLKGATE	Set this bit zero for normal operation. Setting this bit to one (default), gates all of the block level clocks off for miniminizing AC energy consumption. RUN = 0x0 Allow GPMI to operate normally. NO_CLKS = 0x1 Do not clock GPMI gates in order to minimize power consumption.
29 RUN	The GPMI is busy running a command whenever this bit is set to '1'. The GPMI is idle whenever this bit set to zero. This can be set to one by a CPU write. In addition, the DMA sets this bit each time a DMA command has finished its PIO transfer phase. IDLE = 0x0 The GPMI is idle. BUSY = 0x1 The GPMI is busy running a command.

Table continues on the next page...

GPMI_CTRL0*n* field descriptions (continued)

Field	Description
28 DEV_IRQ_EN	When set to '1' and ATA_IRQ pin is asserted, the GPMI_IRQ output will assert.
27 LOCK_CS	For ATA/NAND mode: 0= Deassert chip select (CS) after RUN is complete. 1= Continue to assert chip select (CS) after RUN is complete. For Camera Mode: 0= Dont wait for VSYNC rising edge before capturing data. 1= Wait for VSYNC rising edge before capturing data (Camera mode only). DISABLED = 0x0 Deassert chip select (CS) after RUN is complete. ENABLED = 0x1 Continue to assert chip select (CS) after RUN is complete.
26 UDMA	DISABLED = 0x0 Use ATA-PIO mode on the external bus. ENABLED = 0x1 Use ATA-Ultra DMA mode on the external bus. 0 Use ATA-PIO mode on the external bus. 1 Use ATA-Ultra DMA mode on the external bus.
25–24 COMMAND_ MODE	WRITE = 0x0 Write mode. READ = 0x1 Read mode. READ_AND_COMPARE = 0x2 Read and Compare mode (setting sense flop). WAIT_FOR_READY = 0x3 Wait for Ready mode. For ATA WAIT_FOR_READY command set CS=01. 00 Write mode. 01 Read Mode. 10 Read and Compare Mode (setting sense flop). 11 Wait for Ready.
23 WORD_LENGTH	This bit should only be changed when RUN==0. Reserve = 0x0 Reserved. 8_BIT = 0x1 8-bit Data Bus mode. 0 Reserved. 1 8-bit Data Bus mode.
22–20 CS	Selects which chip select is active for this command. For ATA WAIT_FOR_READY command, this must be set to b01.
19–17 ADDRESS	Specifies the three address lines for ATA mode. In NAND mode, use A0 for CLE and A1 for ALE. NAND_DATA = 0x0 In NAND mode, this address is used to read and write data bytes. NAND_CLE = 0x1 In NAND mode, this address is used to write command bytes. NAND_ALE = 0x2 In NAND mode, this address is used to write address bytes.
16 ADDRESS_ INCREMENT	In ATA mode, the address will increment with each cycle. In NAND mode, the address will increment once, after the first cycle (going from CLE to ALE). DISABLED = 0x0 Address does not increment. ENABLED = 0x1 Increment address. 0 Address does not increment. 1 Increment address.
XFER_COUNT	Number of bytes to transfer for this command. A value of zero will transfer 64K bytes.

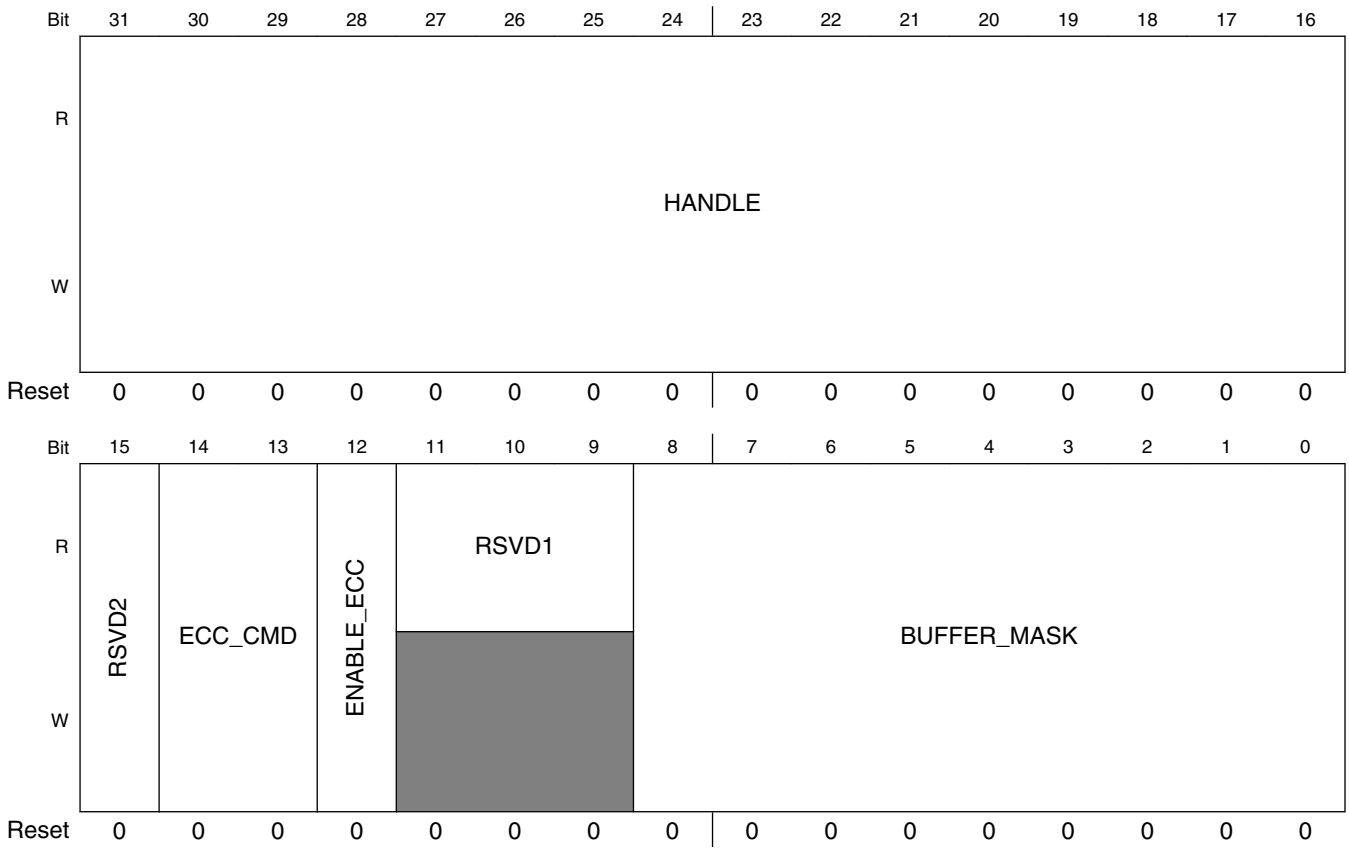
27.6.2 GPMI Compare Register Description (GPMI_COMPARE)

The GPMI compare register specifies the expect data and the xor mask for comparing to the status values read from the device. This register is used by the Read and Compare command.

GPMI_COMPARE 0x010

Address: 180_6000h base + 10h offset = 180_6010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	MASK																REFERENCE															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



GPMI_COMPARE field descriptions

Field	Description
31–16 MASK	16-bit mask which is applied after the read data is XORed with the REFERENCE bit field.
REFERENCE	16-bit value which is XORed with data read from the NAND device.

27.6.3 GPMI Integrated ECC Control Register Description (GPMI_ECCCTRL*n*)

The GPMI ECC control register handles configuration of the integrated ECC accelerator.

Address: 180_6000h base + 20h offset + (4d × i), where i=0d to 3d

GPMI_ECCCTRL*n* field descriptions

Field	Description
31–16 HANDLE	This is a register available to software to attach an identifier to a transaction in progress. This handle will be available from the ECC register space when the completion interrupt occurs.
15 RSVD2	Always write zeroes to this bit field.
14–13 ECC_CMD	ECC Command information. DECODE = 0x0 Decode. ENCODE = 0x1 Encode. RESERVE2 = 0x2 Reserved. RESERVE3 = 0x3 Reserved.

Table continues on the next page...

GPMI_ECCCTRL*n* field descriptions (continued)

Field	Description
12 ENABLE_ECC	Enable ECC processing of GPMI transfers. ENABLE = 0x1 Use integrated ECC for read and write transfers. DISABLE = 0x0 Integrated ECC remains in idle.
11–9 RSVD1	Always write zeroes to this bit field.
BUFFER_MASK	ECC buffer information. The BCH error correction only allows two configurations of the buffer mask - software may either read just the first block on the flash page or the entire flash page. Write operations must be for the entire flash page. Invalid buffer mask values will cause the DMA descriptor command to be terminated. BCH_AUXONLY = 0x100 Set to request transfer from only the auxiliary buffer (block 0 on flash). BCH_PAGE = 0x1FF Set to request transfer to/from the entire page.

27.6.4 GPMI Integrated ECC Transfer Count Register Description (GPMI_ECCCOUNT)

The GPMI ECC Transfer Count Register contains the count of bytes that flow through the ECC subsystem.

GPMI_ECCCOUNT 0x030

Address: 180_6000h base + 30h offset = 180_6030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	RSVD2																COUNT															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_ECCCOUNT field descriptions

Field	Description
31–16 RSVD2	Always write zeroes to this bit field.
COUNT	Number of bytes to pass through ECC. This is the GPMI transfer count plus the syndrome count that will be inserted into the stream by the ECC. In DMA2ECC_MODE this count must match the GPMI_CTRL0_XFER_COUNT. A value of zero will transfer 64K words.

27.6.5 GPMI Payload Address Register Description (GPMI_PAYLOAD)

The GPMI payload address register specifies the location of the data buffers in system memory. This value must be word aligned.

GPMI_PAYLOAD 0x040

Address: 180_6000h base + 40h offset = 180_6040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	ADDRESS															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	ADDRESS														RSVD0	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_PAYLOAD field descriptions

Field	Description
31–2 ADDRESS	Pointer to an array of one or more 512 byte payload buffers.
RSVD0	Always write zeroes to this bit field.

27.6.6 GPMI Auxiliary Address Register Description (GPMI_AUXILIARY)

The GPMI auxiliary address register specifies the location of the auxiliary buffers in system memory. This value must be word aligned.

GPMI_AUXILIARY 0x050

Address: 180_6000h base + 50h offset = 180_6050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	ADDRESS															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	ADDRESS														RSVD0	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_AUXILIARY field descriptions

Field	Description
31–2 ADDRESS	Pointer to ECC control structure and meta-data storage.
RSVD0	Always write zeroes to this bit field.

27.6.7 GPMI Control Register 1 Description (GPMI_CTRL1*n*)

The GPMI control register 1 specifies additional control fields that are not used on a per-transaction basis.

Address: 180_6000h base + 60h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	DEV_CLK_STOP	SSYNC_CLK_STOP	WRITE_CLK_STOP	TOGGLE_MODE	GPMI_CLK_DIV2_EN	UPDATE_CS	SSYNCMODE	DECOUPLE_CS	WRN_DLY_SEL		TEST_TRIGGER	TIMEOUT_IRQ_EN	GANGED_RDYBUSY	BCH_MODE	DLL_ENABLE	HALF_PERIOD
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	RDN_DELAY				DMA2ECC_MODE	DEV_IRQ	TIMEOUT_IRQ	BURST_EN	ABORT_WAIT_REQUEST	ABORT_WAIT_FOR_READY_CHANNEL			DEV_RESET	ATA_IRQRDY_POLARITY	CAMERA_MODE	GPMI_MODE
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

GPMI_CTRL1*n* field descriptions

Field	Description
31 DEV_CLK_STOP	set this bit to 1 will stop gpmi io working clk.
30 SSYNC_CLK_STOP	set this bit to 1 will stop the source synchronous mode clk.
29 WRITE_CLK_STOP	In onfi source synchronous mode, host may save power during the data write cycles by holding the CLK signal high (i.e. stopping the CLK). The host may only stop the CLK during data write, by setting this bit to 1, if the device supports this feature as indicated in the parameter page.
28 TOGGLE_MODE	enable samsung toggle mode.
27 GPMI_CLK_DIV2_EN	This bit should be reset to 0 in asynchronous mode. The frequence ratio of (device clock : ccm gpmi clock) will be (1 : 1). This bit should be set to 1, in source synchronous mode or toggle mode. The frequence raito of (device clock : ccm gpmi clock) will be (1 : 2). enable the gpmi clk divider. 0x0 internal factor-2 clock divider is disabled 0x1 internal factor-2 clock divider is enabled.

Table continues on the next page...

GPMI_CTRL1*n* field descriptions (continued)

Field	Description
26 UPDATE_CS	force the CS value is be updated to external chip select pin, even GPMI is idle.
25 SSYNCMODE	source synchronouse mode 1 or asynchrous mode 0. ASYNC = 0x0 Asynchronous mode. SSYNC = 0x1 Source Synchronous mode.
24 DECOUPLE_CS	Decouple Chip Select from DMA Channel. Setting this bit to 1 will allow a DMA channel to specify any value in the CTRL0_CS register field. Software can use one DMA channel to access all 8 Nand devices.
23–22 WRN_DLY_SEL	Since the GPMI write strobe (WRN) is a fast clock pin, the delay on this signal can be programmed to match the load on this pin. 0 = ~2ns; 1 = ~4ns; 2 = ~6ns; 3 = no delay.
21 TEST_TRIGGER	Test Trigger Enable 0 Disable 1 Enable
20 TIMEOUT_IRQ_EN	Setting this bit to '1' will enable timeout IRQ for transfers in ATA mode only, and for WAIT_FOR_READY commands in both ATA and Nand mode. The Device_Busy_Timeout value is used for this timeout.
19 GANGED_RDYBUSY	Set this bit to 1 will force all Nand RDY_BUSY inputs to be sourced from (tied to) RDY_BUSY0. This will free up all, except one, RDY_BUSY input pins.
18 BCH_MODE	This bit selects which error correction unit will access GPMI. This bit must always be set to '1', since only the BCH unit is available in this design.
17 DLL_ENABLE	Set this bit to 1 to enable the GPMI DLL. This is required for fast NAND reads (above 30 MHz read strobe). After setting this bit, wait 64 GPMI clock cycles for the DLL to lock before performing a NAND read.
16 HALF_PERIOD	Set this bit to 1 if the GPMI clock period is greater than 16ns for proper DLL operation. DLL_ENABLE must be zero while changing this field.
15–12 RDN_DELAY	This variable is a factor in the calculated delay to apply to the internal read strobe for correct read data sampling. The applied delay (AD) is between 0 and 1.875 times the reference period (RP). RP is one half of the GPMI clock period if HALF_PERIOD=1 otherwise it is the full GPMI clock period. The equation is: AD = RDN_DELAY x 0.125 x RP. This value must not exceed 16ns. This variable is used to achieve faster NAND access. For example if the Read Strobe is asserted from time 0 to 13ns but the read access time is 20ns, then choose AD=12ns will cause the data to be sampled at time 25ns (13+12) giving a 5ns data setup time. If RP=13ns then RDN_DELAY = 12/(0.125 x 13ns) = 7.38 (0111b). DLL_ENABLE must be zero while changing this field.
11 DMA2ECC_MODE	This is mainly for testing HWECC without involving the Nand device. Setting this bit will cause DMA write data to redirected to HWECC module (instead of Nand Device) for encoding or decoding.
10 DEV_IRQ	This bit is set when an Interrupt is received from the ATA device. Write 0 to clear.
9 TIMEOUT_IRQ	This bit is set when a timeout occurs using the Device_Busy_Timeout value. Write 0 to clear.

Table continues on the next page...

GPMI_CTRL1*n* field descriptions (continued)

Field	Description
8 BURST_EN	When set to 1 each DMA request will generate a 4-transfer burst on the APB bus.
7 ABORT_WAIT_REQUEST	Request to abort "wait for ready" command on channel indicated by ABORT_WAIT_FOR_READY_CHANNEL. Hardware will clear this bit when abort is done.
6–4 ABORT_WAIT_FOR_READY_CHANNEL	Abort a wait for ready command on selected channel. Set the ABORT_WAIT_REQUEST to kick of operation.
3 DEV_RESET	ENABLED = 0x0 NANDF_WP_B(WPN) pin is held low (asserted). DISABLED = 0x1 NANDF_WP_B(WPN) pin is held high (de-asserted). 0 NANDF_WP_B pin is held low (asserted). 1 NANDF_WP_B pin is held high (de-asserted).
2 ATA_IRQRDY_POLARITY	For ATA MODE: Note NAND_RDY_BUSY[3:2] are not affected by this bit. ACTIVELOW = 0x0 ATA IORDY and IRQ are active low, or NAND_RDY_BUSY[1:0] are active low ready. ACTIVEHIGH = 0x1 ATA IORDY and IRQ are active high, or NAND_RDY_BUSY[1:0] are active high ready. 0 External ATA IORDY and IRQ are active low. 1 External ATA IORDY and IRQ are active high. For NAND MODE: 0 External RDY_BUSY[1] and RDY_BUSY[0] pins are ready when low and busy when high. 1 External RDY_BUSY[1] and RDY_BUSY[0] pins are ready when high and busy when low.
1 CAMERA_MODE	When set to 1 and ATA UDMA is enabled the UDMA interface becomes a camera interface.
0 GPMI_MODE	ATA mode is only supported on channel zero. If ATA mode is selected, then only channel three is available for NAND use. NAND = 0x0 NAND mode. ATA = 0x1 ATA mode. 0 NAND mode. 1 ATA mode.

27.6.8 GPMI Timing Register 0 Description (GPMI_TIMING0)

The GPMI timing register 0 specifies the timing parameters that are used by the cycle state machine to guarantee the various setup, hold and cycle times for the external media type.

GPMI_TIMING0 0x070

Address: 180_6000h base + 70h offset = 180_6070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPMI_TIMING0 field descriptions

Field	Description
31–24 RSVD1	Always write zeroes to this bit field.
23–16 ADDRESS_ SETUP	Number of GPMICLK cycles that the CE/ADDR signals are active before a strobe is asserted. A value of zero is interpreted as 0. For ATA PIO modes this is known in the ATA7 specification as "Address valid to DIOR-/DIOW- setup"
15–8 DATA_HOLD	Data bus hold time in GPMICLK cycles. Also the time that the data strobe is de-asserted in a cycle. A value of zero is interpreted as 256. For ATA PIO modes this is known in the ATA7 specification as "DIOR-/DIOW- recovery time"
DATA_SETUP	Data bus setup time in GPMICLK cycles. Also the time that the data strobe is asserted in a cycle. This value must be greater than 2 for ATA devices that use IORDY to extend transfer cycles. A value of zero is interpreted as 256. For ATA PIO modes this is known in the ATA7 specification as ""DIOR-/DIOW-"

27.6.9 GPMI Timing Register 1 Description (GPMI_TIMING1)

The GPMI timing register 1 specifies the timeouts used when monitoring the NAND READY pin or the ATA IRQ and IOWAIT signals.

GPMI_TIMING1 0x080

Address: 180_6000h base + 80h offset = 180_6080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPMI_TIMING1 field descriptions

Field	Description
31–16 DEVICE_BUSY_ TIMEOUT	Timeout waiting for NAND Ready/Busy or ATA IRQ. Used in WAIT_FOR_READY mode. This value is the number of GPMI_CLK cycles multiplied by 4096.
RSVD1	Always write zeroes to this bit field.

27.6.10 GPMI Timing Register 2 Description (GPMI_TIMING2)

The GPMI timing register 2 specifies the double data rate timing parameters that are used by the cycle state machine to guarantee the various cs delay, pre-amble delay, post-amble delay, command/address delay, data delay, TCR, TRPSTH, and read latency cycle times for the external media type.

GPMI_TIMING2 0x090

Address: 180_6000h base + 90h offset = 180_6090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPMI_TIMING2 field descriptions

Field	Description
31–29 TRPSTH	Only for Toggle NAND timing control delay TRPSTH GPMICLK cycles for CEn_B high to RE_B high, A value of zero is interpreted as 8
28–27 TCR	Only for Toggle NAND timing control delay (TCR+1) GPMICLK cycles for CEn_B low to RE_B low, 0 is less than or equal to TCR, which is less than the PREAMBLE_DELAY
26–24 READ_ LATENCY	This field is for double data rate read latency configuration. others READ LATENCY is 3 000 READ LATENCY is 0 001 READ LATENCY is 1 010 READ LATENCY is 2 011 READ LATENCY is 3 100 READ LATENCY is 4 101 READ LATENCY is 5
23–21 RSVD0	Always write zeroes to this bit field.
20–16 CE_DELAY	GPMI dealy from CEn assert to W/Rn changing edge. value of zero is interpreted as 32.
15–12 PREAMBLE_ DELAY	GPMI pre-amble delay in GPMICLK cycles. A value of zero is interpreted as 16.
11–8 POSTAMBLE_ DELAY	GPMI post-amble delay in GPMICLK cycles. A value of zero is interpreted as 16.
7–4 CMDADD_ PAUSE	GPMI delay time from command or addres pause to command or address resume in GPMICLK cycles. A value of zero is interpreted as 16.
DATA_PAUSE	GPMI delay time from data pause to data resume in GPMICLK cycles. A value of zero is interpreted as 16.

27.6.11 GPMI DMA Data Transfer Register Description (GPMI_DATA)

The GPMI DMA data transfer register is used by the DMA to read or write data to or from the ATA/NAND control state machine.

GPMI_DATA 0x0A0

Address: 180_6000h base + A0h offset = 180_60A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

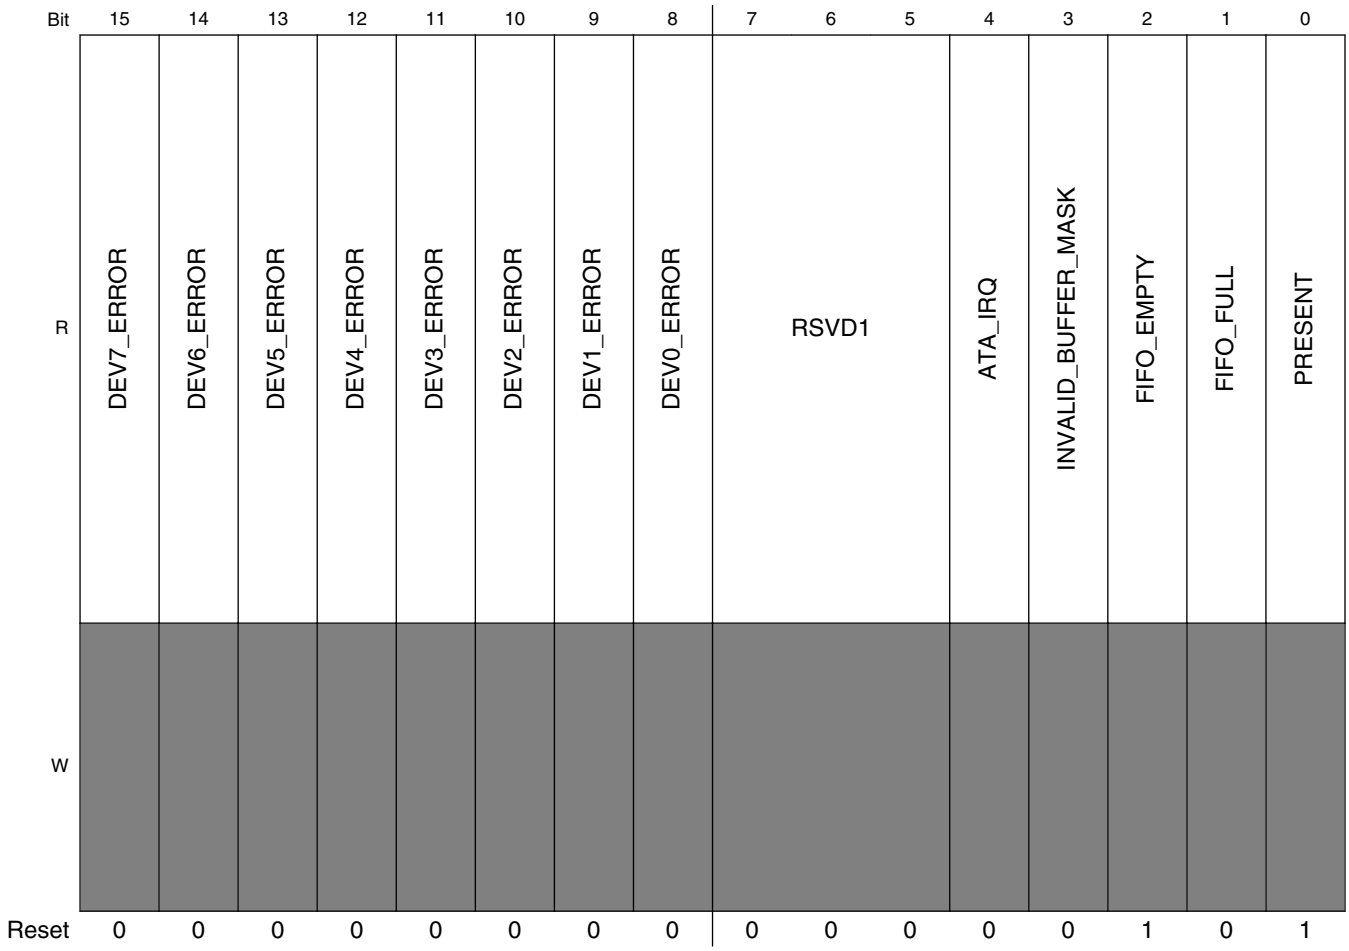
GPMI_DATA field descriptions

Field	Description
DATA	In 8-bit mode, one, two, three or four bytes can can be accessed to send the same number of bus cycles.



27.6.12 GPMI Status Register Description (GPMI_STAT)

The GPMI control and status register provides a read back path for various operational states of the GPMI controller.

GPMI_STAT 0x0B0

Address: 180_6000h base + B0h offset = 180_60B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	READY_BUSY								RDY_TIMEOUT							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_STAT field descriptions

Field	Description
31–24 READY_BUSY	Read-only view of NAND Ready_Busy Input pins.
23–16 RDY_TIMEOUT	State of the RDY/BUSY Timeout Flags. When any bit is set to '1' in this field, it indicates that a time out has occurred while waiting for the ready state of the requested NAND device. Multiple bits may be set simultaneously. When GPMI_CTRL1_DECOUPLE_CS = 0, RDY_TIMEOUT[n] is associated with the NAND device on chip_select[n]. When GPMI_CTRL1_DECOUPLE_CS = 1, these flags become associated to a DMA channel instead of a NAND device. For example if DMA channel 6 sends a WAIT_FOR_READY command for NAND Device 2, and a timeout occured on READY_BUSY2, then READY_TIMEOUT[6] will be set instead of READY_TIMEOUT[2].
15 DEV7_ERROR	DMA channel 7 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 7. 1 An Error has occurred on ATA/NAND Device accessed by

Table continues on the next page...

GPMI_STAT field descriptions (continued)

Field	Description
14 DEV6_ERROR	DMA channel 6 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 6. 1 An Error has occurred on ATA/NAND Device accessed by
13 DEV5_ERROR	DMA channel 5 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 5. 1 An Error has occurred on ATA/NAND Device accessed by
12 DEV4_ERROR	DMA channel 4 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 4. 1 An Error has occurred on ATA/NAND Device accessed by
11 DEV3_ERROR	DMA channel 3 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 3. 1 An Error has occurred on ATA/NAND Device accessed by
10 DEV2_ERROR	DMA channel 2 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 2. 1 An Error has occurred on ATA/NAND Device accessed by
9 DEV1_ERROR	DMA channel 1 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 1. 1 An Error has occurred on ATA/NAND Device accessed by
8 DEV0_ERROR	DMA channel 0 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 0. 1 An Error has occurred on ATA/NAND Device accessed by
7–5 RSVD1	Always write zeroes to this bit field.
4 ATA_IRQ	Status of the ATA_IRQ input pin.
3 INVALID_ BUFFER_MASK	Buffer Mask Validity bit. 0 ECC Buffer Mask is not invalid. 1 ECC Buffer Mask is invalid.
2 FIFO_EMPTY	NOT_EMPTY = 0x0 FIFO is not empty. EMPTY = 0x1 FIFO is empty. 0 FIFO is not empty. 1 FIFO is empty.
1 FIFO_FULL	NOT_FULL = 0x0 FIFO is not full. FULL = 0x1 FIFO is full. 0 FIFO is not full. 1 FIFO is full.
0 PRESENT	UNAVAILABLE = 0x0 GPMI is not present in this product. AVAILABLE = 0x1 GPMI is present in this product.

Field	Description
	0 GPMI is not present in this product. 1 GPMI is present is in this product.

27.6.13 GPMI Debug Information Register Description (GPMI_DEBUG)

The GPMI debug information register provides a read back path for diagnostics to determine the current operating state of the GPMI controller.

GPMI_DEBUG 0x0C0

Address: 180_6000h base + C0h offset = 180_60C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	WAIT_FOR_READY_END								DMA_SENSE								DMAREQ								CMD_END							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_DEBUG field descriptions

Field	Description
31–24 WAIT_FOR_ READY_END	Read Only view of the Wait_For_Ready End toggle signals to DMA. One per channel
23–16 DMA_SENSE	Read-only view of sense state of the 8 DMA channels. A value of "1" in any bit position indicates that a read and compare command failed or a timeout occured for the corresponding channel.
15–8 DMAREQ	Read-only view of DMA request line for 8 DMA channels. A toggle on any bit position indicates a DMA request for the corresponding channel.
CMD_END	Read Only view of the Command End toggle signals to DMA. One per channel

27.6.14 GPMI Version Register Description (GPMI_VERSION)

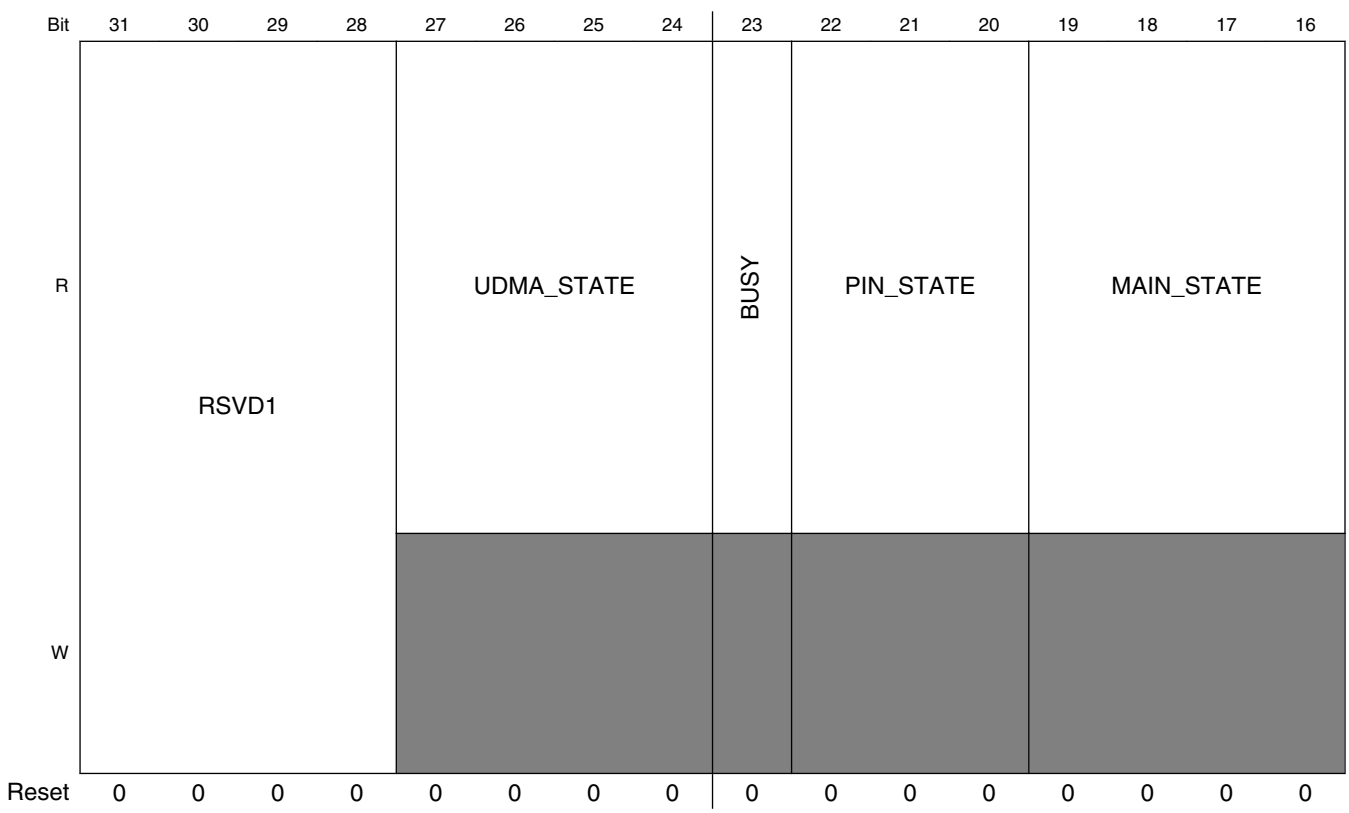
This register reflects the version number for the GPMI.

GPMI_VERSION 0x0D0

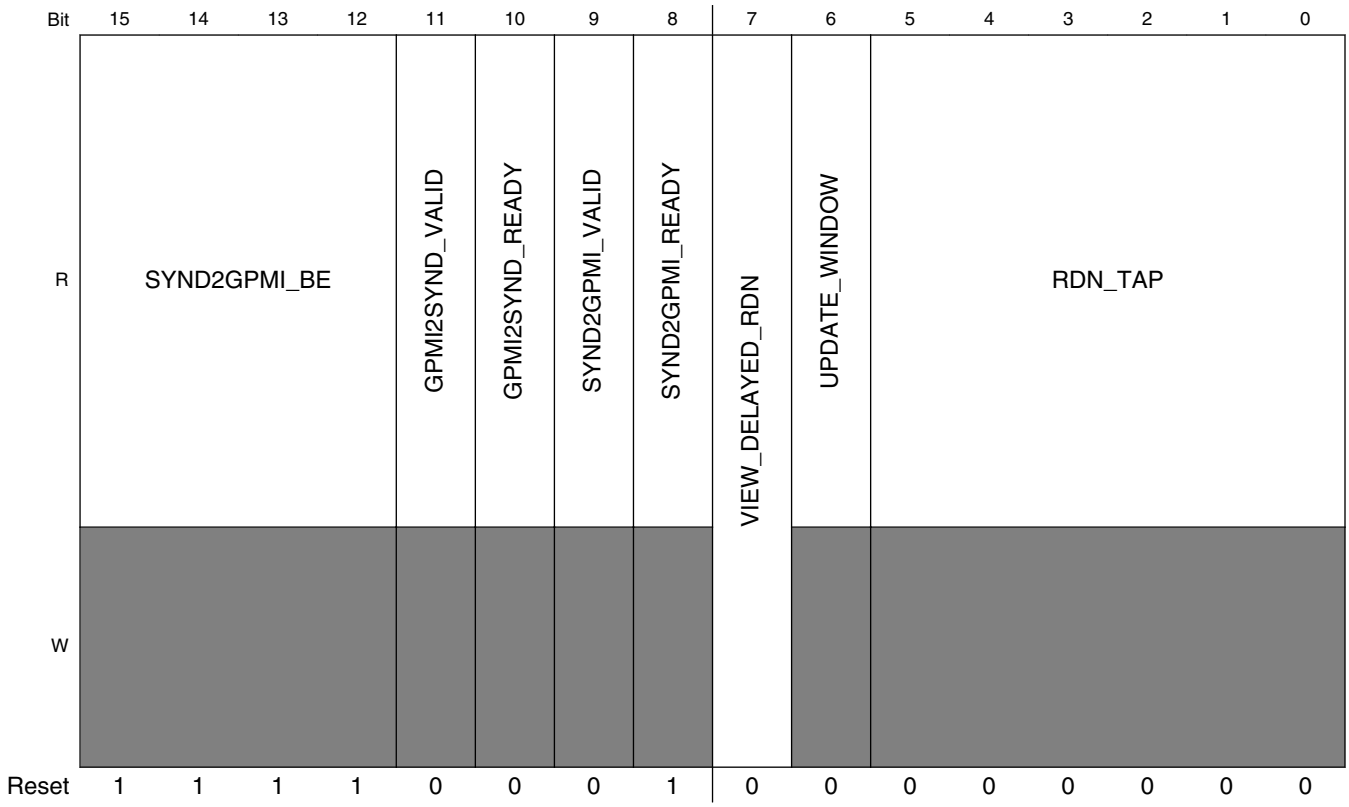
Address: 180_6000h base + D0h offset = 180_60D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MAJOR								MINOR								STEP															
W																																
Reset	0	0	0	0	0	1	0	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_VERSION field descriptions



Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.



27.6.15 GPMI Debug2 Information Register Description (GPMI_DEBUG2)

The GPMI Debug2 information register provides a read back path for diagnostics to determine the current operating state of the GPMI controller.

GPMI_DEBUG2 0x0E0

Address: 180_6000h base + E0h offset = 180_60E0h

GPMI_DEBUG2 field descriptions

Field	Description
31–28 RSVD1	Always write zeroes to this bit field.

11 GPMI2SYND_VALID	Data handshake output to BCH.
10 GPMI2SYND_READY	Data handshake output to BCH.
9 SYND2GPMI_VALID	Data handshake Input from BCH.
8 SYND2GPMI_READY	Data handshake Input from BCH.

Table continues on the next page...

GPMI_DEBUG2 field descriptions (continued)

Field	Description
7 VIEW_ DELAYED_RDN	Set to a 1 to select the delayed feedback RE_B to drive the GPMI_ADDR[0] (Nand CLE) pin. For debug purposes, this will allow you see if DLL is functioning properly.
6 UPDATE_ WINDOW	A 1 indicates that the DLL is busy generating the required delay.
RDN_TAP	This is the DLL tap calculated by the DLL controller. The selects the amount of delay form the DLL chain.

27.6.16 GPMI Debug3 Information Register Description (GPMI_DEBUG3)

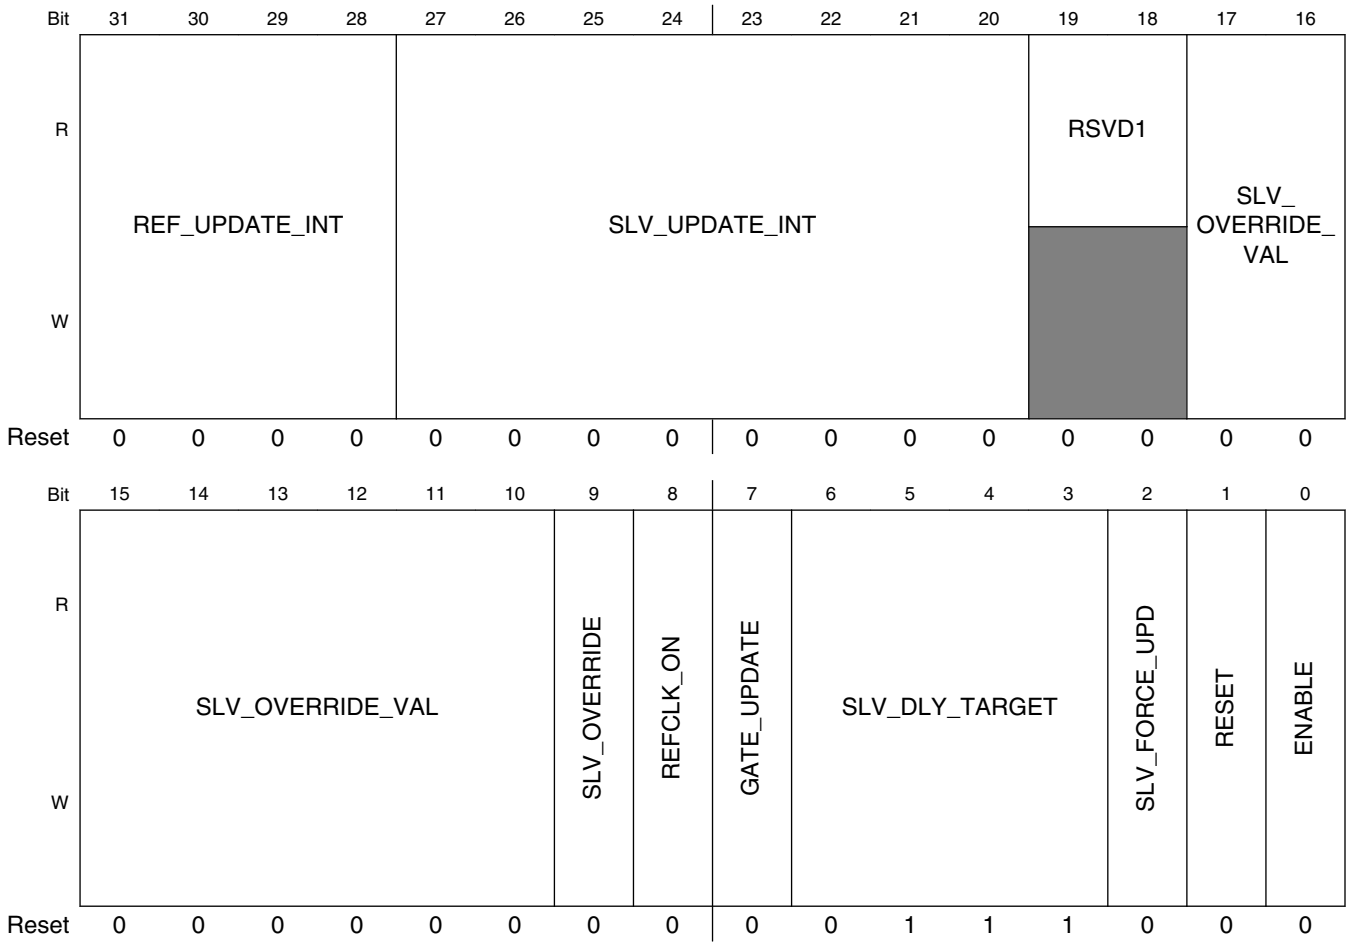
The GPMI Debug3 information register provides a read back path for diagnostics to determine the current operating state of the GPMI controller.

GPMI_DEBUG3 0x0F0

Address: 180_6000h base + F0h offset = 180_60F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	APB_WORD_CNTR																DEV_WORD_CNTR															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_DEBUG3 field descriptions



Field	Description
31–16 APB_WORD_ CNTR	Reflects the number of bytes remains to be transferred on the APB bus.
DEV_WORD_ CNTR	Reflects the number of bytes remains to be transferred on the ATA/Nand bus.

27.6.17 GPMI Double Rate Read DLL Control Register Description (GPMI_READ_DDR_DLL_CTRL)

GPMI DDR Read Delay Loop Lock Control Register. This register provides programmability in DDR mode for data input timing and data formats.

GPMI_READ_DDR_DLL_CTRL 0x100

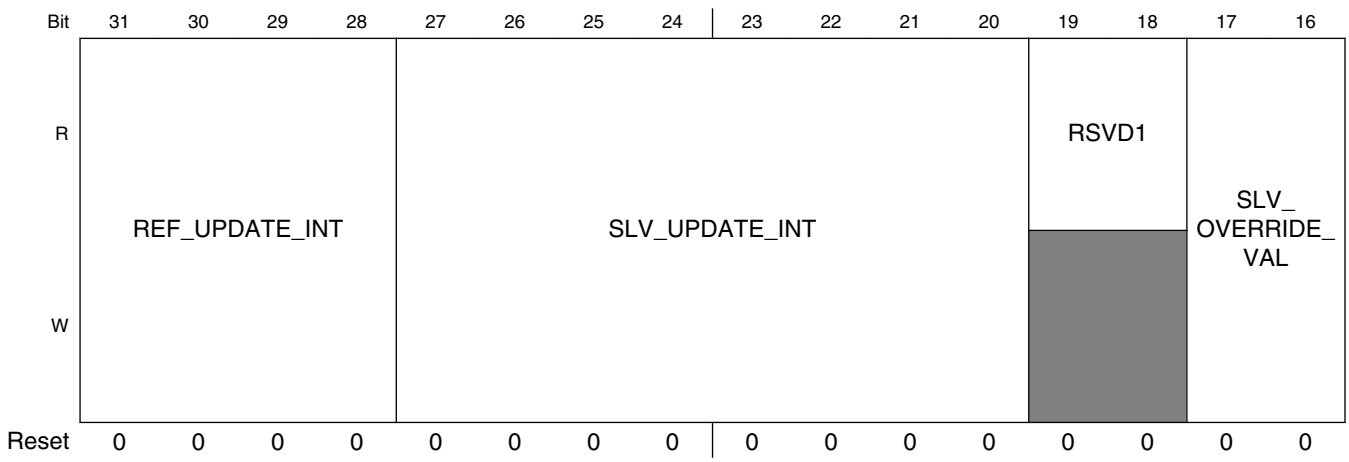
Address: 180_6000h base + 100h offset = 180_6100h

GPMI_READ_DDR_DLL_CTRL field descriptions

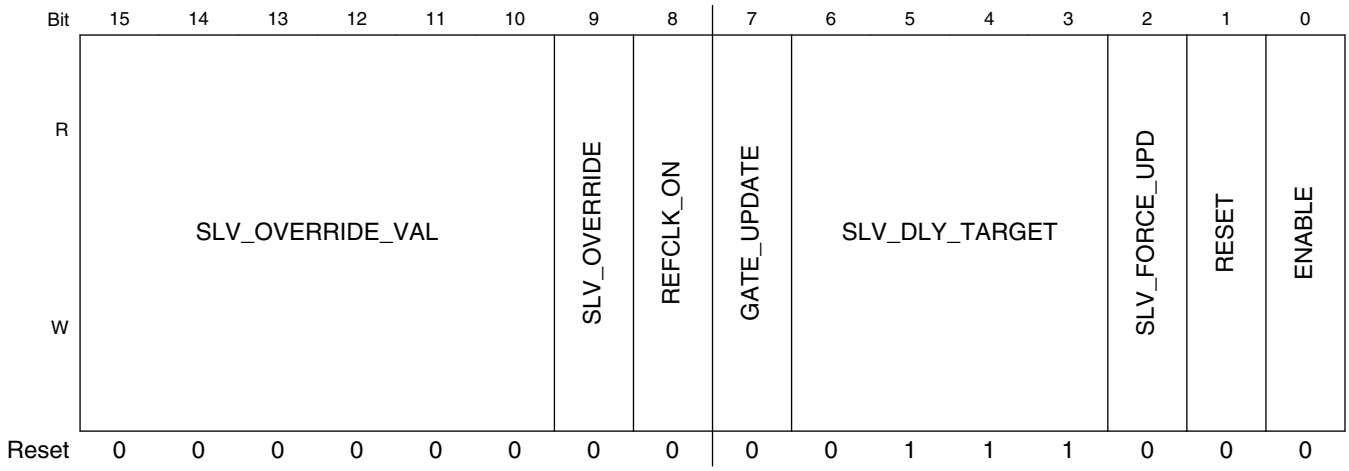
Field	Description
31–28 REF_UPDATE_ INT	This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of (2 + REF_UPDATE_INT) * GPMICLK. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–20 SLV_UPDATE_ INT	Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
19–18 RSVD1	Reserved
17–10 SLV_ OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256.
9 SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to tbe enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0

Table continues on the next page...

GPMI_READ_DDR_DLL_CTRL field descriptions (continued)



Field	Description
8 REFCLK_ON	set this bit to 1 will turn on the reference clock
7 GATE_UPDATE	Setting this bit to 1, forces the slave delay line not update
6–3 SLV_DLY_ TARGET	The delay target for the read clock is can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from (GPMICLK/2)/16 to GPMICLK/2.
2 SLV_FORCE_ UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered).
1 RESET	Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again.
0 ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled.



27.6.18 GPMI Double Rate Write DLL Control Register Description (GPMI_WRITE_DDR_DLL_CTRL)

GPMI DDR Write Delay Loop Lock Control Register. This register provides programmability in DDR mode for data output timing and data formats.

GPMI_WRITE_DDR_DLL_CTRL 0x110

Address: 180_6000h base + 110h offset = 180_6110h

GPMI_WRITE_DDR_DLL_CTRL field descriptions

Field	Description
31–28 REF_UPDATE_INT	This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of (2 + REF_UPDATE_INT) * GPMICLK. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–20 SLV_UPDATE_INT	Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
19–18 RSVD1	Reserved
17–10 SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256.
9 SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to tbe enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0
8 REFCLK_ON	set this bit to 1 will turn on the reference clock
7 GATE_UPDATE	Setting this bit to 1, forces the slave delay line not update
6–3 SLV_DLY_TARGET	The delay target for the read clock can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from (GPMICLK/2)/16 to GPMICLK/2.
2 SLV_FORCE_UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered).
1 RESET	Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again.
0 ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled.

27.6.19 GPMI Double Rate Read DLL Status Register Description (GPMI_READ_DDR_DLL_STS)

GPMI Double Rate Read DLL Status Register, Read Only. GPMI DLL status fields are provided in this register.

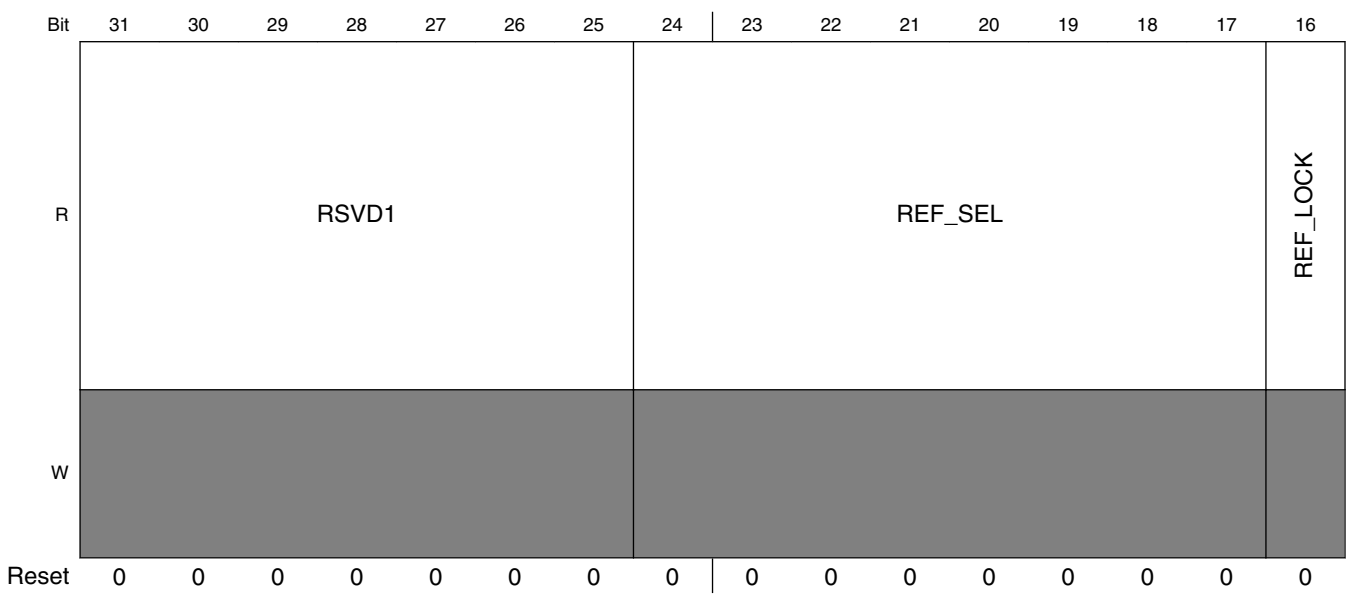
GPMI_READ_DDR_DLL_STS 0x120

Address: 180_6000h base + 120h offset = 180_6120h

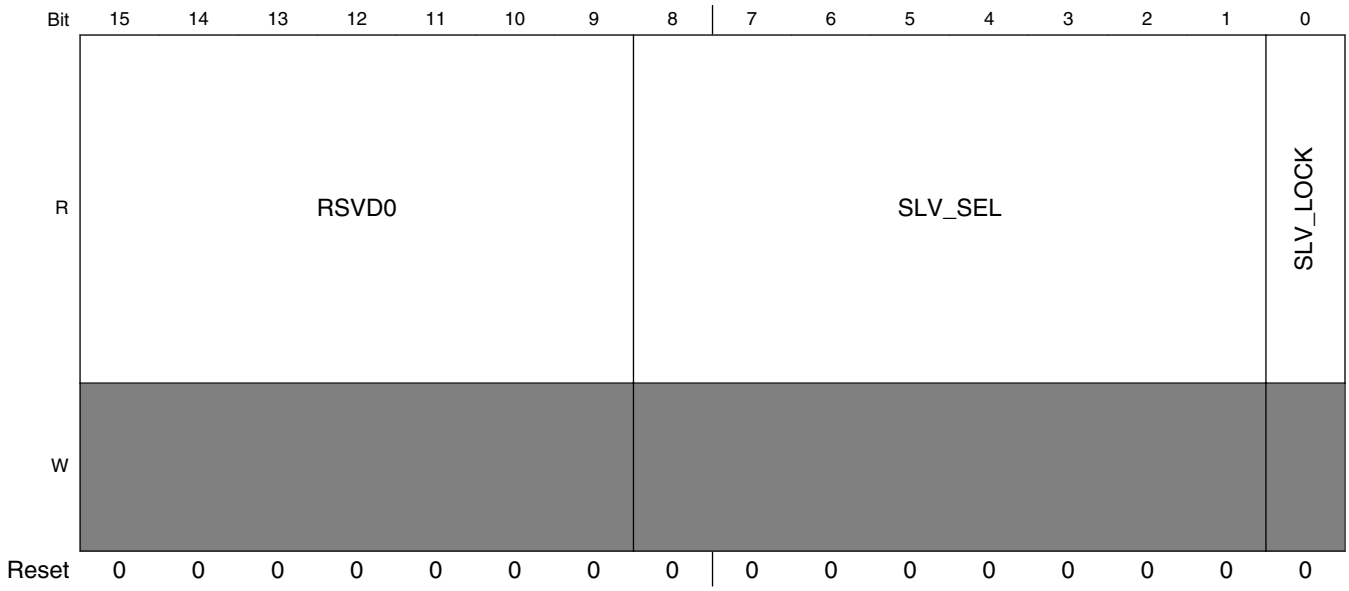
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD1								REF_SEL							REF_LOCK
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0								SLV_SEL							SLV_LOCK
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_READ_DDR_DLL_STS field descriptions



Field	Description
31–25 RSVD1	Reserved
24–17 REF_SEL	Reference delay line select status.
16 REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to a half-phase GPMICLK shift, allowing the slave delay-line to perform programmed clock delays.
15–9 RSVD0	Reserved
8–1 SLV_SEL	Slave delay line select status
0 SLV_LOCK	Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value.



27.6.20 GPMI Double Rate Write DLL Status Register Description (GPMI_WRITE_DDR_DLL_STS)

GPMI Double Rate Write DLL Status Register, Read Only. GPMI DLL status fields are provided in this register.

GPMI_WRITE_DDR_DLL_STS 0x130

Address: 180_6000h base + 130h offset = 180_6130h

GPMI_WRITE_DDR_DLL_STS field descriptions

Field	Description
31–25 RSVD1	Reserved
24–17 REF_SEL	Reference delay line select status.
16 REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to a half-phase GPMICLK shift, allowing the slave delay-line to perform programmed clock delays.
15–9 RSVD0	Reserved
8–1 SLV_SEL	Slave delay line select status
0 SLV_LOCK	Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value.

Chapter 28
General Purpose Timer (GPT)

28.1 Overview

This chapter describes the General Purpose Timer (GPT) module interface. It is also a reference for software driver programming.

The GPT has a 32-bit up-counter. The timer counter value can be captured in a register using an event on an external pin. The capture trigger can be programmed to be a rising or/and falling edge. The GPT can also generate an event on the DO_CMPOUT*n* pins and an interrupt when the timer reaches a programmed value. The GPT has a 12-bit prescaler, which provides a programmable clock frequency derived from multiple clock sources.

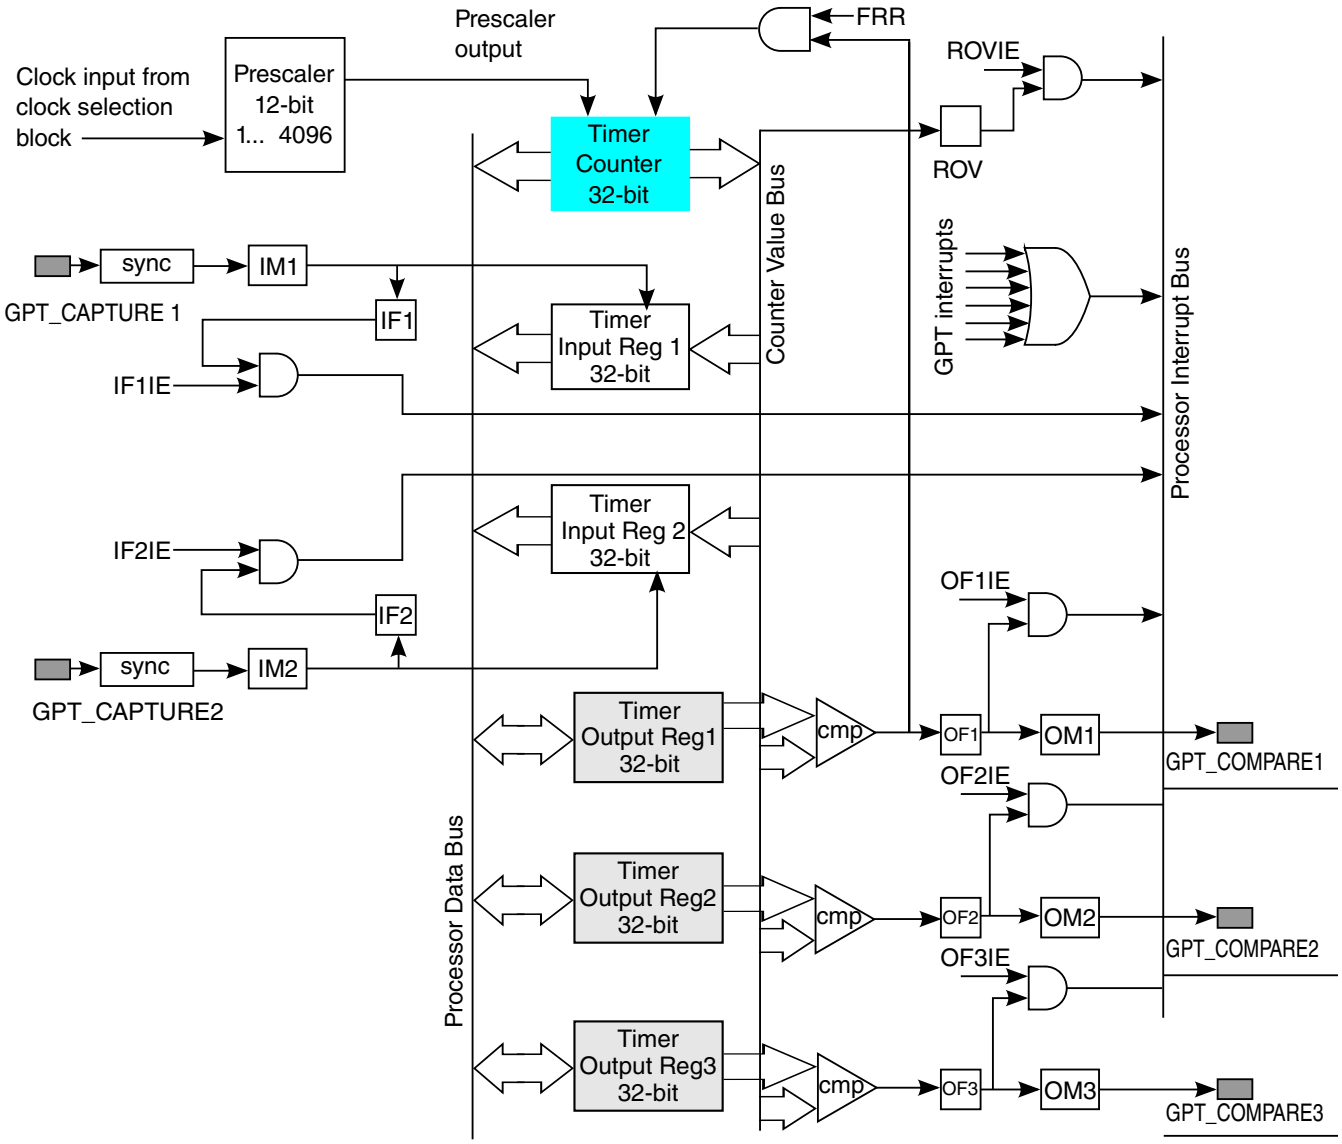


Figure 28-1. GPT Block Diagram

The following figure shows the GPT functional clocking scheme.

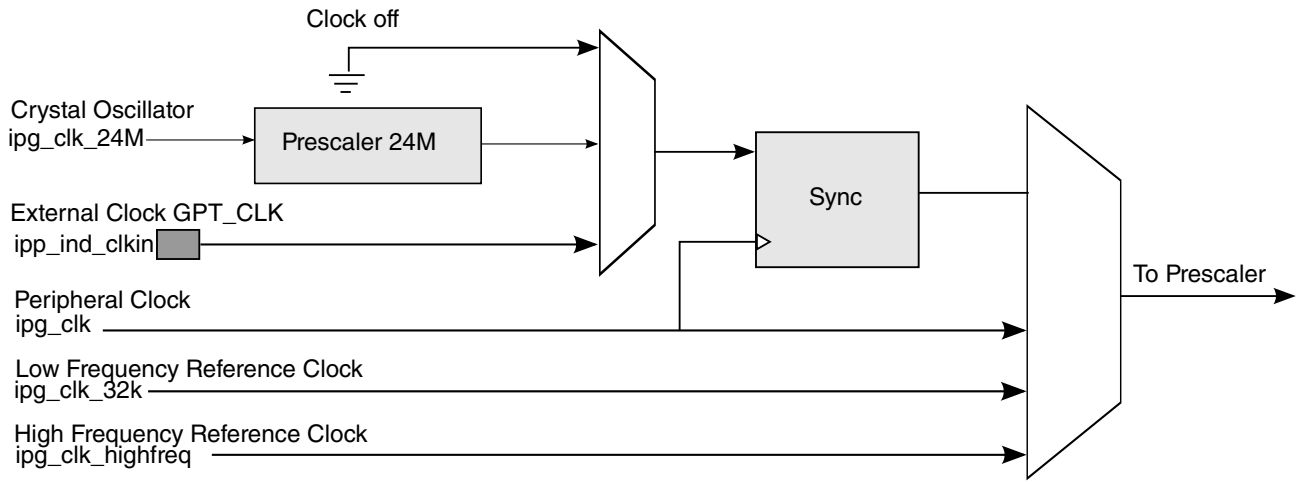

Figure 28-2. GPT Counter Clocks Diagram

28.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

28.1.2 Modes and Operation

The GPT supports the modes described in the indicated sections:

- Operating Modes
  - Restart Mode
  - Free-Run Mode

28.2 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip,* except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

The following table describes all block signals that connect off-chip.

Table 28-1. GPT External Signals

Signal	Description	Pad	Mode	Direction
GPT1_CLK	Input pin for an external clock that the counter can be operated at.	ENET1_TX_CLK	ALT8	I
		UART1_RX_DATA	ALT4	
GPT1_CAPTURE1	Input pin for a capture event for Input Capture Channel 1.	GPIO1_IO00	ALT1	I
		UART2_TX_DATA	ALT4	
GPT1_CAPTURE2	Input pin for a capture event for Input Capture Channel 2.	ENET1_RX_ER	ALT8	I
		UART2_RX_DATA	ALT4	
GPT1_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1.	GPIO1_IO01	ALT1	O
		UART1_TX_DATA	ALT4	
GPT1_COMPARE2	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2.	GPIO1_IO02	ALT1	O
		UART2_CTS_B	ALT4	
GPT1_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3.	GPIO1_IO03	ALT1	O
		UART2_RTS_B	ALT4	
GPT2_CLK	Input pin for an external clock that the counter can be operated at.	JTAG_MODE	ALT1	I
		SD1_DATA1	ALT1	
GPT2_CAPTURE1	Input pin for a capture event for Input Capture Channel 1.	JTAG_TMS	ALT1	I
		SD1_DATA2	ALT1	
GPT2_CAPTURE2	Input pin for a capture event for Input Capture Channel 2.	JTAG_TDO	ALT1	I
		SD1_DATA3	ALT1	
GPT2_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1.	JTAG_TDI	ALT1	O
		SD1_CMD	ALT1	
GPT2_COMPARE2	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2.	JTAG_TCK	ALT1	O
		SD1_CLK	ALT1	
GPT2_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3.	JTAG_TRST_B	ALT1	O
		SD1_DATA0	ALT1	

There are six signals (three input, three output) in the GPT module that *can be* connected to the chip pads.

28.2.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose.

The external clock input GPT_CLK is treated as asynchronous to the peripheral clock. To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock. Hysteresis characteristics on this pad will be required because this is a clock input.

28.2.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*.

A positive or/and negative edge on these signals GPT_CAPTURE1 , GPT_CAPTURE2 can trigger this capture event. These signals are treated as asynchronous to the peripheral clock. Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

28.2.3 Output Compare Signals

The output compare signals: GPT_COMPARE1, GPT_COMPARE2, GPT_COMPARE3, indicate that output compare events have gone through a specified transition.

28.4 Clocks

The clock that is input to the prescaler can be selected from 4 clock sources:

The following table describes the clock sources for GPT. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 28-2. GPT Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock

Table continues on the next page...

Table 28-2. GPT Clocks (continued)

Clock name	Clock Root	Description
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- High-Frequency Clock (ipg_clk_highfreq)

  Provided by the Clock Controller Module (CCM), the High Frequency Clock is intended to be ON in Normal Power mode when the Peripheral Clock is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*. The CCM is expected to provide this clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the High Frequency Clock in a Low Power mode.

- Low-Reference Clock (ipg_clk_32k)

  This 32 kHz Low Reference Clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode. The CCM is expected to provide the Low Reference Clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the Low Reference Clock in a Low Power mode.

- Peripheral Clock (ipg_clk)

  If the Peripheral Clock or the External Clock is selected(CLKSRC=001 or 011) as Clock Source, then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock can be switched OFF.

- External Clock

  The External Clock comes from *outside the device* and can be selected to run the GPT counter. The External Clock is treated as *asynchronous to the Peripheral Clock,* and is synchronized to the Peripheral Clock, *inside* the module. Therefore, the External Clock frequency is limited to < 1/4 frequency of the Peripheral Clock, for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock is not available, then the External Clock *cannot be used* to run the counter.

- Crystal Oscillator Clock

  This 24 MHz Crystal Oscillator Clock (provided by the CCM) is intended to be used against frequency change of Peripheral Clock changes to provide a more accurate timer clock for operation system. The CCM is expected to provide the 24 MHz

Crystal Oscillator Clock *without* synchronizing it to the System Bus Clock in Normal functional mode. Synchronization is done in GPT module. Before synchronization, the 24 MHz Crystal Oscillator Clock is divided by a 24 MHz clock prescaler, to make sure the clock frequency less than half of System Bus Clock .

The clock input source is configured using the clock source field (CLKSRC, in the GPT_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT_CR control register) to 000. **The CLKSRC field value should be changed** *only after disabling the GPT* (by setting the EN bit in the GPT_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

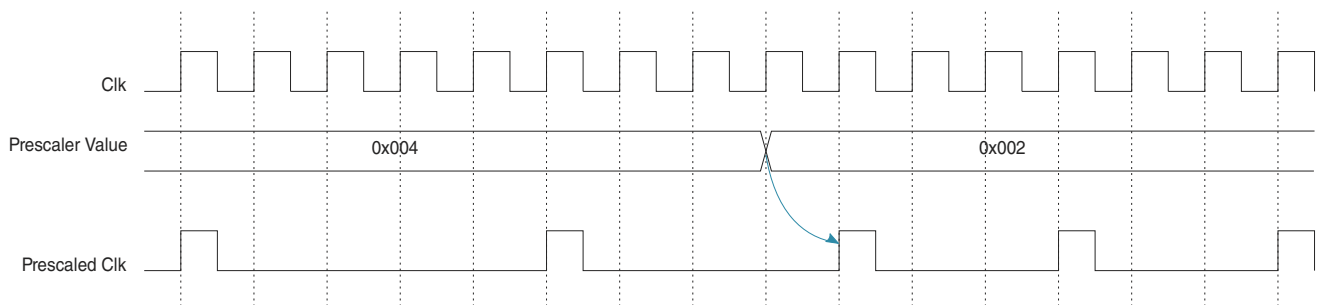

Figure 28-3. Prescaler Value Change Timing Diagram

28.5 Functional Description

This section provides a complete functional description of the GPT.

28.5.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

28.5.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

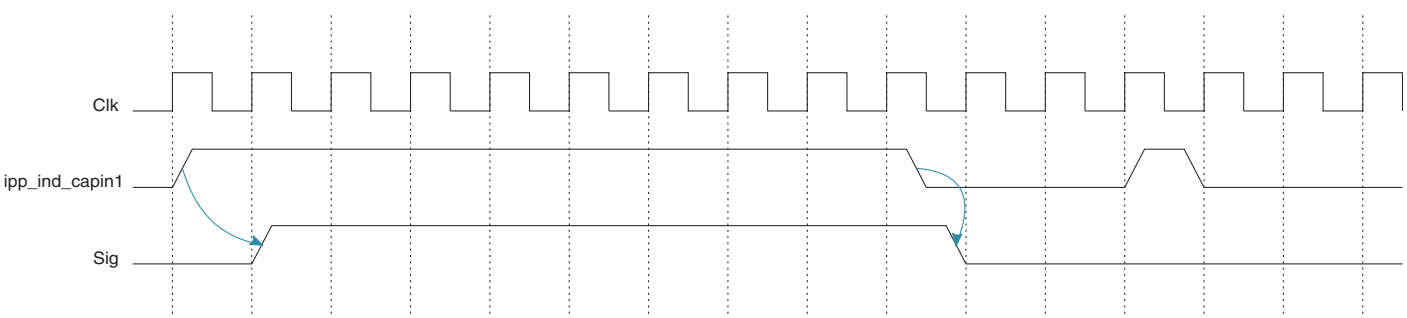
28.5.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

28.5.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT_CNT) that is a 32-bit free-running *up-counter,* which starts counting *after it is enabled by software* (EN=1).

The counter's clock source is the output of the prescaler labelled "Prescaler output" in Figure 28-1.



- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.
  - If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
  - If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT_CNT).

- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xffffffff.
- The software reset (SWR bit in the GPT_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled*.

28.5.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle (clock selected to run the counter) *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.

Clk = The clock selected from CLKSRC bit field setting

ipp_ind_capin1 = Pad signal for capture channel 1

Sig = Capture signal as sensed by the module

Figure 28-4. Input Capture Event Timing

28.5.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin will be set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period (subject to the restriction on the maximum frequency allowed on the pad) according to the mode bits (that were programmed).

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

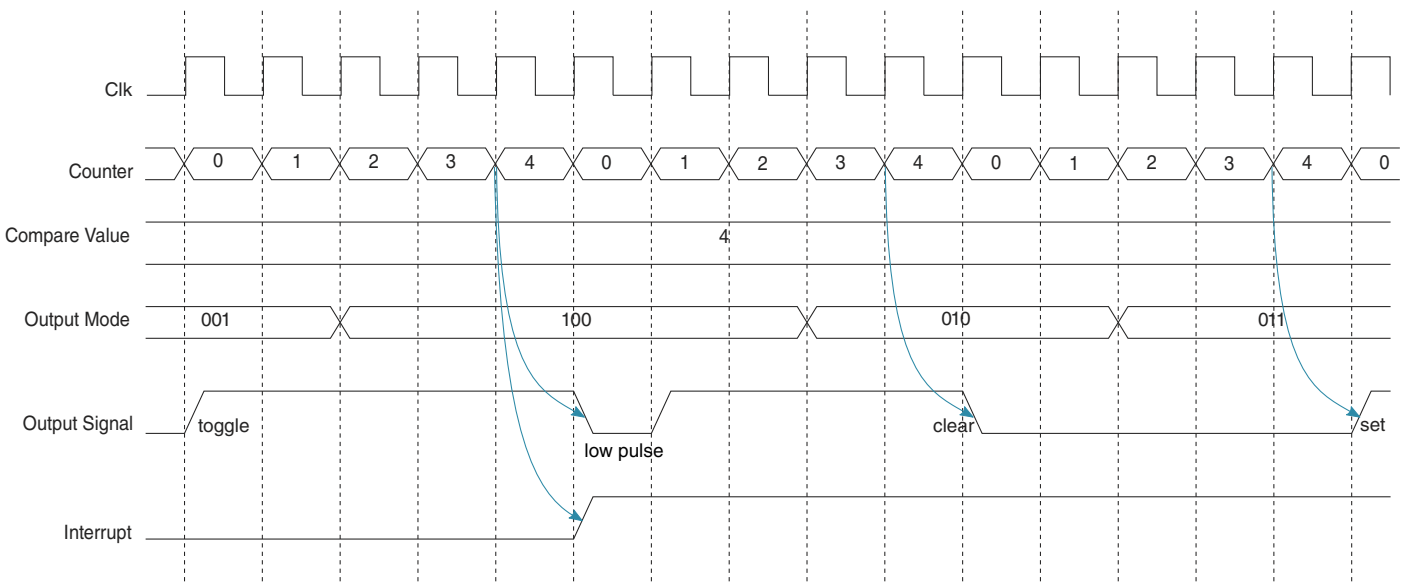


Figure 28-5. Output Compare and Interrupt Timing

28.5.2.3 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes*.

- Rollover Interrupt

The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT_IR register; the associated status bit is the ROV bit in the GPT_SR register.

- Input Capture Interrupt 1, 2

  After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT_IR register); the associated status bits are IF2 and IF1 (in the GPT_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt*. The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

  After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

28.5.2.4 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock, which can be used *only if* the Peripheral Clock is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

28.5.2.5 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGEN bit is not set (in the GPT_CR control register), then the GPT timer is halted.

28.6 Initialization/ Application Information

28.6.1 Selecting the Clock Source

The CLKSRC field in the GPT_CR register selects the clock source. The CLKSRC field value should be changed only after disabling the GPT (EN=0).

The software sequence to be followed while changing clock source is:

1. Disable GPT by setting EN=0 in GPT_CR register.
2. Disable GPT interrupt register (GPT_IR).
3. Configure Output Mode to unconnected/ disconnected—Write zeros in OM3, OM2, and OM1 in GPT_CR
4. Disable Input Capture Modes—Write zeros in IM1 and IM2 in GPT_CR
5. Change clock source CLKSRC to the desired value in GPT_CR register.
6. Assert the SWR bit in GPT_CR register.
7. Clear GPT status register (GPT_SR) (i.e., w1c).
8. Set ENMOD=1 in GPT_CR register, to bring GPT counter to 0x00000000.
9. Enable GPT (EN=1) in GPT_CR register.
10. Enable GPT interrupt register (GPT_IR).

28.7 GPT Memory Map/Register Definition

The GPT has 10 user-accessible 32-bit registers, which are used to configure, operate, and monitor the state of the GPT.

An IP bus write access to the GPT Control Register (GPT_CR) and the GPT Output Compare Register1 (GPT_OCR1) results in *one cycle of wait state*, while other valid IP bus accesses incur 0 wait states.

Irrespective of the Response Select signal value, a Write access to the GPT Status Registers (Read-only registers GPT_ICR1, GPT_ICR2, GPT_CNT) will generate a bus exception.

- If the Response Select signal is driven Low, then the Read/Write access to the *unimplemented* address space of GPT (*ips_addr* is greater than or equal to $BASE + $028) will generate a bus exception.
- If the Response Select is driven High, then the Read/Write access to the unimplemented address space of GPT will *not* generate any error response (like a bus exception).

28.7.1 GPT Control Register (GPTx_CR)

The GPT Control Register (GPT_CR) is used to program and configure GPT operations. An IP Bus Write to the GPT Control Register occurs after one cycle of wait state, while an IP Bus Read occurs after 0 wait states.

Address: Base address + 0h offset

GPTx_CR field descriptions

Field	Description
31 FO3	FO3 Force Output Compare Channel 3 FO2 Force Output Compare Channel 2 FO1 Force Output Compare Channel 1 The FO*n* bit causes the pin action *programmed* for the timer Output Compare *n* pin (according to the OM*n* bits in this register). • The OF*n* flag (OF3, OF2, OF1) in the status register is **not affected**. • This bit is self-negating and always read as zero. 0 Writing a 0 has no effect. 1 Causes the programmed pin action on the timer Output Compare *n* pin; the OF*n* flag is not set.
30 FO2	See F03

Table continues on the next page...

GPTx_CR field descriptions (continued)

Field	Description
29 FO1	See F03
28–26 OM3	OM3 (bits 28-26) controls the Output Compare Channel 3 operating mode. OM2 (bits 25-23) controls the Output Compare Channel 2 operating mode. OM1 (bits 22-20) controls the Output Compare Channel 1 operating mode. The OM*n* bits specify the response that a compare event will generate on the output pin of Output Compare Channel *n*. • The toggle, clear, and set options cause a change on the output pin *only* if a compare event occurs. • When OM*n* is programmed as 1xx (active low pulse), the output pin is set to one immediately on the next input clock; a low pulse (that is an input clock in width) occurs when there is a compare event. Note that here, "input clock" refers to the clock selected by the CLKSRC bits of the GPT Control Register. 000 Output disconnected. No response on pin. 001 Toggle output pin 010 Clear output pin 011 Set output pin 1xx Generate an active low pulse (that is one input clock wide) on the output pin.
25–23 OM2	See OM3
22–20 OM1	See OM3
19–18 IM2	IM2 (bits 19-18, Input Capture Channel 2 operating mode) IM1 (bits 17-16, Input Capture Channel 1 operating mode) The IM*n* bit field determines the transition on the input pin (for Input capture channel *n*), which will trigger a capture event. 00 capture disabled 01 capture on rising edge only 10 capture on falling edge only 11 capture on both edges
17–16 IM1	See IM2
15 SWR	Software reset. This is the software reset of the GPT module. It is a self-clearing bit. • The SWR bit is set when the module is in reset state. • The SWR bit is cleared when the reset procedure finishes. • Setting the SWR bit resets **all of the registers** to their default reset values, except for the CLKSRC, EN, ENMOD, STOPEN, WAITEN, and DBGEN bits in the GPT Control Register (this control register). 0 GPT is not in reset state 1 GPT is in reset state
14–11 Reserved	This read-only field is reserved and always has the value 0.
10 EN_24M	Enable 24 MHz clock input from crystal.

Table continues on the next page...

GPTx_CR field descriptions (continued)

Field	Description
	• A hardware reset resets the EN_24M bit. • A software reset *does not affect* the EN_24M bit. 0 24M clock disabled 1 24M clock enabled
9 FRR	Free-Run or Restart mode. The FFR bit determines the behavior of the GPT when a compare event in channel 1 occurs. • In Restart mode, after a compare event, the counter resets to 0x00000000 and resumes counting (after the occurrence of a compare event). • In Free-Run mode, after a compare event, the counter continues counting until 0xFFFFFFFF and then rolls over to 0. 0 Restart mode 1 Free-Run mode
8–6 CLKSRC	Clock Source select. The CLKSRC bits select which clock will go to the prescaler (and subsequently be used to run the GPT counter). • The CLKSRC bit field value should only be changed after disabling the GPT by clearing the EN bit in this register (GPT_CR). • A software reset does not affect the CLKSRC bit. 000 No clock 001 Peripheral Clock 010 High Frequency Reference Clock 011 External Clock (CLKIN) 100 Low Frequency Reference Clock others Reserved
5 STOPEN	GPT Stop Mode enable. The STOPEN read/write control bit enables GPT operation *during Stop mode*. • A hardware reset resets the STOPEN bit. • A software reset *does not affect* the STOPEN bit. 0 GPT is disabled in Stop mode. 1 GPT is enabled in Stop mode.
4 DOZEEN	GPT Doze Mode Enable. • A hardware reset resets the DOZEEN bit. • A software reset *does not affect* the DOZEEN bit. 0 GPT is disabled in doze mode. 1 GPT is enabled in doze mode.
3 WAITEN	GPT Wait Mode enable. The WAITEN read/write control bit enables GPT operation *during Wait mode*. • A hardware reset resets the WAITEN bit. • A software reset *does not affect* the WAITEN bit. 0 GPT is disabled in wait mode. 1 GPT is enabled in wait mode.

Table continues on the next page...

GPTx_CR field descriptions (continued)

Field	Description
2 DBGEN	GPT debug mode enable. The DBGEN read/write control bit enables GPT operation *during Debug mode*. • A hardware reset resets the DBGEN bit. • A software reset *does not affect* the DBGEN bit. 0 GPT is disabled in debug mode. 1 GPT is enabled in debug mode.
1 ENMOD	GPT Enable mode. When the GPT is disabled (EN=0), then both the Main Counter and Prescaler Counter *freeze their current count values*. The ENMOD bit determines the value of the GPT counter when Counter is enabled again (if the EN bit is set). • If the ENMOD bit is 1, then the Main Counter and Prescaler Counter values are reset to 0 after GPT is enabled (EN=1). • If the ENMOD bit is 0, then the Main Counter and Prescaler Counter restart counting *from their frozen values* after GPT is enabled (EN=1). • If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter *freeze at their current count values* when the GPT enters low power mode. • When GPT exits low power mode, the Main Counter and Prescaler Counter start counting from their frozen values, regardless of the ENMOD bit value. • Setting the SWR bit will clear the Main Counter and Prescaler Counter values, regardless of the value of EN or ENMOD bits. • A hardware reset resets the ENMOD bit. • A software reset *does not affect* the ENMOD bit. 0 GPT counter will retain its value when it is disabled. 1 GPT counter value is reset to 0 when it is disabled.
0 EN	GPT Enable. The EN bit is the GPT module enable bit. **Before setting the EN bit**, we recommend that *all registers be properly programmed*. • A hardware reset resets the EN bit. • A software reset *does not affect* the EN bit. 0 GPT is disabled. 1 GPT is enabled.

28.7.2 GPT Prescaler Register (GPTx_PR)

The GPT Prescaler Register (GPT_PR) contains bits that determine the *divide value* of the clock that runs the counter.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

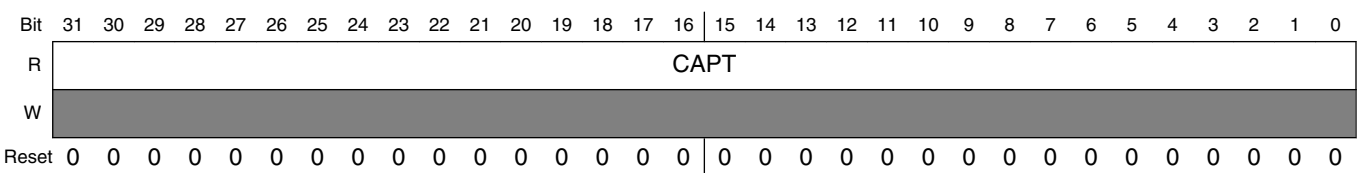
GPTx_OCR3 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 3.

28.7.8 GPT Input Capture Register 1 (GPTx_ICR1)

The GPT Input Capture Register 1 (GPT_ICR1) is a read-only register that holds the value *that was in the counter during the last capture event* on Input Capture Channel 1.

Address: Base address + 1Ch offset



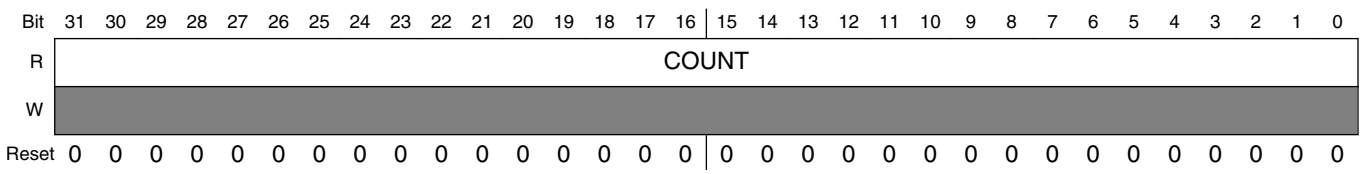
GPTx_ICR1 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 1 occurs, the current value of the counter is loaded into GPT Input Capture Register 1.

28.7.9 GPT Input Capture Register 2 (GPTx_ICR2)

The GPT Input capture Register 2 (GPT_ICR2) is a read-only register which holds the value that was in the counter during the last capture event on input capture channel 2.

Address: Base address + 20h offset



GPTx_ICR2 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 2 occurs, the current value of the counter is loaded into GPT Input Capture Register 2.

28.7.10 GPT Counter Register (GPTx_CNT)

The GPT Counter Register (GPT_CNT) is the main counter's register. GPT_CNT is a read-only register and can be read *without affecting the counting process* of the GPT.

Address: Base address + 24h offset

GPTx_CNT field descriptions

Field	Description
COUNT	Counter Value. The COUNT bits show the current count value of the GPT counter.

Chapter 29
I2C Controller (I2C)

29.1 Overview

This chapter describes block-level operation and programming of I2C. The chapter is intended for a block-driver software developer. To understand how the block is integrated at the SoC level, a system software developer should see discussions of the block in the appropriate SoC-level chapter(s).

References: This document assumes an understanding of the following document:

- *The I2C Bus Specification*, Version 2.1, by Philips Semiconductor

The Inter IC (I2C) provides functionality of a standard I2C slave and master. The I2C is designed to be compatible with the standard NXP I2C bus protocol.

NOTE

independent I2C channels are available.

I2C is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices. The flexible I2C standard allows additional devices to be connected to the bus for expansion and system development. See the connection diagram in the figure below.

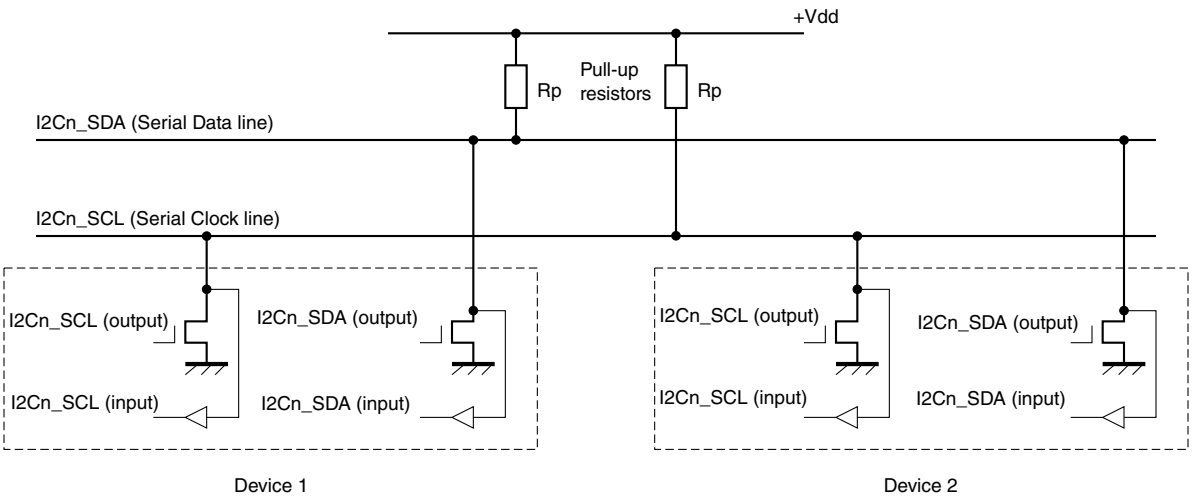


Figure 29-1. Connection of devices to I2C bus

The I2C interface speed is dependent on the I2C bus loading and timing characteristics. For pin requirement details, see *The I2C Bus Specification*. The I2C system is a true multimaster bus including arbitration and collision detection that prevents data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer. The figure below shows the block diagram of I2C.

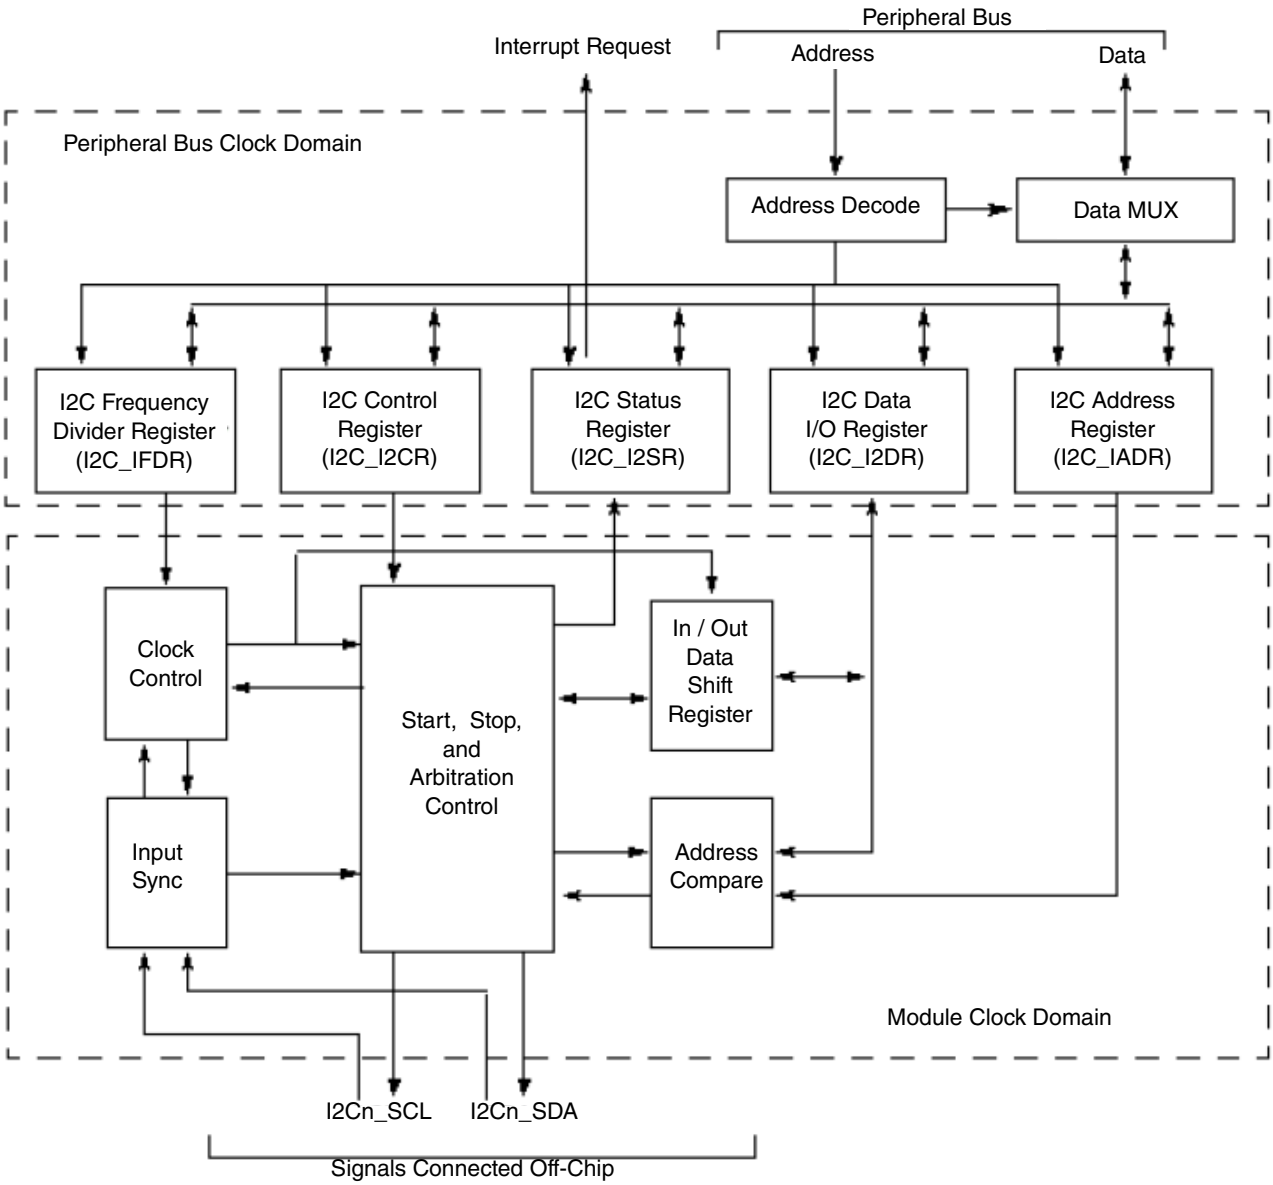

Figure 29-2. I2C block diagram

29.1.1 Features

The I2C has the following key features:

- Compatibility with I2C bus standard
- Multimaster operation
- Software programmability for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Interrupt-driven, byte-by-byte data transfer
- Arbitration-lost interrupt with automatic mode switching from master to slave

- Calling address identification interrupt
- Start and stop signal generation/detection
- Repeated Start signal generation
- Acknowledge bit generation/detection
- Bus-busy detection

29.1.2 Modes and operations

The I2C operates primarily in two functional modes: Standard mode and Fast mode.

- In Standard mode, I2C supports the data transfer rates up to 100 kbits/s.
- In Fast mode, data transfer rates up to 400 kbits/s can be achieved. Per block operation, there is no special configuration required for Fast or Standard mode. It is the data transfer rate that distinguishes Standard and Fast mode.

29.2 External Signals

This section discusses I2C signals that connect off-chip.

For I2C compliance, all devices connected to the I2Cn_SCL and I2Cn_SDA signals must have open-drain or open-collector outputs. The logic AND function is implemented on both lines with external pull-up resistors.

Inputs of I2Cn_SCL and I2Cn_SDA also need to be manually enabled by setting the SION bit in the IOMUX after the corresponding PADs are selected as I2C function.

The table below describes all I2C signals that connect off-chip.

Table 29-1. I2C External Signals

Signal	Description	Pad	Mode	Direction
I2C1_SCL	Serial Clock	CSI_PIXCLK	ALT3	IO
		GPIO1_IO02	ALT0	
		UART4_TX_DATA	ALT2	
I2C1_SDA	Serial Data	CSI_MCLK	ALT3	IO
		GPIO1_IO03	ALT0	
		UART4_RX_DATA	ALT2	
I2C2_SCL	Serial Clock	CSI_HSYNC	ALT3	IO
		GPIO1_IO00	ALT0	
		UART5_TX_DATA	ALT2	
I2C2_SDA	Serial Data	CSI_VSYNC	ALT3	IO

Table continues on the next page...

Table 29-1. I2C External Signals (continued)

Signal	Description	Pad	Mode	Direction
		GPIO1_IO01	ALT0	
		UART5_RX_DATA	ALT2	
I2C3_SCL	Serial Clock	ENET2_RX_DATA0	ALT3	IO
		LCD_DATA01	ALT4	
		UART1_TX_DATA	ALT2	
I2C3_SDA	Serial Data	ENET2_RX_DATA1	ALT3	IO
		LCD_DATA00	ALT4	
		UART1_RX_DATA	ALT2	
I2C4_SCL	Serial Clock	ENET2_RX_EN	ALT3	IO
		LCD_DATA03	ALT4	
		UART2_TX_DATA	ALT2	
I2C4_SDA	Serial Data	ENET2_TX_DATA0	ALT3	IO
		LCD_DATA02	ALT4	
		UART2_RX_DATA	ALT2	

29.3 Clocks

There are two input clocks for I2C.

The following table describes the clock sources for I2C. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 29-2. I2C Clocks

Clock name	Clock Root	Description
ipg_clk_patref	perclk_clk_root	Module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- Peripheral clock: This clock is used for peripheral bus register read/writes.
- Module clock: This is the functional clock of the I2C. The serial bit clock frequency is derived from the module clock. The module clock and peripheral clocks are synchronous with each other. The minimum frequency of the module clock should be 12.8 MHz for Fast mode to achieve 400-kbps operation.

29.4 Functional description

This section provides a complete functional description of the block.

29.4.1 I2C system configuration

After a reset, the I2C defaults to Slave Receive operations. Thus, when not operating as a master or responding to a slave transmit address, the I2C defaults to the Slave Receive state.

For exceptions, see Initialization sequence.

NOTE

The I2C is designed to be compatible with the Philips™ I2C bus protocol. For information on system configuration, protocol, and restrictions, see the *I2C Bus Specification*, version 2.1, by Philips Semiconductors. The I2C supports Standard and Fast modes only.

29.4.2 Arbitration procedure

If multiple devices simultaneously request the bus, the bus clock is determined by a synchronization procedure in which the low period equals the longest clock-low period among the devices, and the high period equals the shortest. A data arbitration procedure determines the relative priority of competing devices.

A device loses arbitration if it sends logic high while another sends logic low; it immediately switches to Slave Receive mode and stops driving I2Cn_SDA. In this case, the transition from master to Slave mode does not generate a Stop condition. Meanwhile, hardware sets the arbitration lost bit in the I2C Status register (I2C_I2SR[IAL] to indicate loss of arbitration).

29.4.3 Clock synchronization

Because wire-AND logic is used, a high-to-low transition on SCL affects devices connected to the bus. Devices start counting their low period when the master drives SCL low. When a device clock goes low, it holds SCL low until the Clock High state is reached. However, the low-to-high change in this device clock may not change the state of SCL if another device clock is still in its low period. Therefore, the device with the longest low period holds the synchronized clock SCL low.

Devices with shorter low periods enter a High Wait state during this time (see Figure 29-3). When all devices involved have counted off their low periods, the synchronized clock SCL is released and pulled high. There is then no difference between device clocks and the state of SCL, so all of the devices start counting their high periods. The first device to complete its high period pulls SCL low again.

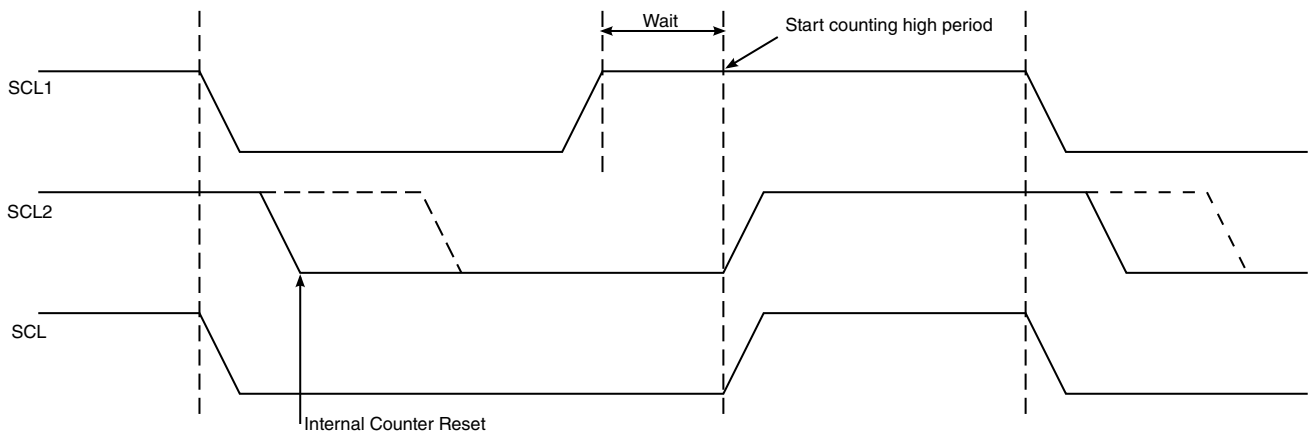

Figure 29-3. Synchronized clock SCL

29.4.4 Handshaking

The clock synchronization mechanism can be used as a handshake in data transfers. Slave devices can hold SCL low after completing one byte transfer (9 bits). In such a case, the clock mechanism halts the bus clock and forces the master clock into a Wait state until the slave releases SCL.

29.4.5 Clock stretching

Slaves can use the clock synchronization mechanism to slow down the transfer bit rate. After the master has driven SCL low, the slave can drive SCL low for the required period and then release it. If the slave SCL low period is longer than the master SCL low period, the resulting SCL bus signal low period is stretched.

29.4.6 Peripheral bus accesses

I2C is a 16-bit block. Only half-word accesses should be performed to the block.

29.4.7 Generation of transfer error on IP bus

If an address is received on the peripheral slave bus interface but it is not implemented, an access error is generated.

29.4.8 Reset

The I2C can be reset in the following ways:

- Global reset: A hard asynchronous reset of the whole I2C
- Software reset: An internal reset for the whole I2C (except for I2C_IADR and I2C_IFDR registers) initiated by deasserting the I2C_I2CR[IEN] bit

29.4.9 Interrupts

There is only one interrupt from the block, which is enabled by setting the I2C_I2CR[IIEN] bit.

The interrupt is generated in any one of the following conditions:

- One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).
- An address is received that matches its own specific address in Slave Receive mode.
- Arbitration is lost.

29.4.10 Byte order

The block only supports the Little-Endian mode.

29.5 Initialization

NOTE

Ensure the input select pins for IOMUXC are configured correctly for I2C.

29.5.1 Initialization sequence

Before the interface can transfer serial data, registers must be initialized, as listed here.

1. Set the data sampling rate (I2C_IFDR[IC] to obtain SCL frequency from the system bus clock.
2. Update the address in the (I2C_IADR) to define its slave address (address can range from 0 to 0x7f).
3. Set the I2C enable bit (I2C_I2CR[IEN]) to enable the I2C bus interface system.
4. Modify the bits in the I2C_I2CR to select Master/Slave mode, Transmit/Receive mode, and Interrupt-Enable or not.

29.5.2 Generation of Start

After completion of the initialization procedure, serial data can be transmitted by selecting the Master Transmit mode. On a multimaster bus system, the busy bus (I2C_I2SR[IBB]) must be tested to determine whether the serial bus is free. If the bus is free (IBB = 0), the Start signal and the first byte (the slave address) can be sent. The data written to the data register comprises the address of the desired slave and the LSB indicates the transfer direction.

The free time between a Stop and the next Start condition is built into the hardware that generates the Start cycle. Depending on the relative frequencies of the system clock and the SCL period, it may be necessary to wait until the I2C is not busy after writing the calling address to the data register (I2C_I2DR), before proceeding to load data into the data register (I2C_I2DR).

29.5.3 Post-transfer software response

Sending or receiving a byte sets the data transferring bit (I2C_I2SR[ICF]), which indicates one byte of communication is finished. Upon completion, the interrupt status (I2C_I2SR[IIF]) is also set. An external interrupt is generated if the interrupt enable (I2C_I2CR[IIEN]) is set. The software must first clear the interrupt status (I2C_I2SR[IIF]) in the interrupt routine.

See the flow chart in Figure 29-5.

The data transferring bit (I2C_I2SR[ICF]) is cleared either by reading from I2C_I2DR in Receive mode or by writing to this register in Transmit mode.

The software can service the I2C I/O in the main program by monitoring the interrupt status (I2C_I2SR[IIF]) if the interrupt enable is deasserted. In this case, the interrupt status should be polled in the data transferring bit (I2C_I2SR[ICF]) because the operation is different when arbitration is lost.

When an interrupt occurs at the end of the address cycle, the master is always in Transmit mode; that is, the address is sent. If Master Receive mode is required, then I2C_I2CR[MTX] should be toggled and a dummy read of the I2C_I2DR register must be executed to trigger receive data.

During Slave-mode address cycles (I2C_I2SR[IAAS] = 1), the slave read/write bit I2C_I2SR[SRW] is read to determine the direction of the next transfer. The transmit/receive bit (I2C_I2CR[MTX]) should also be programmed accordingly. For Slave-mode data cycles (IAAS = 0), SRW is invalid. MTX should be read to determine the current transfer direction.

29.5.4 Generation of Stop

A data transfer ends when the master signals a Stop, which can occur after all data is sent.

For a master receiver to terminate a data transfer, it must inform the slave transmitter by not acknowledging the last data byte. This is done by setting the transmit acknowledge bit (I2C_I2CR[TXAK]) before reading the next-to-last byte. Before the last byte is read, a Stop signal must be generated.

29.5.5 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

29.5.6 Slave mode

In the slave interrupt service routine (see Figure 29-5), the block addressed as slave bit (IAAS) should be tested to check if a calling of its own address has just been received. If IAAS is set, software should set the Transmit/Receive mode select bit (I2C_I2CR[MTX]) according to the I2C_I2SR[SRW]. Writing to the I2C_I2CR clears the IAAS automatically. The only time IAAS is read as set is from the interrupt at the end of the address cycle where an address match occurred; interrupts resulting from subsequent data transfers will have IAAS cleared. A data transfer can now be initiated by writing information to I2C_I2DR for slave transmits, or read from I2C_I2DR in Slave Receive mode. A dummy read of I2C_I2DR in Slave Receive mode releases SCL, allowing the master to send data.

In the slave transmitter routine, the receive acknowledge bit (I2C_I2SR[RXAK]) must be tested before sending the next byte of data. Setting RXAK means an end-of-data signal from the master receiver, after which the software must switch it from Transmit to Receiver mode. Reading the data register (I2C_I2DR) then releases SCL so the master can generate a Stop signal.

29.5.7 Arbitration lost

If several devices try to engage the bus at the same time, one becomes master. Hardware immediately switches devices that lose arbitration to Slave Receive mode. Data output to 12Cn_SDA stops, but 12Cn_SCL is still generated until the end of the byte during which arbitration is lost. An interrupt occurs at the falling edge of the ninth clock of this transfer if the arbitration is lost (I2C_I2SR[IAL] = 1), and the Slave mode is selected (I2C_I2CR[MSTA] = 0).

See the flow chart in Figure 29-5.

If a device that is not a master tries to transmit or do a Start, hardware inhibits the transmission, clears MSTA without signaling a Stop, generates an interrupt to the ARM platform, and sets I2C_I2SR[IAL] to indicate a failed attempt to engage the bus. When considering these cases, the slave service routine should first test I2C_I2SR[IAL], and the software should clear it if it is set.

For Multimaster mode, when an I2C is enabled when the bus is busy and asserts Start, the I2C_I2SR[IAL] bit gets set only for 12Cn_SDA=0, 12Cn_SCL=0/1, 12Cn_SDA=1, and 12Cn_SCL=0; but not for 12Cn_SDA=1 and I2Cn_SCL=1, which is the equivalent of Bus Idle state.

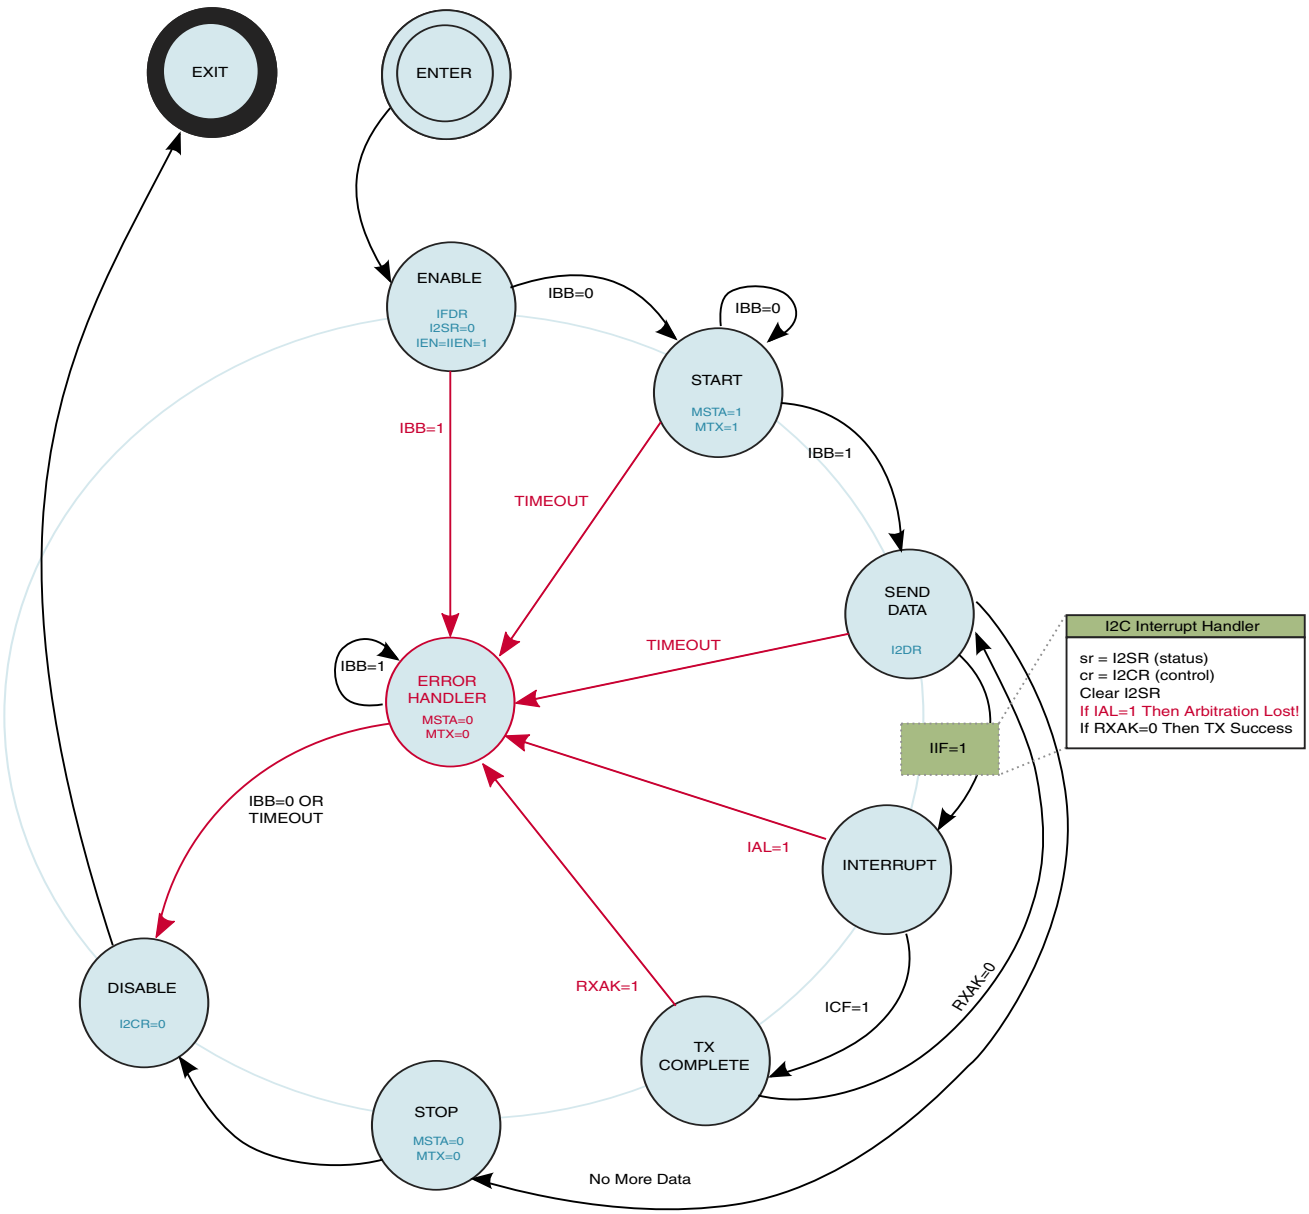

Figure 29-4. I2C Programming state diagram

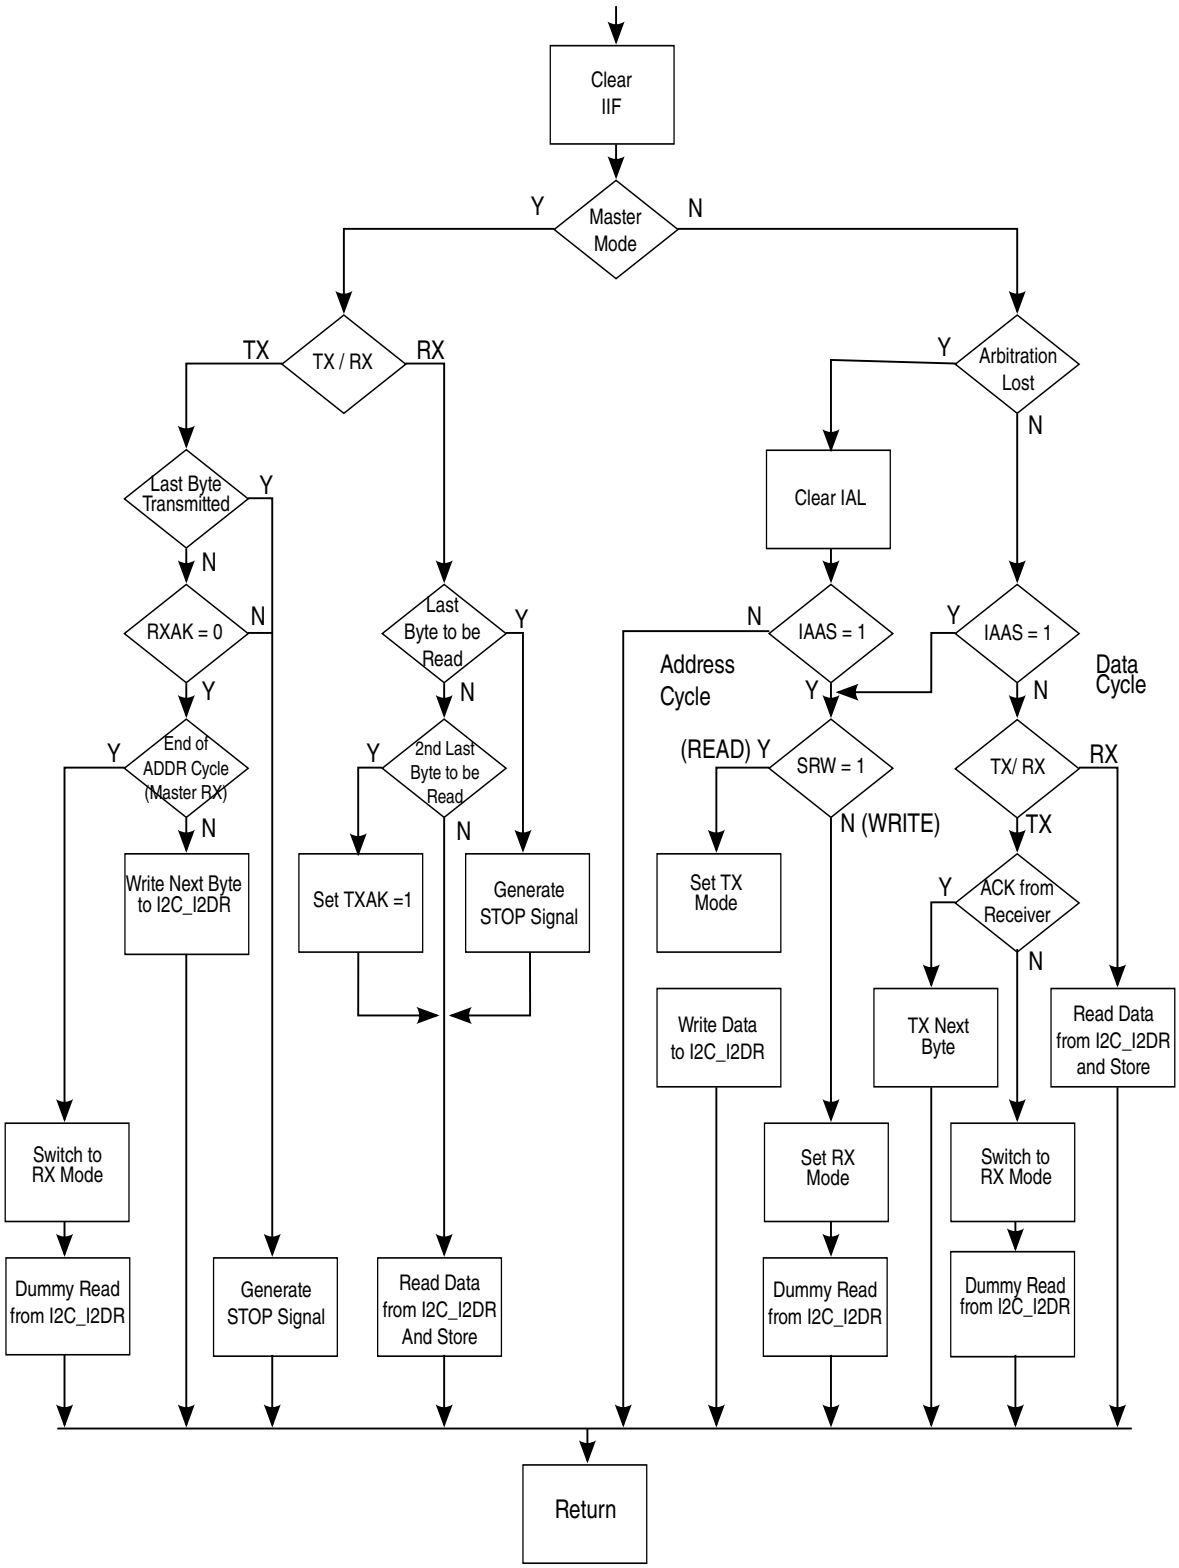

Figure 29-5. Flowchart of typical I2C interrupt routine

NOTE

For a Repeated Start only, the Stop-generation stage does not occur in Master mode. A loop repeats itself without stopping for the next start.

For Master Receive mode, I2C is programmed as Master Transmit during Address mode and after slave address transfer; the MTX bit should be cleared and a dummy read on the I2C_I2DR register should be performed so I2C can read the next receive data.

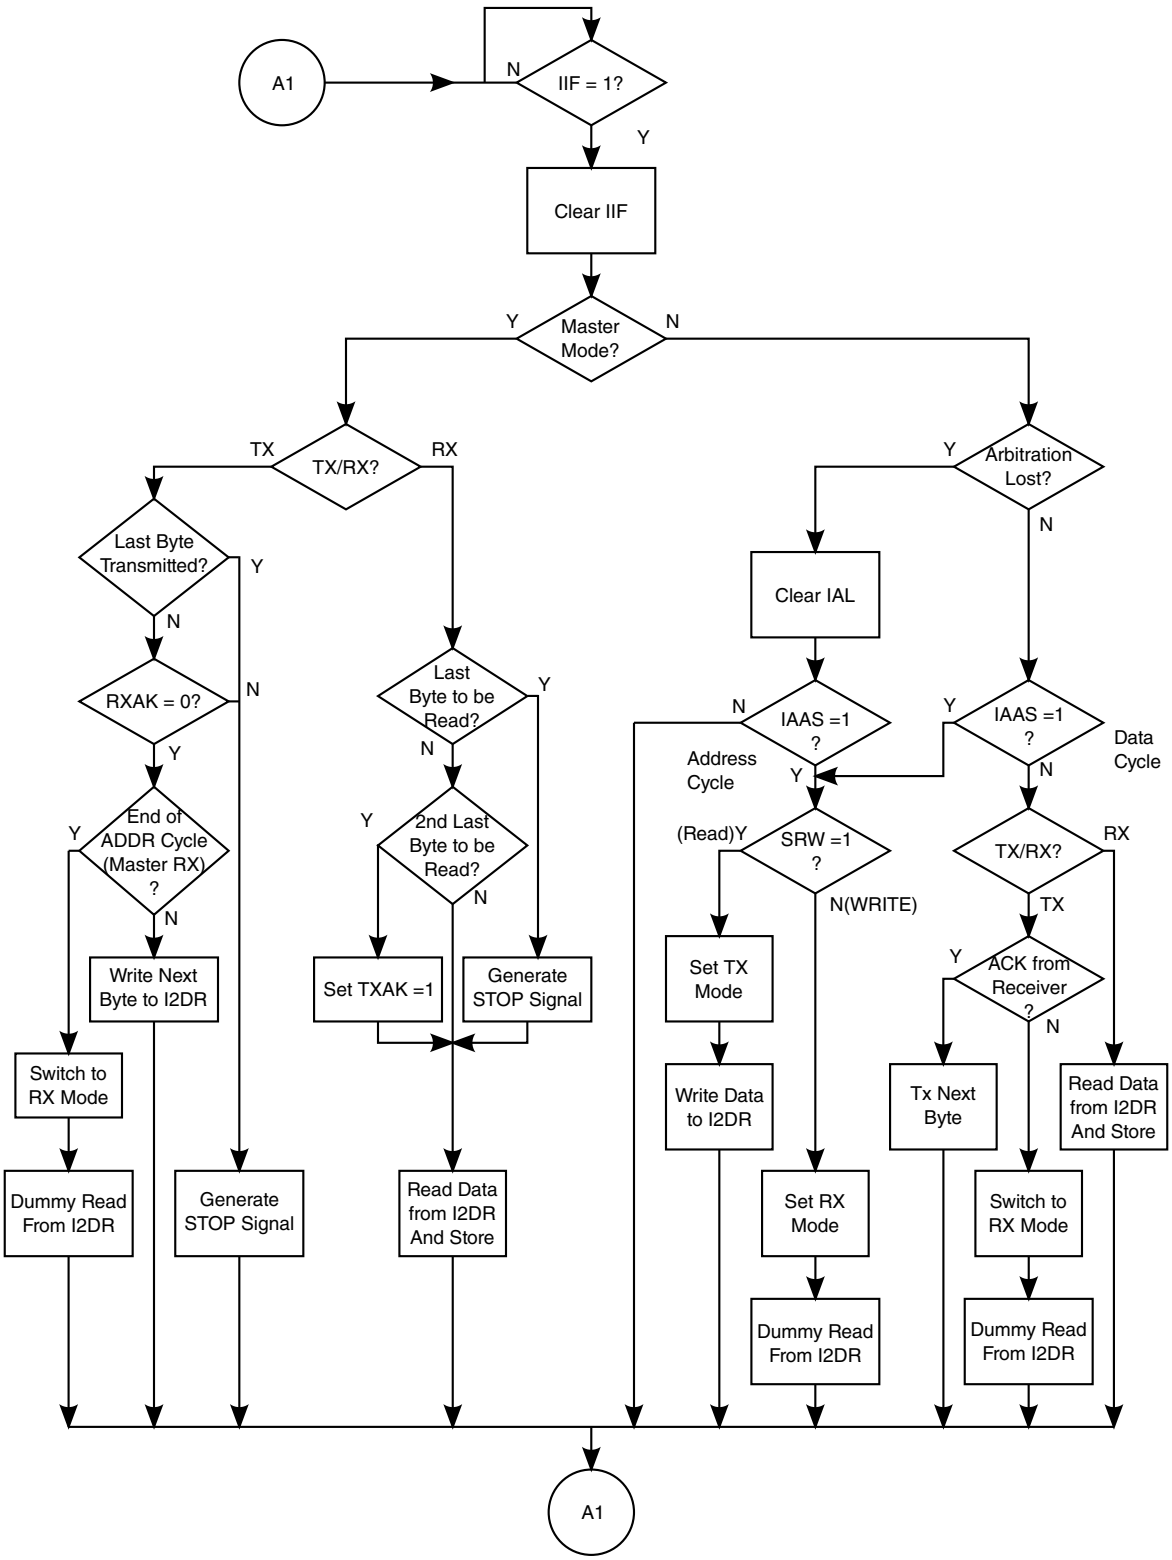

Figure 29-6. Flowchart for typical I2C polling routine

NOTE

The timeout value depends on the bus frequency at which I2C is operating. The minimum timeout for polling the IIF bit at a maximum I2C bus frequency of 400 kHz is T_{min} = 25 µs (=2.5 x 10 µs). This value can be calculated for any bus frequency. The formula is $T_{min} = 10/F_{SCL}$, where F_{SCL} is the frequency of the I2C clock (SCL).

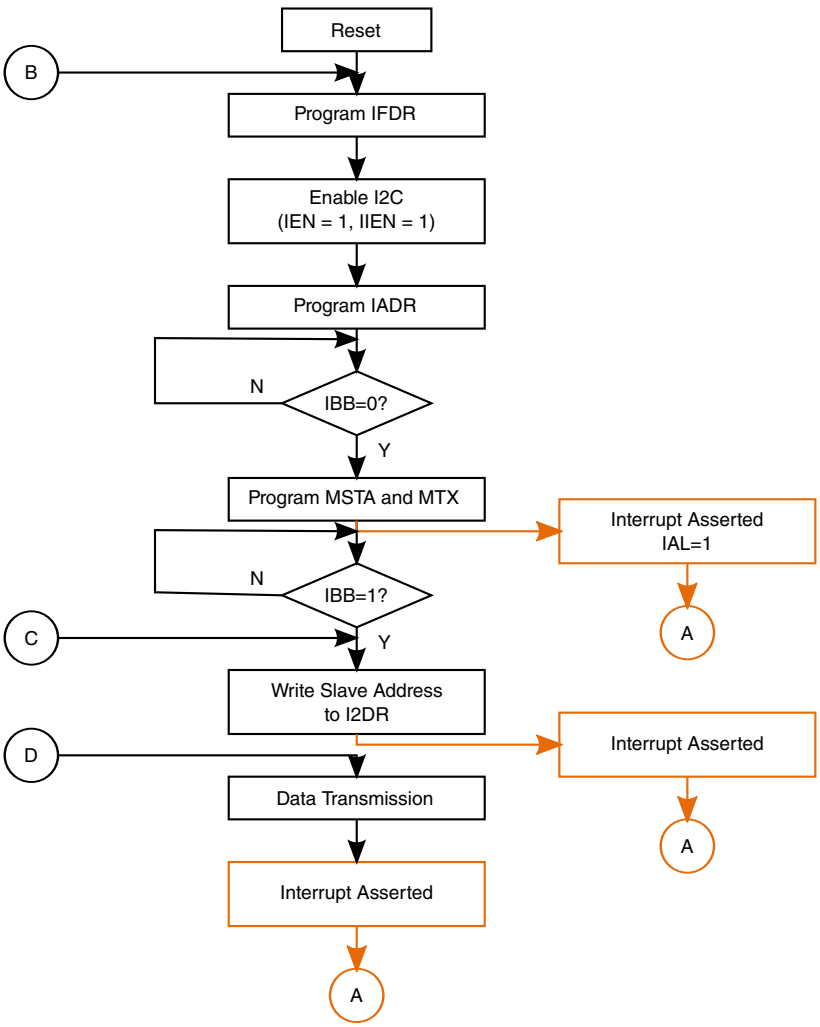

Figure 29-7. Detailed flowchart of a typical I2C Master Transmit mode, part 1

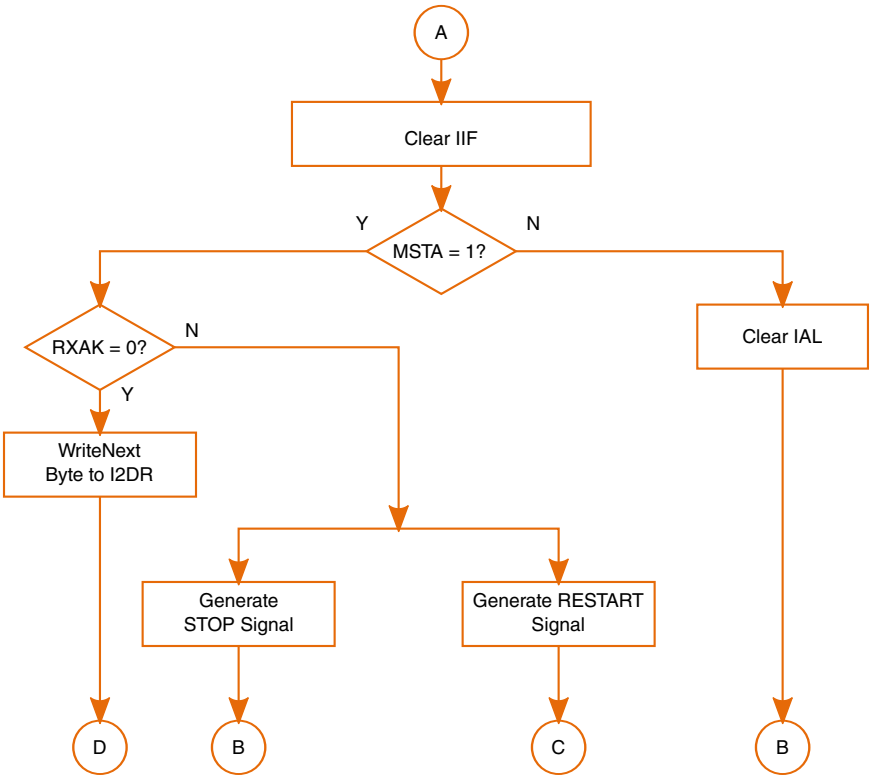

Figure 29-8. Detailed flowchart of a typical I2C Master Transmit mode, part 2

Figure 29-7 and Figure 29-8 show the Master Transmit mode operation with interrupt subroutine. If an interrupt is generated and the MSTA bit is 0, then bus arbitration is lost and IAL is set. Software can clear the IAL bit and reprogram I2C. If the MSTA bit is 1, then it is a transfer-generated interrupt. In this case, software can check the RXAK bit for a data receive acknowledgement by the slave and, accordingly, decide to do one of the following:

- Generate a STOP
- Generate a REPEATED START by writing to the I2C_I2CR register
- Perform the next data transfer by writing to the I2C_I2DR register

NOTE

The IBB bit is asserted by a Start condition on the bus, and it is deasserted by a Stop condition on the bus. Therefore, if arbitration is lost due to an unexpected Stop condition during transfer, then IBB is cleared. If arbitration is lost due to a data mismatch, then it is not cleared. Software should always clear the IEN bit and then set it if arbitration is lost.

29.6 Software restriction

Software should ensure that there is a delay of at least two module clock cycles after it sets the I2C_I2CR[RSTA] bit and before writing to the I2C_I2DR register. The maximum possible clock period of the module clock is 78 ns.

29.7 I2C Memory Map/Register Definition

The I2C contains five 16-bit registers.

NOTE

Registers at offsets 0x0002, 0x0006, 0x000A, and 0x000E are reserved for future additions.

I2C memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

29.7.1 I2C Address Register (I2Cx_IADR)

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								ADR							0
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Cx_IADR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7–1 ADR	Slave address. Contains the specific slave address to be used by the I2C. Slave mode is the default I2C mode for an address match on the bus. **NOTE:** The I2C_IADR holds the address to which the I2C responds when addressed as a slave. The slave address is not the address sent on the bus during the address transfer. The register is not reset by a software reset.
0 Reserved	This read-only field is reserved and always has the value 0.

29.7.2 I2C Frequency Divider Register (I2Cx_IFDR)

The I2C_IFDR provides a programmable prescaler to configure the clock for bit-rate selection. The register does not get reset by a software reset.

I2C clock is sourced from PERCLK_ROOT which is routed from IPG_CLK_ROOT. I2C clock frequency can easily obtained by using the following formula:

I2C clock Frequency = (PERCLK_ROOT frequency)/(division factor corresponding to IFDR)

By default, IPG_CLK_ROOT and PERCLK_ROOT frequencies are set to 49.5 MHz, where the root clock is sourced from PLL2's PFD2. Obtaining the frequencies can be accomplished by:

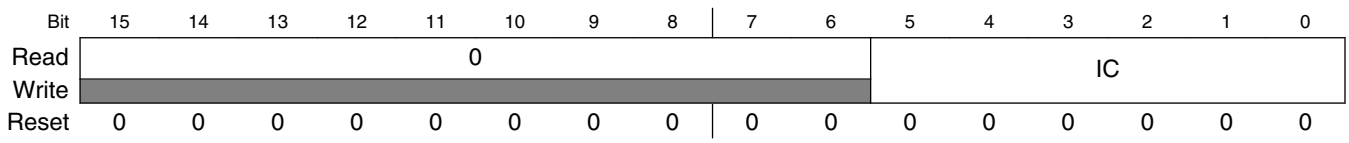
PLL2 = 528 MHz

PLL2_PFD2 = 528 MHz * 18 / 24 = 396 MHz

IPG_CLK_ROOT = (PLL2_PFD2 / ahb_podf)/ ipg_podf = (396 MHz/4)/2 = 49.5 MHz

PER_CLK_ROOT = IPG_CLK_ROOT/perclk_podf = 49.5 MHz/1 = 49.5 MHz

NOTE



The above calculation assumes that the default CCM register settings, routing, and division factors are used. If different routing, PFD values, and/or division factors are used, the user must adjust the parameters accordingly to calculate the correct clock frequency.

The following table describes the divider and register values for the register field "IC."

Table 29-3. I2C_IFDR Register Field Values

IC	Divider		IC	Divider		IC	Divider		IC	Divider
0x00	30		0x10	288		0x20	22		0x30	160

Address: Base address + 4h offset

I2Cx_IFDR field descriptions

Field	Description
15–6 Reserved	This read-only field is reserved and always has the value 0.
IC	I2C clock rate. Prescales the clock for bit-rate selection. Due to potentially slow I2Cn_SCL and I2Cn_SDA rise and fall times, bus signals are sampled at the prescaler frequency. The serial bit clock frequency may be lower than IPG_CLK_ROOT divided by the divider shown in the I2C Data I/O Register. **NOTE:** The IC value should not be changed during the data transfer, however, it can be changed before a Repeat Start or Start programming sequence in I2C. The I2C protocol supports bit rates of up to 400 kbps. The IC bits need to be programmed in accordance with this constraint.

29.7.3 I2C Control Register (I2Cx_I2CR)

The I2C_I2CR is used to enable the I2C and the I2C interrupt. It also contains bits that govern operation as a slave or a master.

Address: Base address + 8h offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read	IEN	IIEN	MSTA	MTX	TXAK	0	0	
Write						RSTA		
Reset	0	0	0	0	0	0	0	0

I2Cx_I2CR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 IEN	I2C enable. Also controls the software reset of the entire I2C. Resetting the bit generates an internal reset to the block. If the block is enabled in the middle of a byte transfer, Slave mode ignores the current bus transfer and starts operating when the next Start condition is detected. Master mode is not aware that the bus is busy, so initiating a start cycle may corrupt the current bus cycle, ultimately causing either the current master or the I2C to lose arbitration. Subsequently, bus operation returns to normal. 0 The block is disabled, but registers can still be accessed. 1 The I2C is enabled. This bit must be set before any other I2C_I2CR bits have an effect.
6 IIEN	I2C interrupt enable. **NOTE:** If data is written during the Start condition, that is, just after setting the I2C_I2CR[MSTA] and I2C_I2CR[MTX] bits, then the ICF bit is cleared at the falling edge of SCLK after Start. If data is written after the Start condition and falling edge of SCLK, then the ICF bit is cleared as soon as data is written. 0 I2C interrupts are disabled, but the status flag I2C_I2SR[IIF] continues to be set when an Interrupt condition occurs. 1 I2C interrupts are enabled. An I2C interrupt occurs if I2C_I2SR[IIF] is also set.
5 MSTA	Master/Slave mode select bit. If the master loses arbitration, MSTA is cleared without generating a Stop signal. **NOTE:** The module clock should be on for writing to the MSTA bit. **NOTE:** The MSTA bit is cleared by software to generate a Stop condition; it can also be cleared by hardware when the I2C loses the bus arbitration.

Table continues on the next page...

I2Cx_I2CR field descriptions (continued)

Field	Description
	0 Slave mode. Changing MSTA from 1 to 0 generates a Stop and selects Slave mode. 1 Master mode. Changing MSTA from 0 to 1 signals a Start on the bus and selects Master mode.
4 MTX	Transmit/Receive mode select bit. Selects the direction of master and slave transfers. 0 Receive. When a slave is addressed, the software should set MTX according to the slave read/write bit in the I2C status register (I2C_I2SR[SRW]). 1 Transmit. In Master mode, MTX should be set according to the type of transfer required. Therefore, for address cycles, MTX is always 1.
3 TXAK	Transmit acknowledge enable. Specifies the value driven onto I2Cn_SDA during acknowledge cycles for both master and slave receivers. **NOTE:** Writing TXAK applies only when the I2C bus is a receiver. 0 An acknowledge signal is sent to the bus at the ninth clock bit after receiving one byte of data. 1 No acknowledge signal response is sent (that is, the acknowledge bit = 1).
2 RSTA	Repeat start. Always reads as 0. Attempting a repeat start without bus mastership causes loss of arbitration. 0 No repeat start 1 Generates a Repeated Start condition
Reserved	This read-only field is reserved and always has the value 0.

29.7.4 I2C Status Register (I2Cx_I2SR)

The I2C_I2SR contains bits that indicate transaction direction and status.

Address: Base address + Ch offset

I2Cx_I2SR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 ICF	Data transferring bit. While one byte of data is transferred, ICF is cleared. 0 Transfer is in progress. 1 Transfer is complete. This bit is set by the falling edge of the ninth clock of the last byte transfer.
6 IAAS	I2C addressed as a slave bit. The ARM platform is interrupted if the interrupt enable (I2C_I2CR[IIEN]) is set. The ARM platform must check the slave read/write bit (SRW) and set its Transfer/Receive mode accordingly. Writing to I2C_I2CR clears this bit. 0 Not addressed 1 Addressed as a slave. Set when its own address (I2C_IADR) matches the calling address.
5 IBB	I2C bus busy bit. Indicates the status of the bus. **NOTE:** When I2C is enabled (I2C_I2CR[IEN] = 1), it continuously polls the bus data (SDA) and clock (SCL) signals to determine a Start or Stop condition. 0 Bus is idle. If a Stop signal is detected, IBB is cleared. 1 Bus is busy. When Start is detected, IBB is set.
4 IAL	Arbitration lost. Set by hardware in the following circumstances (IAL must be cleared by software by writing a "0" to it at the start of the interrupt service routine): • I2Cn_SDA input samples low when the master drives high during an address or data-transmit cycle. • I2Cn_SDA input samples low when the master drives high during the acknowledge bit of a data-receive cycle. For the above two cases, the bit is set at the falling edge of the ninth I2Cn_SCL clock during the ACK cycle. • A Start cycle is attempted when the bus is busy. • A Repeated Start cycle is requested in Slave mode. • A Stop condition is detected when the master did not request it. **NOTE:** Software cannot set the bit. 0 No arbitration lost. 1 Arbitration is lost.
3 Reserved	This read-only field is reserved and always has the value 0.
2 SRW	Slave read/write. When the I2C is addressed as a slave, IAAS is set, and the slave read/write bit (SRW) indicates the value of the R/W command bit of the calling address sent from the master. SRW is valid only when a complete transfer has occurred, no other transfers have been initiated, and the I2C is a slave and has an address match. 0 Slave receive, master writing to slave 1 Slave transmit, master reading from slave
1 IIF	I2C interrupt. Must be cleared by the software by writing a "0" to it in the interrupt routine. **NOTE:** The software cannot set the bit. 0 No I2C interrupt pending. 1 An interrupt is pending.

Table continues on the next page...

I2Cx_I2SR field descriptions (continued)

Field	Description
	This causes a processor interrupt request (if the interrupt enable is asserted [IIEN = 1]). The interrupt is set when one of the following occurs: • One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock). • An address is received that matches its own specific address in Slave Receive mode. • Arbitration is lost.
0 RXAK	Received acknowledge. This is the value received from the I2Cn_SDA input for the acknowledge bit during a bus cycle. 0 An "acknowledge" signal was received after the completion of an 8-bit data transmission on the bus. 1 A "No acknowledge" signal was detected at the ninth clock.

29.7.5 I2C Data I/O Register (I2Cx_I2DR)

In Master Receive mode, reading the data register allows a read to occur and initiates the next byte to be received. In Slave mode, the same function is available after it is addressed.

Address: Base address + 10h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								DATA							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Cx_I2DR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
DATA	Data Byte. Holds the last data byte received or the next data byte to be transferred. Software writes the next data byte to be transmitted or reads the data byte received. **NOTE:** The core-written value in I2C_I2DR cannot be read back by the core. Only data written by the I2C bus side can be read.

Chapter 30
IOMUX Controller (IOMUXC)

30.1 Overview

The IOMUX Controller (IOMUXC), together with the IOMUX, enables the IC to share one pad to several functional blocks. This sharing is done by multiplexing the pad's input and output signals.

Every module requires a specific pad setting (such as pull up or keeper), and for each pad, there are up to 8 muxing options (called ALT modes). The pad settings parameters are controlled by the IOMUXC.

The IOMUX consists only of combinatorial logic combined from several basic IOMUX cells. Each basic IOMUX cell handles only one pad signal's muxing.

Figure 30-1 illustrates the IOMUX/IOMUXC connectivity in the system.

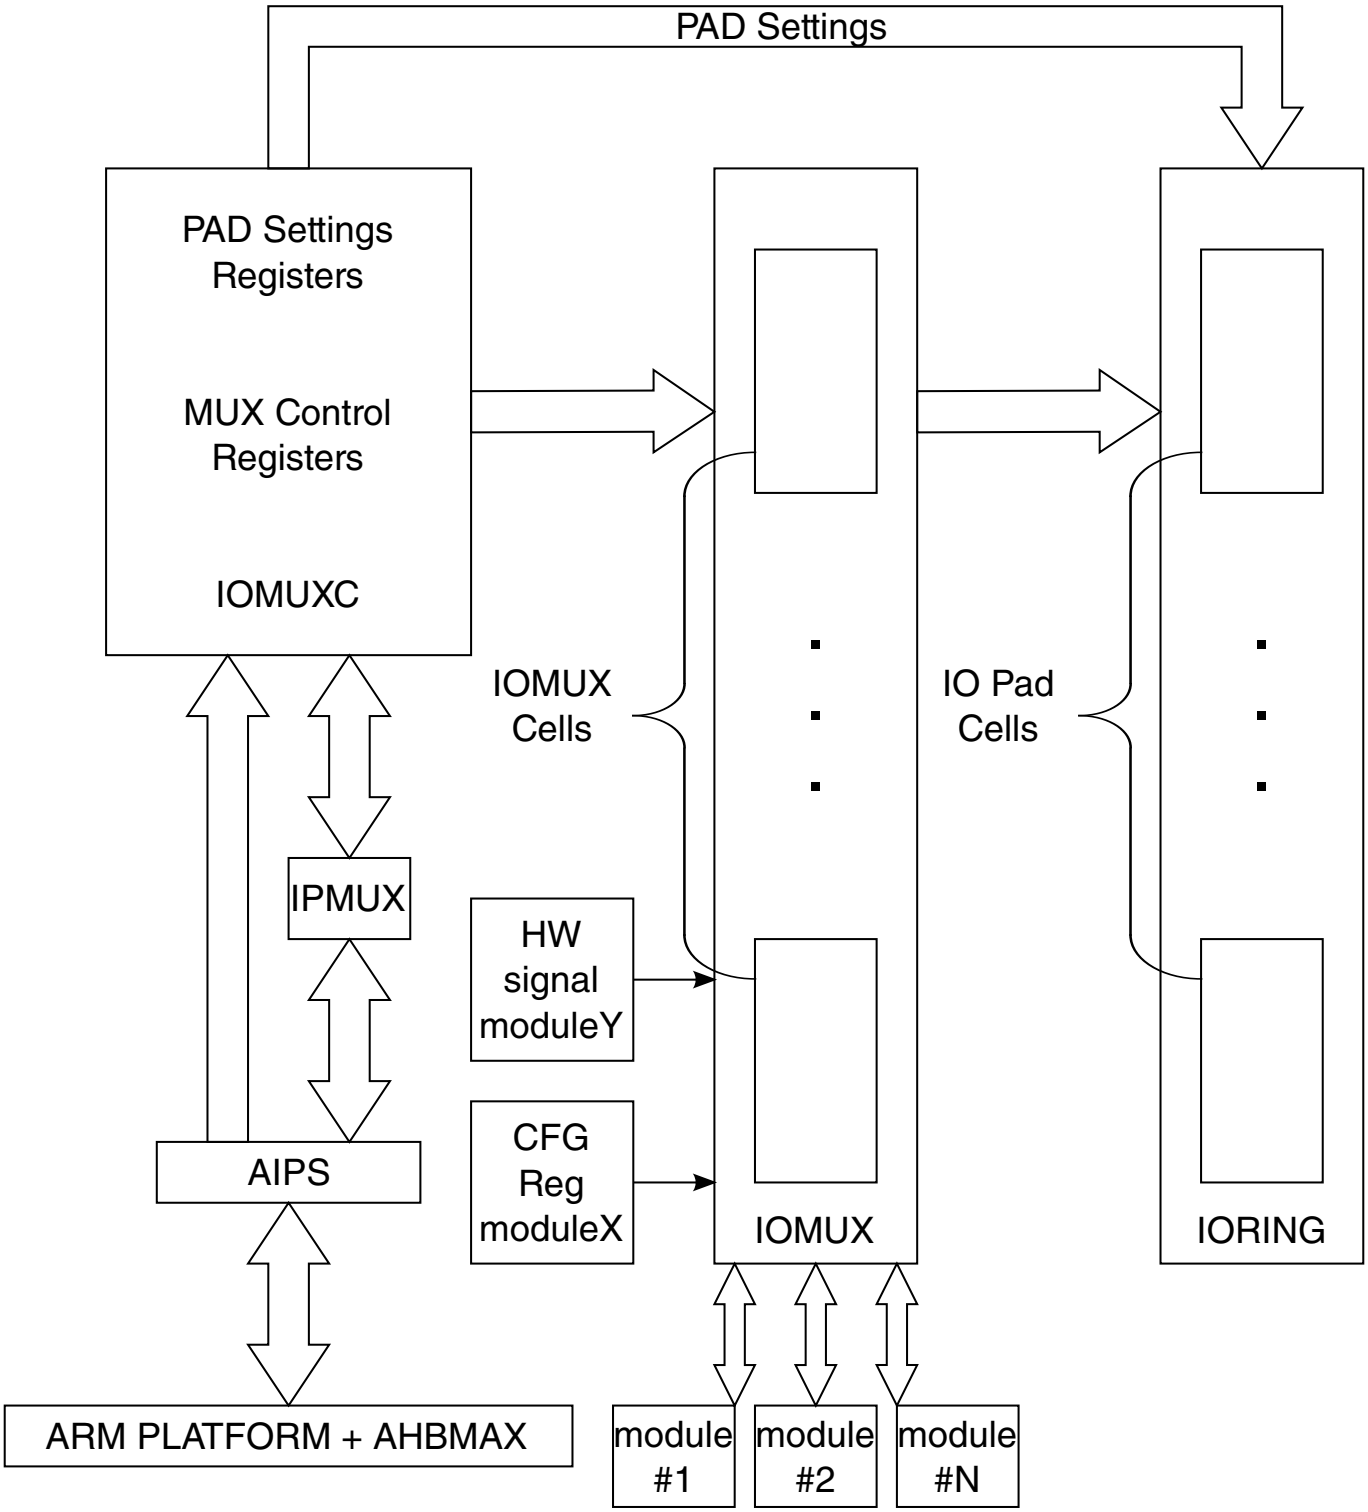

Figure 30-1. IOMUX SoC Level Block Diagram

30.1.1 Features

The IOMUXC features are:

- 32-bit software mux control registers (IOMUXC_SW_MUX_CTL_PAD_<PAD NAME> or IOMUXC_SW_MUX_CTL_GRP_<GROUP NAME>) to configure 1 of 8 alternate (ALT) MUX_MODE feilds of each pad or a predefined group of pads and to enable the forcing of an input path of the pad(s) (SION bit).
- 32-bit software pad control registers (IOMUXC_SW_PAD_CTL_PAD_<PAD_NAME> or IOMUXC_SW_PAD_CTL_GRP_<GROUP NAME>) to configure specific pad settings of each pad, or a predefined group of pads.
- 32-bit general purpose registers - 14 (GPR0 to GPR13) 32-bit registers according to SoC requirements for any usage.
- 32-bit input select control registers to control the input path to a module when more than one pad drives this module input.

Each SW MUX/PAD CTL IOMUXC register handles only one pad or one pad's group.

Only the minimum number of registers required by software are implemented by hardware. For example, if only ALT0 and ALT1 modes are used on Pad x then only one bit register will be generated as the MUX_MODE control field in the software mux control register of Pad x.

The software mux control registers may allow the forcing of pads to become input (input path enabled) regardless of the functional direction driven. This may be useful for loopback and GPIO data capture.

30.2 Clocks

The table found here describes the clock sources for IOMUXC.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 30-1. IOMUXC Clocks

Clock name	Clock Root	Description
ipt_clk_io		IO clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

30.3 Functional description

This section provides a complete functional description of the block.

The IOMUXC consists of two sub-blocks:

- IOMUXC_REGISTERS includes all of the IOMUXC registers (see Features).
- IOMUXC_LOGIC includes all of the IOMUXC combinatorial logic (IP interface controls, address decoder, observability muxes).

The IOMUX consists of a number (about the number of pads in the SoC) of basic iomux_cell units. If only one functional mode is required for a specific pad, there is no need for IOMUX and the signals can be connected directly from the module to the I/O. The IOMUX cell is required whenever two or more functional modes are required for a specific pad or when one functional mode and the one test mode are required.

The basic iomux_cell design, which allows two levels of HW signal control (in ALT6 and ALT7 modes - ALT7 gets highest priority) is shown in Figure 30-2.

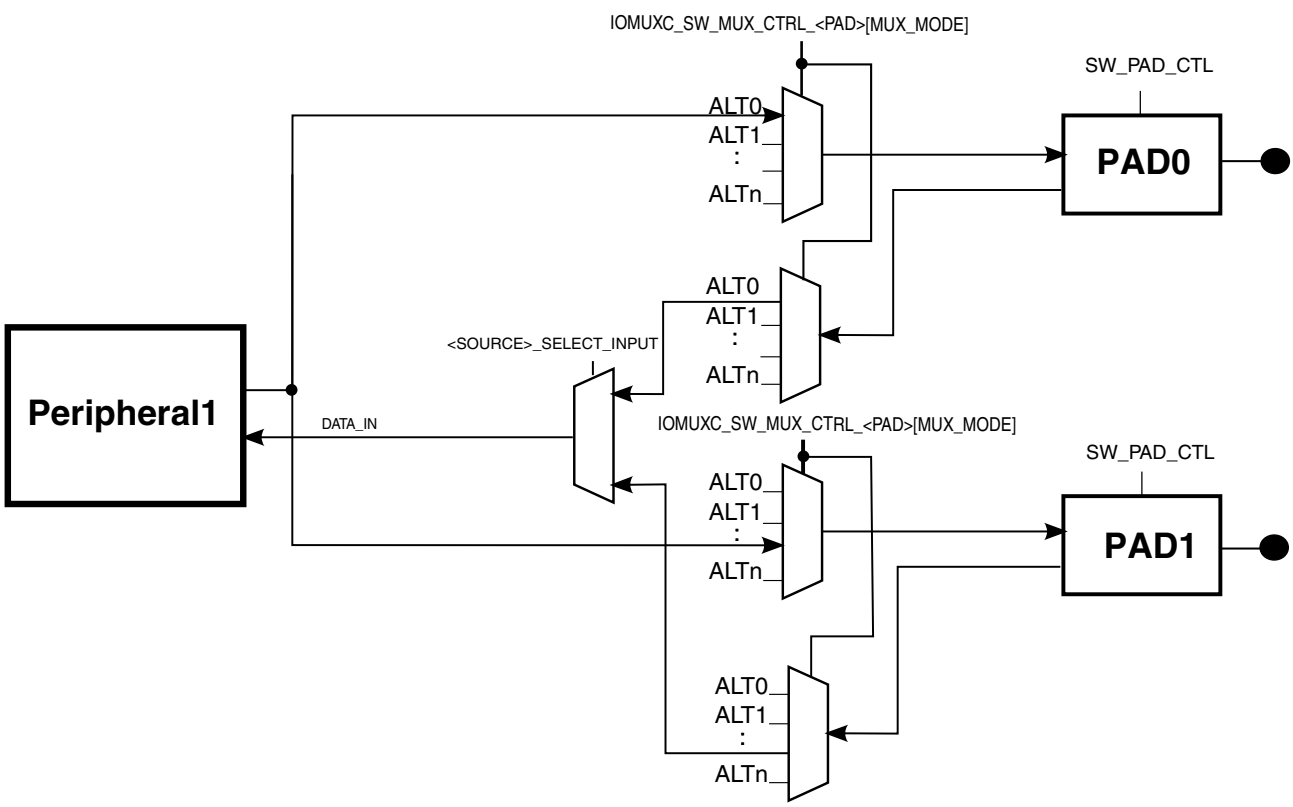

Figure 30-2. IOMUX Cell Block Diagram

30.3.1 ALT6 and ALT7 extended muxing modes

The ALT7 and ALT6 extended muxing modes allow any signal in the system (such as fuse, pad input, JTAG, or software register) to override any software configuration and to force the ALT6/ALT7 muxing mode.

It also allows an IOMUX software register to control a group of pads.

30.3.2 SW Loopback through SION bit

A limited option exists to override the default pad functionality and force the input path to be active (ipp_ibe==1'b1) regardless of the value driven by the corresponding module. This can be done by setting the SION (Software Input On) bit in the IOMUXC_SW_MUX_CTL register (when available) to "1".

Uses include:

- LoopBack - Module x drives the pad and also receives pad value as an input.
- GPIO Capture - Module x drives the pad and the value is captured by GPIO.

30.3.3 Daisy chain - multi pads driving same module input pin

In some cases, more than one pad may drive a single module input pin. Such cases require the addition of one more level of IOMUXing; all of these input signals are muxed, and a dedicated software controlled register controls the mux in order to select the required input path.

A module port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers).

This means that a module port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers). The daisy chain is illustrated in the figure below.

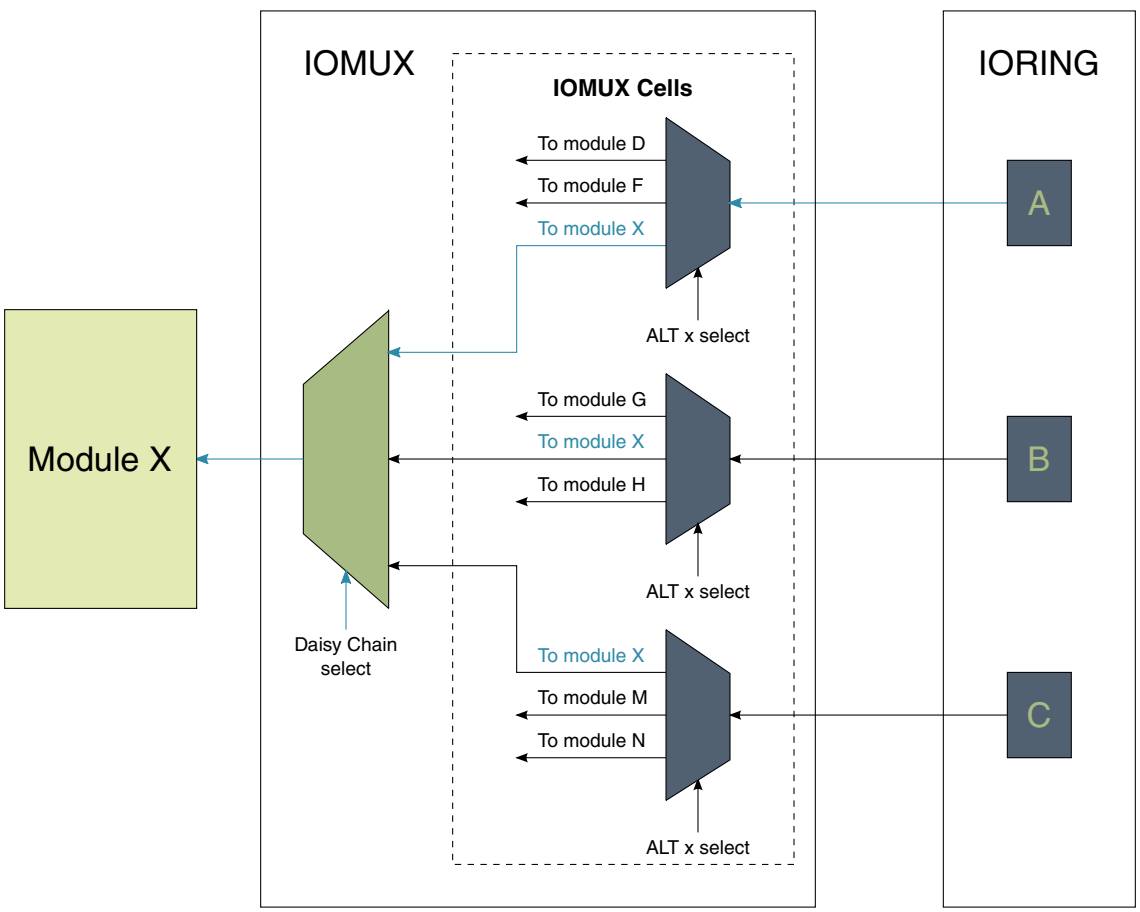

Figure 30-3. Daisy chain illustration

1 PXP_MEM_SHUTDOWN	set to bring memory to shutdown state (most power saving state, Shut Down periphery and core, no memory retention)
0 PXP_MEM_EN_POWERSAVING	enable power saving features on PXP memory 0 none memory power saving features enabled, SHUTDOWN/DEEPSLEEP/LIGHTSLEEP will have no effect 1 memory power saving features enabled, set SHUTDOWN/DEEPSLEEP/LIGHTSLEEP(priority high to low) to enable power saving levels

30.4.4 GPR3 General Purpose Register (IOMUXC_GPR_GPR3)

GPR Register

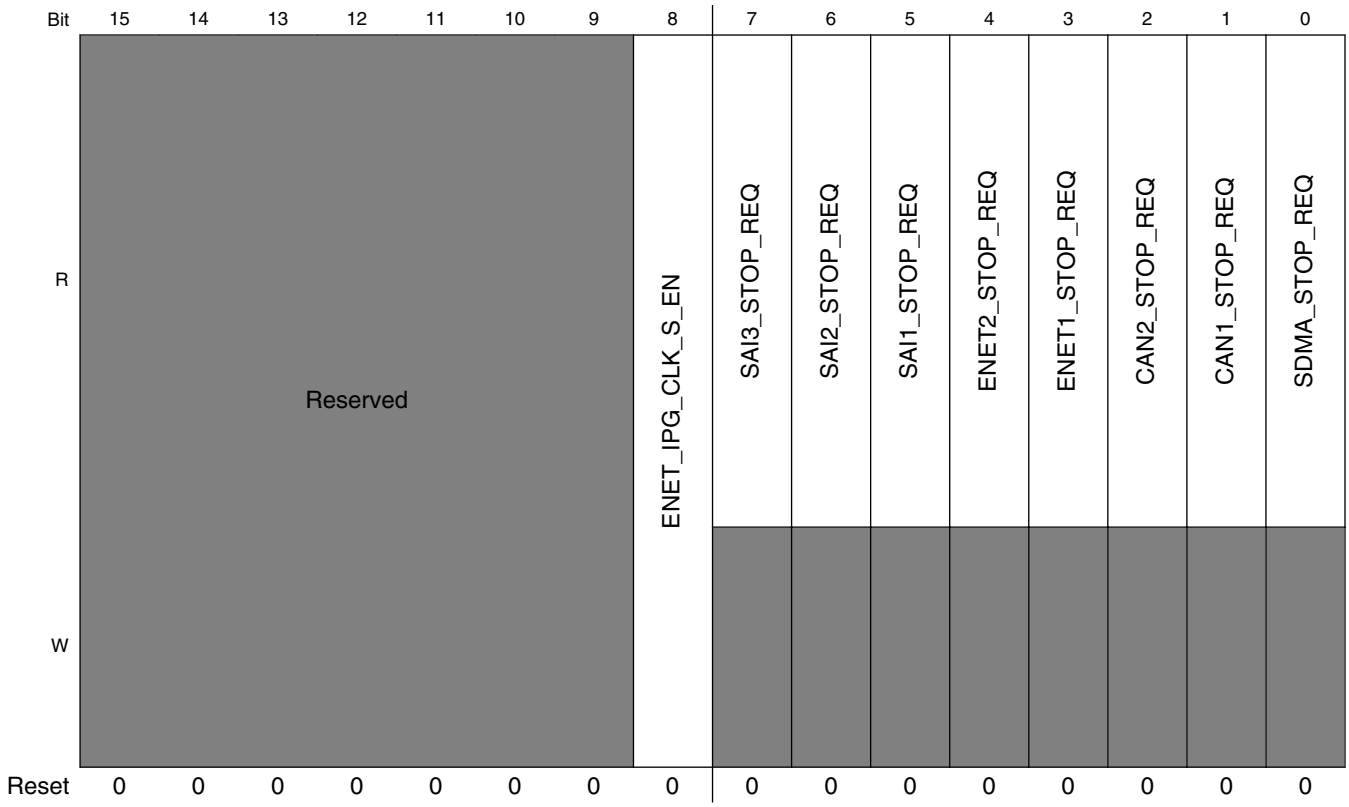
Address: 20E_4000h base + Ch offset = 20E_400Ch

IOMUXC_GPR_GPR3 field descriptions

Field	Description
31–20 -	This field is reserved. Reserved
19–16 OCRAM_ STATUS	This field shows the OCRAM pipeline settings status, controlled by OCRAM_CTL[24:21] bits respectively. When the control bit is changed, the corresponding status bit goes high and keeps high until this new configuration is applied the internal logic. This provides a way for software to detect that the configuration has become valid. The suggested flow for changing the configuration in software is: • set/clear the control bit • poll the status bit until it goes to 0 OCRAM_STATUS[19] shows the write address pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory. OCRAM_STATUS[18] shows the write data pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory. OCRAM_STATUS[17] shows the read address pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory. OCRAM_STATUS[16] shows the read data pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory. 0 read data pipeline configuration valid 1 read data pipeline control bit changed
15–14 -	This field is reserved. Reserved
13 CORE_DBG_ ACK_EN	Mask control of Core debug acknowledge to global debug acknowledge 0 Core debug acknowledge is part of global acknowledge. 1 Core debug acknowledge is masked by this bit, and it is not part of global acknowledge.
12 -	This field is reserved. Reserved
11–4 -	This field is reserved. Reserved
OCRAM_CTL	OCRAM_CTL[3] write address pipeline control bit. When this feature is enabled, the write address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the write access on the memory cell at high frequency. Enable this feature would cost at most 1 more clock cycle for each AXI write transaction, i.e., at most 1 more clock cycle for each write burst with multiple beats of data. When this feature is disabled, the write address from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write data is also ready at this cycle). 0 write address pipeline is disabled 1 write address pipeline is enabled OCRAM_CTL[2] - write data pipeline control bit When this feature is enabled, the write data from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI write transaction, i.e., at most 1 more clock cycle for each write burst with multiple beats of data.

Table continues on the next page...

IOMUXC_GPR_GPR3 field descriptions (continued)



Field	Description
	When this feature is disabled, the write data from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write address is also ready at this cycle). 0 write data pipeline is disabled 1 write data pipeline is enabled OCRAM_CTL[1] read address pipeline control bit. When this feature is enabled, the read address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the read access on the memory cell at high frequency. Enable this feature would cost at most 1 more clock cycle for each AXI read transaction, i.e., at most 1 more clock cycle for each read burst with multiple beats of data. When this feature is disabled, the read address from the AXI master can be accepted by the on-chip RAM without delay, and data can become ready for master at next clock cycle (if no other access and no read data wait). 0 read address pipeline is disabled 1 read address pipeline is enabled OCRAM_CTL[0] - read data wait state control bit When thread data wait state is enabled, it will cost 2 cycles for each read access, (each beat of a read burst). This can avoid the potential timing problem caused by the relatively longer memory access time at higher frequency. When this feature is disabled, it only costs 1 clock cycle to finish a read transaction, i.e., get read data back in the next cycle of read request becomes valid on the bus. 0 read data pipeline is disabled 1 read data pipeline is enabled
