IOMUXC_SW_MUX_CTL_PAD_CSI_DATA07 field descriptions

Field	Description
31–5 -	This field is reserved. Reserved
4 SION	Software Input On Field. Force the selected mux mode Input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad CSI_DATA07 0 **DISABLED** — Input Path is determined by functionality
MUX_MODE	MUX Mode Select Field. Select 1 of 9 iomux modes to be used for pad: CSI_DATA07. 0000 **ALT0** — Select mux mode: ALT0 mux port: CSI_DATA09 of instance: csi 0001 **ALT1** — Select mux mode: ALT1 mux port: USDHC2_DATA7 of instance: usdhc2 0010 **ALT2** — Select mux mode: ALT2 mux port: SIM2_PORT1_TRXD of instance: sim2 0011 **ALT3** — Select mux mode: ALT3 mux port: ECSPI1_MISO of instance: ecspi1 0100 **ALT4** — Select mux mode: ALT4 mux port: EIM_AD07 of instance: eim 0101 **ALT5** — Select mux mode: ALT5 mux port: GPIO4_IO28 of instance: gpio4 0110 **ALT6** — Select mux mode: ALT6 mux port: SAI1_TX_DATA of instance: sai1 1000 **ALT8** — Select mux mode: ALT8 mux port: USDHC1_VSELECT of instance: usdhc1

Chapter 31
Keypad Port (KPP)

31.1 Overview

The Keypad Port (KPP) is a 16-bit peripheral that can be used as a keypad matrix interface or as general purpose input/output (I/O).

The figure below shows the KPP block diagram. The KPP provides interface for the keypad matrix with 2-point contact or 3-point contact keys. The KPP is designed to simplify the software task of scanning a keypad matrix. With appropriate software support, the KPP is capable of detecting, debouncing, and decoding one or multiple keys pressed simultaneously on the keypad.

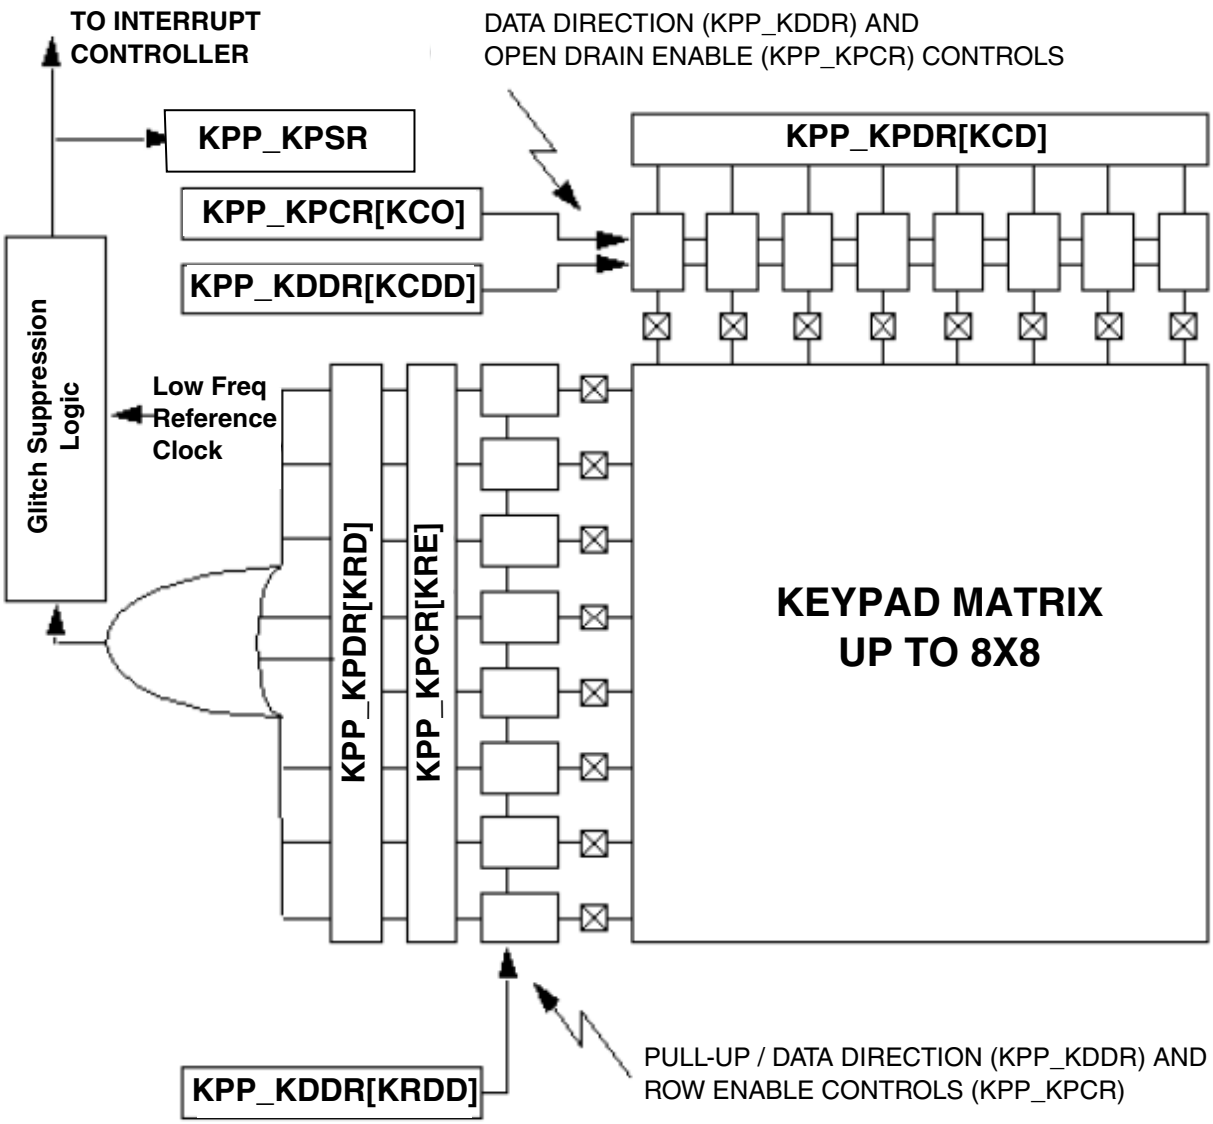

Figure 31-1. KPP Peripheral Block Diagram

31.1.1 Features

The KPP includes these distinctive features:

- Supports up to an 8 x 8 external key pad matrix
- Port pins can be used as general purpose I/O
- Open drain design
- Glitch suppression circuit design
- Multiple-key detection
- Long key-press detection
- Standby key-press detection
- Synchronizer chain clear
- Supports a 2-point and 3-point contact key matrix

31.1.2 Modes and Operations

This block supports the following modes:

- Run Mode-This is the normal functional mode in which the KPP can detect any key press event.
- Low Power Mode-The keypad can detect any key press even in low power modes (when there is no MCU clock).

31.2 Clocks

The table found here describes the clock sources for KPP.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 31-1. KPP Clocks

Clock name	Clock Root	Description
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_s	ipg_clk_root	Peripheral access clock

31.3 External Signals

There are several pins dedicated to the KPP. Keypads of any configuration up to eight rows and eight columns are supported through the software configuration of the peripheral pins. Any pins not used for the keypad are available as general purpose I/O. The registers are configured such that the pins can be treated as an I/O port up to 16 bits wide.

See the table below for the list of external signals.

Table 31-2. KPP External Signals

Signal	Description	Pad	Mode	Direction
KPP_COL0	Column input or output pin, from chip	ENET1_RX_DATA1	ALT6	IO
		NAND_WE_B	ALT3	
KPP_COL1	Column input or output pin, from chip	ENET1_TX_DATA0	ALT6	IO
		NAND_DATA01	ALT3	
KPP_COL2	Column input or output pin, from chip	ENET1_TX_EN	ALT6	IO
		NAND_DATA03	ALT3	
KPP_COL3	Column input or output pin, from chip	ENET1_RX_ER	ALT6	IO

KPP_COL5	Column input or output pin, from chip	ENET2_TX_DATA0	ALT6	IO
KPP_COL6	Column input or output pin, from chip	ENET2_TX_EN	ALT6	IO
KPP_COL7	Column input or output pin, from chip	ENET2_RX_ER	ALT6	IO
KPP_ROW0	Row input or output pin, from chip	ENET1_RX_DATA0	ALT6	IO
		NAND_RE_B	ALT3	
KPP_ROW1	Row input or output pin, from chip	ENET1_RX_EN	ALT6	IO
		NAND_DATA00	ALT3	
KPP_ROW2	Row input or output pin, from chip	ENET1_RX_DATA1	ALT6	IO
		NAND_DATA02	ALT3	
KPP_ROW3	Row input or output pin, from chip	ENET1_TX_CLK	ALT6	IO
KPP_ROW4	Row input or output pin, from chip	ENET2_RX_DATA0	ALT6	IO
KPP_ROW5	Row input or output pin, from chip	ENET2_RX_EN	ALT6	IO
KPP_ROW6	Row input or output pin, from chip	ENET2_TX_DATA1	ALT6	IO
KPP_ROW7	Row input or output pin, from chip	ENET2_TX_CLK	ALT6	IO

31.3.1 Input Pins

Any of the 16 pins associated with the KPP can be configured as inputs by writing a "0" to the appropriate bits in the KPP_KDDR. Additionally, the least significant 8 bits (ROW inputs) corresponding to KPP_KDDR[KRDD] have internal pull-ups, which are enabled when the pin is used as an input.

31.3.2 Output Pins

Any of the 16 pins associated with the KPP can be configured as outputs by writing the appropriate bits in the KPP_KDDR to a "1". Additionally, the 8 most significant bits (15-8) can be designated as open drain outputs by writing a "1" to the appropriate bits in the KPP_KPCR. The lower 8 bits (7-0) are always in "totem pole" style, driven when configured as outputs.

See the table below.

Table 31-3. Keypad Port Column Modes

KPP_KDDR (15:8)	KPP_KPCR (15:8)	Pin Function
0	x	Input
1	0	Totem-Pole Output
1	1	Open-Drain Output

NOTE

Totem pole capability should be provided for column pins. Totem pole configuration helps for a faster discharge of keypad capacitance when all columns need to be quickly brought to a "1" during the scan routine. With this configuration, delay between the scanning of two subsequent columns is reduced.

31.3.3 Generation of Transfer Error Signal on Peripheral Bus

If there is an access to an address which is not implemented, then the KPP asserts a transfer error signal on Peripheral Bus.

31.4 Functional Description

The Keypad Port (KPP) is designed to simplify the software task of scanning a keypad matrix. With appropriate software support and matrix organization, the KPP is capable of detecting, debouncing, and decoding one or more keys pressed simultaneously on the keypad.

Logic in the KPP is capable of detecting a key press even while the processor is in one of the low power standby modes provided that a low frequency reference clock is on. The KPP may generate an ARM platform interrupt any time a key press or key release is detected. This interrupt is capable of forcing the processor out of a low power mode.

31.4.1 Keypad Matrix Construction

The KPP is designed to interface to a keypad matrix, which shorts the intersecting row and column lines together whenever a key is depressed. The interface is not optimized for any other switch configuration.

31.4.2 Keypad Port Configuration

The software must initialize the KPP for the size of the keypad matrix. Pins connected to the keypad columns should be configured as open-drain outputs. Pins connected to the keypad rows should be configured as inputs. On-chip, pull-up resistors should be implemented for active keypad rows.

In addition to enabled row inputs in the Keypad Control register, corresponding interrupt (depress or/and release) must also be enabled to generate an interrupt.

Discrete switches that are not part of the matrix may be connected to any unused row inputs. The second terminal of the discrete switch is connected to ground. The hardware detects closures of these switches without the need for software polling.

31.4.3 Keypad Matrix Scanning

Keypad scanning is performed by a software loop that walks a zero across each of the keypad columns, reading the value on the rows at each step. The process is repeated several times in succession, with the results of each pass optionally compared to those from the previous pass. When several (3 or 4) consecutive scans yield the same key closures, a valid key press has been detected. Software then can decode exactly which switch was depressed and pass the value up to the next higher software layer.

The basic debouncing period, which must be defined in the software routine, may be controlled with an internal timer. The basic period is the period between the scan of two consecutive columns, so the debouncing time between two consecutive scans of the whole matrix shall be the number of columns multiplied by the basic period.

31.4.4 Keypad Standby

There is no need for the ARM platform to continually scan the keypad. Between key presses, the keypad can be left in a state that requires no software intervention until the next key press is detected. To place the keypad in a standby state, software should write all column outputs low. Row inputs are left enabled. At this point, the ARM platform can attend to other tasks or revert to a low power standby mode. The KPP will interrupt the ARM platform if any key is pressed.

Upon receiving a keypad interrupt, the ARM platform should set all the column strobes high, and begin a normal keypad scanning routine to determine which key was pressed. It is important that open-drain drivers be used when scanning to prevent a possible DC path between power and ground through two or more switches.

31.4.5 Glitch Suppression on Keypad Inputs

A glitch suppression circuit qualifies the keypad inputs to prevent noise from inadvertently interrupting the ARM platform. The circuit is a 4-state synchronizer clocked from a low frequency reference clock source.

This clock must continue to run in any low power mode where the keypad is a wake-up source, as the ARM platform interrupt is generated from the synchronized input. An interrupt is not generated until all four synchronizer stages have latched a valid key assertion. This guarantees the filtering out of any noise less than three clock periods in duration of a low frequency reference clock. Noise filtering of the duration between three to four clock periods cannot be guaranteed. The interrupt output is latched in an S-R latch and remains asserted until cleared by the software. The Set input of the latch is rising-edge clocked. See the figure below.

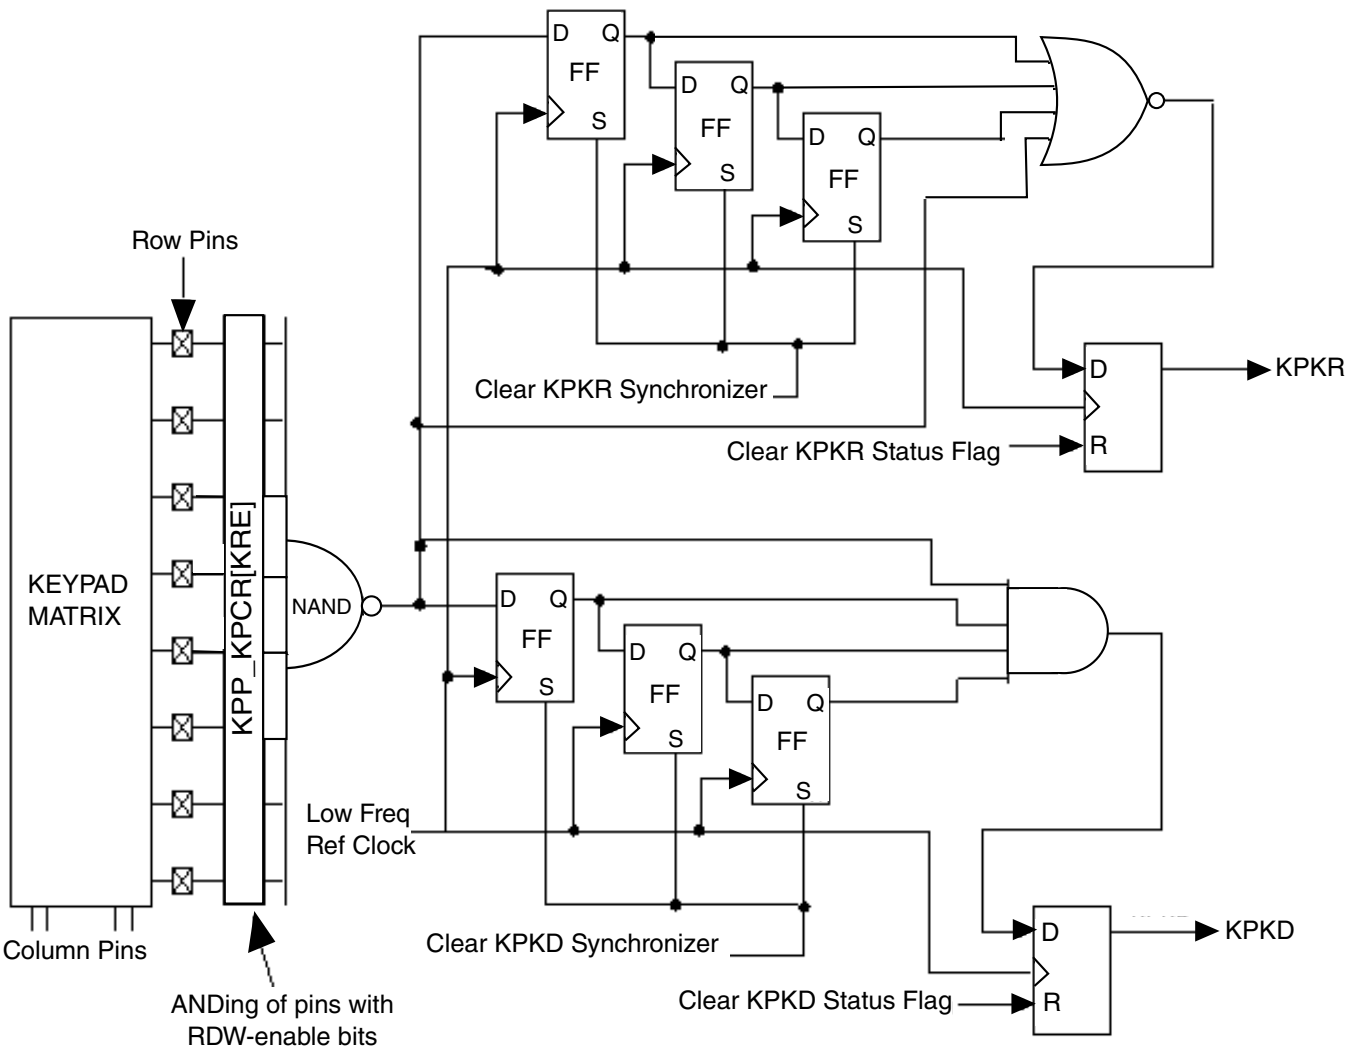

Figure 31-2. Keypad Synchronizer Functional Diagram

31.4.6 Multiple Key Closures

Using the key press and Key release interrupts, the software can detect multiple keys or achieve n key rollover. The key scanning routine can be programmed accordingly.

See the following figures for illustrations of the interfacing of a 2-contact keypad matrix with the KPP controller. With proper enabling of row lines and the performing scan-routine, multiple key presses can be detected. When keys present on the same row are pressed, corresponding row lines (multiple lines) become low when the column is driven low during a scan-routine. By reading the data-register, pressed keys can be detected. Similarly, when keys present on same row line are pressed, the corresponding row line (only one line) becomes low when logic "0" is driven on the column line during a scan-routine.

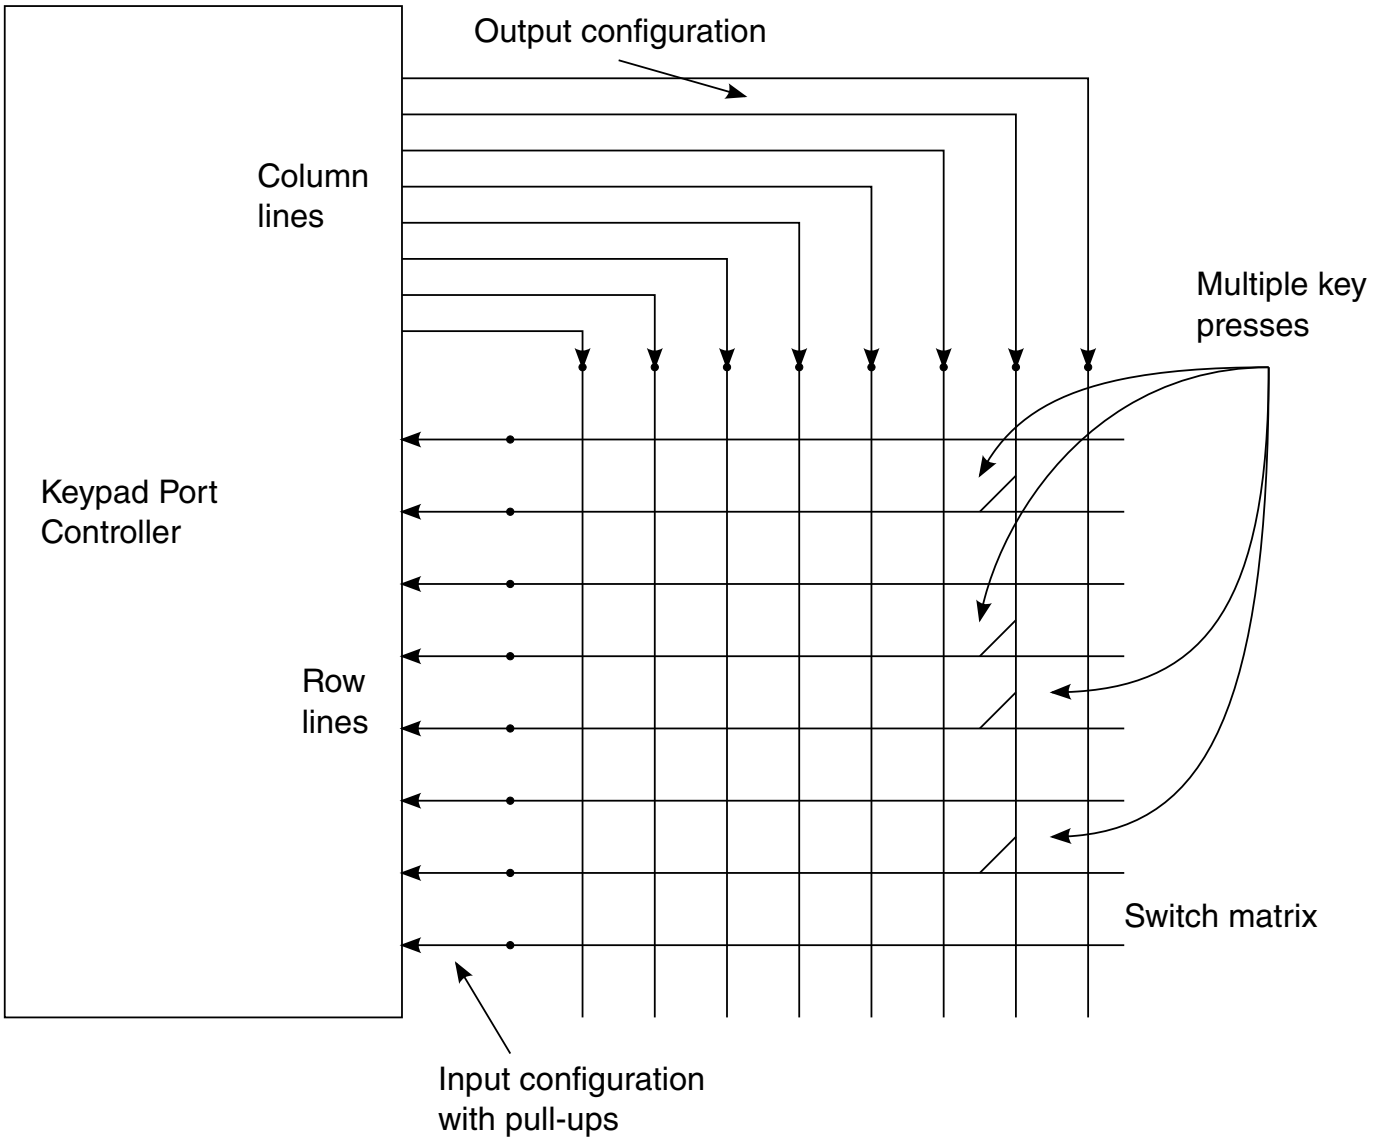

Figure 31-3. Multiple Key Presses on Same Column Line (Simplified View)

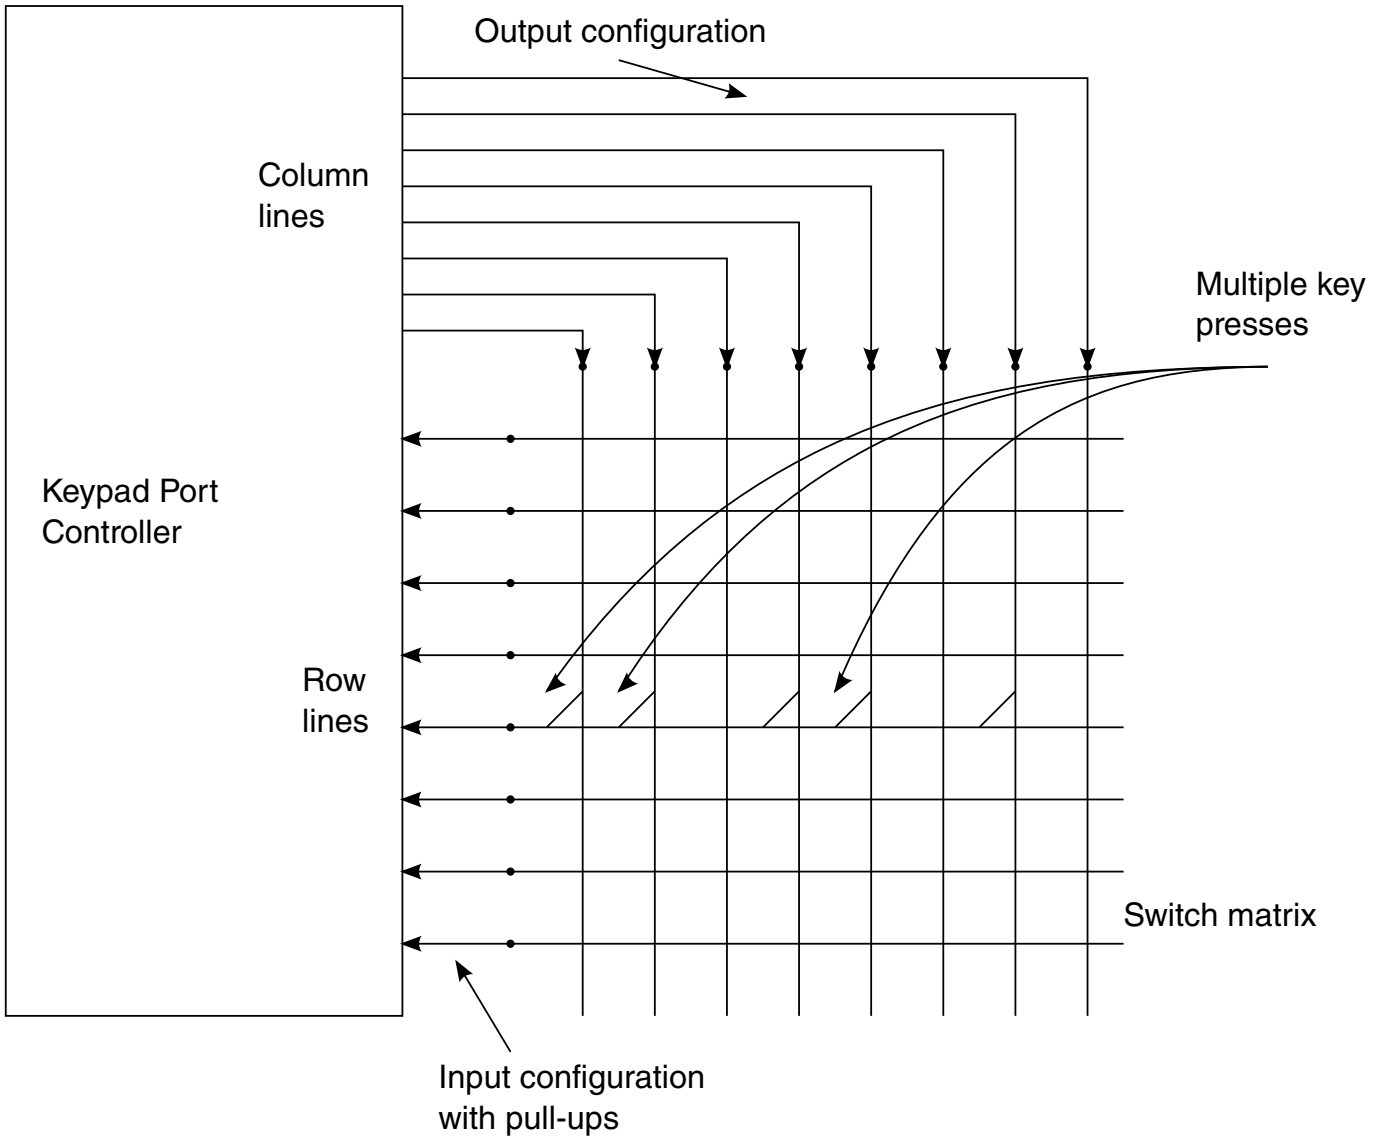

Figure 31-4. Multiple Key Presses on Same Row Line (Simplified View)

NOTE

An n key rollover is a technique with which the system can recognize the order in which keys are pressed.

31.4.6.1 Ghost Key Problem and Correction

The KPP detects if one or multiple keys are pressed or released. In the case where a simple keypad matrix with two-contact switches is used, there is a chance of "ghost" key detection when three or more keys are pressed. This is a limitation imposed by such a keypad matrix.

As can be seen in Figure 31-5, three keys pressed simultaneously can cause a short between the column currently "scanned" by the software and another column. Depending on the location of the third key pressed, a "ghost" key press may be detected.

However, this can be corrected by using a keypad matrix that provides "ghost" key protection. Such a matrix implements a one-way "diode" at all keypad points between rows and columns. This way, the multiple pressing of three keys will not cause a short at a fourth key (see Figure 31-6).

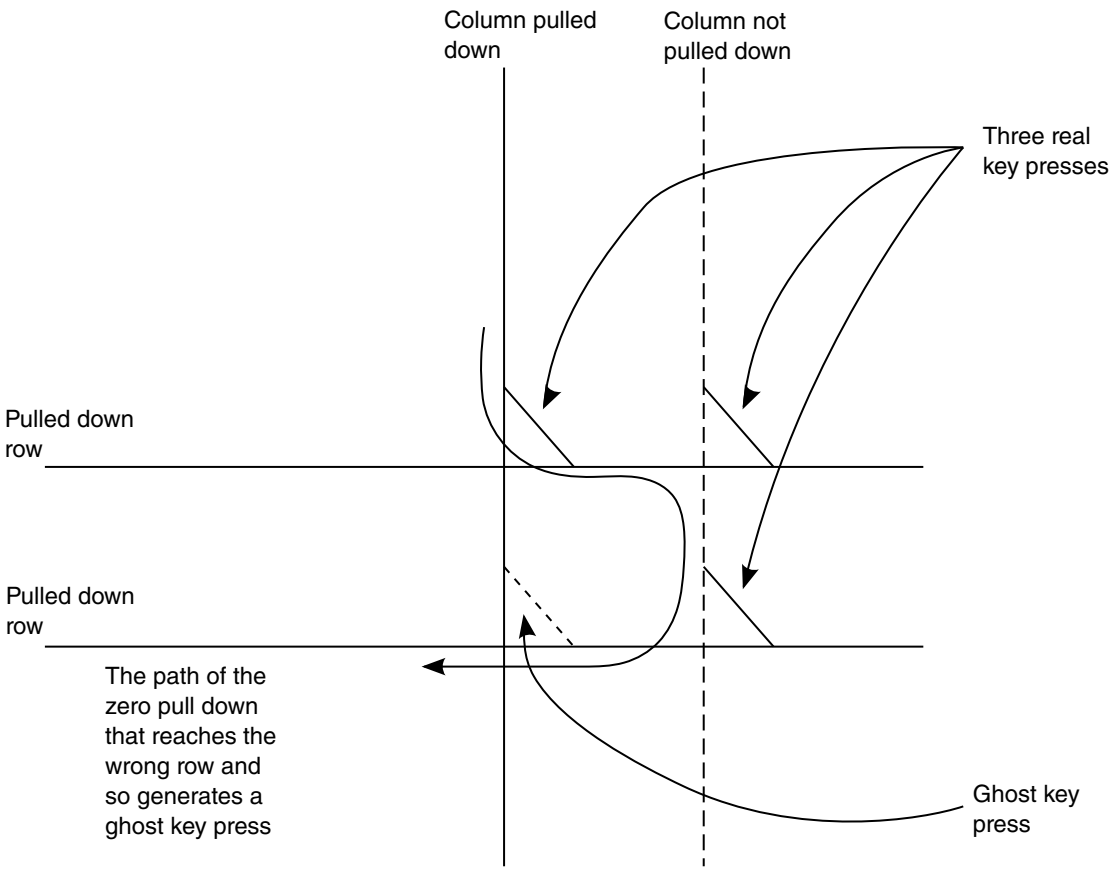

Figure 31-5. Decoding Wrong Three- Key-Presses

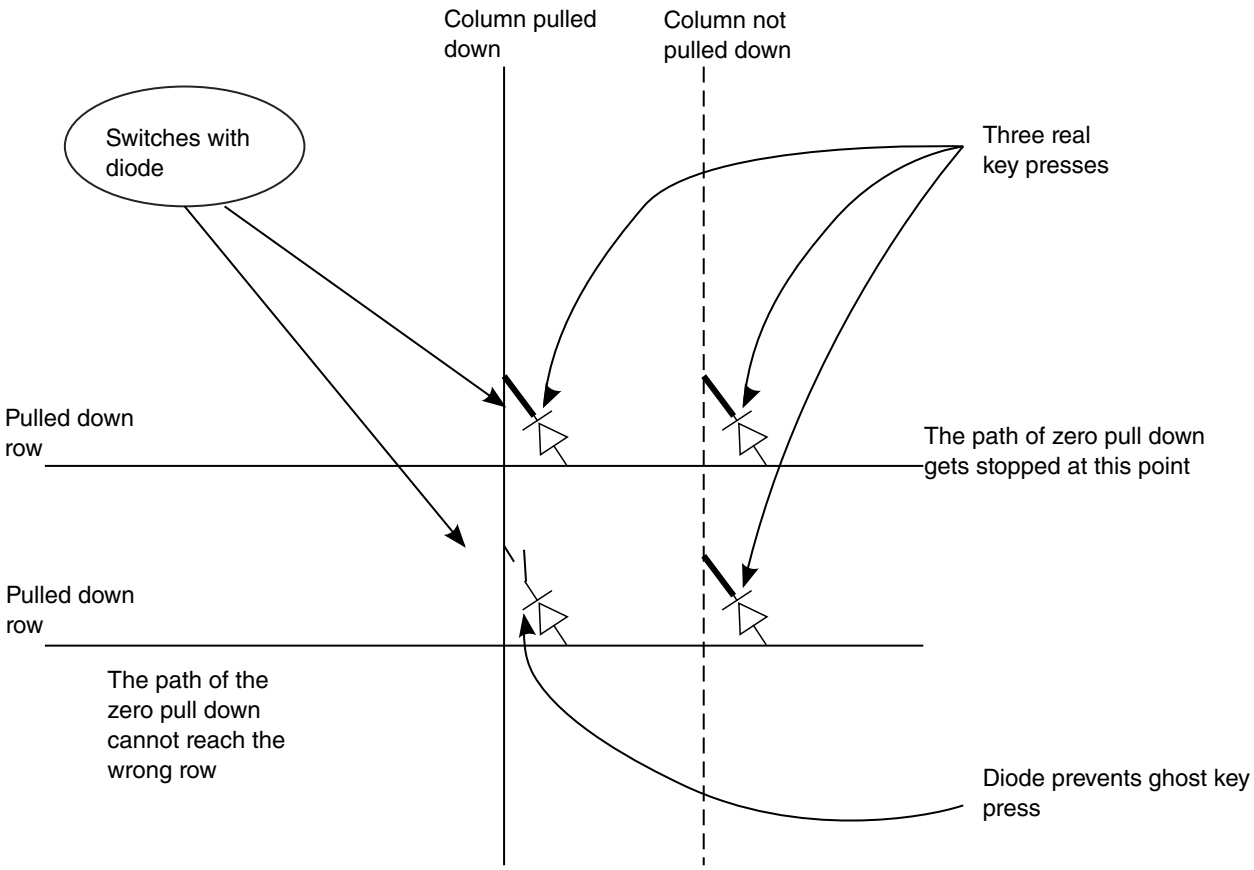

Figure 31-6. Matrix with "Ghost" Key Protections

31.4.7 3-Point Contact Keys Support

The KPP supports interfacing to a matrix consisting of 3-point contact keys. As shown in Figure 31-7, two points of such a key are connected to keypad lines, while a third point is connected to ground (low logic).

The keypad lines should be configured as input and a pull-up should to be present on these lines. When such a key is pressed, corresponding keypad lines go low and an interrupt is generated. There is no need to perform a scanning routine for identification of pressed key as it can be done by reading the keypad data-register. A limitation with such a matrix is that for every key at least one keypad row line should be used.

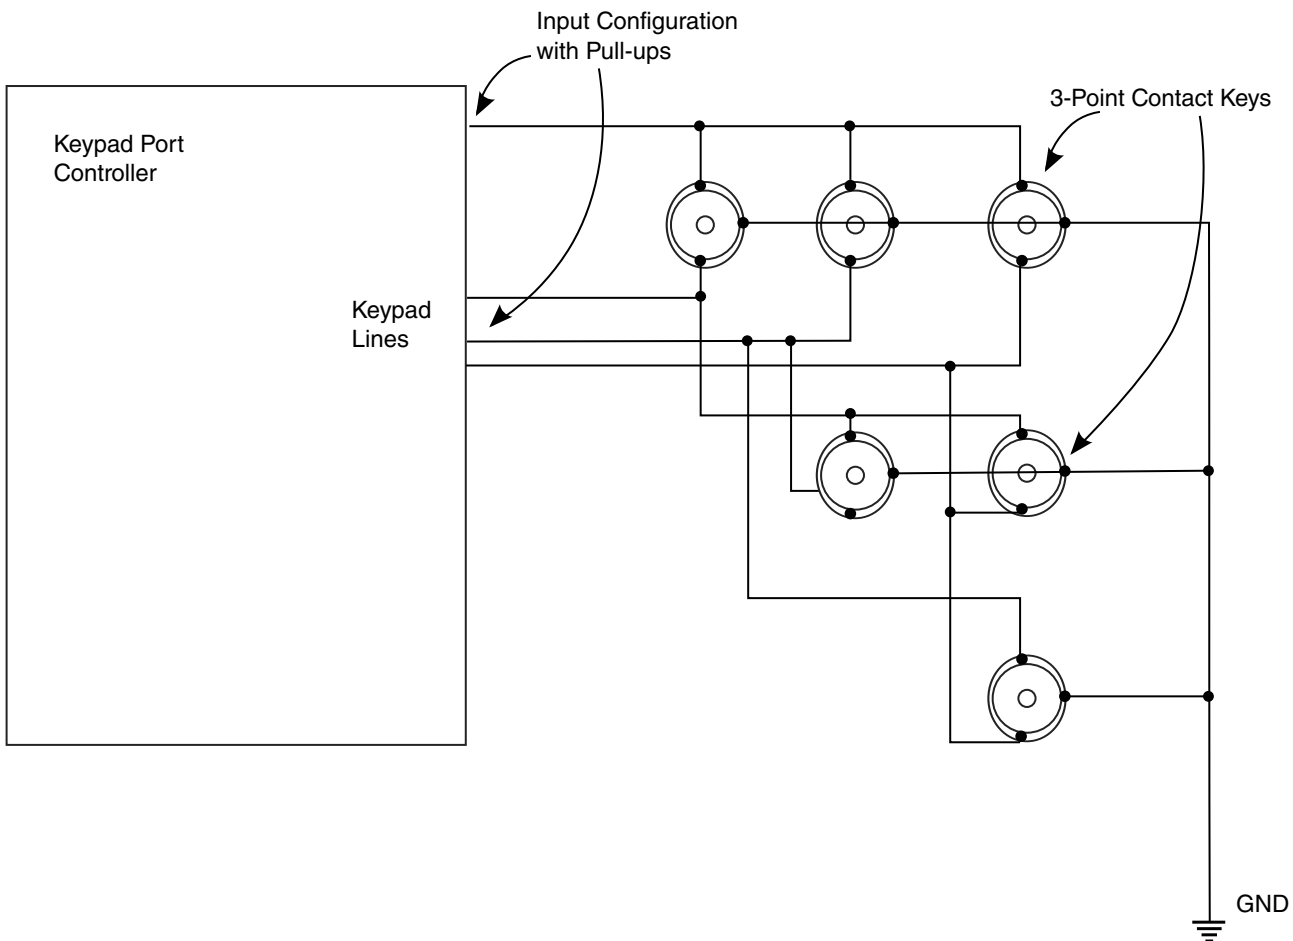

Figure 31-7. KPP Interface with 3-point Contact Key Matrix (Simplified View)

31.5 Initialization/Application Information

31.5.1 Typical Keypad Configuration and Scanning Sequence

Perform the following steps to configure the keypad:

1. Enable the number of rows in the keypad (KPP_KPCR[KRE]).
2. Write 0s to KPP_KPDR[KCD].
3. Configure the keypad columns as open-drain (KPP_KPCR[KCO]).
4. Configure columns as output (KPP_KDDR[KCDD]) and rows as input (KPP_KDDR[KRDD]).
5. Clear the KPKD Status Flag and Synchronizer chain.
6. Set the KDIE control bit, and clear the KRIE control bit (avoid false release events).
7. (The system is now in standby mode, and awaiting a key press.)

31.5.2 Key Press Interrupt Scanning Sequence

Perform the following steps to perform a keypad scanning routine:

1. Disable both (depress and release) keypad interrupts.
2. Write 1s to KPP_KPDR[KCD], setting column data to 1s.
3. Configure columns as totem pole outputs (for quick discharging of keypad capacitance).
4. Configure columns as open-drain.
5. Write a single column to 0, and other columns to 1.
6. Sample row inputs and save data. Multiple key presses can be detected on a single column.
7. Repeat Steps 2-6 for remaining columns.
8. Return all columns to 0 in preparation for standby mode.
9. Clear KPKD and KPKR status bit(s) by writing to a "1"; set the KPKR synchronizer chain by writing a "1" to the KPP_KRSS register; and clear the KPKD synchronizer chain by writing a "1" to the KDSC register.
10. Re-enable the appropriate keypad interrupt(s) so that the KDIE detects a key hold condition, or the KRIE detects a key-release event.

31.5.3 Additional Comments

The order of key press detection can be done in software only. Therefore, the software may need to run the scan routines at very short intervals of time per the application's demands. The reason that such functionality cannot be put in the KPP is that the block is limited by the number of external pins.

For the keys that require a very precise order (such as game keys), individual GPIO pins may be more useful.

31.6 KPP Memory Map/Register Definition

The KPP contains four registers.

KPP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20B_8000	Keypad Control Register (KPP_KPCR)	16	R/W	0000h	31.6.1/1922
20B_8002	Keypad Status Register (KPP_KPSR)	16	R/W	0400h	31.6.2/1923
20B_8004	Keypad Data Direction Register (KPP_KDDR)	16	R/W	0000h	31.6.3/1925
20B_8006	Keypad Data Register (KPP_KPDR)	16	R/W	0000h	31.6.4/1925

31.6.1 Keypad Control Register (KPP_KPCR)

The Keypad Control Register determines which of the eight possible column strobes are to be open drain when configured as outputs, and which of the eight row sense lines are considered in generating an interrupt to the core.

It is up to the programmer to ensure that pins being used for functions other than the keypad are properly disabled. The KPP_KPCR register is byte- or half-word-addressable.

Address: 20B_8000h base + 0h offset = 20B_8000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	KCO								KRE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KPCR field descriptions

Field	Description
15–8 KCO	Keypad Column Strobe Open-Drain Enable. Setting a column open-drain enable bit (KCO7-KCO0) disables the pull-up driver on that pin. Clearing the bit allows the pin to drive to the high state. This bit has no effect when the pin is configured as an input. **NOTE:** Configuration of external port control logic (for example, IOMUX) should be done properly so that the KPP controls an open-drain enable of the pin. 0 **TOTEM_POLE** — Column strobe output is totem pole drive. 1 **OPEN_DRAIN** — Column strobe output is open drain.

Table continues on the next page...

KPP_KPCR field descriptions (continued)

Field	Description
KRE	Keypad Row Enable. Setting a row enable control bit in this register enables the corresponding row line to participate in interrupt generation. Likewise, clearing a bit disables that row from being used to generate an interrupt. This register is cleared by a reset, disabling all rows. The row-enable logic is independent of the programmed direction of the pin. Writing a "0" to the data register of the pins configured as outputs will cause a keypad interrupt to be generated if the row enable associated with that bit is set. 0 Row is not included in the keypad key press detect. 1 Row is included in the keypad key press detect.

31.6.2 Keypad Status Register (KPP_KPSR)

The Keypad Status Register reflects the state of the key press detect circuit. The KPP_KPSR register is byte- or half-word-addressable.

Address: 20B_8000h base + 2h offset = 20B_8002h

Bit	15	14	13	12	11	10	9	8
Read	0						KRIE	KDIE
Write								
Reset	0	0	0	0	0	1	0	0

Bit	7	6	5	4	3	2	1	0
Read	0				0	0	KPKR	KPKD
Write					KRSS	KDSC	w1c	w1c
Reset	0	0	0	0	0	0	0	0

KPP_KPSR field descriptions

Field	Description
15–10 Reserved	This read-only field is reserved and always has the value 0.
9 KRIE	Keypad Release Interrupt Enable. The software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain. 0 No interrupt request is generated when KPKR is set. 1 An interrupt request is generated when KPKR is set.
8 KDIE	Keypad Key Depress Interrupt Enable. Software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice-versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain.

Table continues on the next page...

KPP_KPSR field descriptions (continued)

Field	Description
	0 No interrupt request is generated when KPKD is set. 1 An interrupt request is generated when KPKD is set.
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 KRSS	Key Release Synchronizer Set. Self-clear bit. The Key release synchronizer is set by writing a logic one into this bit. Reads return a value of "0". 0 No effect 1 Set bits which sets keypad release synchronizer chain
2 KDSC	Key Depress Synchronizer Clear. Self-clear bit. The Key depress synchronizer is cleared by writing a logic "1" into this bit. Reads return a value of "0". 0 No effect 1 Set bits that clear the keypad depress synchronizer chain
1 KPKR	Keypad Key Release. The keypad key release (KPKR) status bit is set when all enabled rows are detected high after synchronization (the KPKR status bit will be set when cleared by a reset). The KPKR bit may be used to generate a maskable key release interrupt. The key release synchronizer may be set high by software after scanning the keypad to ensure a known state. Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by software prior to the system exiting the state it represents. Reset value of register is "0" as long as reset is asserted. However when reset is de-asserted, the value of the register depends upon the external row pins and can become "1". 0 No key release detected 1 All keys have been released
0 KPKD	Keypad Key Depress. The keypad key depress (KPKD) status bit is set when one or more enabled rows are detected low after synchronization. The KPKD status bit remains set until cleared by the software. The KPKD bit may be used to generate a maskable key depress interrupt. If desired, the software may clear the key press synchronizer chain to allow a repeated interrupt to be generated while a key remains pressed. In this case, a new interrupt will be generated after the synchronizer delay (4 cycles of the low frequency reference clock elapses if a key remains pressed. This functionality can be used to detect a long key press. This allows detection of additional key presses of the same key or other keys. Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by the software prior to the system exiting the state it represents. 0 No key presses detected 1 A key has been depressed

31.6.3 Keypad Data Direction Register (KPP_KDDR)

The bits in the KPP_KDDR control the direction of the keypad port pins. The upper eight bits in the register affect the pins designated as column strobes, while the lower eight bits affect the row sense pins. Setting any bit in this register configures the corresponding pin as an output. Clearing any bit in this register configures the corresponding port pin as an input. For the Keypad Row DDR, an internal pull-up is enabled if the corresponding bit is clear. This register is cleared by a reset, configuring all pins as inputs. The KPP_KDDR register is byte- or half-word addressable.

NOTE

When a pin is used as row pin for keypad purposes, all corresponding pull-ups should be enabled at the upper level (for example, IOMUX) when the bit in KRDD is cleared.

Address: 20B_8000h base + 4h offset = 20B_8004h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	KCDD								KRDD							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KDDR field descriptions

Field	Description
15–8 KCDD	Keypad Column Data Direction Register. Setting a bit configures the corresponding COL*n* pin as an output (where *n* = 7 through 0). 0 **INPUT** — COLn pin is configured as an input. 1 **OUTPUT** — COLn pin is configured as an output.
KRDD	Keypad Row Data Direction. Setting a bit configures the corresponding ROW*n* pin as an output (where *n* = 7 through 0). 0 **INPUT** — ROWn pin configured as an input. 1 **OUTPUT** — ROWn pin configured as an output.

31.6.4 Keypad Data Register (KPP_KPDR)

This 16-bit register is used to access the column and row data. Data written to this register is stored in an internal latch, and for each pin configured as an output, the stored data is driven onto the pin. A read of this register returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register.

The KPP_KPDR register is byte- or half-word addressable. This register is not initialized by a reset. Valid data should be written to this register before any bits are configured as outputs.

Address: 20B_8000h base + 6h offset = 20B_8006h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	KCD								KRD							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KPDR field descriptions

Field	Description
15–8 KCD	Keypad Column Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register. 0 Read/Write "0" from/to column ports 1 Read/Write "1" from/to column ports
KRD	Keypad Row Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register. 0 Read/Write "0" from/to row ports 1 Read/Write "1" from/to row ports

Chapter 32
Enhanced LCD Interface (eLCDIF)

32.1 Overview

The eLCDIF is a general purpose display controller used to drive a wide range of display devices varying in size and capability.

Many of these displays have had an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer. There are other popular displays that support moving pictures and require the RGB interface mode (called DOTCLK interface in this document) or the VSYNC mode for high-speed data transfers. In addition to these displays, it is also common to provide support for digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals. The eLCDIF block supports these interfaces by providing fully programmable functionality.

The block has several major features:

- Bus master interface to source frame buffer data for display refresh. This interface can also be used to drive data for "Smart" displays.
- PIO interface to manage data transfers between "Smart" displays and SoC.
- 8/16/18/24 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation.

32.2 External Signals

The following table describes the external signals of LCD:

Table 32-1. LCD External Signals

Signal	Description	Pad	Mode	Direction
LCD_BUSY	Busy Signal	LCD_VSYNC	ALT1	I
LCD_CLK	Clock signal	LCD_CLK	ALT0	I
LCD_CS	Chip select	LCD_RESET	ALT1	O
LCD_DATA0	Data signals	LCD_DATA00	ALT0	IO
LCD_DATA1		LCD_DATA01	ALT0

32.3 Clocks

The following table describes the clock sources for eLCDIF. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 32-2. eLCDIF Clocks

Clock name	Clock Root	Description
apb_clk	axi_clk_root	AXI clock
pix_clk	lcdif_pix_clk_root	Pixel clock

32.4 Functional Description

Bus Interface Mechanisms through Initializing the eLCDIF, describe the internal pipeline for the MPU write/read interface, VSYNC, DOTCLK, and DVI interfaces. Differences for each mode are then described in separate sections, as follows:

- MPU Interface
- VSYNC Interface
- DOTCLK Interface
- ITU-R BT.656 Digital Video Interface (DVI)

eLCDIF pin usage by interface mode is described in eLCDIF Pin Usage by Interface Mode.

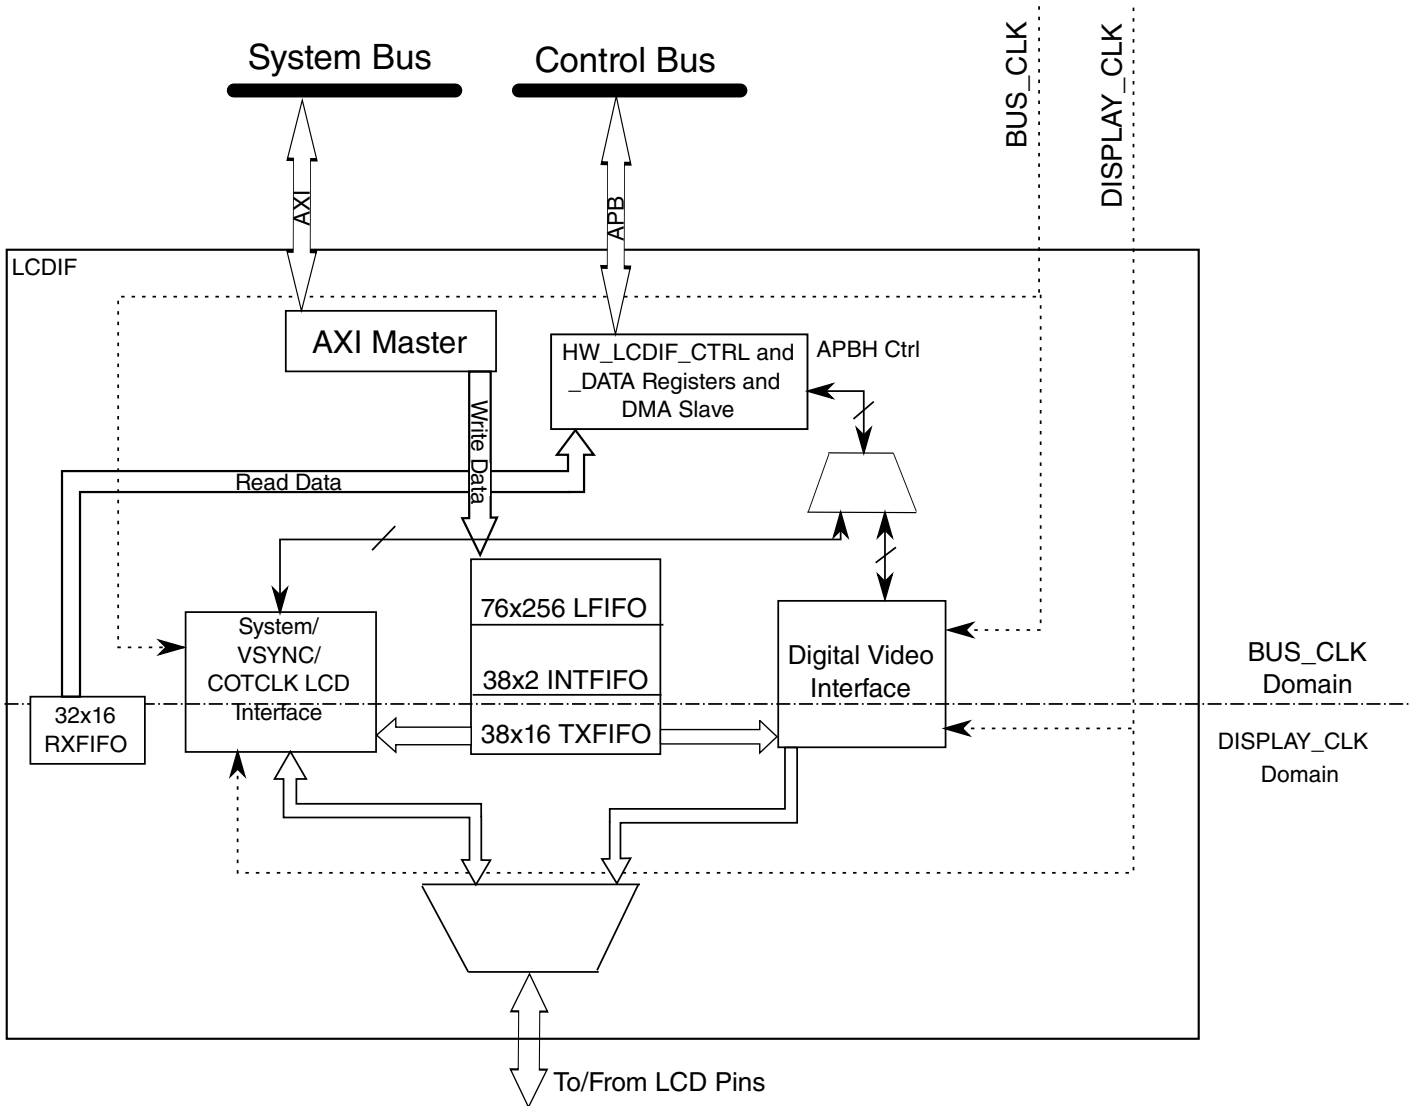

Figure 32-1. Top-Level Block Diagram of eLCDIF subsystem

32.4.1 Bus Interface Mechanisms

The LCDIF module has memory-mapped control, data and status registers. It provides several interfaces to transfer data between the display and SoC.

The bus master interface is used to initiate the requests to transfer data from external memory to the display. It is completely autonomous, or no CPU intervention is required, to manage the cyclical nature of refreshing standard display types. Bus mastering can also be used for MPU mode data writes.

The PIO interface is used to interface to "Smart" displays to transfer frame buffer data and control information to/from the external display. The host CPU executes display drivers to manage the display solution.

The following sections describe the system bus interface mechanisms.

32.4.1.1 Bus Master Operation in Write/Display Modes

The eLCDIF block has a bus master interface that initiates requests for data to drive the display. The LCDIF_MASTER bit must be set to 1 to enable the bus master interface. Software should program all control registers required to transfer the frame sequence.

In the MPU and VSYNC modes, single frames are transferred. When a complete frame is transferred, eLCDIF enters idle and clears the RUN bit in the CTRL register. For subsequent frame transmission, the eLCDIF setup sequence should be repeated.

The DOTCLK and DVI modes are used to refresh the display at the desired refresh rate and resolution. These modes are used to drive displays that do not integrate a display buffer memory. When the display is refreshed, the eLCDIF will automatically update the LCDIF_CUR_BUF_ADDR register with the value in LCDIF_NEXT_BUF_ADDR at the end of current frame and start fetching the next frame from the new address. If the LCDIF_NEXT_BUF_ADDR register was not updated within a frame refresh cycle, eLCDIF will keep transmitting the last frame until a new value is programmed into that register.

eLCDIF also provides the capability of interlacing a progressive frame by fetching odd lines in the first field and then fetching even lines in the second field. This feature can be used in the DVI mode and can be turned on by setting the INTERLACE_FIELDS bit in the LCDIF_CTRL1 register.

32.4.1.2 System Bus Master Performance

The performance of the eLCDIF block can be controlled by changing the burst length and the outstanding cycle issuing capability depending on the memory bandwidth requirements. Two fields in the LCDIF_CTRL2 register will throttle system memory requests. The LCDIF_CTRL2_OUTSTANDING_REQS field will control how many requests the eLCDIF can have in flight on any given clock cycle. This should be programmed based on the expected system bus latency for returned read data. Also, the LCDIF_CTRL2_BURST_LEN_8 bit will set the number of 64 bit words requested for each eLCDIF system bus request to either 8 or 16 QWORDS. Generally, 4 outstanding requests of length 16 will provide enough performance to drive any standard display resolution. These configuration bits are intended to change the access pattern of the eLCDIF to optimize system bus throughput when other system masters will contend for system memory resources.

The LCDIF_THRES register can also be used to optimize bus throughput and power consumption.

The LCDIF_THRES_PANIC value can be used to raise the priority of requests initiated by the eLCDIF to alter how the eLCDIF requests are arbitrated by the system bus infrastructure. The panic output control signal is raised when the number of 32bpp pixel equivalents in the LFIFO is less than this programmed value. Since the LFIFO is arranged as a 256x64bit quadword FIFO, it contains two 32bpp pixels per quadword, or 512 32bpp pixels total. To set the panic output when 3/4s of the LFIFO is empty, set the LCDIF_THRES_PANIC value to 3/4 * 512, or 128. The panic signal output is used to assess higher priority to eLCDIF system requests to avoid eLCDIF under run errors during periods of high system bandwidth utilization.

The features available with the LCDIF_THRES register require support from system clocking and dynamic priority control. Refer to the appropriate block documentation to assess the system support for these features.

32.4.2 Write Data Path

eLCDIF supports raster based frame buffers and there is no support for tiled buffers.

There are several options to accommodate endianness of display buffers in memory before the data is processed for the external display. The INPUT_DATA_SWIZZLE field in the LCDIF_CTRL register provides the following options for data word multiplexing:

```
00 (0): No swizzle (little-endian)
01 (1): Swap bytes 0 and 3, swap bytes 1 and 2 (big-endian)
10 (2): Swap half-words
11 (3): Swap bytes within each half-word
```

The WORD_LENGTH field of LCDIF_CTRL register indicates the input data/pixel format. LCDIF_TRANSFER_COUNT register denotes how much data is contained in each frame. The H_COUNT field of this register indicates the number of pixels per line and V_COUNT indicates the total number of lines per frame. A special bit field in the LCDIF_CTRL1 register, called the BYTE_PACKING_FORMAT, can be used to specify which bytes within the 32-bit word are going to be valid. For example, if the entire 32-bit word is valid, BYTE_PACKING_FORMAT should be set to 0xF, if only lower 3 bytes of each word in the frame buffer are valid, then BYTE_PACKING_FORMAT should be set to 0x7.

The LCD_DATABUS_WIDTH field in LCDIF_CTRL register suggests the width of the bus going to the external display controller. There is an option to source all 32 bits of the input word and transfer it to the output I/O display interface. Refer to the system I/O muxing options for support of this feature. If the LCD_DATABUS_WIDTH is not the

same as WORD_LENGTH, eLCDIF will perform RGB to RGB color space conversion. For example, if the input frame has fewer bits per pixel than the display, as in a 16 bpp input frame going to 24 bpp LCD, eLCDIF will pad the MSBs of each color to the LSBs of the same color for each pixel. If the input frame has more bits per pixel than the display, for example, 24 bpp input frame going to 16 bpp LCD, eLCDIF will drop the LSBs of each color channel to convert to the lower color depth. eLCDIF also has the capability to support delta pixel displays by swizzling the R, G and B colors of each pixel in the odd and even lines of the frame separately by programming the ODD_LINE_PATTERN and the EVEN_LINE_PATTERN bit fields. This operation occurs after the RGB-to-RGB color space conversion operation.

eLCDIF also supports RGB to YCbCr 4:2:2 color space conversion. This is useful in the DVI mode since the TV encoder requires input in YCbCr 4:2:2 format. The LCDIF_CSC* registers have complete programmability over the CSC coefficients and offsets. The values must be written into these registers in the signed two's complement format.

The following list shows how the different input/output combinations can be obtained:

- WORD_LENGTH=1 indicates that the input is 8-bit data. This is most likely going to be used for sending commands in MPU interface, or maybe a gray scale image. Any combination of BYTE_PACKING_FORMAT [3:0] is permissible.

  Limitation: H_COUNT must be a multiple of the sum of BYTE_PACKING_FORMAT [3], BYTE_PACKING_FORMAT [2], BYTE_PACKING_FORMAT [1] and BYTE_PACKING_FORMAT [0]. LCD_DATABUS_WIDTH must be 1, indicating an 8-bit data bus.

- WORD_LENGTH=0 implies the input frame buffer is RGB 16 bits per pixel. DATA_FORMAT_16_BIT field determines the pixels are RGB 555 or RGB 565.

  Limitation: BYTE_PACKING_FORMAT [3:0] should be 0x3 or 0xC if there is only one pixel per word. If there are two pixels per word, it should be 0xF and H_COUNT will be restricted to be a multiple of 2 pixels.

- WORD_LENGTH=2 indicates that input frame buffer is RGB 18 bits per pixel, that is, RGB 666. The valid RGB values can be left-aligned or right-aligned within a 32-bit word. The alignment of the valid 18 bits within a word is indicated by the DATA_FORMAT_18_BIT bit.

  Limitation: BYTE_PACKING_FORMAT can be 0x7, 0xE or 0xF. Packed pixels are not supported in this case. H_COUNT can be any number.

- WORD_LENGTH=3 indicates that the input frame-buffer is RGB 24 bits per pixel (RGB 888). If BYTE_PACKING_FORMAT [3:0] is 0x7, it indicates that there is only one pixel per 32-bit word and there is no restriction on H_COUNT. This is also

the option that provides 32 bit output depending on the I/O muxing options available. The fourth byte, or bits [31:24], and connected to the I/Os if this muxing is available in the chip package.

Limitation: If BYTE_PACKING_FORMAT [3:0] is 0xF, it indicates that the pixels are packed, that is, there are 4 pixels in 3 words or 12 bytes and H_COUNT must be a multiple of 4 pixels.

- YCBCR422_INPUT=1 implies that the input frame is in YCbCr 4:2:2 format. BYTE_PACKING_FORMAT must be 0xF.

  Limitation: LCD_DATABUS_WIDTH must be 8-bit and H_COUNT must be a multiple of 2 pixels.

  ODD_LINE_PATTERN and EVEN_LINE_PATTERN must be 0 when any of RGB_TO_YCBCR422_CSC or INTERLACE_FIELDS or YCBCR422_INPUT bits is 1.

After the RGB to RGB or RGB to YCbCr 4:2:2 color space conversions, there is one more opportunity to swizzle the data before sending it out to the display or the encoder. This can be done with the CSC_DATA_SWIZZLE field in the LCDIF_CTRL register, and it provides the same options as the INPUT_DATA_SWIZZLE register.

Finally, there is an option to shift the output data before sending it out to the display. This is done based on the SHIFT_DIR and SHIFT_NUM_BITS fields in LCDIF_CTRL register.

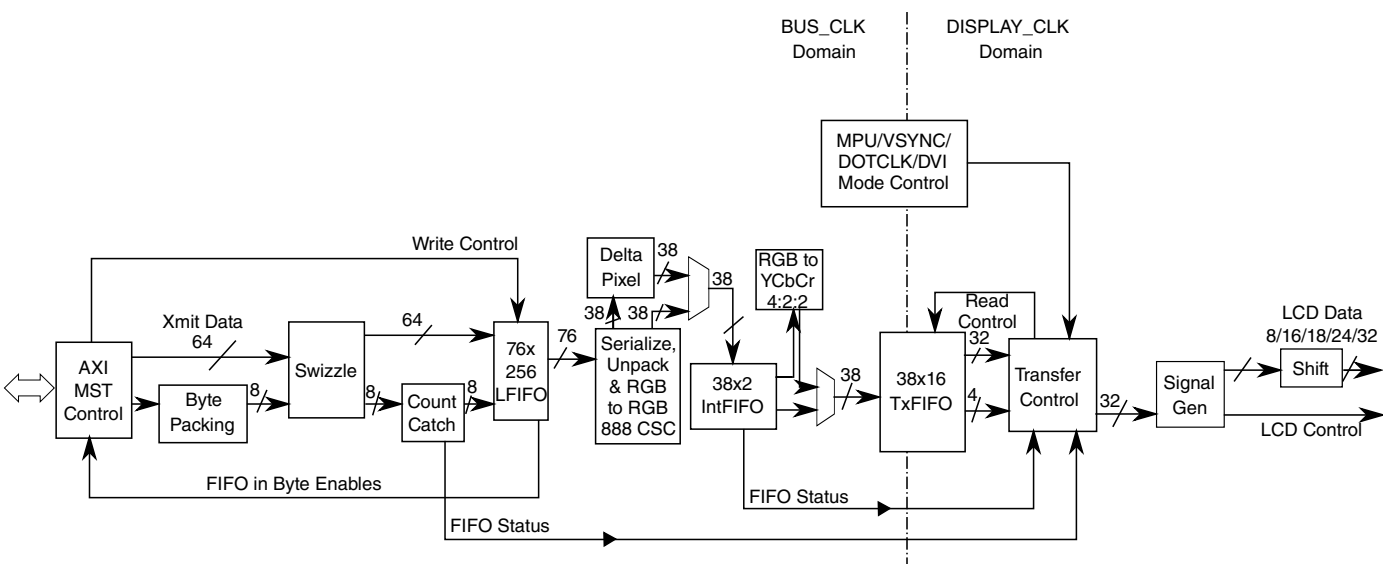

Figure 32-2. General Operations in Write Data Path

The examples in the following figures illustrate some different combinations of register programming for write mode. Assume that the data transferred over the system bus within a 32 bit word is organized as {A7-A0, B7-B0, C7-C0, D7-D0} in 8-bit mode and {A15-A0, B15-B0} in 16-bit mode.

In this example, all 32 bits of the input word are transferred out over an 8 bit display bus. Each byte within the 32 bit word is shifted to the right with zeros appended to I/O bits D[7:6]. The input data bits [7:2] are shifted to the right by 2 bits and presented on the D[5:0].

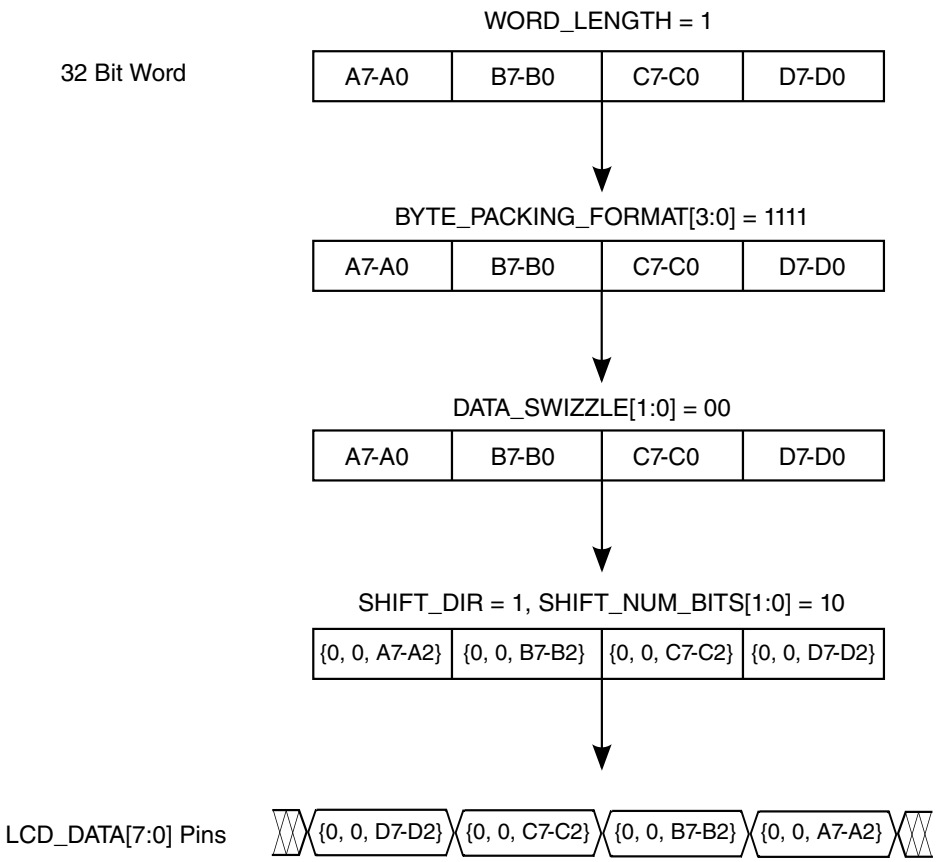

Figure 32-3. Register programming for write mode

In this 8 bit display interface example, one byte of the input word is deleted and not transferred over the external 8 bit display interface. This mode could be used to transfer 24bpp pixels over the 8 bit interface. In this case, the 4th unused byte is not transferred.

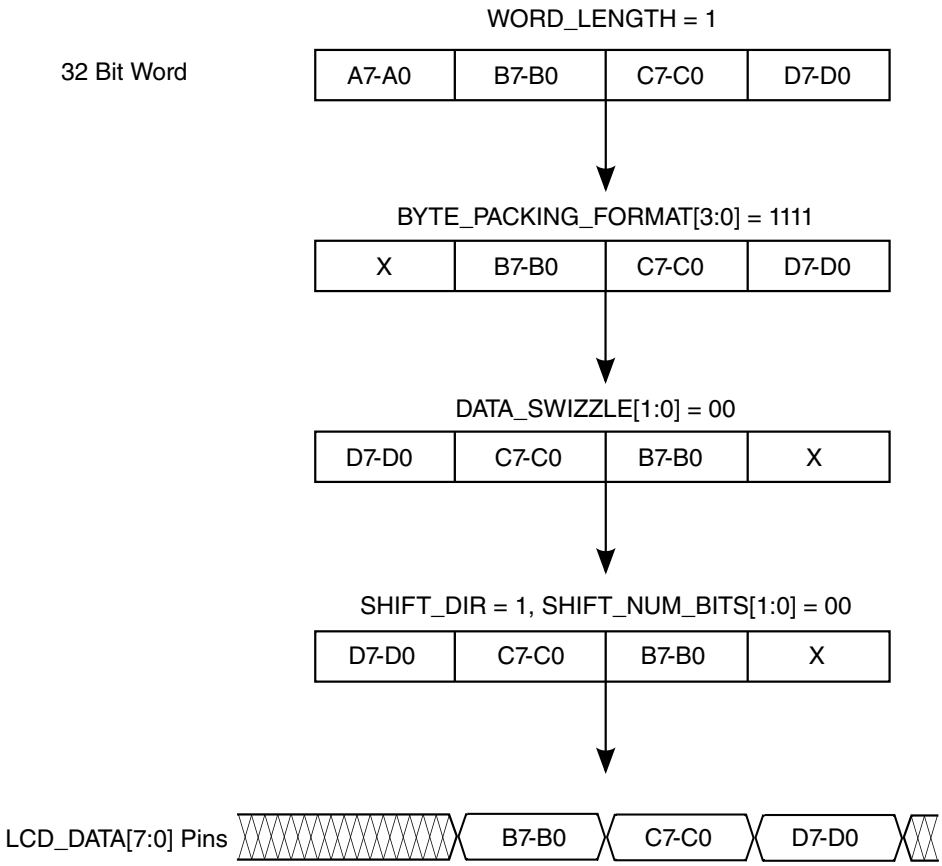

Figure 32-4. Register programming for write mode

The following example uses a 16 bit display interface. Each 16 bit half word is shifted to the right by two bits with zeros appended to the most significant two bits.

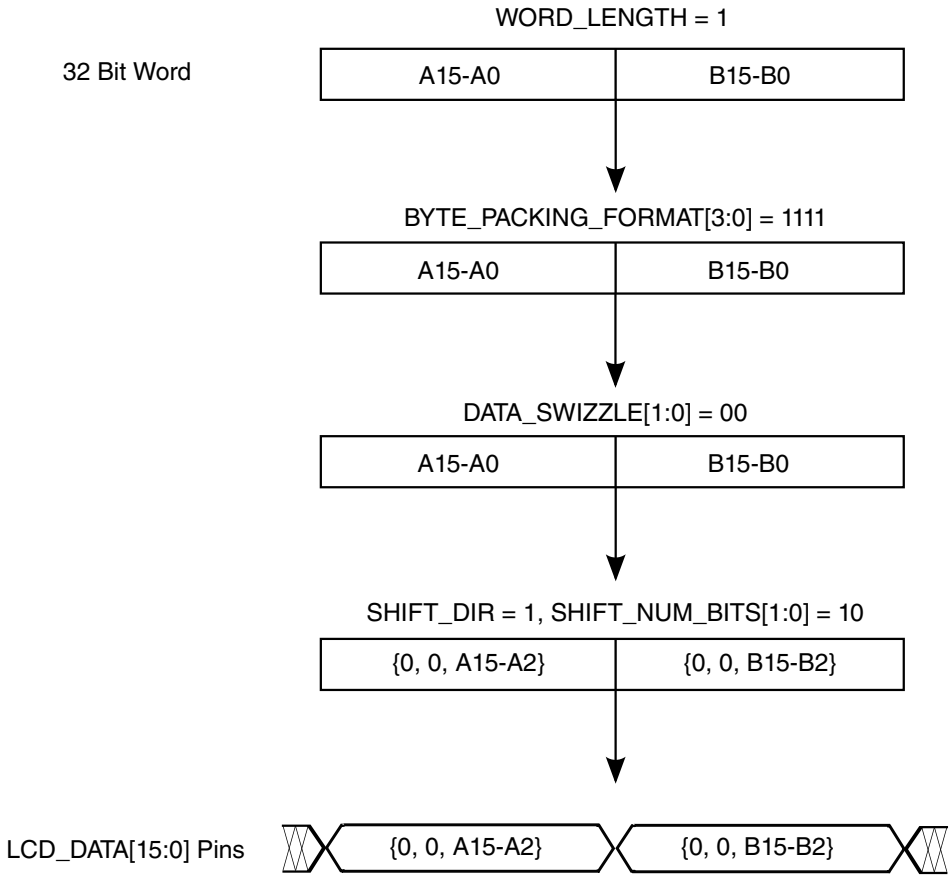

Figure 32-5. Register programming for write mode

This example indicates how an unpacked frame buffer can sourced for display. Only a single 16 bit half word within the 32 bit word is tranferred out via the 16 display bus.

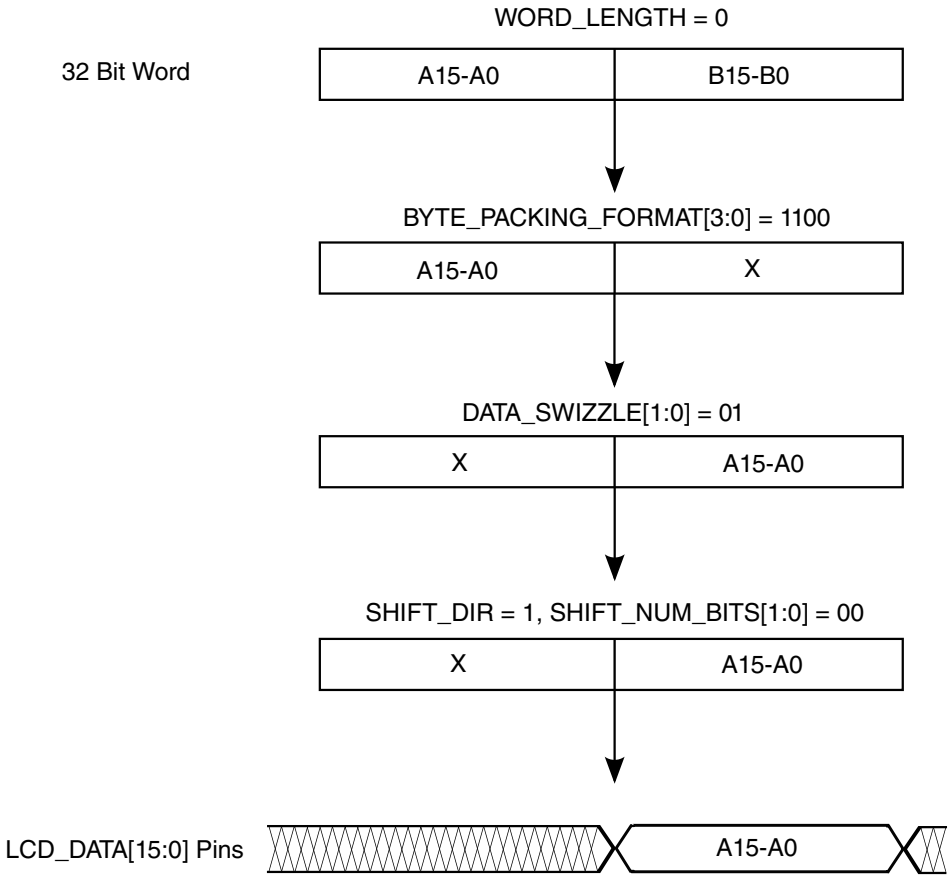

Figure 32-6. Register programming for write mode

32.4.3 Read Data Path

Figure 32-7 shows the MPU read data path in detail.

eLCDIF can read from an external display that follows the 6800/8080 MPU protocol.

The display bus width is determined by the LCD_DATABUS_WIDTH bit field. The data sampled at every read strobe is called a subword and the number of subwords that can be packed in a 32-bit word is given by the READ_MODE_NUM_PACKED_SUBWORDS bit field. The INITIAL_DUMMY_READ bit field directs the eLCDIF to skip the number of programmed subwords before starting to process read data. This feature is useful in the case of an LCD controller that returns the last written data the first time a read is issued, and then sends the correct data thereafter. SHIFT_DIR and SHIFT_NUM_BITS bit fields indicate whether the data needs to be shifted before getting stored in the internal registers. For example, a value of 2 in READ_MODE_NUM_PACKED_SUBWORDS if lcd

databus width is 8 bits indicates two bytes should be packed in a 32-bit word, while if the lcd databus width is 16 bits, it indicates that two half words (or 4 bytes) should be packed.

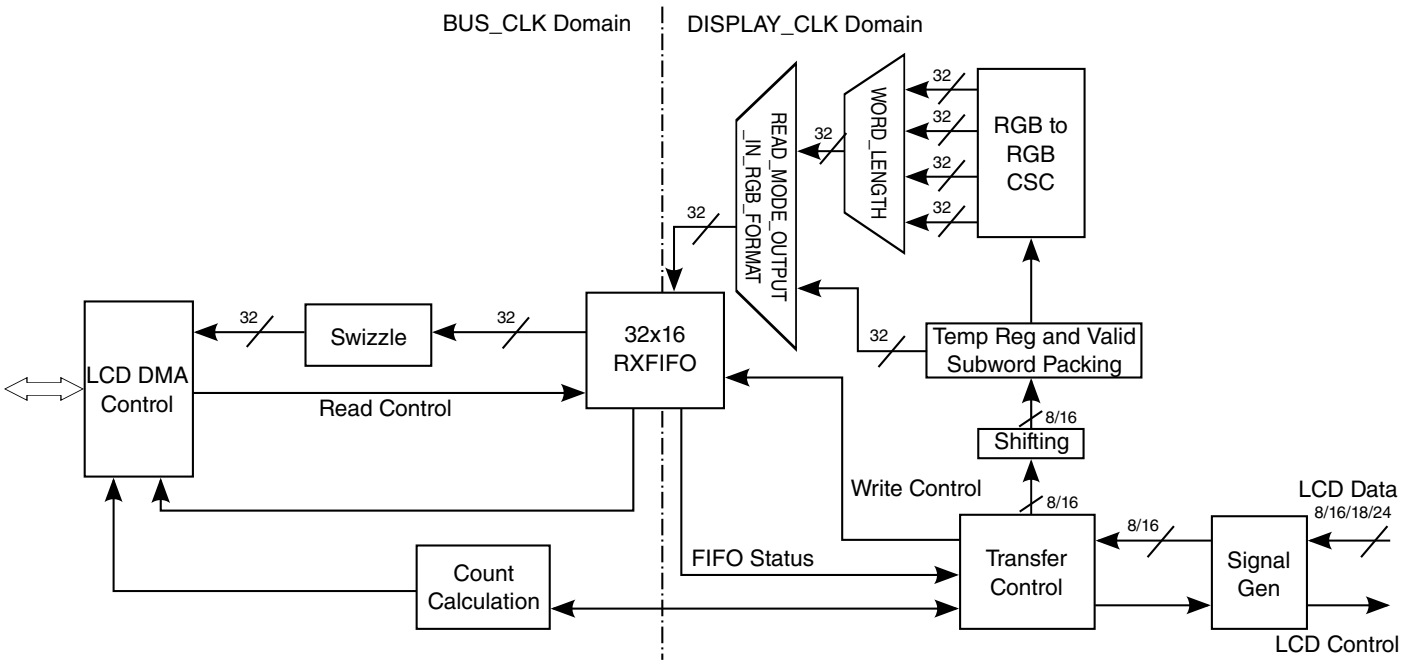

Figure 32-7. MPU Read Data Path

After the last subword within a word is reached, the block looks at the READ_PACK_DIR in the HW_LCDIF_CTRL2 register. If this bit is set, the block will swizzle the data, but only within the valid bytes, unlike in the write mode, where swizzle occurs across all 4 bytes. If the READ_MODE_OUTPUT_IN_RGB_FORMAT bit is set, eLCDIF will convert the data obtained from the READ_PACK_DIR operation into 24-bit unpacked RGB and then re-convert it into 16/18/24 bpp RGB depending on the WORD_LENGTH field. The DATA_FORMAT_16/18/24_BIT bit fields are also considered while converting to 24-bit unpacked RGB format. For example, if DATA_FORMAT_18_BIT is 1, the RGB666 data will be packed in the upper bits [31:4]of a 32-bit word, and that bit is 0, the data will be packed in the lower bits [17:0]. After all these operations, the data gets written into the RXFIFO.

The following figures show some examples of how data is handled in different MPU read modes.

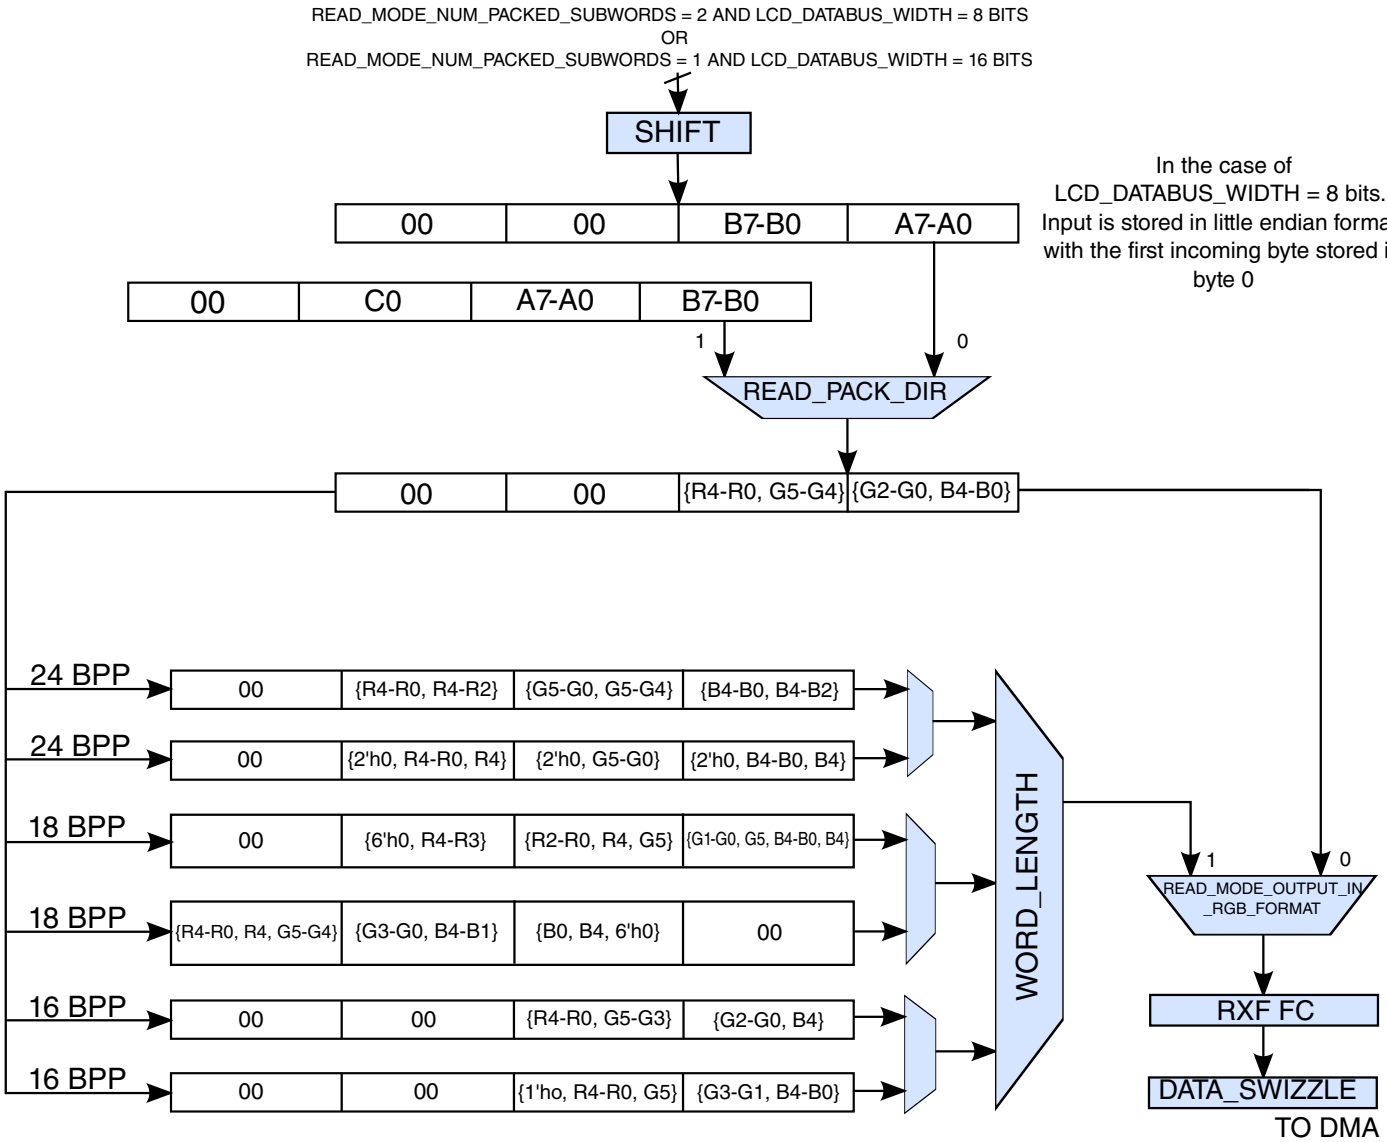

Figure 32-8. Data in MPU read mode

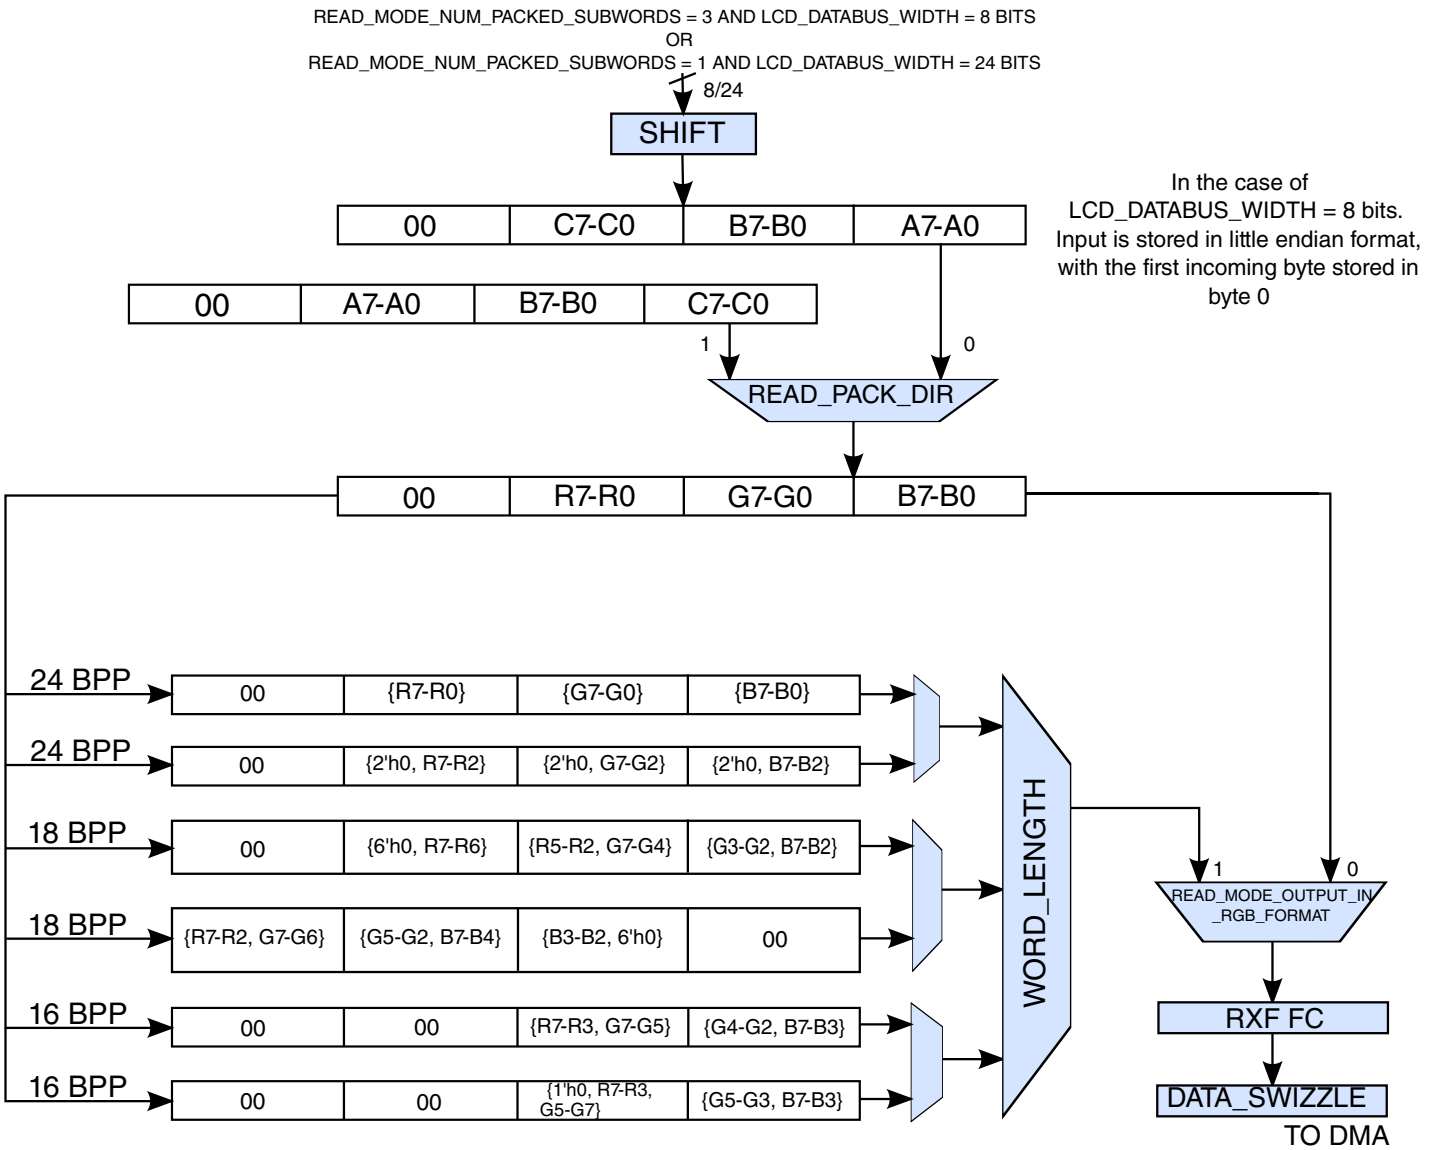

Figure 32-9. Data in MPU read mode

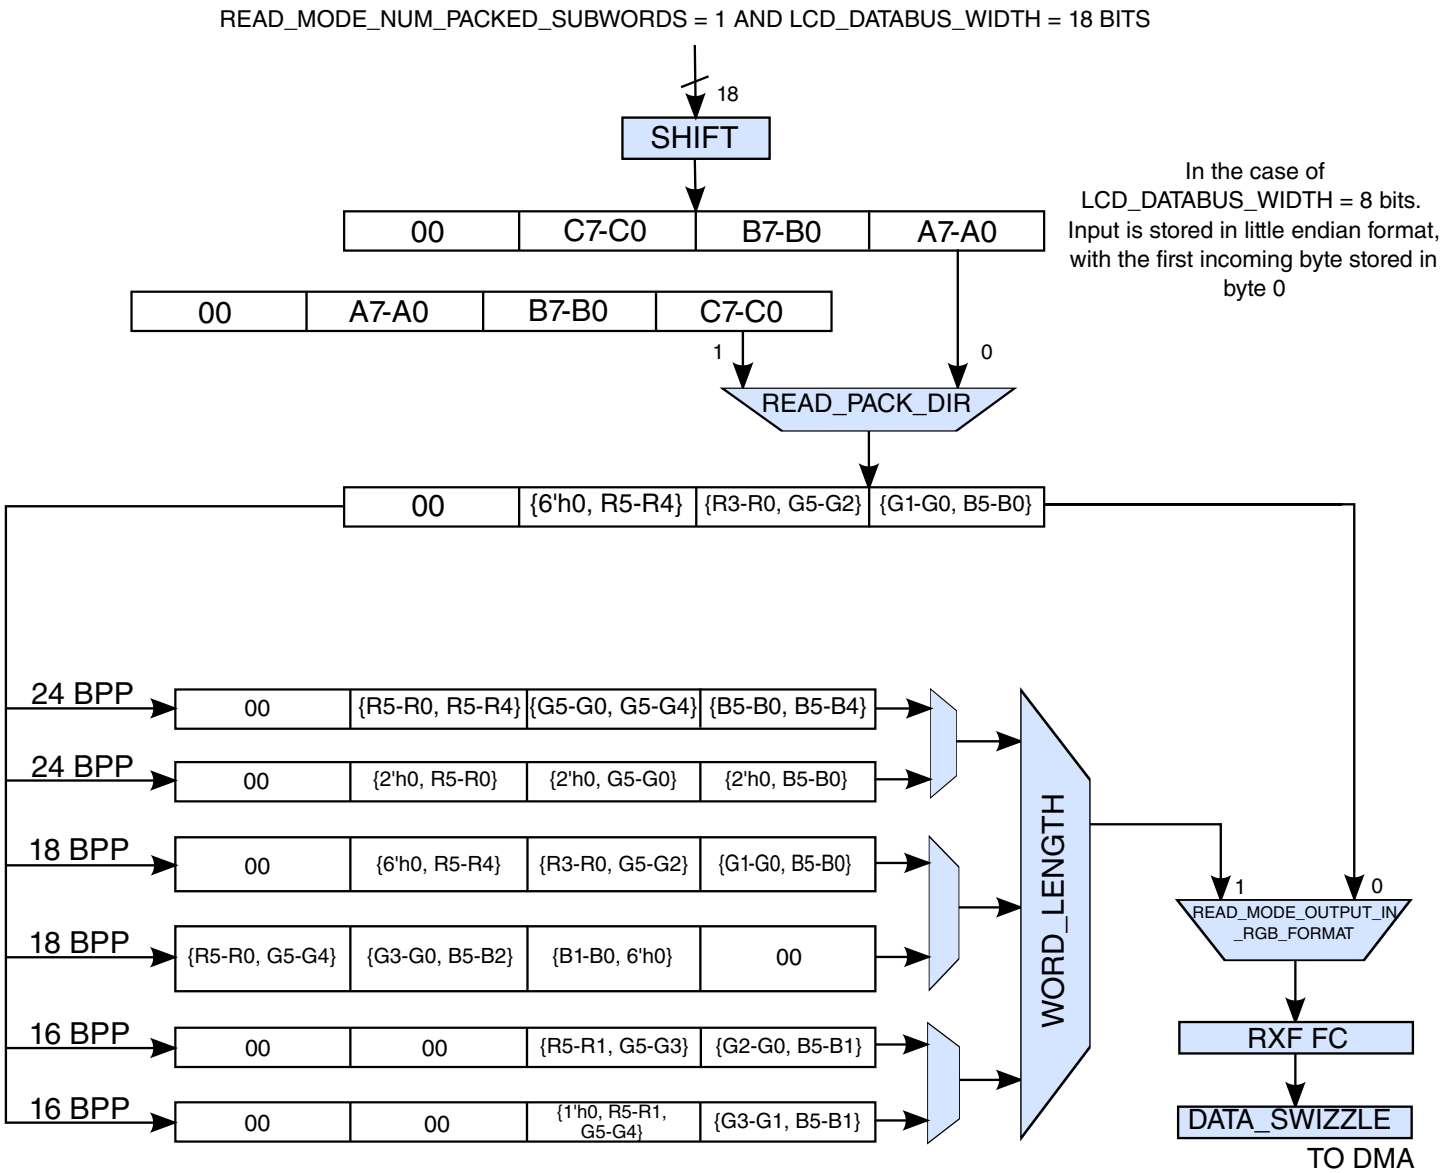

Figure 32-10. Data in MPU read mode

Restrictions:

READ_PACK_DIR should only be used if it is required to swizzle the subwords before doing RGB to RGB CSC, otherwise the DATA_SWIZZLE field should be used to swizzle across bytes.

READ_PACK_DIR must be 0 if LCD_DATABUS_WIDTH is 8 bits and READ_MODE_NUM_PACKED_SUBWORDS =1

If READ_MODE_OUTPUT_IN_RGB_FORMAT bit is set, the following restrictions should be followed:

- If LCD_DATABUS_WIDTH = 8 bits, then READ_MODE_NUM_PACKED_SUBWORDS <= 3.
- If LCD_DATABUS_WIDTH = 16/18/24 bits, then READ_MODE_NUM_PACKED_SUBWORDS = 1.

32.4.4 eLCDIF Interrupts

eLCDIF supports a number of interrupts to aid controlling and status reporting of the block.

All the interrupts have individual mask bits for enabling or disabling each of them. They all get funneled through a single interrupt line connected to the interrupt collector (ICOLL).

The following list describes the different interrupts supported by eLCDIF:

- Underflow interrupt is asserted when the clock domain crossing FIFO (TXFIFO) becomes empty but the block is in active display portion during that time. Software should take corrective action to make sure that this does not happen.
- In the bus master mode, the overflow interrupt will be asserted if the block has requested more data than it's FIFOs could hold. In the read mode, it will be asserted if the RxFIFO becomes full and the block reads more data.
- VSYNC edge interrupt will be asserted every time a leading VSYNC edge occurs.
- Cur_frame_done interrupt occurs at the end of every frame in all modes except DVI. In DVI mode, if IRQ_ON_ALTERNATE_FIELDS bit is set, it will occur at the end of every frame, otherwise it will occur at the end of every field.

32.4.5 Initializing the eLCDIF

This section describes write modes and MPU read mode.

32.4.5.1 Write Modes

The following initialization steps are common to all eLCDIF write modes of operation before entering any particular mode.

Initialization steps:

1. Configure the external I/Os to correctly interface the external display.
2. Start the DISPLAY_CLK clock and set the appropriate frequency by programming the registers in CCM.

3. Start the BUS_CLK and set the appropriate frequency by programming the registers in CCM.
4. Bring the eLCDIF out of soft reset and disable the clock gate bit.
5. Reset the LCD controller by setting LCDIF_CTRL1_RESET bit appropriately, being careful to observe the reset requirements of the controller. See Behavior During Reset for more information on Reset requirements.
6. Make sure READ_WRITEB bit in HW_LCDIF_CTRL register is 0.
7. Select the transfer mode of operation. The LCDIF_MASTER bit in HW_LCDIF_CTRL register determines the transfer mode selected. Bus master (LCDIF_MASTER =1) or PIO (LCDIF_MASTER =0) mode are the transfer modes to select.
8. Set the INPUT_DATA_SWIZZLE according to the endianness of the LCD controller. Also, set the DATA_SHIFT_DIR and SHIFT_NUM_BITS if it is required to shift the data left or right before it is output.
9. Set the WORD_LENGTH field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24/32-bit input. Also, select the correct 16/18/24 bit data format with the corresponding fields in HW_LCDIF_CTRL register.
10. Set the BYTE_PACKING_FORMAT field in HW_LCDIF_CTRL1 according to the input frame.
11. Set the LCD_DATABUS_WIDTH appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24/32-bit output.
12. Enable the necessary IRQs.

32.4.5.2 MPU Read Mode

The following initialization steps should be done to enter the MPU read mode of operation:

Initialization steps:

1. Configure the external I/Os to correctly interface the external display.
2. Start the DISPLAY_CLK and set the appropriate frequency by programming the registers in CCM.
3. Start the BUS_CLK and set the appropriate frequency by programming the registers in CCM.
4. Bring the eLCDIF out of soft reset and clock gate.
5. Reset the LCD controller by setting LCDIF_CTRL1_RESET bit appropriately, being careful to observe the reset requirements of the controller.
6. Set the READ_WRITEB bit in LCDIF_CTRL register to 1.
7. Set the LCDIF_MASTER bit in LCDIF_CTRL register to 0. Bus master mode is not supported for reading data from the display.

8. Also, set the DATA_SHIFT_DIR and SHIFT_NUM_BITS if it is required to shift the data left or right before it is output.
9. Indicate if the read data needs to color-space-converted and stored in a different RGB format by setting the READ_MODE_OUTPUT_IN_RGB_FORMAT field accordingly.
10. Set the WORD_LENGTH field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24-bit input if READ_MODE_OUTPUT_IN_RGB_FORMAT is required. Also, select the correct 16/18/24 bit data format with the corresponding fields in LCDIF_CTRL register.
11. Set the READ_MODE_NUM_PACKED_SUBWORDS field in LCDIF_CTRL2 according to the number of subwords per word required to be packed.
12. Set the READ_PACK_DIR to 1 if it is required to store the data in big-endian format.
13. Set the LCD_DATABUS_WIDTH appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24-bit output.
14. Enable the necessary IRQs.

32.4.6 MPU Interface

The MPU interface is used to transfer data and commands between the SoC via the eLCDIF and the external display at modest data rates.

Bus master or PIO transactions using the LCDIF_DATA register can be used for MPU mode write operations. For MPU mode read operations, only PIO can be used. eLCDIF can support the 6800 as well as the 8080 MPU protocol. If DOTCLK_MODE, DVI_MODE and VSYNC_MODE bits in LCDIF_CTRL registers are 0, it implies that the block is in MPU interface mode of operation. The LCDIF MPU mode has four basic timing parameters: Setup and Hold for the Command/Data register selection (TCS, TCH) and Setup and Hold for the Data bus (TDS, TDH). These parameters are expressed in DISPLAY_CLK cycles. The LCD_WR signal is used as the write strobe while LCD_RS signal is typically used to switch between command and data modes.

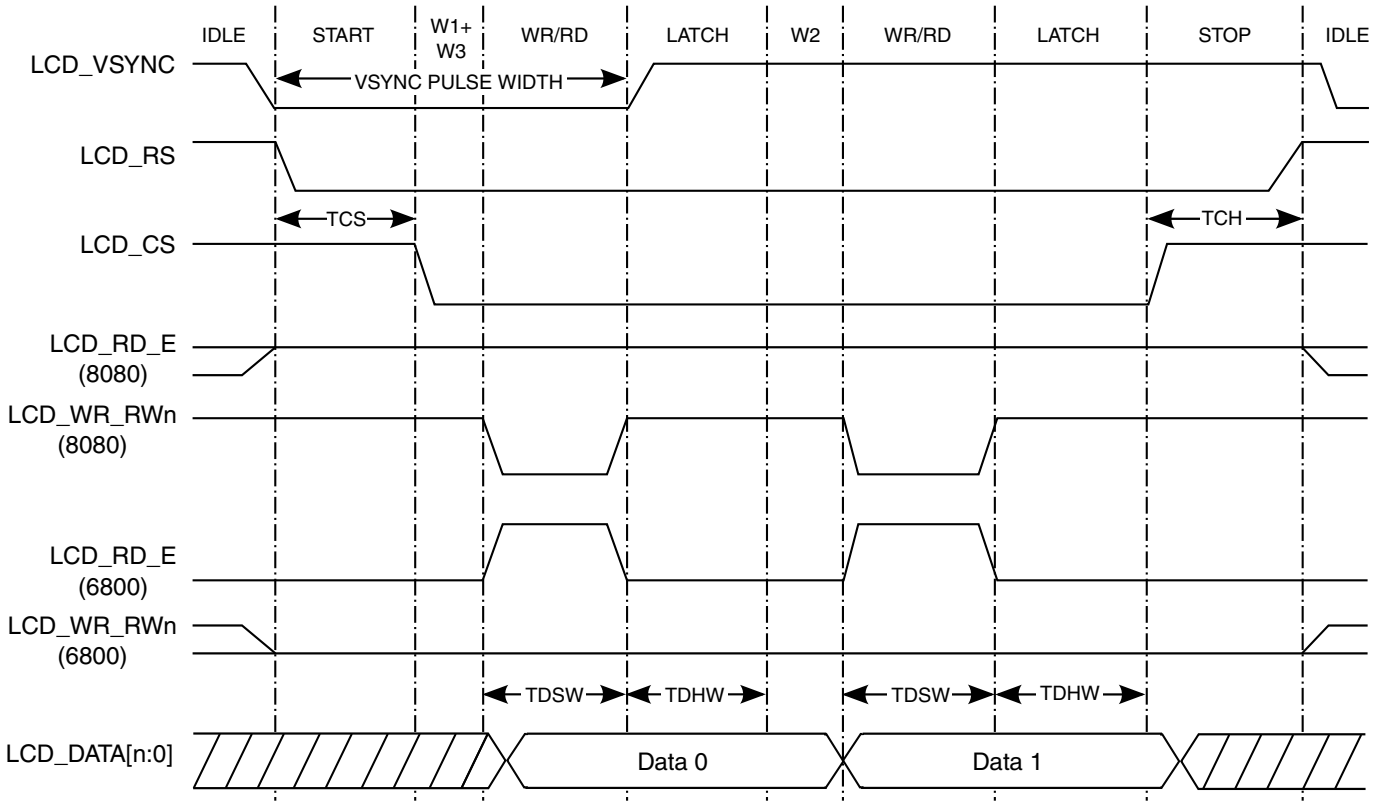

Figure 32-11. Timing in write mode of 6800 and 8080 protocols

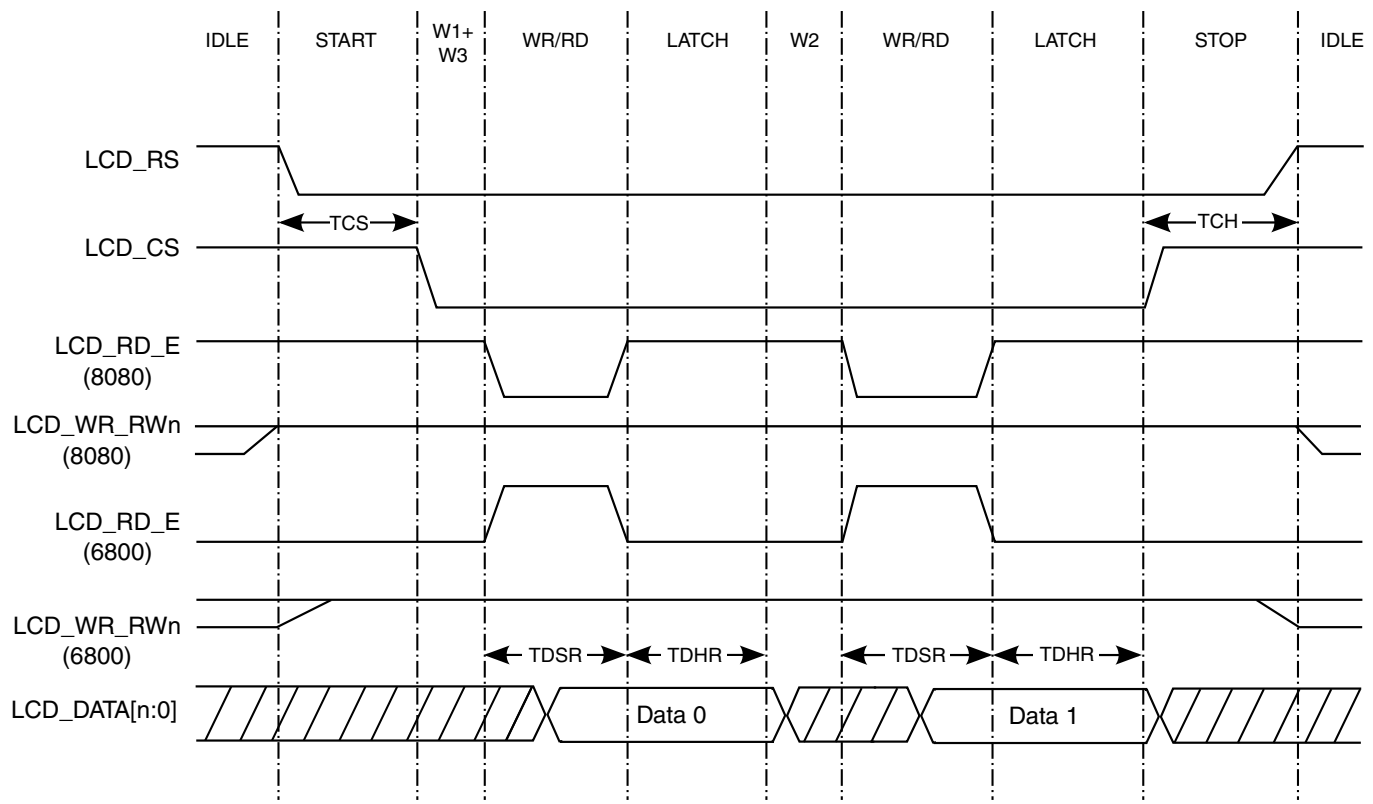

Figure 32-12. Read timing interface in 6800 and 8080 protocols

The eLCDIF has flexible pin and strobe timings which enable it to optimally support a wide range of LCDs. The minimum cycle time is two DISPLAY_CLK cycles (TDS=TDH=1). For example, this results in a maximum LCD data rate of 12 MB/s when DISPLAY_CLK is 24 MHz. TDS and TDH are 8-bit values, so the minimum eLCDIF period is 510 DISPLAY_CLK cycles (47 KHz with a 24 MHz DISPLAY_CLK). The timings are not automatically adjusted if the DISPLAY_CLK frequency changes, so it may be necessary to adjust the timings if DISPLAY_CLK changes.

In the MPU interface mode, the LCDIF_CTRL_ BYPASS_COUNT bit must be 0. The RUN bit is cleared automatically once the eLCDIF has received/transmitted all the data as per the LCDIF_TRANSFER_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

32.4.6.1 Code Example to Initialize the eLCDIF in MPU Write Mode

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1(LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that the
                                    // idle state for LCD_RS signal is high, regardless of the
                                     // programming of the DATA_SELECT register.
BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, READ_WRITEB, 0);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 1);//Only if LCD controller implements a busy line
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2);  //Values
based
                               // on DISPLAY_CLK frequency and timing requirements of
controller.
                              // Note that these register must be non-zero for correct
operation.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240); //For a 320 RGB x 240 display
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The eLCDIF is now ready to receive data via bus master PIO write transactions using the LCDIF_DATA register. Note that when using the PIO write operations to the LCDIF_DATA register, the software will need to poll the FIFO STATUS bits to ensure that it does not overflow the eLCDIF data buffers. When eLCDIF is done transmitting H_COUNT x V_COUNT pixels, it will stop, turn off the RUN bit and assert the cur_frame_done interrupt.

32.4.7 VSYNC Interface

The VSYNC interface uses the same protocol as the MPU interface, with an additional signal VSYNC at the frame rate of the display, as shown in the figure given in MPU Interface section.

It is used in the moving picture display mode where data has to be written to the internal LCD buffer at a speed higher than the display rate and displayed in synchronization with the VSYNC signal. This mode is selected by setting the VSYNC_MODE bit in LCDIF_CTRL register. The VSYNC signal is programmable for period, polarity and direction. Many other programmable parameters are shared with the MPU interface. The VSYNC_OEB bit in LCDIF_VDCTRL0 register indicates whether the display controller will send the VSYNC signal, or whether it should be generated by eLCDIF. The timing of the VSYNC signal is based on the DISPLAY_CLK (make sure VSYNC_PULSE_WIDTH_UNIT = VSYNC_PERIOD_UNIT = 0 and VSYNC_ONLY = 1) and it is determined by the VSYNC_PERIOD, VSYNC_PULSE_WIDTH and VSYNC_POL fields in LCDIF_VDCTRL0-4 registers. The SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set if the target requires the VSYNC signal to be generated by eLCDIF. If the WAIT_FOR_VSYNC_EDGE bit in LCDIF_CTRL register is set, it indicates that the hardware should wait until it sees the leading VSYNC edge before starting the data transfer. The VERITCAL_WAIT_CNT indicates the number of DISPLAY_CLK cycles from the leading VSYNC edge after which data transfer will be started on the interface.

In the VSYNC interface mode, the LCDIF_CTRL_ BYPASS_COUNT bit must be 0. The RUN bit is cleared automatically once the eLCDIF has received/transmitted all the data as per the LCDIF_TRANSFER_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

32.4.7.1 Code Example to Initialize eLCDIF in VSYNC Mode

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that
//the idle state for LCD_RS signal is high, regardless of the programming of the DATA_SELECT
//register.

BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 0);
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2);  //Values
//based on DISPLAY_CLK frequency and timing requirements of controller. Note that these
//register must be non-zero for the MPU and VSYNC modes.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240);//For a 320 RGB x 240 display
//The following section indicates setting up the VSYNC signal timing when VSYNC is an output
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Making VSYNC signal an output
BF_CS1 (LCDIF_VDCTRL4, VSYNC_ONLY, 1); //Only need to generate VSYNC signal
BF_CS1 (VDCTRL0, VSYNC_POL, 0); //Setting the polarity of VSYNC signal to be low during
//VSYNC_PULSE_WIDTH time
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 0, VSYNC_PULSE_WIDTH_UNIT, 0);
BF_CS2 (LCDIF_VDCTRL1, VSYNC_PERIOD, 400000, VSYNC_PULSE_WIDTH, 100);//Frame display rate in
//terms of number of DISPLAY_CLKs.
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 0, HSYNC_PERIOD, 0);
BF_CS1 (LCDIF_VDCTRL3, VERTICAL_WAIT_CNT, 50);
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
```

```
BF_CS2 (LCDIF_CTRL, VSYNC_MODE, 1, WAIT_FOR_VSYNC_EDGE, 1); //set WAIT_FOR_VSYNC_EDGE if
//software wishes to transfer the next frame after the VSYNC edge occurs.
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The eLCDIF is now ready to receive data via bus master requests or PIO writes to the LCDIF_DATA register. When eLCDIF is done transmitting H_COUNT x V_COUNT pixels, it will stop, turn off the RUN bit and assert the cur_frame_done interrupt.

32.4.8 DOTCLK Interface

The DOTCLK interface is another mode used in moving picture displays.

It includes the VSYNC, HSYNC, DOTCLK and (optional) ENABLE signals. The interface is popularly called the RGB interface if the ENABLE signal is present.

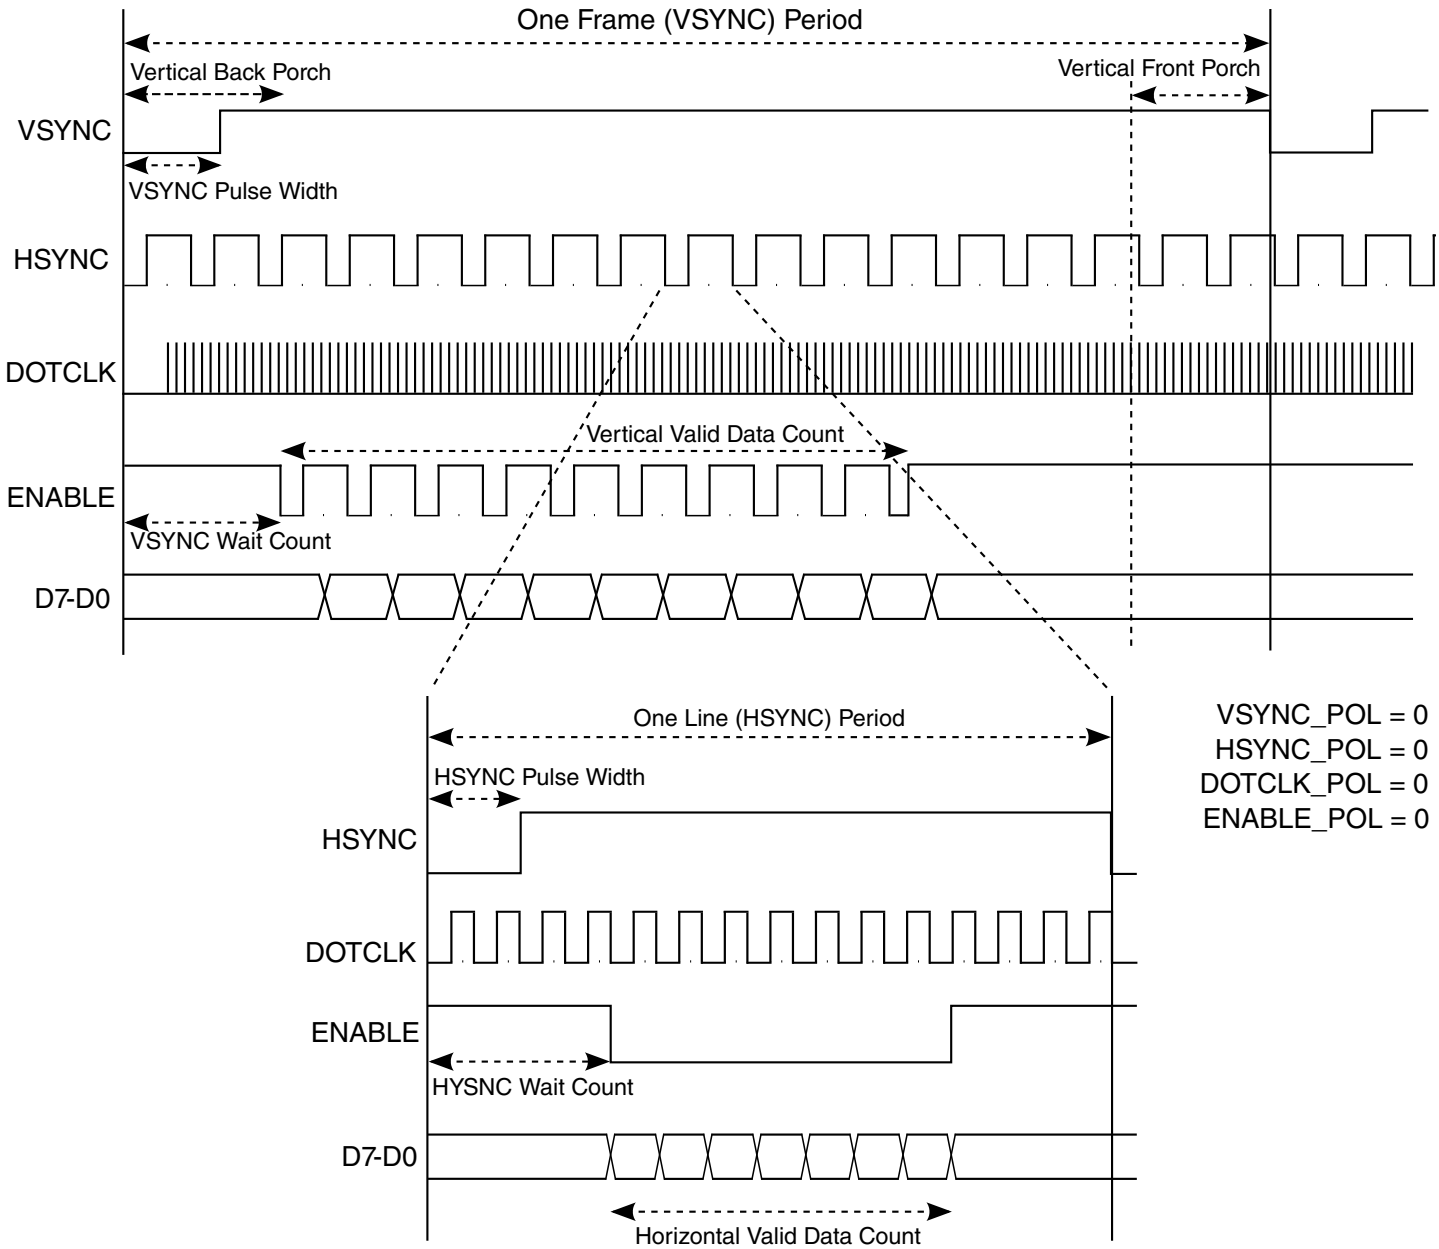

Figure 32-13. DOTCLK protocol with programmable parameters

The DOTCLK mode writes data at high speed to the LCD, and the display operation is synchronized with the VSYNC, HSYNC, ENABLE and DOTCLK signals. The polarities, periods and pulse-widths of the sync signals are programmable using the LCDIF_VDCTRL0-4 registers. The units for the VSYNC signal must be number of horizontal lines and can be selected using the VSYNC_PULSE_WIDTH_UNIT and VSYNC_PERIOD_UNIT bit fields. The VERTICAL_WAIT_CNT is by default given the same unit as the VSYNC_PERIOD. The DISPLAY_CLK frequency is managed by the CCM.

In DOTCLK mode, LCDIF_CTRL_BYPASS_COUNT bit must be set to 1. To end the current transfer, the software should make the DOTCLK_MODE bit 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and issue the cur_frame_done interrupt.

32.4.8.1 Code Example

The following code shows an example for programming a 320x240 display. Note that setting up the display must be done through the MPU mode or via SPI.

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DOTCLK_MODE, 1);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 1); //Always for DOTCLK mode
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Vsync is always an output in the DOTCLK mode
BF_CS4 (LCDIF_VDCTRL0, VSYNC_POL, 0, HSYNC_POL, 0, DOTCLK_POL, 0, ENABLE_POL, 0);
BF_CS1 (LCDIF_VDCTRL0, ENABLE_PRESENT, 1);
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 1, VSYNC_PULSE_WIDTH_UNIT, 1);
BF_CS1 (LCDIF_VDCTRL0, VSYNC_PULSE_WIDTH, 2);
BF_CS1 (LCDIF_VDCTRL1, VSYNC_PERIOD, 280);
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 10, HSYNC_PERIOD, 360); //Assuming
                                                    //  LCD_DATABUS_WIDTH is 24bit
BF_CS2 (LCDIF_VDCTRL3, VSYNC_ONLY, 0);
BF_CS2 (LCDIF_VDCTRL3, HORIZONTAL_WAIT_CNT, 20, VERTICAL_WAIT_CNT, 20);
BF_CS1 (LCDIF_VDCTRL4, DOTCLK_H_VALID_DATA_CNT, 320);//Note that DOTCLK_V_VALID_DATA_CNT is
                              //implicitly assumed to be HW_LCDIF_TRANSFER_COUNT_V_COUNT
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

To stop the transfer completely, the ideal way is to make DOTCLK_MODE = 0. In that case, the block will transmit the contents in the FIFO and reset the RUN bit.

32.4.9 CSI HANDSHAKE INTERFACE

The LCDIF and CSI support a pipeline mode to use double buffers inside OCRAM for the video pass through from CSI to LCDIF, the pipeline buffer size can be 8 line or 16 line as configurable. The pipeline will be handle by hardware handshake signals between CSI and LCDIF. The LCDIF will have the capability to synchronize display with CSI based on the VSYNC signal from CSI. When LCDIF is enabled to start display,it can optionally wait for the VSYNC edge from CSI before it starts the display for next frame,The delay from VSYNC input to the start of next frame is programmable by LCDIF_SYNC_DELAY register.

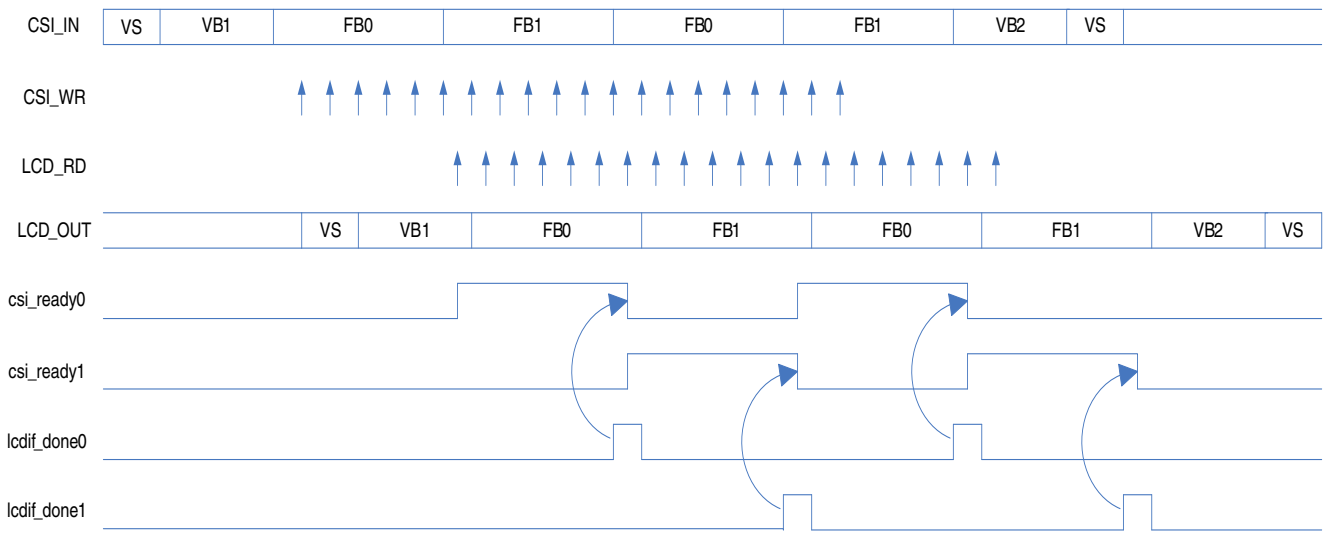

Figure 32-14. CSI HandShake Interface

When this mode is enabled ,The hardware handshake protocol will process. At the start of CSI with camera input,the CSI will put the input data to one frame buffer.When the frame buffer is ready for LCDIF display,CSI will assert csi_ready signal to indicate LCDIF to read the buffer and LCDIF will display data in this buffer.When one frame buffer reading finished ,LCDIF will set the lcdif_done signal to indicate CSI this buffer has been displayed and can be written again.With this double buffer handshake mode,the LCDIF can display the video input within very short delay and minimize DRAM bandwidth.

32.4.10 Alpha Blending Interface

The LCDIF have the capability to add an extra overlay on the normal display buffer,LCDIF can fetch data from two buffers and combine them before display,one buffer data can have the alpha value with the RGB pixels. With LCDIF_AS_CTRL[AS_ENABLE] is set, the LCDIF will start fetching alpha surface buffer data in bus master mode and combine it with another buffer.

The LCDIF_AS_CTRL[ALPHA_CTRL] bits determines how the alpha value is constructed for the alpha surface and alpha blending process is as same as in PXP block, for the alpha blend and color key process refer to the PXP block descriptions.

32.4.11 ITU-R BT.656 Digital Video Interface (DVI)

ITU-R BT.656 Digital Video Interface shown below transmits 4:2:2 YCbCr digital component video to a digital video encoder that can translate it into 525/60 or 625/50 analog TV signal.

Unique timing codes (timing reference signals) are embedded within the video stream to indicate the different timing events that would have been otherwise indicated by VSYNC, HSYNC and BLANK signals. The hardware supports 8-bit data transfers; the pins are shared with the lower 8 bits of LCD data bus. The LCD_RS pin is shared with the clock signal of the interface (called CCIRCLK here for uniqueness). CCIRCLK also can be obtained on the LCD_DOTCK pin. The mode shares the write FIFO with the LCD interface and the associated pipeline. The programmable parameters in registers LCDIF_DVICTRL0-3 allow setting the total number of horizontal lines per frame, vertical and horizontal blanking interval, odd and even field start and end positions, and so on. In short, these parameters are provided to ensure that the hardware has enough flexibility to generate the right 525/60 or 625/50 data streams. Most of the initialization steps in Initializing the eLCDIF such as data shifting, swizzle, and so on, are applicable to DVI mode also. The register descriptions in the programmable registers section at the end of this chapter include example code for programming the DVICTRL0-3 registers.

In DVI mode, LCDIF_CTRL_BYPASS_COUNT bit must be set to 1. To end the current transfer, the software should make the DVI_MODE bit the value 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and assert the cur_frame_done interrupt.

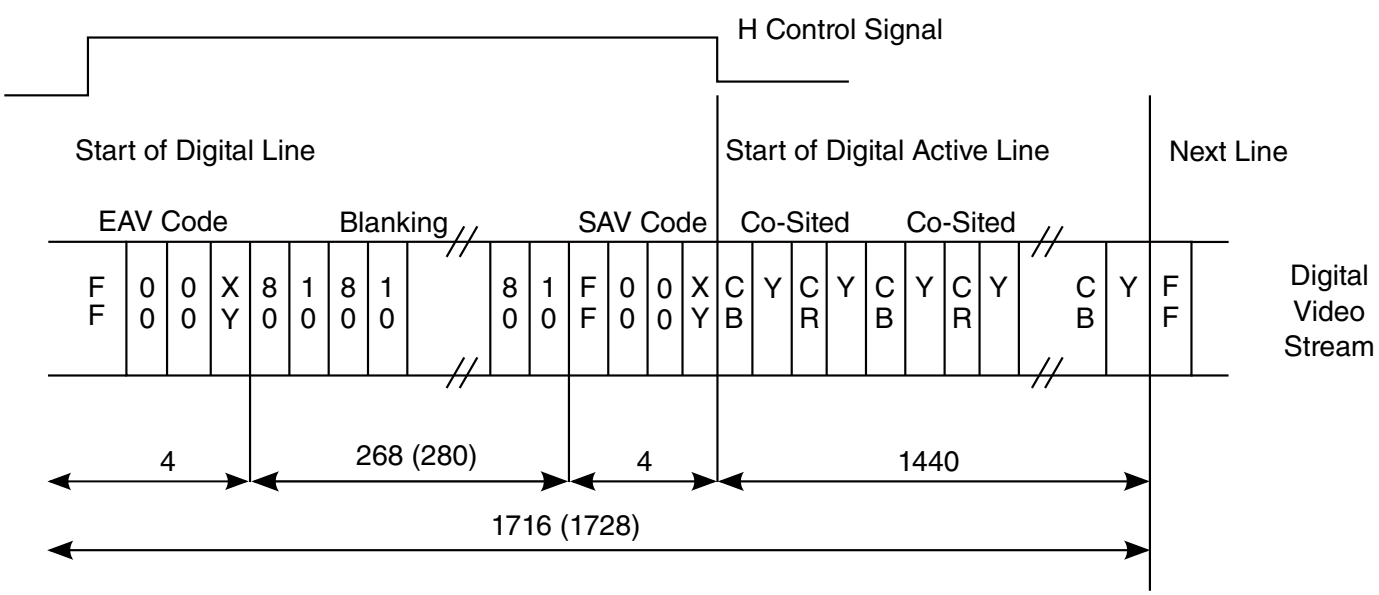

Figure 32-15. Digital Video Interface

32.4.12 eLCDIF Pin Usage by Interface Mode

Table 32-3 and Table 32-4 indicates how the eLCDIF level interface pins are used based on the desired mode of operation. The chip level I/Os should also be configured to be consistent with the desired eLCDIF operating mode.

The VSYNC signal has been mapped onto two pins, LCD_BUSY and LCD_VSYNC. The pin multiplexing can be programmed to select either of those pins to function as VSYN.

NOTE

There is an option to internally mux the HSYNC, DOTCLK and ENABLE signals in the DOTCLK mode by setting the MUX_SYNC_SIGNALS bit in the VDCTRL0 register. There is also an option to internally mux the LCD_WR_RWn and LCD_RD_E pins in the CTRL1 register for backward compatibility.

32.5 Behavior During Reset

BUS_CLK and DISPLAY_CLK must be running before making any changes to SFTRST or CLKGATE bits.

A soft reset (SFTRST) can take multiple clock periods to complete, so do not set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically.

32.6 ELCDIF Memory Map/Register Definition

eLCDIF Hardware Register Format Summary

32.6.1 eLCDIF General Control Register (LCDIF_RL*n*)

The LCD Interface Control Register provides overall control of the eLCDIF block. The eLCDIF Control Register provides a variety of control functions to the programmer. These functions allow the interface to be very flexible to work with a variety of LCD controllers, and to minimize overhead and increase performance of LCD programming. The register has been organized such that switching between the different LCD modes can be done with minimum PIO writes.

Address: 21C_8000h base + 0h offset + (4d × i), where i=0d to 3d

LCDIF_RL*n* field descriptions

Field	Description
31 SFTRST	This bit must be set to zero to enable normal operation of the eLCDIF. When set to one, it forces a block level reset.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 YCBCR422_INPUT	Zero implies input data is in RGB color space. One implies input data is in YCbCr 4:2:2 format, such that YCbYCr are packed in a 32-bit word. It also means that there are 2 pixels in 4 bytes. If this bit is set, software should program the H_COUNT field in the TRANSFER_COUNT register to the total number of pixels that will have to be fetched by the eLCDIF block per line and the BYTE_PACKING_FORMAT should be 0xF. The WORD_LENGTH does not matter in this case.

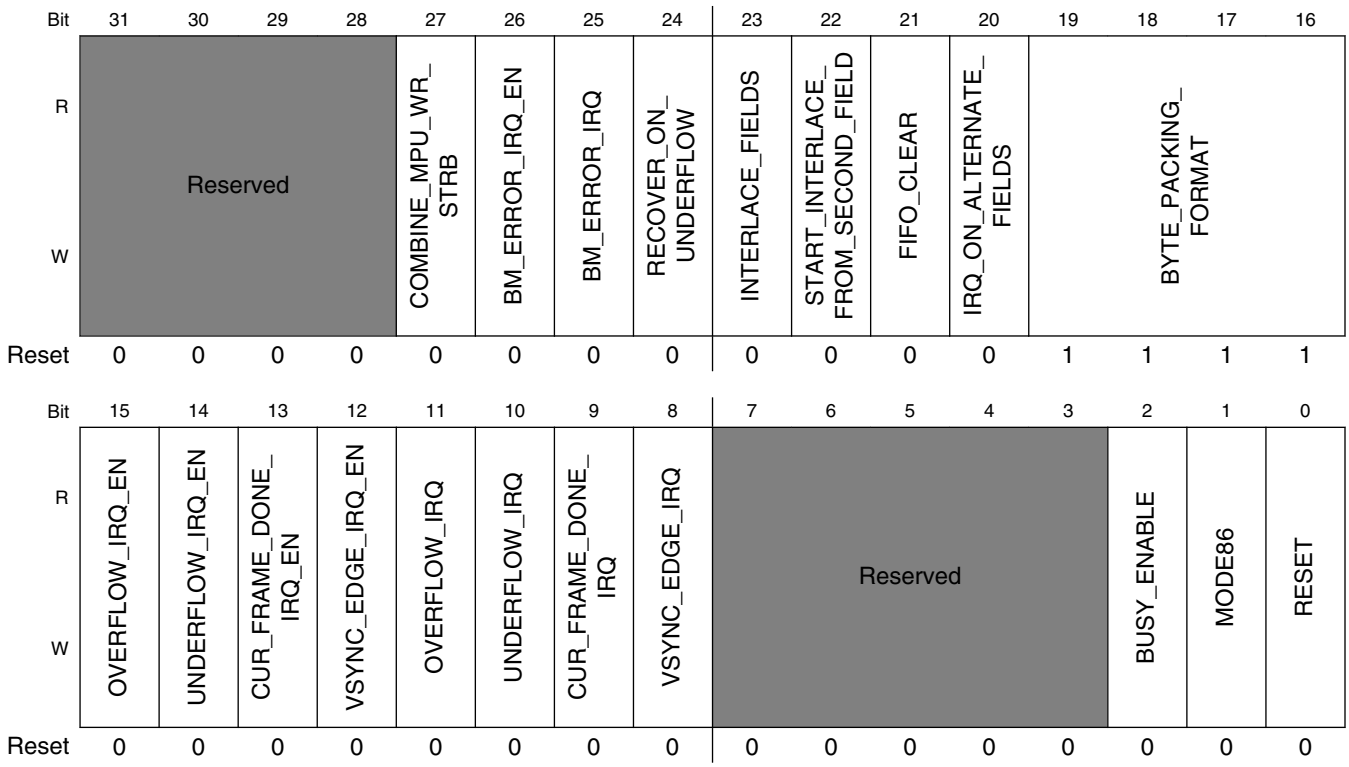
Table continues on the next page...

LCDIF_RL*n* field descriptions (continued)

Field	Description
28 READ_WRITEB	By default, eLCDIF is in the write mode. Setting this bit to 1 will make the hardware go into 6800/8080 MPU read mode. The LCDIF_MASTER bit must be 0, since bus master mode can only be used for writing the display.
27 WAIT_FOR_ VSYNC_EDGE	Setting this bit to 1 will make the hardware wait for the triggering VSYNC edge before starting write transfers to the LCD. Used only in the VSYNC mode of operation.
26 DATA_SHIFT_ DIR	Use this bit to determine the direction of shift of transmit data. In the DVI mode, it works only on the active data, not on the timing codes and ancillary data. 0x0 **TXDATA_SHIFT_LEFT** — Data to be transmitted is shifted LEFT by SHIFT_NUM_BITS bits. 0x1 **TXDATA_SHIFT_RIGHT** — Data to be transmitted is shifted RIGHT by SHIFT_NUM_BITS bits.
25–21 SHIFT_NUM_ BITS	The data to be transmitted is shifted left or right by this number of bits.
20 DVI_MODE	Set this bit to 1 to get into the ITU-R BT.656 digital video interface mode. Toggle this bit from 1 to 0 to make the hardware go out of DVI mode after completing all data transfer and after the RUN bit has been deasserted.
19 BYPASS_ COUNT	When this bit is 0, it means that eLCDIF will stop the block operation and turn off the RUN bit after the amount of data indicated by the LCDIF_TRANSFER_COUNT register has been transferred out. When this bit is set to 1, the block will continue normal operation indefinitely until it is told to stop. This bit must be 0 in MPU and VSYNC modes, and must be 1 in DOTCLK and DVI modes of operation.
18 VSYNC_MODE	Setting this bit to 1 will make the eLCDIF hardware go into VSYNC mode. WAIT_FOR_VSYNC_EDGE can be used only if this bit is set. If VSYNC signal is required to be an output from the block, SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set.
17 DOTCLK_MODE	Set this bit to 1 to make the hardware go into the DOTCLK mode, i.e. VSYNC/HSYNC/DOTCLK/ENABLE interface mode. ENABLE is optional, selected by the ENABLE_PRESENT bit. Toggle this bit from 1 to 0 to make the hardware go out of DOTCLK mode after completing all data transfer and deasserting the RUN bit.
16 DATA_SELECT	Command Mode polarity bit. This bit should only be changed when RUN is 0. 0x0 **CMD_MODE** — Command Mode. DCn signal is Low. 0x1 **DATA_MODE** — Data Mode. DCn signal is High.
15–14 INPUT_DATA_ SWIZZLE	This field specifies how to swap the bytes fetched by the bus master interface. The swizzle function is independent of the WORD_LENGTH bit. The supported swizzle configurations are: 0x0 **NO_SWAP** — No byte swapping.(Little endian) 0x0 **LITTLE_ENDIAN** — Little Endian byte ordering (same as NO_SWAP). 0x1 **BIG_ENDIAN_SWAP** — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 **SWAP_ALL_BYTES** — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 **HWD_SWAP** — Swap half-words. 0x3 **HWD_BYTE_SWAP** — Swap bytes within each half-word.
13–12 CSC_DATA_ SWIZZLE	This field specifies how to swap the bytes after the data has been converted into an internal representation of 24 bits per pixel and before it is transmitted over the LCD interface bus. The data is always transmitted with the least significant byte/hword (half word) first after the swizzle takes place. So, INPUT_DATA_SWIZZLE takes place first on the incoming data, and then CSC_DATA_SWIZZLE is applied. The swizzle function is independent of the WORD_LENGTH or the LCD_DATABUS_WIDTH fields. If RGB_TO_YCRCB422_CSC bit is set, the swizzle occurs on the Y, Cb, Cr values. The supported swizzle configurations are: 0x0 **NO_SWAP** — No byte swapping.(Little endian)

Table continues on the next page...

LCDIF_RL*n* field descriptions (continued)



Field	Description
	0x0 **LITTLE_ENDIAN** — Little Endian byte ordering (same as NO_SWAP). 0x1 **BIG_ENDIAN_SWAP** — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 **SWAP_ALL_BYTES** — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 **HWD_SWAP** — Swap half-words. 0x3 **HWD_BYTE_SWAP** — Swap bytes within each half-word.
11–10 LCD_DATABUS_WIDTH	LCD Data bus transfer width. 0x0 **16_BIT** — 16-bit data bus mode. 0x1 **8_BIT** — 8-bit data bus mode. 0x2 **18_BIT** — 18-bit data bus mode. 0x3 **24_BIT** — 24-bit data bus mode.
9–8 WORD_LENGTH	Input data format. 0x0 **16_BIT** — Input data is 16 bits per pixel. 0x1 **8_BIT** — Input data is 8 bits wide. 0x2 **18_BIT** — Input data is 18 bits per pixel. 0x3 **24_BIT** — Input data is 24 bits per pixel.
7 RGB_TO_YCBCR422_CSC	Set this bit to 1 to enable conversion from RGB to YCbCr colorspace. See the LCDIF_CSC_ registers for further details.
6 ENABLE_PXP_HANDSHAKE	If this bit is set and LCDIF_MASTER bit is set, the eLCDIF will act as bus master and the handshake mechanism between eLCDIF and PXP will be turned on. If LCDIF_MASTER bit is not set, this bit becomes a don't care.
5 MASTER	Set this bit to make the eLCDIF act as a bus master. If this bit is reset, the eLCDIF will support or PIO mode.
4 RSRVD0	This field is reserved. Reserved bits. Write as 0.
3 DATA_FORMAT_16_BIT	When this bit is 1 and WORD_LENGTH = 0, it implies that the 16-bit data is in ARGB555 format. When this bit is 0 and WORD_LENGTH = 0, it implies that the 16-bit data is in RGB565 format. When WORD_LENGTH is not 0, this bit does not care.
2 DATA_FORMAT_18_BIT	Used only when WORD_LENGTH = 2, i.e. 18-bit. 0x0 **LOWER_18_BITS_VALID** — Data input to the block is in 18 bpp format, such that lower 18 bits contain RGB 666 and upper 14 bits do not contain any useful data. 0x1 **UPPER_18_BITS_VALID** — Data input to the block is in 18 bpp format, such that upper 18 bits contain RGB 666 and lower 14 bits do not contain any useful data.
1 DATA_FORMAT_24_BIT	Used only when WORD_LENGTH = 3, i.e. 24-bit. Note that this applies to both packed and unpacked 24-bit data. 0x0 **ALL_24_BITS_VALID** — Data input to the block is in 24 bpp format, such that all RGB 888 data is contained in 24 bits. 0x1 **DROP_UPPER_2_BITS_PER_BYTE** — Data input to the block is actually RGB 18 bpp, but there is 1 color per byte, hence the upper 2 bits in each byte do not contain any useful data, and should be dropped.
0 RUN	When this bit is set by software, the eLCDIF will begin transferring data between the SoC and the display. This bit must remain set until the operation is complete.

32.6.2 eLCDIF General Control1 Register (LCDIF_CTRL1*n*)

The eLCDIF Control Register provides overall control of the eLCDIF block.

The eLCDIF Control1 Register provides additional programming to the eLCDIF. It implements some bits which are unlikely to change often in a particular application. It also carries interrupt-related bits which are common across more than one mode of operation.

Address: 21C_8000h base + 10h offset + (4d × i), where i=0d to 3d

LCDIF_CTRL1*n* field descriptions

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits. Write as 0.
27 COMBINE_MPU_WR_STRB	If this bit is not set, the write strobe will be driven on LCD_WR_RWn pin in the 8080 mode and on the LCD_RD_E pin in the 6800 mode. If it is set, the write strobe of both the 6800 and 8080 modes will be driven only on the LCD_WR_RWn pin. Note that this does not work for read strobe.
26 BM_ERROR_IRQ_EN	This bit is set to enable bus master error interrupt in the eLCDIF master mode.
25 BM_ERROR_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. This bit will be set when the eLCDIF is in master mode and an error response was returned by the slave.

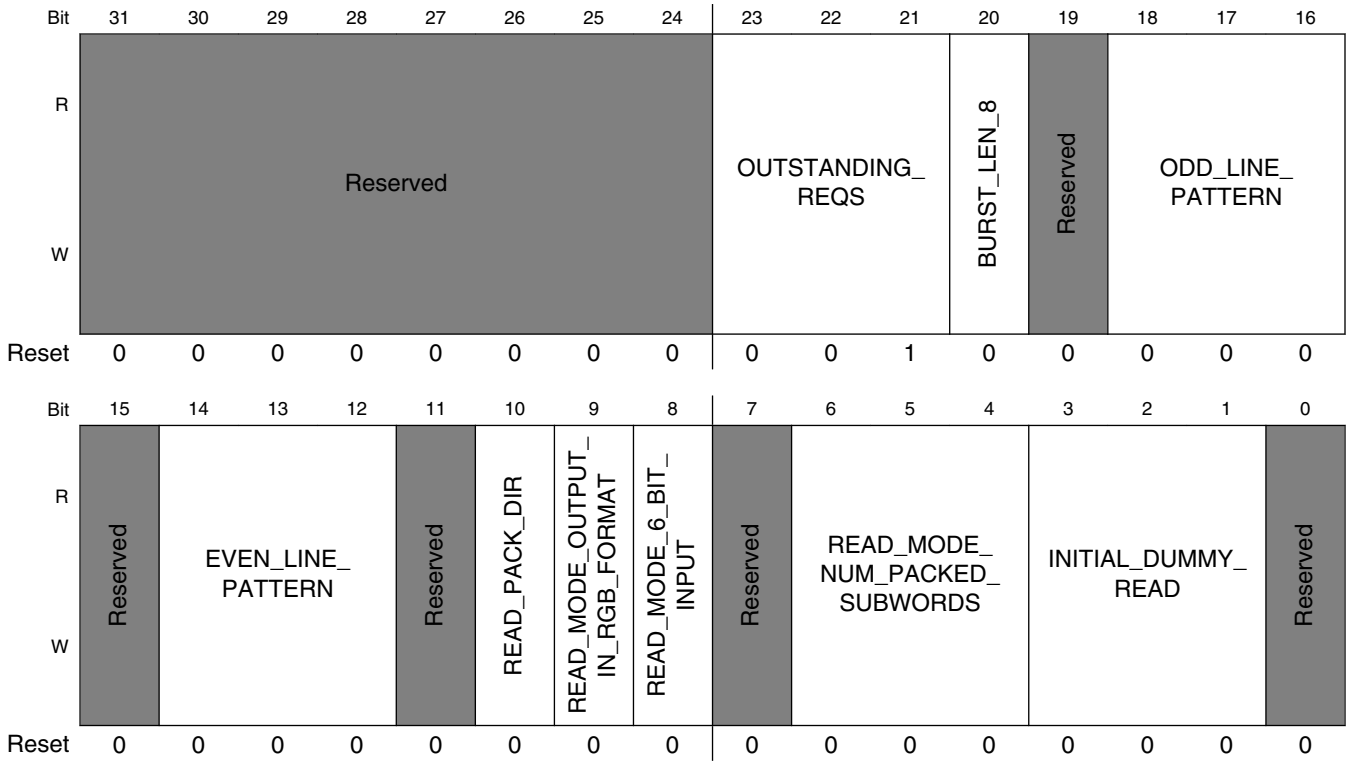
Table continues on the next page...

LCDIF_CTRL1*n* field descriptions (continued)

Field	Description
	0x0 **NO_REQUEST** — No Interrupt Request Pending. 0x1 **REQUEST** — Interrupt Request Pending.
24 RECOVER_ON_ UNDERFLOW	Set this bit to enable the eLCDIF block to recover in the next field/frame if there was an underflow in the current field/frame.
23 INTERLACE_ FIELDS	Set this bit if it is required that the eLCDIF block fetches odd lines in one field and even lines in the other field. It will work only in LCDIF_MASTER is set to 1.
22 START_ INTERLACE_ FROM_ SECOND_FIELD	The default is to grab the odd lines first and then the even lines. Set this bit if it is required to grab the even lines first and then the odd lines. (Line numbers start from 1, so odd lines are 1,3,5,etc. and even lines are 2,4,6, etc.)
21 FIFO_CLEAR	Set this bit to clear all the data in the latency FIFO (LFIFO), TXFIFO and the RXFIFO.
20 IRQ_ON_ ALTERNATE_ FIELDS	If this bit is set, the eLCDIF block will assert the cur_frame_done interrupt only on alternate fields, otherwise it will issue the interrupt on both odd and even field. This bit is mostly relevant if INTERLACE_FIELDS is set. This feature is only available in DOTCLK and DVI modes.
19–16 BYTE_ PACKING_ FORMAT	This bitfield is used to show which data bytes in a 32-bit word are valid. Default value 0xf indicates that all bytes are valid. For 8-bit transfers, any combination in this bitfield will mean valid data is present in the corresponding bytes. In the 16-bit mode, a 16-bit half-word is valid only if adjacent bits [1:0] or [3:2] or both are 1. A value of 0x0 will mean that none of the bytes are valid and should not be used. For example, set the bit field value to 0x7 if the display data is arranged in the 24-bit unpacked format (A-R-G-B where A value does not have be transmitted). When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of pixels that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF.(Note - YCBCR422_INPUT = 1 implies 2 pixels per 32 bits).
15 OVERFLOW_ IRQ_EN	This bit is set to enable an overflow interrupt in the TXFIFO in the write mode.
14 UNDERFLOW_ IRQ_EN	This bit is set to enable an underflow interrupt in the TXFIFO in the write mode.
13 CUR_FRAME_ DONE_IRQ_EN	This bit is set to 1 enable an interrupt every time the hardware enters in the vertical blanking state.
12 VSYNC_EDGE_ IRQ_EN	This bit is set to enable an interrupt every time the hardware encounters the leading VSYNC edge in the VSYNC and DOTCLK modes, or the beginning of every field in DVI mode.
11 OVERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A latency FIFO (LFIFO) overflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected, data samples have been lost. 0x0 **NO_REQUEST** — No Interrupt Request Pending. 0x1 **REQUEST** — Interrupt Request Pending.
10 UNDERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A TXFIFO underflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected. Could produce an error in the DOTCLK / DVI modes.

Table continues on the next page...

LCDIF_CTRL1*n* field descriptions (continued)



Field	Description
	0x0 **NO_REQUEST** — No Interrupt Request Pending. 0x1 **REQUEST** — Interrupt Request Pending.
9 CUR_FRAME_DONE_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It indicates that the hardware has completed transmitting the current frame and is in the vertical blanking period in the DOTCLK/DVI modes. In the MPU and VSYNC modes, this IRQ is asserted at the end of the data transfer indicated by LCDIF_TRANSFER_COUNT register. 0x0 **NO_REQUEST** — No Interrupt Request Pending. 0x1 **REQUEST** — Interrupt Request Pending.
8 VSYNC_EDGE_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It is set whenever the leading VSYNC edge is detected in the VSYNC and DOTCLK modes. In the DVI mode, it is asserted every time the block enters a new field. 0x0 **NO_REQUEST** — No Interrupt Request Pending. 0x1 **REQUEST** — Interrupt Request Pending.
7–3 RSRVD0	This field is reserved. Reserved bits. Write as 0.
2 BUSY_ENABLE	This bit enables the use of the interface's busy signal input. This should be enabled for LCD controllers that implement a busy line (to stall the eLCDIF from sending more data until ready). Otherwise this bit should be cleared. 0x0 **BUSY_DISABLED** — The busy signal from the LCD controller will be ignored. 0x1 **BUSY_ENABLED** — Enable the use of the busy signal from the LCD controller.
1 MODE86	This bit is used to select between the 8080 and 6800 series of microprocessor modes. This bit should only be changed when RUN is 0. 0x0 **8080_MODE** — Pins LCD_WR_RWn and LCD_RD_E function as active low WR and active low RD signals respectively. 0x1 **6800_MODE** — Pins LCD_WR_RWn and LCD_RD_E function as Read/Write and active high Enable signals respectively.
0 RESET	Reset bit for the external LCD controller. This bit can be changed at any time. It CANNOT be reset by SFTRST. 0x0 **LCDRESET_LOW** — LCD_RESET output signal is low. 0x1 **LCDRESET_HIGH** — LCD_RESET output signal is high.

32.6.3 eLCDIF General Control2 Register (LCDIF_CTRL2*n*)

The eLCDIF Control Register provides overall control of the eLCDIF block.

The eLCDIF Control2 Register provides additional programming to the eLCDIF. It implements some bits which are unlikely to change often in a particular application.

Address: 21C_8000h base + 20h offset + (4d × i), where i=0d to 3d

LCDIF_CTRL2*n* field descriptions

Field	Description
31–24 RSRVD5	This field is reserved. Reserved bits. Write as 0.
23–21 OUTSTANDING_ REQS	This bitfield indicates the maximum number of outstanding transactions that eLCDIF should request when it is acting as a bus master. Default is 2 outstanding transactions. 0x0 **REQ_1** — 0x1 **REQ_2** — 0x2 **REQ_4** — 0x3 **REQ_8** — 0x4 **REQ_16** —
20 BURST_LEN_8	By default, when the eLCDIF is in the bus master mode, it will issue AXI bursts of length 16 (except when in packed 24 bpp mode, it will issue bursts of length 15). When this bit is set to 1, the block will issue bursts of length 8 (except when in packed 24 bpp mode, it will issue bursts of length 9). Note that this bitfield is only applicable when LCDIF_MASTER is set to 1.
19 RSRVD4	This field is reserved. Reserved bits. Write as 0.
18–16 ODD_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in ODD lines (line numbers 1,3,5,..). This bitfield must be 0 in DVI mode. 0x0 **RGB** — 0x1 **RBG** — 0x2 **GBR** — 0x3 **GRB** —

Table continues on the next page...

LCDIF_CTRL2*n* field descriptions (continued)

Field	Description
	0x4 **BRG** — 0x5 **BGR** —
15 RSRVD3	This field is reserved. Reserved bits. Write as 0.
14–12 EVEN_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in EVEN lines (line numbers 2,4,6,..). This bitfield must be 0 in DVI mode. 0x0 **RGB** — 0x1 **RBG** — 0x2 **GBR** — 0x3 **GRB** — 0x4 **BRG** — 0x5 **BGR** —
11 RSRVD2	This field is reserved. Reserved bits. Write as 0.
10 READ_PACK_DIR	The default value of 0 indicates data is stored in the little endian format. When LCD_DATABUS_WIDTH is 8-bit, this bit provides the option of rearranging the data byte-wise in the big endian format. For example, if READ_MODE_NUM_PACKED_SUBWORDS = 3 and the order of incoming data is 0x11, 0x22 and 0x33, then setting this bit to 1 will cause the data to be stored as 0x00112233 as opposed to the default 0x00332211. This operation occurs after the shifting operation done by SHIFT_NUM_BITS bitfield.
9 READ_MODE_ OUTPUT_IN_ RGB_FORMAT	Setting this bit will enable the eLCDIF to convert the incoming data to the RGB format given by WORD_LENGTH bitfield. This feature is not available when WORD_LENGTH is set to 8 bits. eLCDIF performs this operation of converting to RGB format after the endianness has been determined by the READ_PACK_DIR bitfield.
8 READ_MODE_6_ BIT_INPUT	Setting this bit to 1 indicates to eLCDIF that even though LCD_DATABUS_WIDTH is set to 8 bits, the input data is actually only 6 bits wide and exists on D5-D0.
7 RSRVD1	This field is reserved. Reserved bits. Write as 0.
6–4 READ_MODE_ NUM_PACKED_ SUBWORDS	Indicates the number of valid 8/16/18/24-bit subwords that will be packed into the 32-bit word in read mode. The subword size (8,16, 18 or 24 bits) is determined by the LCD_DATABUS_WIDTH field. The swizzle operation is performed after READ_MODE_NUM_PACKED_SUBWORDS number of subwords has been received and stored in little-endian format. For example, if LCD_DATABUS_WIDTH is set to 8-bit and data to be read back has to be stored in memory in 24-bit unpacked RGB format, set READ_MODE_NUM_PACKED_SUBWORDS to 0x3 so that each 32-bit word will contain only 3 valid bytes (RGB). Maximum value of READ_MODE_NUM_PACKED_SUBWORDS is 4 for 8-bit databus, 2 for 16-bit databus and 1 for 18/24-bit databus.
3–1 INITIAL_DUMMY_ READ	The value in this field determines the number of dummy 8/16/18/24-bit subwords that have to be read back from the LCD panel/controller. They will then not be stored in the read FIFO.
0 RSRVD0	This field is reserved. Reserved bits. Write as 0.

32.6.4 eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIF_TRANSFER_COUNT)

This register tells the eLCDIF how much data will be sent for this frame, or transaction. The total number of words is a product of the V_COUNT and H_COUNT fields. The word size is specified by the WORD_LENGTH field.

This register gives the dimensions of the input frame. For normal operation, but V_COUNT and H_COUNT should be non-zero.

Address: 21C_8000h base + 30h offset = 21C_8030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	V_COUNT																H_COUNT															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_TRANSFER_COUNT field descriptions

Field	Description
31–16 V_COUNT	Number of horizontal lines per frame which contain valid data. In DOTCLK mode, V_COUNT should be the same as the number of active horizontal lines in a progressive frame. In DVI mode, V_COUNT should be the number of active horizontal lines per frame, and not per field.
H_COUNT	Total valid data (pixels) in each horizontal line. The data size is given by the WORD_LENGTH. When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of 32-bit words that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF. In 24-bit packed format (WORD_LENGTH=0x3, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 4 pixels. In 16-bit packed format (WORD_LENGTH=0x0, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 2 pixels.

32.6.5 LCD Interface Current Buffer Address Register (LCDIF_CUR_BUF)

This register indicates the address of the current frame being transmitted by eLCDIF.

When the eLCDIF is behaving as a master, this address points to the address of the current frame of data being sent out via the LCDIF. When the current frame is done, the LCDIF block will assert the cur_frame_done interrupt for software to take action. The block will also copy the LCDIF_NEXT_BUF_ADDR into this bitfield so that the software can program the next frame address into the LCDIF_NEXT_BUF_ADDR bitfield. This address must always be double-word aligned.

Address: 21C_8000h base + 40h offset = 21C_8040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_CUR_BUF field descriptions

Field	Description
ADDR	Address of the current frame being transmitted by eLCDIF.

32.6.6 LCD Interface Next Buffer Address Register (LCDIF_NEXT_BUF)

This register indicates the address of next frame that will be transmitted by eLCDIF.

When the eLCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the eLCDIF. It is up to the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the eLCDIF. This address must always be double-word aligned.

Address: 21C_8000h base + 50h offset = 21C_8050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_NEXT_BUF field descriptions

Field	Description
ADDR	Address of the next frame that will be transmitted by eLCDIF.

32.6.7 LCD Interface Timing Register (LCDIF_TIMING)

The LCD interface timing register controls the various setup and hold times enforced by the LCD interface in the 6800/8080 MPU and VSYNC modes of operation.

The values used in this register are dependent on the particular LCD controller used, consult the users manual for the particular controller for required timings. Each field of the register must be non-zero, therefore the minimum value is: 0x01010101. NOTE: the timings are not automatically adjusted if the CLK_DIS_LCDIFn frequency changes—it

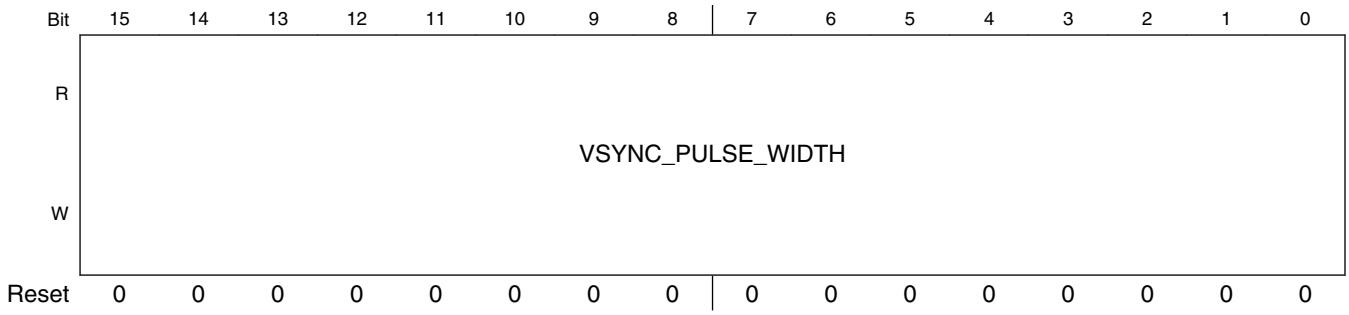
may be necessary to adjust the timings if CLK_DIS_LCDIFn changes. NOTE: Each field in this register must be non-zero for the MPU and VSYNC modes to function. The settings in this register do not affect the DOTCLK and DVI modes.

Address: 21C_8000h base + 60h offset = 21C_8060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	CMD_HOLD								CMD_SETUP								DATA_HOLD								DATA_SETUP							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_TIMING field descriptions

Field	Description
31–24 CMD_HOLD	Number of CLK_DIS_LCDIFn cycles that the DCn signal is active after CEn is deasserted.
23–16 CMD_SETUP	Number of CLK_DIS_LCDIFn cycles that the DCn signal is active before CEn is asserted.
15–8 DATA_HOLD	Data bus hold time in CLK_DIS_LCDIFn cycles. Also the time that the data strobe is deasserted in a cycle
DATA_SETUP	Data bus setup time in CLK_DIS_LCDIFn cycles. Also the time that the data strobe is asserted in a cycle.



32.6.8 eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF_VDCTRL0*n*)

This register is used to control the VSYNC and DOTCLK modes of the LCDIF so as to work with different types of LCDs like moving picture displays and delta pixel displays.

This register gives general programmability to the VSYNC signal including polarity, direction, pulse width, etc.

Address: 21C_8000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved		VSYNC_OEB	ENABLE_PRESENT	VSYNC_POL	HSYNC_POL	DOTCLK_POL	ENABLE_POL	Reserved		VSYNC_PERIOD_UNIT	VSYNC_PULSE_WIDTH_UNIT	HALF_LINE	HALF_LINE_MODE	VSYNC_PULSE_WIDTH	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_VDCTRL0*n* field descriptions

Field	Description
31–30 RSRVD2	This field is reserved. Reserved bits. Write as 0.
29 VSYNC_OEB	0 means the VSYNC signal is an output, 1 means it is an input. Should be set to 0 in the DOTCLK mode. 0x0 **VSYNC_OUTPUT** — The VSYNC pin is in the output mode and the VSYNC signal has to be generated by the eLCDIF block. 0x1 **VSYNC_INPUT** — The VSYNC pin is in the input mode and the LCD controller sends the VSYNC signal to the block.
28 ENABLE_ PRESENT	Setting this bit to 1 will make the hardware generate the ENABLE signal in the DOTCLK mode, thereby making it the true RGB interface along with the remaining three signals VSYNC, HSYNC and DOTCLK.
27 VSYNC_POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.
26 HSYNC_POL	Default 0 active low during HSYNC_PULSE_WIDTH time and will be high during the rest of the HSYNC period. Set it to 1 to invert the polarity.
25 DOTCLK_POL	Default is data launched at negative edge of DOTCLK and captured at positive edge. Set it to 1 to invert the polarity. Set it to 0 in DVI mode.
24 ENABLE_POL	Default 0 active low during valid data transfer on each horizontal line.
23–22 RSRVD1	This field is reserved. Reserved bits. Write as 0.
21 VSYNC_ PERIOD_UNIT	Default 0 for counting VSYNC_PERIOD in terms of CLK_DIS_LCDIFn cycles. Set it to 1 to count in terms of complete horizontal lines. CLK_DIS_LCDIFn cycles should be used in the VSYNC mode, while horizontal line should be used in the DOTCLK mode.
20 VSYNC_PULSE_ WIDTH_UNIT	Default 0 for counting VSYNC_PULSE_WIDTH in terms of CLK_DIS_LCDIFn cycles. Set it to 1 to count in terms of complete horizontal lines.
19 HALF_LINE	Setting this bit to 1 will make the total VSYNC period equal to the VSYNC_PERIOD field plus half the HORIZONTAL_PERIOD field (i.e. VSYNC_PERIOD field plus half horizontal line), otherwise it is just VSYNC_PERIOD. Should be only used in the DOTCLK mode, not in the VSYNC interface mode.
18 HALF_LINE_ MODE	When this bit is 0, the first field (VSYNC period) will end in half a horizontal line and the second field will begin with half a horizontal line. When this bit is 1, all fields will end with half a horizontal line, and none will begin with half a horizontal line.
VSYNC_PULSE_ WIDTH	Number of units for which VSYNC signal is active. For the DOTCLK mode, the unit is determined by the VSYNC_PULSE_WIDTH_UNIT. If the VSYNC_PULSE_WIDTH_UNIT is 0 for DOTCLK mode, VSYNC_PULSE_WIDTH must be less than HSYNC_PERIOD. For the VSYNC interface mode, it should be in terms of number of CLK_DIS_LCDIFn cycles only.

32.6.9 eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF_VDCTRL1)

This register is used to control the VSYNC signal in the VSYNC and DOTCLK modes of the block.

This register determines the period and duty cycle of the VSYNC signal when it is generated in the block.

Address: 21C_8000h base + 80h offset = 21C_8080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	VSYNC_PERIOD																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_VDCTRL1 field descriptions

Field	Description
VSYNC_PERIOD	Total number of units between two positive or two negative edges of the VSYNC signal. If HALF_LINE is set, it is implicitly calculated to be VSYNC_PERIOD plus half HSYNC_PERIOD.

32.6.10 LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF_VDCTRL2)

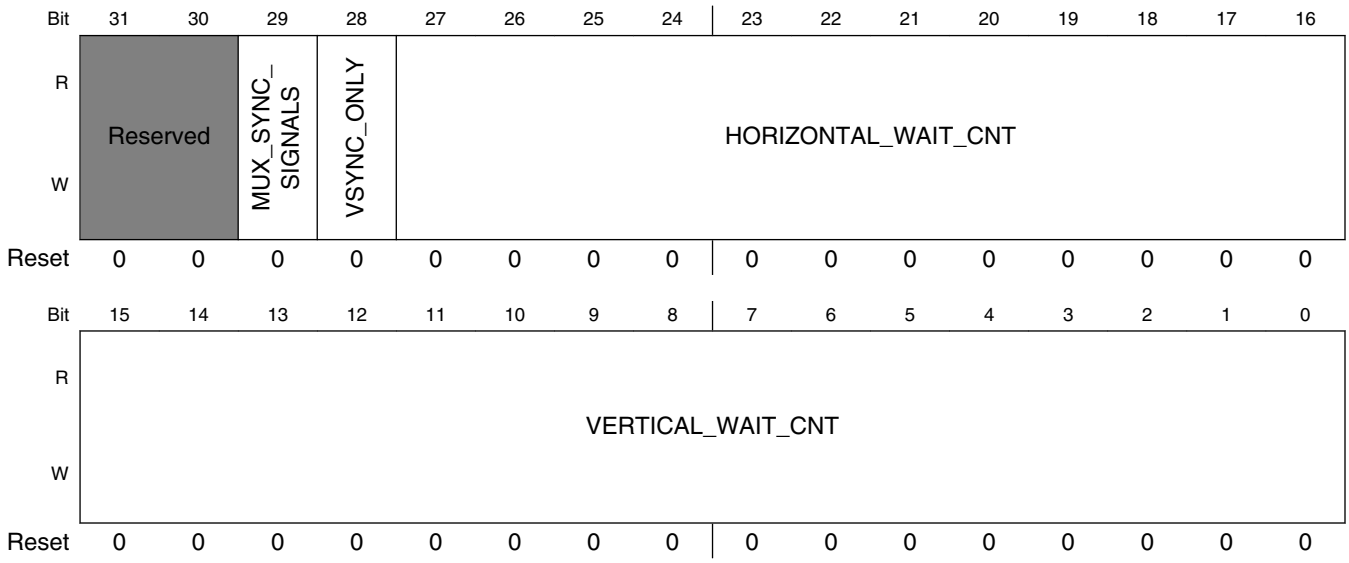
This register is used to control the HSYNC signal in the DOTCLK mode of the block.

This register determines the period and duty cycle of the HSYNC signal when it is generated in the block.

Address: 21C_8000h base + 90h offset = 21C_8090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	HSYNC_PULSE_WIDTH																HSYNC_PERIOD															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_VDCTRL2 field descriptions



Field	Description
31–18 HSYNC_PULSE_WIDTH	Number of CLK_DIS_LCDIFn cycles for which HSYNC signal is active.
HSYNC_PERIOD	Total number of CLK_DIS_LCDIFn cycles between two positive or two negative edges of the HSYNC signal.

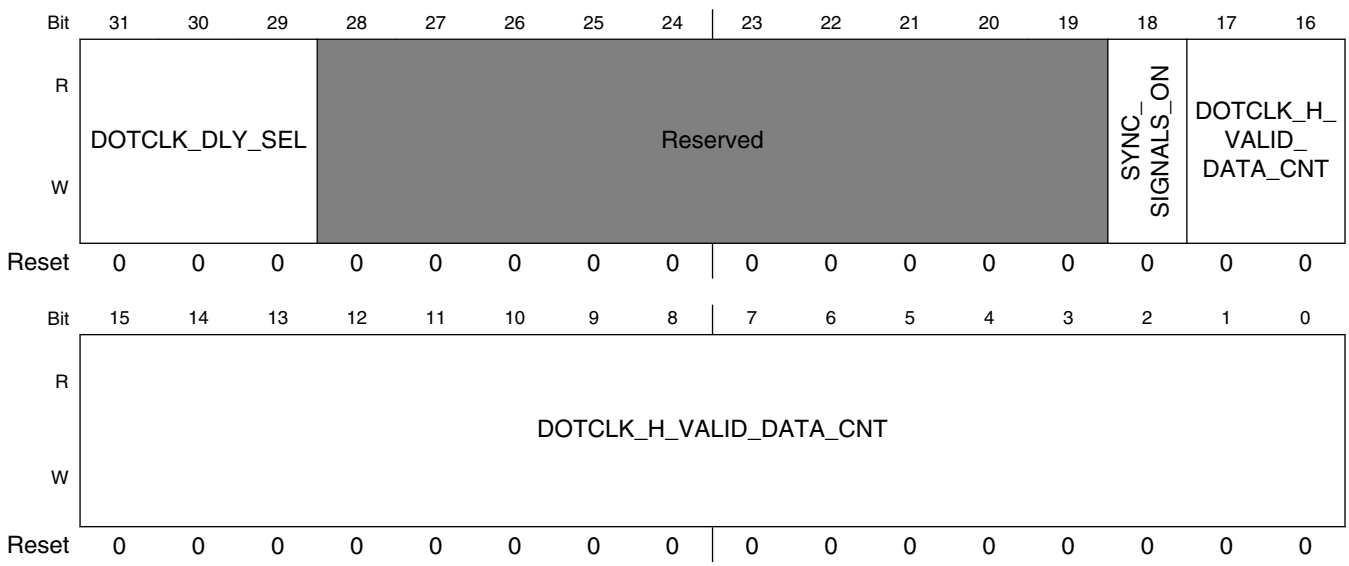
32.6.11 eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF_VDCTRL3)

This register is used to determine the vertical and horizontal wait counts.

This register determines the back porches of HSYNC and VSYNC signals when they are generated by the block.

Address: 21C_8000h base + A0h offset = 21C_80A0h

LCDIF_VDCTRL3 field descriptions



Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29 MUX_SYNC_SIGNALS	When this bit is set, the eLCDIF block will internally mux HSYNC with LCD_D14, DOTCLK with LCD_D13 and ENABLE with LCD_D12, otherwise these signals will go out on separate pins. This feature can be used to maintain backward compatible with 37xx.
28 VSYNC_ONLY	This bit must be set to 1 in the VSYNC mode of operation, and 0 in the DOTCLK mode of operation.
27–16 HORIZONTAL_WAIT_CNT	In the DOTCLK mode, wait for this number of clocks from falling edge (or rising if HSYNC_POL is 1) of HSYNC signal to account for horizontal back porch plus the number of DOTCLKs before the moving picture information begins.
VERTICAL_WAIT_CNT	In the VSYNC interface mode, wait for this number of CLK_DIS_LCDIFn cycles from the falling VSYNC edge (or rising if VSYNC_POL is 1) before starting LCD transactions and is applicable only if WAIT_FOR_VSYNC_EDGE is set. Minimum is CMD_SETUP+5. In the DOTCLK mode, it accounts for the vertical back porch lines plus the number of horizontal lines before the moving picture begins. The unit for this parameter is inherently the same as the VSYNC_PERIOD_UNIT.

32.6.12 eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF_VDCTRL4)

This register is used to control the DOTCLK mode of the block.

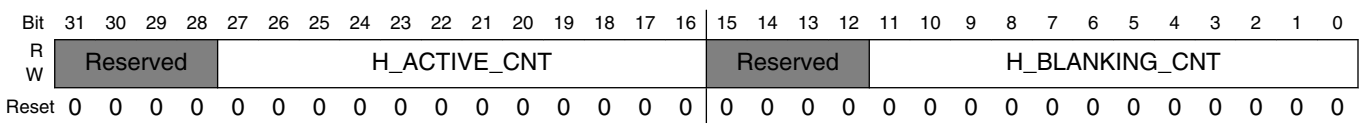
This register determines the active data in each horizontal line in the DOTCLK mode. Note that the total number of active horizontal lines in the DOTCLK mode is the same as the V_COUNT bitfield in the LCDIF_TRANSFER_COUNT register.

Address: 21C_8000h base + B0h offset = 21C_80B0h

LCDIF_VDCTRL4 field descriptions

Field	Description
31–29 DOTCLK_DLY_ SEL	This bitfield selects the amount of time by which the DOTCLK signal should be delayed before coming out of the LCD_DOTCK pin. 0 = 2ns; 1=4ns;2=6ns;3=8ns. Remaining values are reserved.
28–19 RSRVD0	This field is reserved. Reserved bits, write as 0.
18 SYNC_ SIGNALS_ON	Set this field to 1 if the LCD controller requires that the VSYNC or VSYNC/HSYNC/DOTCLK control signals should be active at least one frame before the data transfers actually start and remain active at least one frame after the data transfers end. The hardware does not count the number of frames automatically. Rather, the VSYNC edge interrupt can be monitored by software to count the number of frames that have occurred after this bit is set and then the RUN bit can be set to start the data transactions. This bit must always be set in the DOTCLK mode of operation, and it must be set in the VSYNC mode of operation when VSYNC signal is an output.
DOTCLK_H_ VALID_DATA_ CNT	Total number of CLK_DIS_LCDIFn cycles on each horizontal line that carry valid data in DOTCLK mode.

32.6.13 Digital Video Interface Control0 Register (LCDIF_DVICTRL0)



The Digital Video interface Control0 register provides the overall control of the Digital Video interface.

This register gives information about the horizontal active, horizontal blanking and total number of lines in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0);//1440
HW_LCDIF_DVICTRL0_H_BLANKING_CNT_WR(0x106);//262
//625/50 video system
HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0);//1440
HW_LCDIF_DVICTRL0_H_BLANKING_CNT_WR(0x112);//274
```

Address: 21C_8000h base + C0h offset = 21C_80C0h

LCDIF_DVICTRL0 field descriptions

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits, write as 0.
27–16 H_ACTIVE_CNT	Number of active video samples to be transmitted. (Mostly will be 1440 for both PAL and NTSC). Must always be a multiple of 4.
15–12 RSRVD0	This field is reserved. Reserved bits, write as 0.
H_BLANKING_ CNT	Number of blanking samples to be inserted between EAV and SAV during horizontal blanking interval.

32.6.14 Digital Video Interface Control1 Register (LCDIF_DVICTRL1)

The Digital Video interface Control1 register provides the overall control of the Digital Video interface.

This register contains information about the Field1 start and end, and the Field2 start in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x4);//4
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x109);//265
HW_LCDIF_DVICTRL1_F2_START_LINE_WR(0x10A);//266
//625/50 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x1);//1
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x138);//312
HW_LCDIF_DVICTRL1_F2_START_LINE_WR(0x139);//313
```

Address: 21C_8000h base + D0h offset = 21C_80D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved		F1_START_LINE										F1_END_LINE

R W	F1_END_LINE								F2_START_LINE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DVICTRL1 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 F1_START_LINE	Vertical line number from which Field 1 begins.
19–10 F1_END_LINE	Vertical line number at which Field1 ends.
F2_START_LINE	Vertical line number from which Field 2 begins.

32.6.15 Digital Video Interface Control2 Register (LCDIF_DVICTRL2)

The Digital Video interface Control2 register provides the overall control of the Digital Video interface.

This register contains information about the Field2 end, and the Vertical Blanking1 interval in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL2_F2_END_LINE_WR(0x3);//3
HW_LCDIF_DVICTRL2_V1_BLANK_START_LINE_WR(0x108);//264
HW_LCDIF_DVICTRL2_V1_BLANK_END_LINE_WR(0x11A);//282
//625/50 video system
HW_LCDIF_DVICTRL2_F2_END_LINE_WR(0x271);//625
HW_LCDIF_DVICTRL2_V1_BLANK_START_LINE_WR(0x137);//311
HW_LCDIF_DVICTRL2_V1_BLANK_END_LINE_WR(0x14F);//335
```

Address: 21C_8000h base + E0h offset = 21C_80E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	V1_BLANK_START_LINE						V1_BLANK_END_LINE									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DVICTRL2 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 F2_END_LINE	Vertical line number at which Field 2 ends.
19–10 V1_BLANK_ START_LINE	Vertical line number towards the end of Field1 where first Vertical Blanking interval starts.
V1_BLANK_ END_LINE	Vertical line number in the beginning part of Field2 where first Vertical Blanking interval ends.

32.6.16 Digital Video Interface Control3 Register (LCDIF_DVICTRL3)

The Digital Video interface Control3 register provides the overall control of the Digital Video interface.

This register contains information about the Vertical Blanking2 interval in the ITU-R BT. 656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL3_V2_BLANK_START_LINE_WR(0x1);//1
HW_LCDIF_DVICTRL3_V2_BLANK_END_LINE_WR(0x13);//19
HW_LCDIF_DVICTRL0_V_LINES_CNT_WR(0x20D);//525
//625/50 video system
HW_LCDIF_DVICTRL3_V2_BLANK_START_LINE_WR(0x270);//624
HW_LCDIF_DVICTRL3_V2_BLANK_END_LINE_WR(0x16);//22
HW_LCDIF_DVICTRL0_V_LINES_CNT_WR(0x271);//625
```

Address: 21C_8000h base + F0h offset = 21C_80F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved		V2_BLANK_START_LINE										V2_BLANK_END_LINE			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	V2_BLANK_END_LINE								V_LINES_CNT							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DVICTRL3 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 V2_BLANK_ START_LINE	Vertical line number towards the end of Field2 where second Vertical Blanking interval starts.
19–10 V2_BLANK_ END_LINE	Vertical line number in the beginning part of Field1 where second Vertical Blanking interval ends.
V_LINES_CNT	Total number of vertical lines per frame (generally 525 or 625)

32.6.17 Digital Video Interface Control4 Register (LCDIF_DVICTRL4)

The Digital Video interface Control4 register provides the overall control of the Digital Video interface.

This register is used to add side borders to the output if the input frame width is less than 720 pixels.

EXAMPLE

```
                //If input frame has only 640 pixels per line, but output is supposed to have
720 pixels per line.
                HW_LCDIF_DVICTRL4_H_FILL_CNT_WR(0x50);//80
                HW_LCDIF_DVICTRL4_Y_FILL_VALUE_WR(0x10);//16
                HW_LCDIF_DVICTRL4_CB_FILL_VALUE_WR(0x80);//128
                HW_LCDIF_DVICTRL4_CR_FILL_VALUE_WR(0x80);//128
```

Address: 21C_8000h base + 100h offset = 21C_8100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_DVICTRL4 field descriptions

Field	Description
31–24 Y_FILL_VALUE	Value of Y component of filler data

Table continues on the next page...

LCDIF_DVICTRL4 field descriptions (continued)

Field	Description
23–16 CB_FILL_VALUE	Value of CB component of filler data
15–8 CR_FILL_VALUE	Value of CR component of filler data.
H_FILL_CNT	Number of active video samples that have to be filled with the filler data in the front and back portions of the active horizontal interval. Must be a multiple of 4. This field will have to be programmed if the input frame has less than 720 pixels per line.

32.6.18 RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIF_CSC_COEFF0)

LCDIF_CSC_COEFF0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF0_C0_WR(0x41);//0.257x256=65
HW_LCDIF_CSC_COEFF0_CSC_SUBSAMPLE_FILTER_WR(0x3);
```

Address: 21C_8000h base + 110h offset = 21C_8110h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved								C0							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved														CSC_ SUBSAMPL E_FILTER	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_CSC_COEFF0 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C0	Two's complement red multiplier coefficient for Y
15–2 RSRVD0	This field is reserved. Reserved bits, write as 0.

Table continues on the next page...

LCDIF_CSC_COEFF0 field descriptions (continued)

Field	Description
CSC_ SUBSAMPLE_ FILTER	This register describes the filtering and subsampling scheme to be performed on the chroma components in order to convert from YCbCr 4:4:4 to YCbCr 4:2:2 space. Note that the following descriptions apply individually to Cb and Cr. 0x0 **SAMPLE_AND_HOLD** — No filtering, simply keep every chroma value for samples numbered 2n and discard chroma values associated with all samples numbered 2n+1. 0x1 **RSRVD** — Reserved 0x2 **INTERSTITIAL** — Chroma samples numbered 2n and 2n+1 are averaged (weights 1/2, 1/2) and that chroma value replaces the two chroma values at 2n and 2n+1. This chroma now exists horizontally halfway between the two luma samples. 0x3 **COSITED** — Chroma samples numbered 2n-1, 2n, and 2n+1 are averaged (weights 1/4, 1/2, 1/4) and that chroma value exists at the same site as the luma sample numbered 2n and the chroma samples at 2n+1 are discarded.

32.6.19 RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIF_CSC_COEFF1)

LCDIF_CSC_COEFF1 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF1_C1_WR(0x81);//0.504x256=129
HW_LCDIF_CSC_COEFF1_C2_WR(0x19);//0.098x256=25
```

Address: 21C_8000h base + 120h offset = 21C_8120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved						C2										Reserved						C1									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_CSC_COEFF1 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C2	Two's complement blue multiplier coefficient for Y
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C1	Two's complement green multiplier coefficient for Y

32.6.20 RGB to YCbCr 4:2:2 CSC Coefficent2 Register (LCDIF_CSC_COEFF2)

LCDIF_CSC_COEFF2 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```

LCDIF_CSC_COEFF2 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C4	Two's complement green multiplier coefficient for Cb
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C3	Two's complement red multiplier coefficient for Cb

32.6.21 RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIF_CSC_COEFF3)

LCDIF_CSC_COEFF3 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF3_C5_WR(0x70);//0.439x256=112
HW_LCDIF_CSC_COEFF3_C6_WR(0x70);//0.439x256=112
```

Address: 21C_8000h base + 140h offset = 21C_8140h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_CSC_COEFF3 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C6	Two's complement red multiplier coefficient for Cr
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C5	Two's complement blue multiplier coefficient for Cb

32.6.22 RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIF_CSC_COEFF4)

LCDIF_CSC_COEFF4 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF4_C7_WR(0x3A2);//-0.368x256=-94
HW_LCDIF_CSC_COEFF4_C8_WR(0x3EE);//-0.071x256=-18
```

Address: 21C_8000h base + 150h offset = 21C_8150h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C7	Two's complement green multiplier coefficient for Cr

32.6.23 RGB to YCbCr 4:2:2 CSC Offset Register (LCDIF_CSC_OFFSET)

LCDIF_CSC_ register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

Address: 21C_8000h base + 160h offset = 21C_8160h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved							CBCR_OFFSET									Reserved							Y_OFFSET								
Reset	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

LCDIF_CSC_OFFSET field descriptions

Field	Description
31–25 RSRVD1	This field is reserved. Reserved bits, write as 0.
24–16 CBCR_OFFSET	Two's complement offset for the Cb and Cr components
15–9 RSRVD0	This field is reserved. Reserved bits, write as 0.
Y_OFFSET	Two's complement offset for the Y component

32.6.24 RGB to YCbCr 4:2:2 CSC Limit Register (LCDIF_CSC_LIMIT)

LCDIF_CSC_CTRL0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC. Note that the values in this register are unsigned.

EXAMPLE

```
HW_LCDIF_CSC_LIMIT_CBCR_MIN_WR(0x10);//16
HW_LCDIF_CSC_LIMIT_CBCR_MAX_WR(0xF0);//240
HW_LCDIF_CSC_LIMIT_Y_MIN_WR(0x10);//16
HW_LCDIF_CSC_LIMIT_Y_MAX_WR(0xEB);//235
```

Address: 21C_8000h base + 170h offset = 21C_8170h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	CBCR_MIN								CBCR_MAX								Y_MIN								Y_MAX							
Reset	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

LCDIF_CSC_LIMIT field descriptions

Field	Description
31–24 CBCR_MIN	Lower limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
23–16 CBCR_MAX	Upper limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
15–8 Y_MIN	Lower limit of Y after RGB to 4:2:2 YCbCr conversion
Y_MAX	Upper limit of Y after RGB to 4:2:2 YCbCr conversion

32.6.25 LCD Interface Data Register (LCDIF_DATA)

This register is used to transfer data using the PIO interface mode of operation. In MPU mode, data written to this register will be transferred out to the display device. When receiving data from the display, data is read from this register using PIO operations. During write operations, data can be written to this register (from the processor's perspective) as bytes, half-words (16 bits), or words (32 bits) as desired.

This register holds the 32-bit word written by the ARM platform into LCDIF. This data then gets sent out by the block across the interface.

Address: 21C_8000h base + 180h offset = 21C_8180h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DATA_THREE								DATA_TWO								DATA_ONE								DATA_ZERO							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DATA field descriptions

Field	Description
31–24 DATA_THREE	Byte 3 (most significant byte) of data written to LCDIF.
23–16 DATA_TWO	Byte 2 of data written to eLCDIF.
15–8 DATA_ONE	Byte 1 of data written to eLCDIF.
DATA_ZERO	Byte 0 (least significant byte) of data written to eLCDIF.

32.6.26 Bus Master Error Status Register (LCDIF_BM_ERROR_STAT)

This register reflects the virtual address at which the AXI master received an error response from the slave.

When the BM_ERROR_IRQ is asserted, the address of the bus error is updated in the register.

Address: 21C_8000h base + 190h offset = 21C_8190h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_BM_ERROR_STAT field descriptions

Field	Description
ADDR	Virtual address at which bus master error occurred.

32.6.27 CRC Status Register (LCDIF_CRC_STAT)

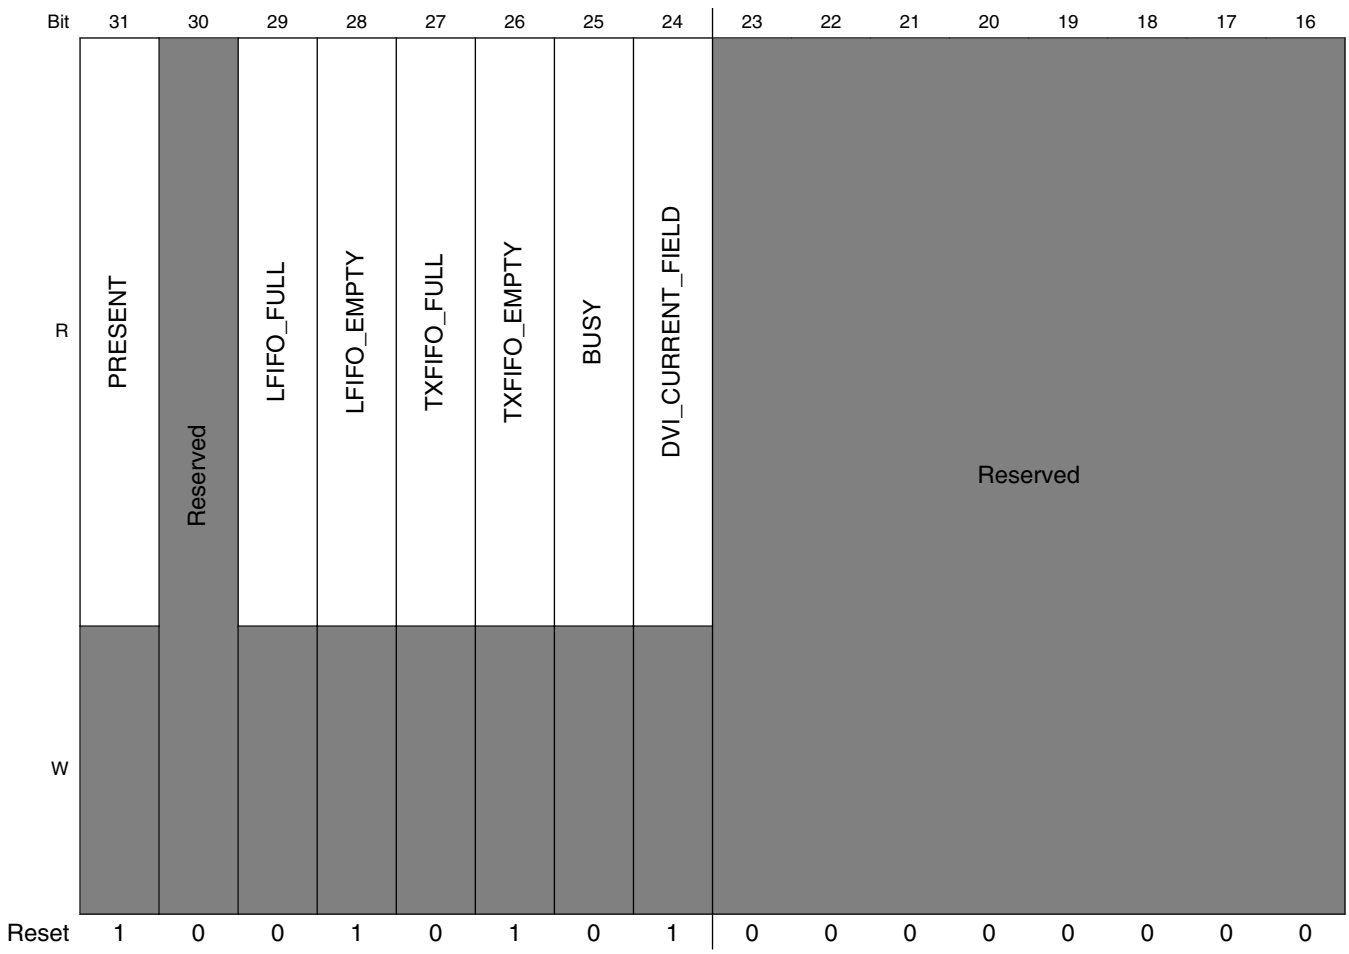
This register reflects the CRC value of each frame sent out by eLCDIF. The CRC is done on the final output bus, so the value will be dependent on the LCD_DATABUS_WIDTH bitfield even if the input data is the same.

This register will be updated when the CUR_FRAME_DONE_IRQ is asserted. In the case of DVI mode, the CRC is calculated for the entire frame, not separately for each field in the frame.

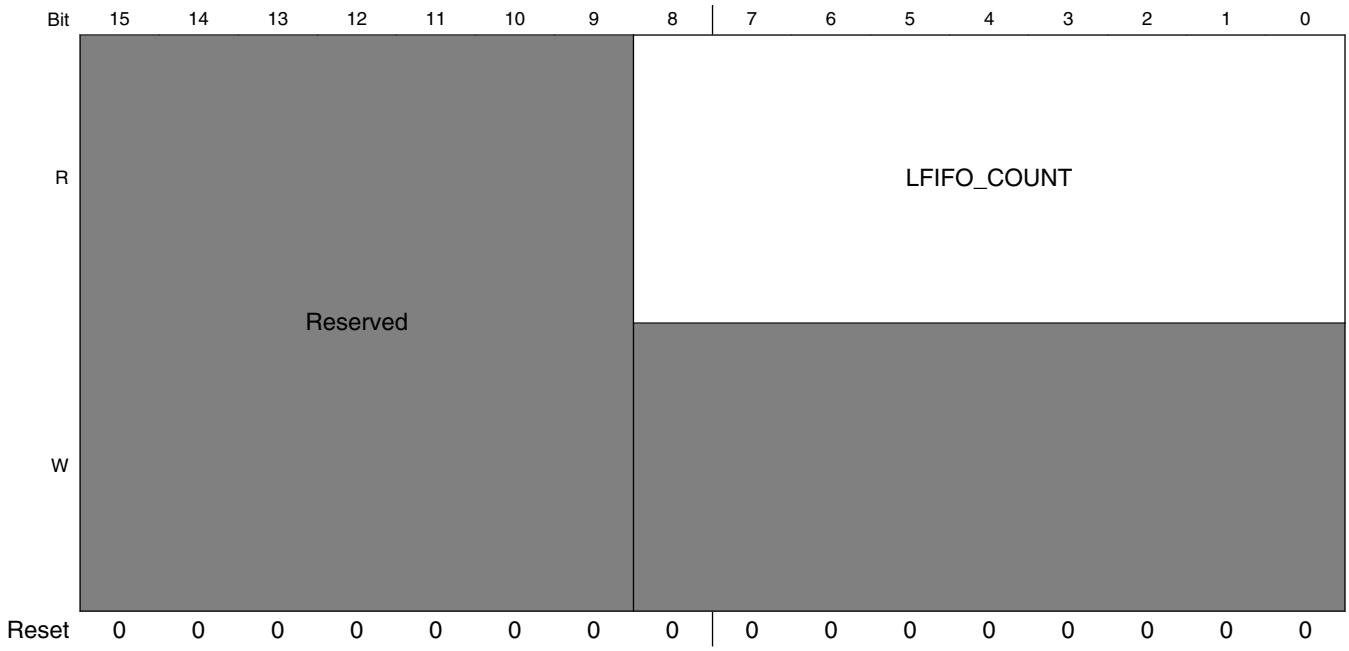
Address: 21C_8000h base + 1A0h offset = 21C_81A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	CRC_VALUE																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_CRC_STAT field descriptions



Field	Description
CRC_VALUE	Calculated CRC value.



32.6.28 LCD Interface Status Register (LCDIF_STAT)

The LCD interface status register can be used to check the current status of the eLCDIF block.

The LCD interface status register that contains read only views of some parameters or current state of the block.

Address: 21C_8000h base + 1B0h offset = 21C_81B0h

LCDIF_STAT field descriptions

Field	Description
31 PRESENT	0: eLCDIF not present on this product 1: eLCDIF is present.
30 -	This field is reserved. Reserved.
29 LFIFO_FULL	Read only view of the signal that indicates that LCD read datapath FIFO is full, will be generally used in the write mode of the LCD interface.
28 LFIFO_EMPTY	Read only view of the signal that indicates that LCD read dapatath FIFO is empty, will be generally used in the read mode of the LCD interface.
27 TXFIFO_FULL	Read only view of the signal that indicates that LCD write datapath FIFO is full, will be generally used in the write mode of the LCD interface.
26 TXFIFO_EMPTY	Read only view of the signal that indicates that LCD write dapatath FIFO is empty, will be generally used in the read mode of the LCD interface.
25 BUSY	Read only view of the input busy signal from the external LCD controller.
24 DVI_CURRENT_FIELD	Read only view of the current field being transmitted. DVI_CURRENT_FIELD = 0 means field 1. DVI_CURRENT_FIELD = 1 means field 2.
23–9 RSRVD0	This field is reserved. Reserved bits. Write as 0.
LFIFO_COUNT	Read only view of the current count in Latency buffer (LFIFO).

32.6.29 LCD Interface Version Register (LCDIF_VERSION)

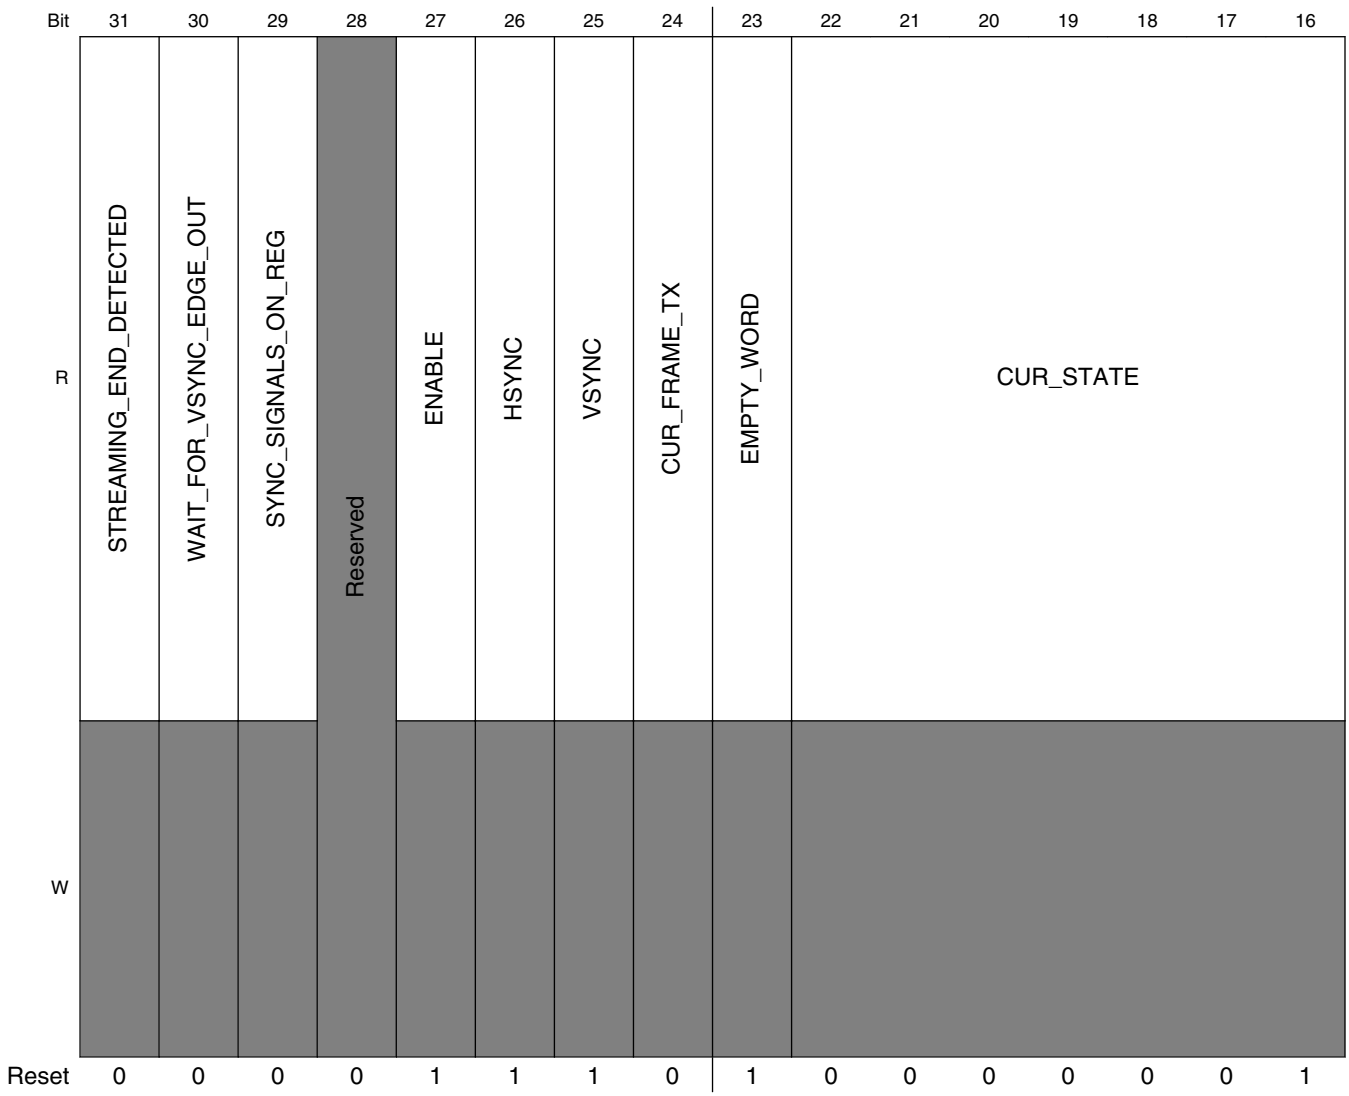
The LCD interface version register can be used to read the version of the eLCDIF IP being used in this SoC.

The LCD interface debug register is for diagnostic use only.

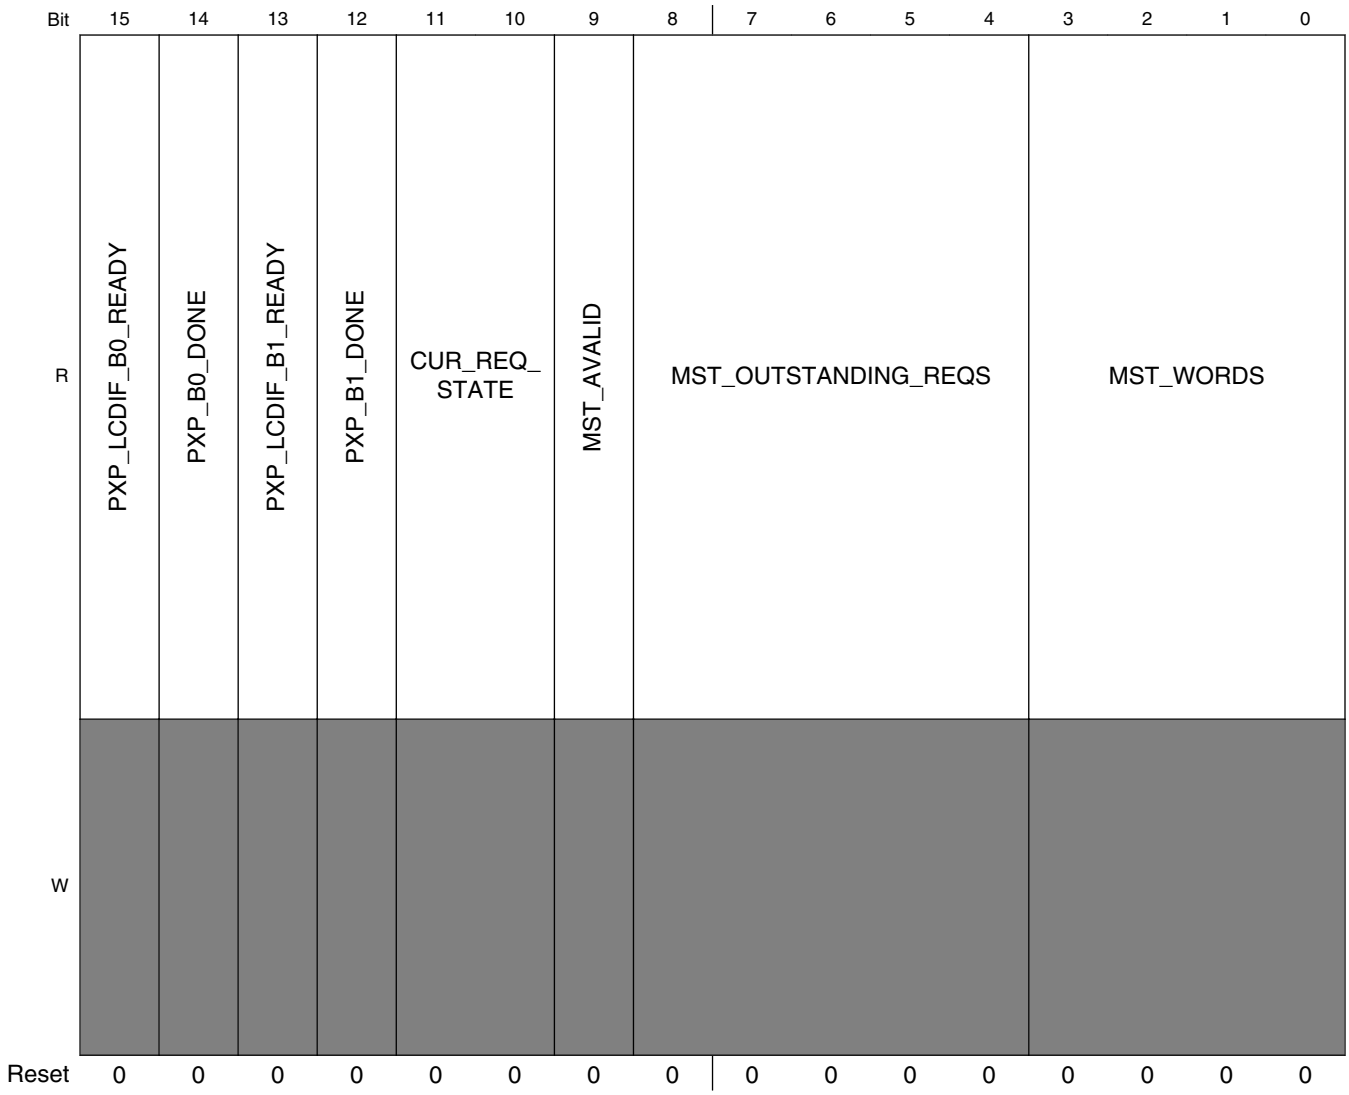
Address: 21C_8000h base + 1C0h offset = 21C_81C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MAJOR								MINOR								STEP															
W																																
Reset	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_VERSION field descriptions



Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of RTL version.
STEP	Fixed read-only value reflecting the stepping of RTL version.



32.6.30 LCD Interface Debug0 Register (LCDIF_DEBUG0)

The LCD interface debug0 register provides a diagnostic view of the state machine and other useful internal signals.

The LCD interface debug register is for diagnostic use only.

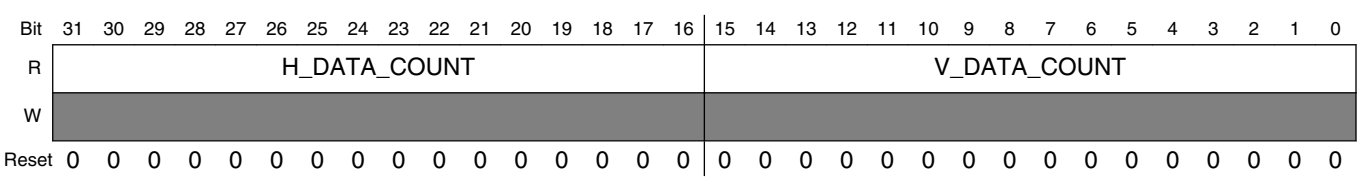
Address: 21C_8000h base + 1D0h offset = 21C_81D0h

LCDIF_DEBUG0 field descriptions

Field	Description
31 STREAMING_ END_DETECTED	Read only view of the DOTCLK_MODE or DVI_MODE bit going from 1 to 0.
30 WAIT_FOR_ VSYNC_EDGE_ OUT	Read only view of WAIT_FOR_VSYNC_EDGE bit in the VSYNC mode after it comes out of the TXFIFO.
29 SYNC_SIGNALS_ ON_REG	Read only view of internal sync_signals_on_reg signal.
28 -	This field is reserved. Reserved.
27 ENABLE	Read only view of ENABLE signal.

Table continues on the next page...

LCDIF_DEBUG0 field descriptions (continued)



Field	Description
26 HSYNC	Read only view of HSYNC signal.
25 VSYNC	Read only view of VSYNC signal.
24 CUR_FRAME_TX	This bit is 1 for the time the current frame is being transmitted in the VSYNC mode. Useful for VSYNC mode debug.
23 EMPTY_WORD	Indicates that the current word is empty.
22–16 CUR_STATE	Read only view of the current state machine state in the current mode of operation.
15 PXP_LCDIF_B0_READY	Buffer0 ready signal issued by PXP.
14 PXP_B0_DONE	Buffer0 done signal issued by eLCDIF.
13 PXP_LCDIF_B1_READY	Buffer1 ready signal issued by PXP.
12 PXP_B1_DONE	Buffer1 done signal issued by eLCDIF.
11–10 CUR_REQ_STATE	Read only view of the request state machine.
9 MST_AVALID	Read only view of the mst_avalid signal issued by the AXI bus master.
8–4 MST_OUTSTANDING_REQS	Read only view of the current outstanding requests issued by the AXI bus master.
MST_WORDS	Read only view of the current bursts issued by the AXI bus master.

32.6.31 LCD Interface Debug1 Register (LCDIF_DEBUG1)

The LCD interface debug1 register provides a diagnostic view of the state machine and other useful internal signals.

The LCD interface debug register is for diagnostic use only.

Address: 21C_8000h base + 1E0h offset = 21C_81E0h

LCDIF_DEBUG1 field descriptions

Field	Description
31–16 H_DATA_ COUNT	Read only view of the current state of the horizontal data counter.
V_DATA_ COUNT	Read only view of the current state of the vertical data counter.

32.6.32 LCD Interface Debug2 Register (LCDIF_DEBUG2)

The LCD interface debug2 register provides a diagnostic view of the state machine and other useful internal signals.

The LCD interface debug register is for diagnostic use only.

Address: 21C_8000h base + 1F0h offset = 21C_81F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_DEBUG2 field descriptions

Field	Description
MST_ADDRESS	Read only view of the current address issued by the AXI bus master.

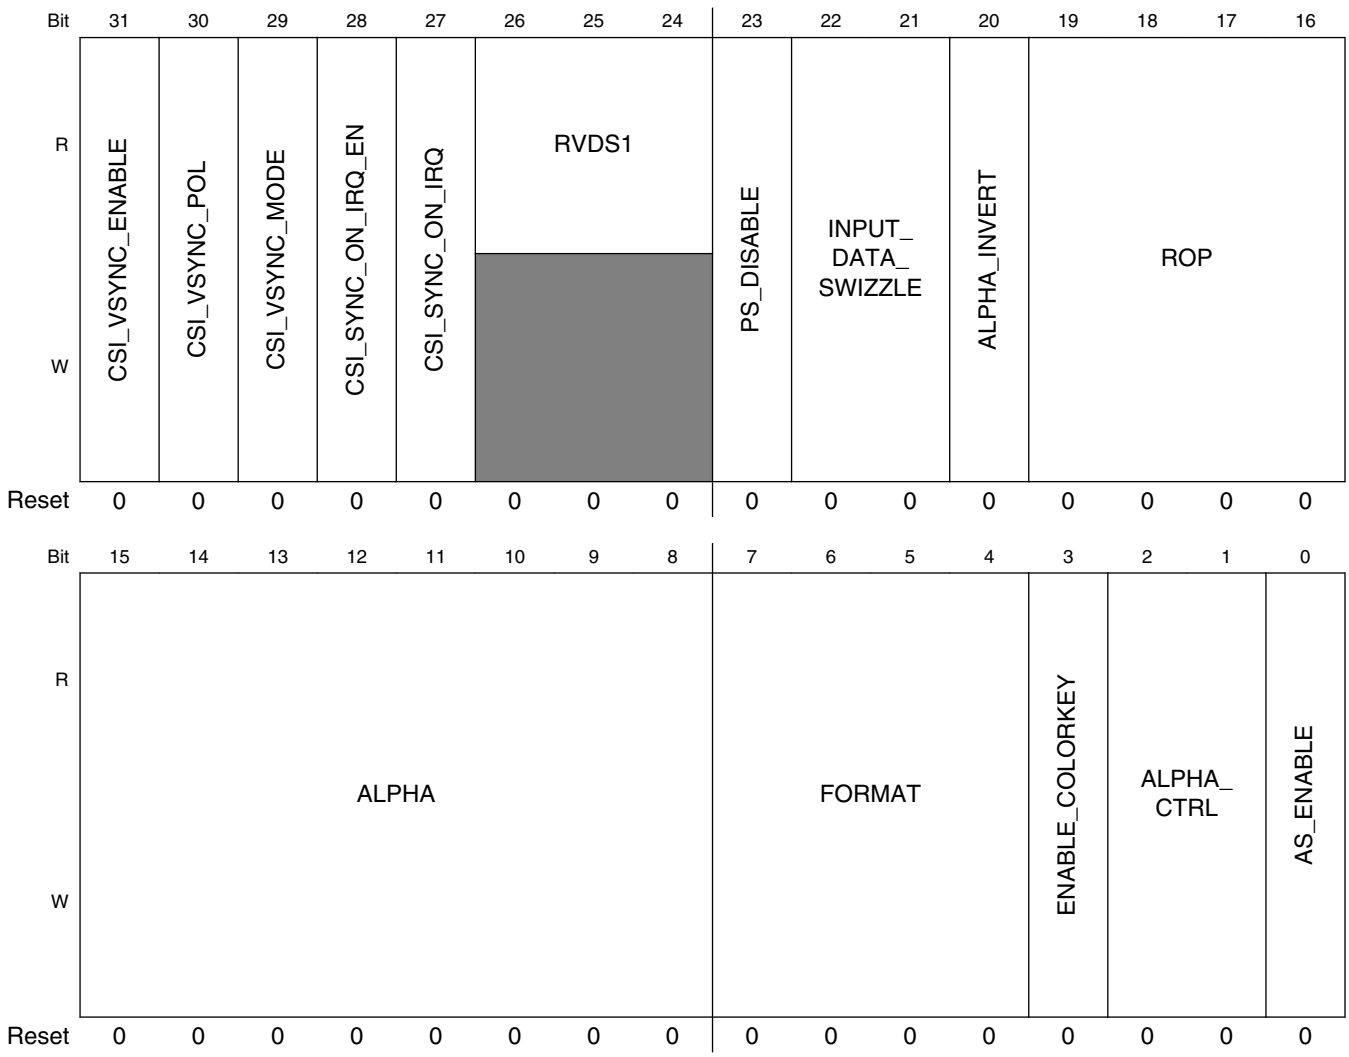
32.6.33 eLCDIF Threshold Register (LCDIF_THRES)

This register is used to activate control signals when the number of pixels reaches the programmed threshold. These control signals, in turn, can be used to manipulate access priority or dynamically change the input clock frequency to meet the required pixel throughput.

Memory request priority threshold register.

Address: 21C_8000h base + 200h offset = 21C_8200h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved							FASTCLOCK									Reserved							PANIC								
Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1



LCDIF_THRES field descriptions

Field	Description
31–25 RSRVD2	This field is reserved. Reserved bits. Write as 0.
24–16 FASTCLOCK	This value should be set to a value of pixels, from 0 to 511. When the number of pixels in the input pixel FIFO is LESS than this value, the fast clock control output will be raised. This signal can be used to reduce the system bus clock frequency to save power during horizontal or vertical blanking intervals. This value should also be programmed to a value that is greater than the "PANIC" threshold value. This will allow a faster clock to recover the number of pixels in the FIFO before a "panic" level is encountered.
15–9 RSRVD1	This field is reserved. Reserved bits. Write as 0.
PANIC	This value should be set to a value of pixels from 0 to 511. When the number of pixels in the input pixel FIFO is less than this value, the internal panic control output will be raised. This signal can be used to raise the access eLCDIF's access priority.

32.6.34 eLCDIF AS Buffer Control Register (LCDIF_AS_CTRL)

The Alpha Surface Parameter register provides additional controls for AS.

Address: 21C_8000h base + 210h offset = 21C_8210h

LCDIF_AS_CTRL field descriptions

Field	Description
31 CSI_VSYNC_ ENABLE	When this bit is set by software, the LCDIF work as sync mode with CSI input.
30 CSI_VSYNC_ POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.

Table continues on the next page...

LCDIF_AS_CTRL field descriptions (continued)

Field	Description
29 CSI_VSYNC_MODE	this bit is set by software to decide which vsync generate mode. LCDIF vsync generate by internal counter when set to 0, LCDIF vsync delayed by each csi_vsync_in when set to 1; INT_SYNC_MODE = 0x0 LCDIF vsync generate by internal counter. EXT_SYNC_MODE = 0x1 LCDIF vsync delayed by each csi_vsync_in.
28 CSI_SYNC_ON_IRQ_EN	This bit is set to enable an interrupt when LCDIF lock with CSI vsync input.
27 CSI_SYNC_ON_IRQ	this bit is set by software to decide which vsync generate mode. LCDIF vsync generate by internal counter when set to 0, LCDIF vsync delayed by each csi_vsync_in when set to 1; INT_SYNC_MODE = 0x0 LCDIF vsync generate by internal counter. EXT_SYNC_MODE = 0x1 LCDIF vsync delayed by each csi_vsync_in.
26–24 RVDS1	Reserved, always set to zero.
23 PS_DISABLE	When this bit is set by software, the LCDIF will disable PS buffer data.
22–21 INPUT_DATA_SWIZZLE	This field specifies how to swap the bytes either in the HW_LCDIF_DATA register or those fetched by the AXI master part of LCDIF. The swizzle function is independent of the WORD_LENGTH bit. See the explanation of the HW_LCDIF_DATA below for names and definitions of data register fields. The supported swizzle configurations are: NO_SWAP = 0x0 No byte swapping.(Little endian) LITTLE_ENDIAN = 0x0 Little Endian byte ordering (same as NO_SWAP). BIG_ENDIAN_SWAP = 0x1 Big Endian swap (swap bytes 0, 3 and 1, 2). SWAP_ALL_BYTES = 0x1 Swizzle all bytes, swap bytes 0, 3 and 1, 2 (aka Big Endian). HWD_SWAP = 0x2 Swap half-words. HWD_BYTE_SWAP = 0x3 Swap bytes within each half-word.
20 ALPHA_INVERT	Setting this bit to logic 0 will not alter the alpha value. A logic 1 will invert the alpha value and apply (1-alpha) for image composition.
19–16 ROP	Indicates a raster operation to perform when enabled. Raster operations are enabled through the ALPHA_CTRL field. MASKAS = 0x0 AS AND PS MASKNOTAS = 0x1 nAS AND PS MASKASNOT = 0x2 AS AND nPS MERGEAS = 0x3 AS OR PS MERGENOTAS = 0x4 nAS OR PS MERGEASNOT = 0x5 AS OR nPS NOTCOPYAS = 0x6 nAS NOT = 0x7 nPS NOTMASKAS = 0x8 AS NAND PS NOTMERGEAS = 0x9 AS NOR PS XORAS = 0xA AS XOR PS NOTXORAS = 0xB AS XNOR PS

Table continues on the next page...

LCDIF_AS_CTRL field descriptions (continued)

Field	Description
15–8 ALPHA	Alpha modifier used when the ALPHA_MULTIPLY or ALPHA_OVERRIDE values are programmed in REG_AS_CTRL[ALPHA_CTRL]. The output alpha value will either be replaced (ALPHA_OVERRIDE) or scaled (ALPHA_MULTIPLY) when selected.
7–4 FORMAT	Indicates the input buffer format for AS. ARGB8888 = 0x0 32-bit pixels with alpha RGB888 = 0x4 32-bit pixels without alpha (unpacked 24-bit format) ARGB1555 = 0x8 16-bit pixels with alpha ARGB4444 = 0x9 16-bit pixels with alpha RGB555 = 0xC 16-bit pixels without alpha RGB444 = 0xD 16-bit pixels without alpha RGB565 = 0xE 16-bit pixels without alpha
3 ENABLE_ COLORKEY	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
2–1 ALPHA_CTRL	Determines how the alpha value is constructed for this alpha surface. Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. Embedded = 0x0 Indicates that the AS pixel alpha value will be used to blend the AS with PS. The ALPHA field is ignored. Override = 0x1 Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. Multiply = 0x2 Indicates that the value in the ALPHA field should be used to scale all pixel alpha values. Each pixel alpha is multiplied by the value in the ALPHA field. ROPs = 0x3 Enable ROPs. The ROP field indicates an operation to be performed on the alpha surface and PS pixels.
0 AS_ENABLE	When this bit is set by software, the LCDIF will start fetching AS buffer data in bus master mode and combine it with another buffer.

32.6.35 Alpha Surface Buffer Pointer (LCDIF_AS_BUF)

This register is used to indicate the base address of the AS buffer.

Address: 21C_8000h base + 220h offset = 21C_8220h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_AS_BUF field descriptions

Field	Description
ADDR	Address pointer for the alpha surface 0 buffer.

32.6.36 LCDIF_AS_NEXT_BUF

When the LCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the LCDIF. It is upto the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the LCDIF. This address must always be double-word aligned.

Address: 21C_8000h base + 230h offset = 21C_8230h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_AS_NEXT_BUF field descriptions

Field	Description
ADDR	Address of the next frame that will be transmitted by eLCDIF.

32.6.37 eLCDIF Overlay Color Key Low (LCDIF_AS_CLRKEYLOW)

If a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. Colorkey operations are higher priority than alpha or ROP operations.

Address: 21C_8000h base + 240h offset = 21C_8240h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

31–16 V_COUNT_ DELAY	LCDIF VSYNC delayed counter for CSI_VSYNC.
H_COUNT_ DELAY	LCDIF VSYNC delayed counter for CSI_VSYNC.

32.6.40 eLCDIF Interface Debug3 Register (LCDIF_DEBUG3)

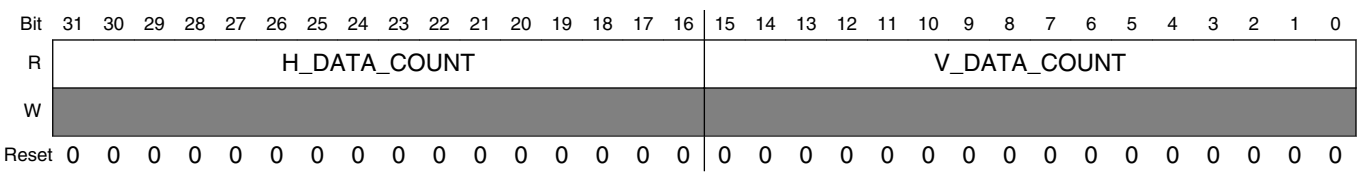
The LCD interface debug register is for diagnostic use only.

Address: 21C_8000h base + 270h offset = 21C_8270h

LCDIF_DEBUG3 field descriptions

Field	Description
31–12 RSVD0	Reserved bits, write as 0.

Table continues on the next page...



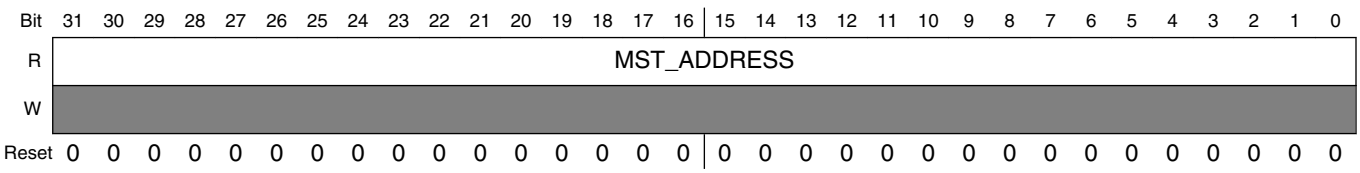
LCDIF_DEBUG3 field descriptions (continued)

Field	Description
11–10 CUR_REQ_ STATE	Read only view of the request state machine
9 MST_AVALID	Read only view of the mst_avalid signal issued by the AXI bus master
8–4 MST_ OUTSTANDING_ REQS	Read only view of the current outstanding requests issued by the AXI bus master
MST_WORDS	Read only view of the current bursts issued by the AXI bus master.

32.6.41 LCD Interface Debug4 (LCDIF_DEBUG4)

The LCD interface debug register is for diagnostic use only.

Address: 21C_8000h base + 280h offset = 21C_8280h



LCDIF_DEBUG4 field descriptions

Field	Description
31–16 H_DATA_ COUNT	Read only view of the current AS state of the horizontal data counter.
V_DATA_ COUNT	Read only view of the current AS state of the vertical data counter.

32.6.42 LCD Interface Debug5 (LCDIF_DEBUG5)

The LCD interface debug register is for diagnostic use only.

Address: 21C_8000h base + 290h offset = 21C_8290h

LCDIF_DEBUG5 field descriptions

Field	Description
MST_ADDRESS	Read only view of the AS channel address issued by the AXI bus master.

Chapter 33
Multi Mode DDR Controller (MMDC)

33.1 Overview

MMDC is a multi-mode DDR controller that supports DDR3/DDR3L x16 and LPDDR2 x16 memory types. MMDC is configurable, high performance, and optimized.

The following figure shows the MMDC block diagram.

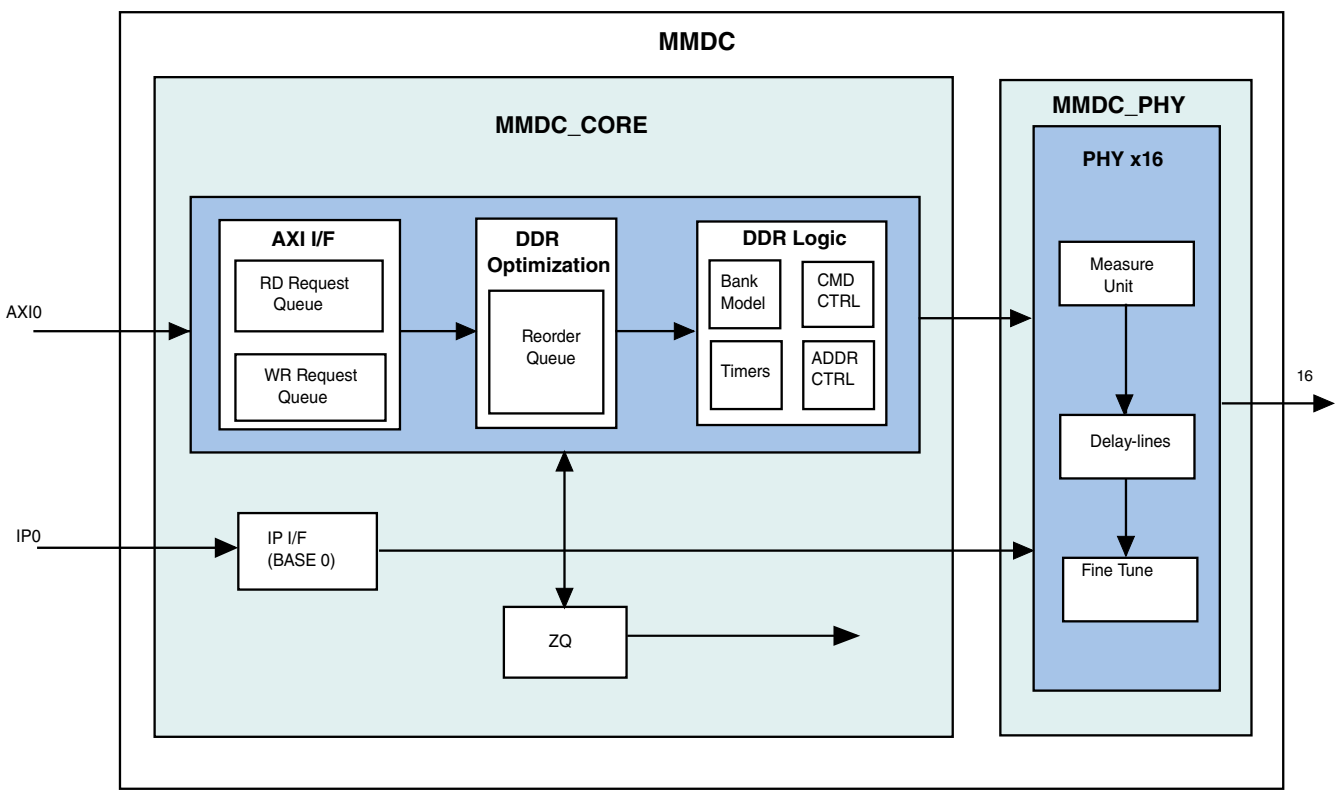


Figure 33-1. MMDC block diagram

MMDC consists of a core (MMDC_CORE) and PHY (MMDC_PHY).

- The core is responsible for communication with the system through an AXI interface, DDR command generation, DDR command optimizations, and a read/write data path.
- The PHY is responsible for the timing adjustment; it uses special calibration mechanisms to ensure data capture margin at a clock rate of up to 400 MHz.

The internal memory map(configuration registers) of the MMDC can be configured through an IP channel (IP0). .

33.1.1 MMDC feature summary

The table found here summarizes the MMDC features.

Table 33-1. MMDC feature summary

Feature	Details
DDR standards	• DDR3L, DDR3 x16 • LPDDR2 x16 • Does not support LPDDR1MDDR or DDR2

DDR interface	• x16 data bus width
	• Density per DDR device of 256 Mbits–8 Gbits with the following column and row combinations:
	  • Column size of 8–12 bits
	  • Row size of 11–16 bits
	• Two chip selects (one chip select for DDR3/DDR3L, two chip selects for LPDDR2)
	• Up to 4 Gbytes of address space with configurable partitioning between CS0 and CS1 (for LPDDR2 2ch x32 up to 2 Gbytes per channel)
	• Supports burst length of 8 (aligned) for DDR3
	• Supports burst length of 4 for LPDDR2

DDR performance	• MMDC running at up to 400 MHz (800 MT/s), see CCM block for actual clock frequencies supported. • Supports Real-Time priority by means of QoS sideband priority signals from the chip to enable various priority levels in the re-ordering mechanism: real-time, latency sensitive, normal priority. • Page hit/page miss optimizations • Consecutive read/write access optimizations • Supports deep read and write request queues to enable bank prediction. • Drives back the critical word in a read transaction as soon as it is received by the DDR device (does not wait until the whole data phase has been completed). • Keeps tracking of open memory pages • Supports bank interleaving • Special optimization in case of non-aligned wrap accesses in DDR3 mode (burst length 8) **NOTE:** Due to reordering and optimization mechanisms (per different AXI Identifier (ID)), the transactions towards the DDR device may be driven in a different ID order than was received by the AXI master. In a similar fashion, the write response, read response or read data may be driven to the AXI master in a different ID order.
AXI interface	• AXI bus compliant • Supports bus transfers of 8, 16 , 64 bits (single accesses and bursts) running at 400 MHz.

Table continues on the next page...

Table 33-1. MMDC feature summary (continued)

Feature	Details

	• Supports AXI bursts length of up to 16
	• Supports burst types of WRAP, INCR and FIXED
	• Supports 16 bits AXI ID
	• Write data interleave depth is 1 (no support for Write Data Interleave)
	• Supports write data before address
	• Supports buffered/non-buffered accesses (AWCACHE[0] = 0b means a non-bufferable access and AWCACHE[0] = 1b means a bufferable access). The rest of the CACHE options are not supported
	  • To keep data access coherency between write and read access of the same master, the response signal is sent as follows:
	  • Bufferable write access—BRESP will be sent when last data of the access has entered the MMDC.
	  • Non-bufferable write access—BRESP will be sent when the data was physically written into the external memory device.
	• Supports four exclusive monitors per configurable ID for only a single access with a size of up to 64 bits
	• Supports AXI responses as follows:
	  • Okay in case the access has been successful or exclusive access failure
	  • Slave error in case of security violation
	  • Exclusive okay in case the read or the write portion of an exclusive access has been successful

DDR calibration and delay-lines.	• Supports various calibration processes which can be performed either automatically (hardware) or manually (software) towards either CS0 or CS1. (At the end of the process the delay-lines will work with one set of results.) The following calibration processes are supported:
	  • ZQ calibration for external DDR device (in DDR3 through ZQ calibration command and in LPDDR2 through MRW command)
	  • Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh)
	  • Can be handled manually at ZQ INIT
	  • ZQ calibration for DDR I/O pads for calibrating the DDR driving strength
	  • The sequence can be handled automatically by hardware
	  • The sequence can be handled step by step manually by software
	  • Read data calibration. Adjustment of read DQS with read data byte.
	  • Read DQS gating calibration for DDR3 only. Adjustment of DQS gate with read preamble window.
	  • Write data calibration. Adjustment of write DQS with write data byte.
	  • Write leveling calibration. Adjustment of write DQS with CK (DDR differential clock).
	  • Read fine tuning. Adjustment of up to 7 delay-line units for each read data bit.
	  • Write fine tuning. Adjustment of up to 3 delay-line units for each read data bit.
	  • Periodic delay-line measurement for keeping its accuracy during refresh interval.
	  • Additional fine tuning delay lines to adjust DDR clock delay, DDR clock duty cycle, DQS duty cycle.

Power saving	• Support of dynamic voltage, frequency change and self-refresh mode entry through hardware and software negotiation with the system (request/acknowledge handshake)
	  • Upon hardware or software self-refresh request assertion, further AXI requests are blocked (even before the assertion of the acknowledge).
	  • During self-refresh mode the system may deassert the operating clock of the MMDC for power saving.
	  • During self-refresh mode the clock (CK) that is driven to the DDR device will be gated for power saving.
	• Supports automatic self-refresh and power down entry and exit
	  • In automatic self-refresh, the internal operating clock will be gated for power saving.

Table continues on the next page...

Table 33-1. MMDC feature summary (continued)

Feature	Details
	• Supports fast and slow precharge power down in DDR3 • Automatic active and precharge power down timer per chip select (one chip select can enter power down while the other is still working) • While CS (chip-select) is inactive (high) the command and address buses are not toggling for power saving.

DDR general	• Configurable timing parameters
	• Configurable refresh scheme
	• Page boundary crossing support
	  • Automatically generates precharge command and activates the next row
	• Supports various ODT control schemes
	  • Assertion or deassertion of ODT control per read or write accesses and for active or passive CS (chip-select)
	• Supports MRW and MRR commands for LPDDR2
	• Software control in LPDDR2 mode for switching to derated timing parameters and/or update the refresh rate according to temperature sensor
	• Debug and profiling capabilities

33.2 External Signals

The table found here describes the external signals of MMDC.

Table 33-2. MMDC External Signals

Signal	Description	Pad	Mode	Direction
DRAM_ADDR[15:0]	Address Bus Signals	DRAM_A[15:0]	No Muxing	O
DRAM_CAS	Column Address Strobe Signal	DRAM_CAS	No Muxing	O
DRAM_CS[1:0]	Chip Selects	DRAM_CS[1:0]	No Muxing	O
DRAM_DATA[31:0]	Data Bus Signals	DRAM_D[31:0]	No Muxing	I/O
DRAM_DQM[1:0]	Data Mask Signals	DRAM_DQM[1:0]	No Muxing	O
DRAM_ODT[1:0]	On-Die Termination Signals	DRAM_SDODT[1:0]	No Muxing	O
DRAM_RAS	Row Address Strobe Signal	DRAM_RAS	No Muxing	O
DRAM_RESET	Reset Signal	DRAM_RESET	No Muxing	O
DRAM_SDBA[2:0]	Bank Select Signals	DRAM_SDBA[2:0]	No Muxing	O
DRAM_SDCKE[1:0]	Clock Enable Signals	DRAM_SDCKE[1:0]	No Muxing	O
DRAM_SDCLK0_N	Negative Clock Signals	DRAM_SDCLK_[1:0]	No Muxing	O
DRAM_SDCLK0_P	Positive Clock Signals	DRAM_SDCLK_[1:0]	No Muxing	O
DRAM_SDQS[1:0]_N	Negative DQS Signals	DRAM_SDQS[1:0]_N	No Muxing	I/O
DRAM_SDQS[1:0]_P	Positive DQS Signals	DRAM_SDQS[1:0]_P	No Muxing	I/O
DRAM_SDWE	WE signal	DRAM_SDWE	No Muxing	O
DRAM_ZQPAD	ZQ signal	DRAM_ZQPAD	No Muxing	O

33.3 Clocks

The table found here describes the clock sources for MMDC. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 33-3. MMDC Clocks

Clock name	Clock Root	Description
aclk_fast_core_p0	mmdc_axi_clk_root	Fast clock (channel 1)
ipg_clk_p0	ipg_clk_root	Peripheral clock (channel 1)
aclk_fast_phy_p0	mmdc_axi_clk_root	Fast clock (channel 1 - PHY)

33.4 Functional Description

This section provides a complete functional description of the block.

33.4.1 Write/Read data flow

33.4.1.1 Write data flow

1. Write requests are received into an 8 entries request FIFO. Access is received only when there are at least two available entries. Each entry holds all of the AXI attributes.
   - If the burst length is greater than 8, the access splits into two accesses: one with burst length 8 and the other with the remainder.
   - The access can be performed as soon as the entire data phase of the associated write request is completed (all data beats were received).
2. A simple round-robin arbitration between the pending read and write accesses is performed, and the pointer to this stage's winner access is sent to the re-ordering buffer.
3. The reordering mechanism is activated to find the winner access, which is the access that best utilizes the DDR bus, based on its dynamic score. For further information see Dynamic scoring mode (Arbitration Winning Conditions).
4. The winner write access at the previous stage is received and is held for dispatch to the DDR logic.

5. When the DDR command control unit is ready to accept the write request, it issues (if needed) a precharge/active command to the DDR device according to the status of the bank model and the parameters of the timers.
6. The DDR logic drives the associated data to the DDR device through the DDR PHY.

33.4.1.2 Read data flow

1. Read requests are received into a 16 entry request FIFO in MMDC if there are at least two available entries. Each entry holds all of the AXI attributes.

NOTE

If the burst length is greater than 8, the access splits into 2 accesses (one with burst length 8 and the other with the remainder).

2. A simple round-robin arbitration between the pending read and write accesses is performed and the pointer to this phase's winner access is sent to the re-ordering buffer.
3. The reordering mechanism is activated to find the winner access, which is the access that best utilizes the DDR bus, based on its dynamic score. For further information see Dynamic scoring mode (Arbitration Winning Conditions).
4. The winner read access at the previous stage is sampled and is held for dispatch to the DDR logic. This read access will be dispatched when there is at least one free slot in the read data buffer to store the data.
5. When the DDR command control unit is ready to accept the read request, it issues (if needed) a precharge/active command to the DDR device according to the status of the bank model and the parameters of the timers.
6. The MMDC PHY samples the read data, and the DDR logic transfers the data to the associated slot in the read data buffer.
7. MMDC transfers the data back to the master.

33.4.2 MMDC initialization

Because the MMDC is disabled when the chip exits reset, no clock is driven to the DDR device and the whole interface towards the DDR device is inactive. The following steps are required to activate the MMDC properly.

NOTE

To guarantee that the DRAM_RESET and DRAM_SDCKE signals are kept low during the power-up and reset sequences of

the chip (as defined by JEDEC), you must connect those signals to pull-down resistors.

1. Set MDSCR[CON_REQ], which sets the configuration request; note that because the MMDC is disabled, there is no need to poll the configuration acknowledge bit at MDSCR[CON_ACK].
2. Configure the desired timing parameters at the MDCFG0, MDCFG1, MDCFG2, and MDOTC registers.
3. Configure the DDR type and other miscellaneous parameters at the MDMISC register.
4. Configure the required delay while leaving reset, at the MDOR register.
5. Configure the DDR physical parameters (density and burst length) at the MDCTL register.
6. Perform a ZQ calibration of the MMDC module to correctly initialize drive strengths.
7. Enable MMDC with the desired chip select at MDCTL[SDE_0] (for chip select 0) and MDCTL[SDE_1] (for chip select 1). At this point, MMDC starts the reset and initialization sequence related to DRAM_RESET/DRAM_SDCKE as defined by JEDEC.
8. Complete the initialization sequence as defined by JEDEC by issuing MRS/MRW commands for (ZQ, ODT, PRE, and so on). To issue those commands, configure the appropriate command and address at the MDSCR register.
9. Program the DDR mode registers by configuring the appropriate command and address at the MDSCR register.
10. Configure the power down and self-refresh entry and exit parameters at the MDPDC and MAPSR registers.
11. Configure the ZQ scheme at the MPZQHWCTRL and MPZQLP2CTRL registers.
12. Configure and activate the periodic refresh scheme at the MDREF register.
13. Deassert the configuration request by clearing MDSCR[CON_REQ].

NOTE

Steps 1 through 5 are non-blocking and can be done in any order.

Upon completion of these steps, MMDC is ready for work and to process AXI accesses.

NOTE

To achieve better timing and better precision, it is recommended that users configure the MMDC PHY delay parameters by operating either the automatic or manual calibration process. Before starting any calibration process, you must disable the periodic refresh scheme (MDREF[REF_SEL] = 11) and then issue a manual refresh command by configuring

MDSCR[CMD] to 2h. For further information, see Calibration Process.

33.4.3 Configuring the MMDC registers

To safely modify MMDC's internal configuration registers, MMDC must be placed into configuration mode.

Use the following steps to enter configuration mode.

1. Issue a configuration request by setting MDSCR[CON_REQ].
2. Poll on configuration acknowledge until it is set at MDSCR[CON_ACK].

At this point, MMDC enters configuration mode and accessing the MMDC registers is permitted.

NOTE

During configuration mode, MMDC prevents further AXI accesses from being acknowledged.

Upon deassertion of MDSCR[CON_REQ], MMDC leaves configuration mode and AXI accesses are processed.

33.4.4 MMDC Address Space

33.4.4.1 Address decoding

MMDC supports up to two consecutive chip selects, each with the same density.

It is optional to configure the partition between the chip selects through MDASP[CS0_END].

The incoming AXI address bus is 32 bits. MMDC decodes each access as follows:

1. chip select
2. bank number
3. row number
4. column number

The following registers in the MMDC define the DDR address space:

- MDMISC[DDR_4_BANK]—Defines either 4 or 8 banks in the DDR device
- MDCTL[DSIZ]—Defines the DDR data bus width of x16

- MDMISC[BI]—Defines whether bank interleaving is on or off
- MDCTL[COL]—Defines the column size of the DDR device
- MDCTL[ROW]—Defines the row size of the DDR device

The following tables show address decoding examples for x16 bit DDR devices when bank interleaving is both on and off. It is assumed that the configration is as follows: 8 banks (3 bits), 15 bit assignment for the row, and 10 bit sassignment for the column. The total density is 256 MWords (512 Mbytes for x16).

NOTE

Chip selection is done by comparing the 7 most significant address bits (ARADDR[31:25]/AWADDR[31:25]) with MDASP[CS0_END].

A0	—	—

NOTE

In cases where this is an access to a non-initialized or disconnected chip select, behavior may be unexpected.

33.4.4.2 Chip select settings

MMDC drives the incoming access to either CS0 or CS1 by comparing the 7 most significant address bits (ARADDR[31:25]/AWADDR[31:25]) with MDASP[CS0_END].

Generally, the total density per chip-select must be the same, and the total density per chip-select must be a power of two.

Creating 4 Gbyte address space with 2 Gbyte CS density and Creating 2 Gbyte address spaces with 1 Gbyte CS density show how to create a continous address space and configure the MMDC accordingly.

33.4.4.2.1 Creating 4 Gbyte address space with 2 Gbyte CS density

If the DDR memory space allocation is 4 Gbytes, only one configuration of chip select partition is allowed. The register MDASP[CS0_END] should be set to 2 Gbytes partition (16Gb).

The figure below shows the associated memory space.

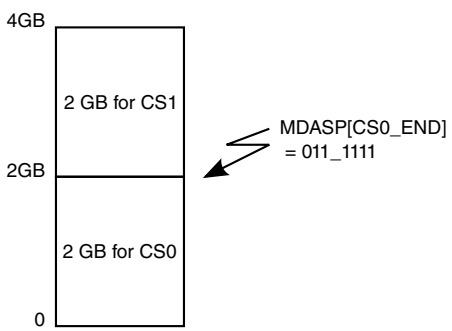

Figure 33-2. Chip select partion—2 Gbytes per chip select

33.4.4.2.2 Creating 2 Gbyte address spaces with 1 Gbyte CS density

If the DDR memory space allocation is 2 Gbytes, there are three options for configuring the chip select partition:MDASP[CS0_END] to 001_1111 (1 Gbyte), MDASP[CS0_END] to 011_1111 (2 Gbytes), and MDASP[CS0_END] to 101_1111 (3 Gbytes).

If DDR memory space allocation is 2 Gbytes, there are three options for configuring the chip select partition:

- MDASP[CS0_END] to 001_1111 (1 Gbyte)
- MDASP[CS0_END] to 011_1111 (2 Gbytes)
- MDASP[CS0_END] to 101_1111 (3 Gbytes)

The figure below shows the associated memory space:

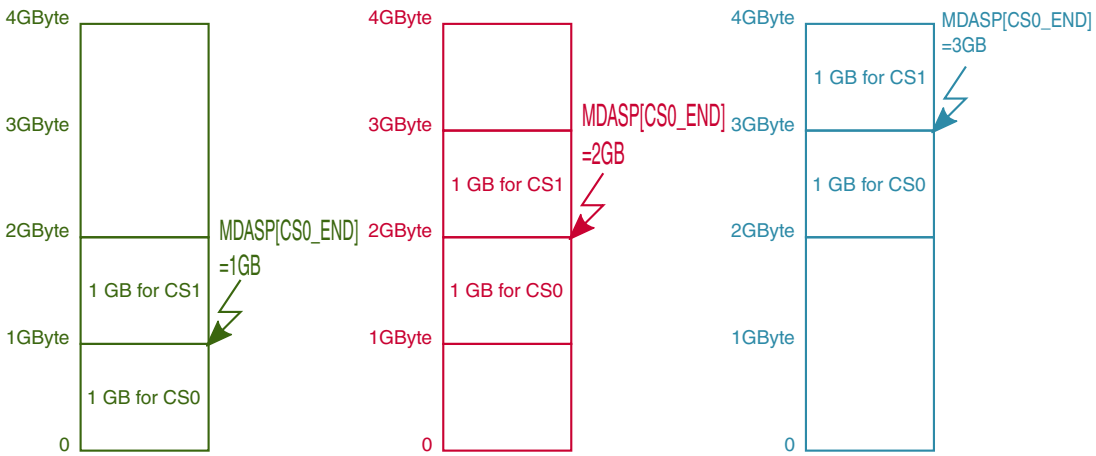

Figure 33-3. Chip select partion—1 Gbyte per chip select

33.4.4.3 Translation of AXI accesses to DDR accessess

33.4.4.3.1 Example 1

Assume the AXI read access has the following attributes:

- Wrap (arburst[1:0] = 10b)
- AXI size of 128 bits (arsize[2:0] = 100b)
- AXI length of 8 (arlen[3:0] = 0111b)
- AXI address with suffix B0h (non-aligned to AXI wrap boundary which is 16Bx8 = 128B = 0x80)

Toward DDR3(MDMISC[DDR_TYPE] = 00b) with the following attributes:

- x32 (MDCTL[DSIZ] = 01b)
- burst length of 8 (MDCTL[BL] = 1b)

In this case, the AXI wrap boundary is every 16Bx8=128B (0x80) and the DDR wrap boundary is every 4Bx8=32B(0x20).

The master expects to fetch the data that is associated with the following addresses: 0xB0, 0xC0, 0xD0, 0xE0, 0xF0, 0x80, 0x90, 0xA0.

The first aligned AXI address that is associated with suffix 0xB0 is with suffix 0x80, and the last wrap AXI address is with suffux 0xFF. Because the AXI master expects to get the first data from AXI address with suffix 0xB0, the MMDC issues the following accesses toward the DDR:

- Read access toward logic address with suffix 0xA0 (DDR boundary is 0x20 and 0xA0 is the closest to 0xB0)

NOTE

Logic address is the address of the column normalized to 1 byte.

- Read access toward logic address with suffix 0xC0
- Read access toward logic address with suffix 0xE0
- Read access toward logic address with suffix 0x80

The MMDC breaks the AXI access into four DDR accesses and returns the read data associated with address 0xB0 to the master first. The read data fetched from address 0xA0 is stored in the internal buffers and is driven back to the master at the end.

33.4.4.3.2 Example 2

Assume the AXI write access has the following attributes:

- Increment (awburst[1:0]=2'b01)
- AXI size of 64bits (awsize[2:0]=3'b011)
- AXI length of 8 (awlen[3:0]=4'b0111)
- AXI address with suffix 0xB0 (aligned as the size of the increment is 8B)

Toward DDR3(MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x64 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case, the AXI alignment is every 8B and the DDR boundary is every 8Bx8=64B(0x40).

The master expects to write the data to the following addresses: 0xB0, 0xB8, 0xC0, 0xC8, 0xD0, 0xD8, 0xE0, 0xE8.

The MMDC will issue the following accesses toward the DDR:

- Write access toward logic address with suffix 0x80 (DDR boundary is 0x40 and 0x80 is the closest to 0xB0) while address 0x80 to 0xAF are masked by DM (data masking signal).

NOTE

Logic address is the address of the column normalized to 1 byte.

- Write access toward logic address with suffix 0xC0 while addresses 0xF0 through 0xFF are masked by DM (data masking signal)

The MMDC will break the AXI access into two DDR accesses.

33.4.4.3.3 Example 3

Assume the AXI write access has the following attributes:

- Wrap (awburst[1:0]=2'b10)
- AXI size of 128bits (awsize[2:0]=3'b100)
- AXI length of 4 (awlen[3:0]=4'b0011)
- AXI address with suffix 0x80 (aligned)

Toward DDR3(MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x64 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case, the AXI wrap boundary is every 16Bx4=64B (0x40) and the DDR wrap boundary is every 8x8=64B(0x40).

The master expects to write the data to the following addresses: 0x80, 0x90, 0xA0, 0xB0.

Because the AXI wrap boundary and DDR wrap boundary are similar and the starting AXI address is aligned, the MMDC will issue only one access toward the DDR as follows:

- Write access towards logic address with suffix 0x80

NOTE

Logic address is the address of the column normalized to 1 byte.

33.4.4.3.4 Example 4

Assume the AXI write access has the following attributes:

- Increment (awburst[1:0]=2'b01)

- AXI size of 64bits (awsize[2:0]=3'b011)
- AXI length of 2 (awlen[3:0]=4'b0001)
- AXI address with suffix 0x5 (non aligned)

Toward DDR3(MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x32 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case the AXI alignment is every 8B (0x8) and the DDR boundary is every 4Bx8=32B(0x20).

The master expects to write the data to the following addresses: 0x5 (with WSTRB=0xE0), 0x8 (till 0xF).

The MMDC will issue one access toward the DDR as follows:

Write access toward logic address with suffix 0x0 (DDR boundary is 0x20 and 0x0 is the closest to 0x0) while address 0x0 till 0x4 are masked by DM (data masking signal) and address 0x10 till 0x1F are also masked by DM.

33.4.4.3.5 Example 5

Assume AXI write access has the following attributes:

- Increment (awburst[1:0]=2'b01)
- AXI size of 64bits (awsize[2:0]=3'b011)
- AXI length of 7 (awlen[3:0]=4'b0001)
- AXI address with suffix 0x10 (aligned)

Toward DDR3 (MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x64 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case the AXI alignment is every 8B (0x8) and the DDR boundary is every 8Bx8=64B(0x40).

The master expects to write the data to the following addresses: 0x10, 0x18, 0x20, 0x28, 0x30, 0x38, 0x40, 0x48.

Because the AXI access is not aligned to DDR boundary, which is every 0x40, the MMDC will issue two accesses toward the DDR as follows:

- Write access toward logic address with suffix 0x0 while address 0x0 till 0xF are masked by DM (data masking signal).

NOTE

Logic address is the address of the column normalized to 1 byte.

- Write access towards logic address with suffix 0x40 while addresses 0x50 till 0x7F are masked by DM (data masking signal).

33.4.4.4 Address mirroring

When enabling this feature, address bits DRAM_A3, DRAM_A4, DRAM_A5, DRAM_A6, DRAM_A7, DRAM_A8, DRAM_SDBA0, and DRAM_SDBA1 behave differently according to the associated chip select.

This feature facilitates PCB board routing for devices on chip select 1, which are typically populated on the opposite side of the PCB from the devices on chip select 0.

NOTE

This feature is only supported for DDR3 memories. It is not supported for LPDDR2 memories.

NOTE

This feature will not be supported for DDR3 since only a single chip select is supported for DDR3

The following table specifies the address mirroring options:

Table 33-6. Address mirroring options

MMDC pin	Chip select 0 pin	Chip select 1 pin
DRAM_A3	DRAM_A3	DRAM_A4
DRAM_A4	DRAM_A4	DRAM_A3
DRAM_A5	DRAM_A5	DRAM_A6
DRAM_A6	DRAM_A6	DRAM_A5

DRAM_A8	DRAM_A8	DRAM_A7
DRAM_SDBA0	DRAM_SDBA0	DRAM_SDBA1
DRAM_SDBA1	DRAM_SDBA1	DRAM_SDBA0

33.4.5 LPDDR2 and DDR3 pin mux mapping

The following table shows the pin mux mapping between LPDDR2 and DDR3. The i.MX DDR I/O pads corresponds with the DDR3 standard.

- In DDR3, all DRAM_DATA, DRAM_SDQS, and DRAM_DQM data lines work with channel 0.
- In LPDDR2, DRAM_DDQS[3:0], DRAM_DATA[31:0] and DRAM_DQM[3:0] work with channel 0. DRAM_SDQS[7:4], DRAM_DATA[63:32], and DRAM_DQM[7:4] work with channel 1.

Table 33-7. LPDDR2 and DRAM pin mux mapping

DRAM I/O pad	LPDDR2 I/O pad

33.4.6 Power Saving and Clock Frequency Change modes

33.4.6.1 Power saving general

MMDC supports multiple DDR power saving modes.

NOTE

At default, the power saving modes are disabled. These modes may dramatically decrease the power consumption of DDR memories.

1. Self-refresh entry to the entire DDR device (for both chip select 0 and 1) can be activated through two mechanisms:
   - LPMD (Low Power Mode)
     - Hardware handshaking (LPMD/LPACK) with the clock module in the system
     - Software handshaking by setting the field MAPSR[LPMD] and polling MAPSR[LPACK]
     - Automatic entry by configuring the amount of idle cycle for triggering self-refresh entry through MAPSR[PST] and by clearing MAPSR[PSD]
   - DVFS (Dynamic Voltage and Frequency Change)
     - Hardware handshaking (DVFS/DVACK) with the clock module in the system
     - Software handshaking by setting the field MAPSR[DVFS] and polling MAPSR[DVACK]

NOTE

If hardware or software requests for self-refresh entry were detected by the MMDC (even before the assertion of the LPACK), no write or read accesses will be acknowledged utnil the deassertion of those requests.

2. Automatic active/precharge power down entry to a specific chip select can be activated by configuring the ESDPDC register:
   - PWDT_0/PWDT_1 - define the number of idle cycles before entering power down, can be different value per chip select.
   - SLOW_PD - In case of DDR3 memory is configured to use slow precharge power down then this bit should be set as well.
   - BOTH_CS_PS - The MMDC can either set each chip select independently to power down, according to its idle state, or set both chip selects to power down only if both in idle state for the configured period.
   - Few paramters must be configured in addition:

- Timing parameters at MDCFG0[tXP and tXPDLL].
- ODT timing at MDOTC[tAOFPD, tAONPD, tANPD and tAXPD]

NOTE

It is possible to enter certain chip selects to low power consumption while the second chip select is activated.

3. Automatic precharge of all DDR banks to a specific chip select. Can be activated by configuring ESDPDC fields: PRCT_0 and PRCT_1. Each field determines a value loaded to a different chip select.

33.4.6.2 Self refresh and Frequency change entry/exit

As described in Power saving general, the MMDC supports two mechanisms that will cause the DDR device to enter self-refresh mode:

- LPMD (Low Power Mode) - For power saving purposes
- DVFS (Dynamic Voltage and Frequency Change) - For clock frequency changes

While the DDR device is in self-refresh mode, there is no need to provide periodic refresh commands.

The MMDC treats hardware/software handshaking of LPMD/DVFS in the same manner:

- Upon the assertion of LPMD/DVFS request, the following is done:
  - The MMDC blocks any further AXI accesses even before the acknowledge is asserted
  - Completes all opened AXI accesses
  - Closes (precharge) all banks in the appropriate timing
  - Drives self-refresh command by deasserting clock enable signal (DRAM_SDCKE is driven to "0") together with a refresh command. This occurs after satisfying tRP/tRPA from the precharge all command.
  - Deasserts the clock (CK) that is driven to the DDR device
  - Asserts LPMD/DVFS acknowledge (LPACK/DVACK)
  - Allows deassertion of the operating clock of the MMDC (AXI clock)
- Upon the deassertion of LPMD/DVFS request, the following is done:
  - Operating clock of the MMDC must be turned on before LPMD/DVFS is deasserted
  - Starts driving the clock (CK) to the DDR device
  - After satisfying tCKSRX from clock renewal the clock enable signal (DRAM_SDCKE) is asserted
  - LPMD/DVFS acknowledge (LPACK/DVACK) is deasserted

- After satisfying tXS from the assertion of DRAM_SDCKE, a refresh command is driven to the DDR device.
- If ZQ calibration is enabled then tRFC is satisfied from the refresh command and a long ZQ command is driven.
- tZQoper idle cycles are counted after the ZQ command.
- After satisfying tDLLK from the assertion DRAM_SDCKE, the MMDC returns to normal operation.

The figure below shows the timing diagram of the hardware/software handshaking of LPMD/DVFS:

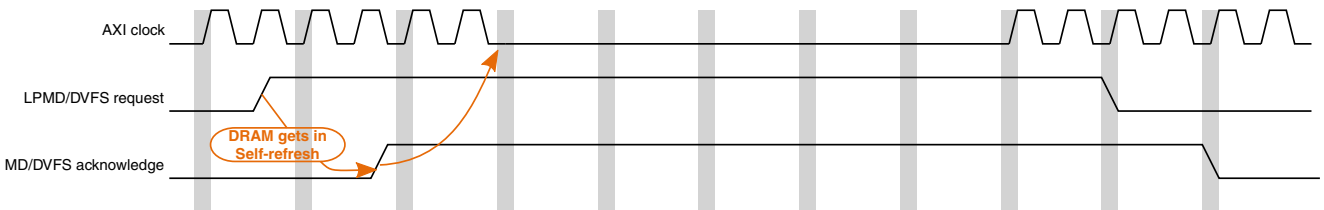

Figure 33-4. LPMD/DVFS Hardware/Software Handshaking

Note for self-refresh:

- As soon as LPMD or DVFS requests are detected by either hardware or software handshaking, the MMDC will deassert the AXI ARREADY/AWREADY signals immediately to block further requests from the system.
- In case of automatic self-refresh, the internal operating clock will be negated to save power.

33.4.7 Reset

33.4.7.1 Hard reset

When hard reset is asserted (aresetn is driven to "0") while warm reset is deasserted (warm_reset is driven to "0"), the entire MMDC will be initialized, including configuration/status registers and state machines.

In order to access the DDR device, the MMDC will then have to be reconfigured.

33.4.7.2 Warm reset

The MMDC supports warm reset signal. The warm reset signal must envelop the hard reset signal and then the MMDC will reset all the internal registers. The only registers that are not reset are those that are essential for returning it to normal operation without repeating the initialization sequence and without losing data stored in the memory (configuration/status registers won't be initialized).

For the successful operation of warm reset, the following steps must be performed:

- The MMDC must enter self-refresh mode. This can be achieved by either LPMD or DFVS requests
- Wait for LPMD or DVFS acknowledge
- Assert warm reset signal (i.e. drive warm_reset to "1")
- Assert hard reset signal (i.e. drive aresetn to "0")
- Deassert hard reset signal
- Deassert warm reset
- Get out of the LPMD/DVFS mode

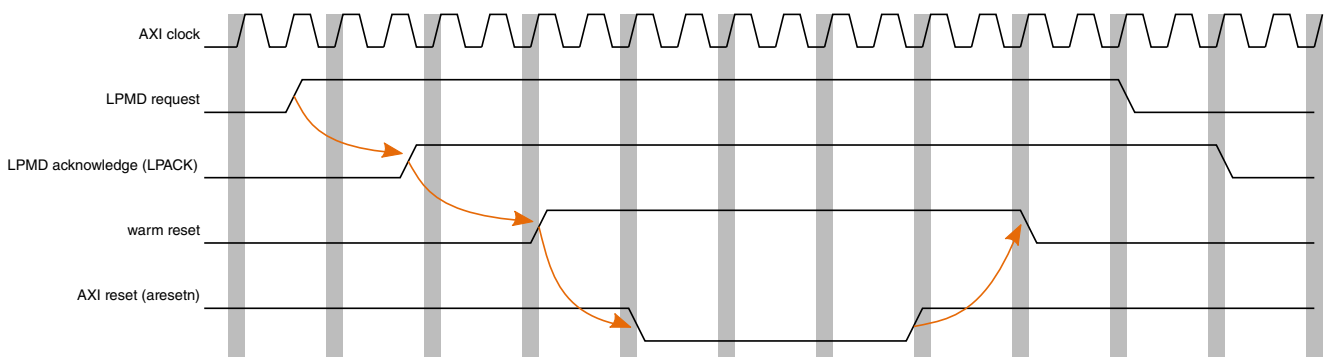

Figure 33-5. Warm Reset Diagram

33.4.7.3 Software reset

The MMDC supports software reset. When software reset is configured then the MMDC will reset all the internal registers except those that are essential for returning to normal operation without repeating the initialization sequence or without losing data stored in the memory (configuration/status registers won't be initialized).

The following steps should be performed for successful operation of software reset:

- The MMDC should enter self-refresh mode. This can be achieved by either LPMD or DFVS request.
- Wait for LPMD or DVFS acknowledge

- Assert software reset, by setting MDMISC[RST]
- Get out of the LPMD/DVFS mode

Normal operation can be resumed.

33.4.8 Refresh Scheme

The MMDC supports various automatic refresh options which can be configured via the MDREF register.

The periodic auto refresh can be triggered by the following clocks:

- 32 kHz clock
- 64 kHz clock
- MMDC operating clock

The refresh scheme of the MMDC is flexible and allows the system to configure the desired AXI accesses delay/latency in each refresh cycle.

The table below shows an example of four configurations of the refresh cycles that will be handled by the MMDC. Each configuration meets a refresh rate of 3.9us (tREFI, refresh command every 3.9µs).

Table 33-8. MMDC Refresh Scheme

Option number	Description	REFR	REF_SEL	REF_CNT	DDR hang time
1	Issue 8 refresh commands every 31,250 ns	0x7 (8 refreshes)	0x0 (64 kHz)	not needed	tRFC * 8
2	Issue 4 refresh commands every 15,625ns	0x3 (4 refreshes)	0x1(32 kHz)	not needed	tRFC * 4
3	Issue 2 refresh commands every 7800ns	0x1(2 refreshes)	0x2 (REF_CNT)	7800/2.5 = 3120 (0xC30)	tRFC * 2
4	Issue 1 refresh command every 3900 ns	0x0 (1 refresh)	0x2 (REF_CNT)	3900/2.5 = 1560(0x618)	tRFC

33.4.9 Burst Length options towards DDR

The MMDC supports burst lengths which can be configured through MD+CTL[BL] as follows:

- In DDR3 mode, only burst length 8 can be used.
- In LPDDR2 mode, only burst length 4 can be used.

In DDR3 mode read/write accesses to the DDR are always 8 words (x16) and aligned in according to JEDEC standards.

In case of AXI INCREMENT, accesses that are not aligned the irrelevant data is masked in write accesses and ignored in read accesses. In case of AXI WRAP accesses, even if the access is not aligned, then the MMDC provides an internal optimization mechanism for better efficiency of the DDR data bus.

33.4.10 Exclusive accesses handling

The MMDC contains four exclusive monitors, each for dedicated ID as configured in MAEXIDR0 and MAEXIDR1.

- If legal read exclusive is received by the MMDC, the associated monitor is turned on.
- While the monitor is turned on upon legal write exclusive, the monitor will be turned off and the write will be completed successfully with EXOKAY.
- The following rules must be met for successful exclusive access:
  - Aligned access (the AXI address is aligned to the AXI size)
  - AXI single access (AXI burst length isn't greater than 1)
  - AXI size of up to 64 bits
  - AXI non-cachable access (i.e. ARCACHE[1]/AWCACHE[1] is equal "0" or ARCACHE[1]/AWCACHE[1] is equal "1" while ARCACHE[3:2]/ AWCACHE[3:2] are equal "00")
  - AXI ID that matches one of the four exclusive IDs

Exclusive read behavior (first bullet also correct for non-exclusive accesses):

- In case of security violation, the read is blocked and is not sent to DDR. There are two options for response:
  - If ARCR_SEC_ERR_EN (MAARCR[30]) is high, SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- If AXI exclusive rules violation occurs (as described above), the read access is not blocked and is sent to DDR. The data will be fetched and be driven to the master, but the type of response may be unpredicted.
- If none of the above occurs, the read is sent to the DDR. The exclusive monitor will be turned on and the response is ExOKAY
- If additional legal AXI read exclusive is received with the same ID before the AXI exclusive write, the monitor will be updated with the latest attributes.

Exclusive write behavior (first bullet also correct for non-exclusive accesses):

- In case of security violation, the write is blocked and is not sent to DDR, but the monitor will be kept on. There are two options for response:
  - If ARCR_SEC_ERR_EN (MAARCR[30]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- In case of AXI exclusive rules violation (as described above), the write is blocked and is not sent to DDR. In that case the type of response may be unpredicted.
- In case the exclusive write access has different AXI attributes, but the same ID as the read exclusive access, the write is blocked and is not sent to DDR and the monitor will be turned off. There are two options for response:
  - If ARCR_EXC_ERR_EN (MAARCR[28]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- In case of regular (non exclusive) write access is received to the same address or overlapping addresses then the write will be sent to the DDR and the monitor will be turned off.
- In case of legal write exclusive access is received with the same attributes as the read exclusive access while the monitor is on (no write accesses occured to the same address between the read exclusive and write exclusive), then the write is sent to DDR and the response is EXOKAY. But, if the legal write exclusive is received while the monitor is off, the write is blocked and there are two options for response.
  - If ARCR_EXC_ERR_EN (MAARCR[28]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.

33.4.11 AXI Error Handling

The MMDC supports the AXI responses listed here.

- In case of AXI exclusive violation there are two options for response:
  - If MAARCR[28] is high then SLVError is issued towards the Master, Otherwise OKAY response is sent to the Master

NOTE

In case of read error MMDC drives zeros on the read data bus

33.5 Performance

33.5.1 Arbitration and reordering mechanism

33.5.1.1 Arbitration General

The following specifies arbitration and reordering flow in MMDC towards the DDR.

- AXI read and write accesses are sampled in the associated queue.
- Read/write arbitration is handled to select the winning access.
- Winning access is sampled in the reordering queue
- Reordering mechanism is handled between valid requests that reside in the reordering queue to select the access that will be dispatched to the DDR.
  - The reordering is held in order to optimize the accesses and to maximize the utilization of the DDR bus
  - As soon as the reordered access is completed (indicated by end of response or data phase) then it is erased from the associated queue and the MMDC is ready to receive the next available access from the master

In general, the reordering/arbitration mechanism is based on dynamic priority mechanism, which compares dynamic priorities between valid entries in the reordering queue and issues the entry with highest dynamic priority towards the DDR Logic.

The selection of the winning access is based on two modes, which can be activated together, as following:

- Real time channel mode:
  - Accesses with QoS='f' (i.e. awqos[3:0]/arqos[3:0] = "f") will bypass all other requests towards the DDR
- Dynamic scoring mode:
  - The arbitration mechanism is based on dynamic priority. Relevant for the accesses with QoS smaller than 'f' or when real time channel mode is disabled.

NOTE

Due to re-ordering and optimization mechanism (per different AXI ID), the transactions towards the DDR may be driven in a different ID order they were received by the AXI master. In similar way, the write response, read response or read data may be driven to the AXI master in a different ID order.

33.5.1.2 Real time channel mode

When real time mode is enabled (i.e MAARCR[ARCR_RCH_EN] = "1") , all requests with QoS='f' (i.e. awqos[3:0]/aqqos[3:0] = "f") will bypass all other pending accesses towards the DDR. This mode is enabled by default.

33.5.1.3 Dynamic scoring mode (Arbitration Winning Conditions)

The arbitration between pending accesses in the MMDC is handled according to a dynamic priority of each access.

The dynamic priority (may be also called score) is calculated according to a sum of some factors (final_score[3:0]), where part of them may be updated dynamically. The following will specify each scoring factor:

- MAARCR[ARCR_PAG_HIT] (Page hit score) - A static score which is taken into account in case the pending access has a page hit
- MAARCR[ARCR_ACC_HIT] (Access hit score) - A static score, which is taken into account in case the current access type (read/write) is the same as the access that has been dispatched to the DDR previously
- MAARCR[ARCR_DYN_JMP] (Dynamic jump score) - A dynamic score which is given to any pending access in case it was not chosen in the arbitration. The dynamic jump counter is limited by maximum value which is set in MAARCR[ARCR_DYN_MAX] .
- QoS score which is indicated through a sideband 4bits AXI signals (awqos[3:0]/ aqqos[3:0]) and is driven by the AXI master per access

Note: In order to prevent an overflow in the total sum of scores, a clipping is held and selects the maximum score value of 'f' once a total scores sum is greater than 'f'.

The figure below shows the dynamic score calculations

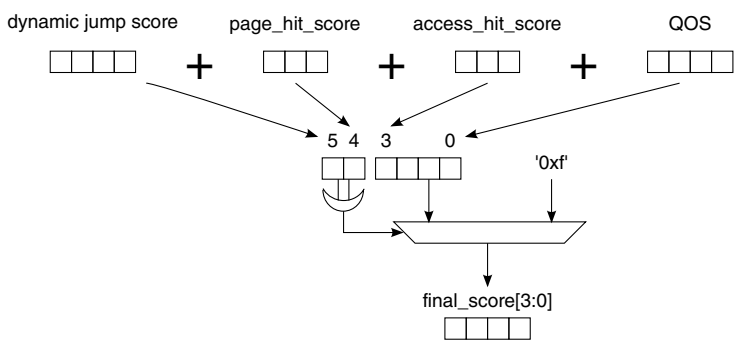

Figure 33-6. Dynamic score/priority calculation

33.5.1.4 Guarding (aging) mechanism

The guarding mechanism (may be also called aging) is used to prevent a starvation of accesses.

As soon as the dynamic jump score reaches its maximum value (MAARCR[ARCR_DYN_MAX]) then each time a pending request was not chosen in the arbitration, the "guarding" counter is incremented by 1. When the "guarding" counter reaches its predefined value, set in MAARCR[ARCR_GUARD], the associated request gets the highest priority and will be chosen in the next arbitration cycle towards the DDR unless a real time channel (i.e access with QoS ="f") is arrived.

Note: In case real time channel has arrived then the dynamic score of the non real time channels won't increment in order to prevent a case where the "guarding" counter of more than one access has reached its limit.

33.5.2 Prediction mechanism

When prediction mechanism is enabled (i.e by configuring MDMISC[MIF3_MODE]) then the MMDC predicts the chip-select, bank address and row address that is going to be issued towards the DDR before the access is physically dispatched towards DDR device.

That mechanism enables to prepare the DDR device with future accesses and improves the overall DDR performance.

This prediction mechanism operates in parallel to the reordering mechanism and may yield a prediction based on 3 levels of pending accesses:

1. Access in first stage of pipeline.
2. Valid access on AXI bus either read channel or write channel.
3. Valid access on special bus from arbitration - this access is chosen by the arbitration as the next miss access in its buffers

33.5.3 Special Optimization for accesses towards DDR3

In case an AXI read/write wrap non-aligned access is acknowledged in DDR3 mode with the same wrap boundary as the DDR wrap boundary then the MMDC will make an optimization and issue only one access towards the DDR, although all the accesses towards the DDR3 must be aligned.

For example: AXI write access with size of 128bits (awsize[2:0]=3'b100), length of 4 (awlen[3:0]=4'b0011) towards DDR3 x64 (burst length 8). In that case the AXI wrap boundary is 16Bx4=64B (0x40) and the DDR3 wrap boundary is 8Bx8=64B (0x40). If, for example, the AXI access is towards AXI address with suffix of 0x10 (non-aligned to 64B boundary) then the MMDC will get from the AXI master the data that is associated with addresses 0x10, 0x20, 0x30, 0x0. The MMDC will rearrange internally the data so it

will match DDR3 alignment as following: 0x0, 0x10, 0x20, 0x30 and drive it in one access towards the DDR to address 0x0. The alternative was to issue two accesses towards the DDR with address 0x0 with different data masking

NOTE

In read wrap access the same optimization is handled, while as soon as the critical AXI word is fetched from the DDR then it is driven immediately to the AXI master without buffering. Based on the example above, the master expects to fetch first the data that is associated with address 0x10. Therefore the MMDC will issue read access from address 0x0 of the DDR and as soon as the data that is associated with address 0x10 is received then it will be driven back immediately to the master even before fetching the data of the furhter addresses.

33.6 MMDC Debug

33.6.1 Hardware debug monitor

The MMDC has a hardware debugging mechanism that monitors each access that is driven to the MMDC. Every time this mechanism is enabled (setting of MADPCR0[DBG_EN] to "1") then each access that will be dispatched to the DDR will be also observed in the I/O pads (i.e. over ipp_do_ddr_debug[50:0]). The content of this bus is described in the table below.

Table 33-9. Hardware monitor debugging

Signal Name	Number of Bits	Description
acc_addr	[31:0]	AXI ADDRESS of the selected access
acc_type	1	access type of the selected access. "0 indicates write. "1" indicates read.
acc_id	[15:0]	AXI transaction ID of the selected access
valid_strobe	1	indication for a valid request . This signal will be asserted for 1 clock cycle

The fields above are organized as following:

MMDC_DEBUG[50:0] = {1'b0,valid_strobe,acc_id,access_type,addr}

These signals are sent to IOMUX, in IOMUX user can configure it to be output from the chip for debug usage.

33.6.2 Step By Step (SBS) software monitor

The MMDC has a Step By Step (SBS) software debugging mechanism that monitors each access that is driven to the MMDC. Every time this mechanism is trigerred then one AXI access will be dispatched to the DDR and in parallel its attributes will be observed in a status register.

Once the "step by step" is enabled (i.e. MADPCR0[SBS_EN] is "1") then all accesses to the DDR device will be halted. This SBS feature is used during DDR SDCLK frequency scaling to prevent any accesses to the DDR device during the transition. Setting MADPCR0[SBS] to "1" will dispatch the access that is pending in the head of the MMDC queue (read or write). Upon every setting of MADPCR0[SBS]:

- The AXI attributes of the access will be sampled in the associated MASBS0 and MASBS1 fields
- MADPCR0[SBS] will be cleared automatically.

Setting again MADPCR0[SBS] to "1" will dispatch the next pending access in the MMDC queue.

NOTE

Setting the ARCR_ARB_REO_DIS bit in the MMDC0_MAARCR Register disables the SBS function

33.7 MMDC Profiling

The profiling mechanism provides the ability to calculate the DDR utilization together with read and write accesses statistics towards DDR per given period of time.

MMDC supports the following profiling counters:

- MADPSR0 (Total cycles count) - Indicates the total amount of cycles of the profiling period (up to 2^32 cycles)
- MADPSR1 (Busy cycles count) - Indicates the total busy cycles during the profiling period. Busy cycles are any MMDC clock cycles where the internal state machine is not idle. If any read or write requests are pending in the FIFOs, the MMDC is not idle.
- MADPSR2 (Total read accesses count) - Indicates the total read accesses towards MMDC during the profiling period
- MADPSR3 (Total write accesses count) - Indicates the total write accesses towards MMDC during the profiling period

- MADPSR4 (Total read bytes count) - Indicates total bytes that were read from MMDC during the profiling period
- MADPSR5 (Total write bytes count) - Indicates total bytes that were written to MMDC during the profiling period

All profiling items described above are disabled by default. The following describes how to control the profiling mechanism:

- MADPCR0[DBG_EN] enables profiling.
- MADPCR0[PRF_FRZ] stops/freezes the profiling for example in case user wishes to perform DDR profiling per specific task. In order to resume profiling then MADPCR0[PRF_FRZ] should be cleared.
- MADPCR0[DBG_RST] clears all profiling counters
- MADPCR0[CYC_OVF] indicates whether an overflow occured in the total cycles counter (i.e. total amount of cycles are greater than 2^32) . This field can only cleared by writing '0'.

Read/Write statistics can be collected per specific AXI ID (16bits). The following fields in MADPCR1 register determines which AXI-ID or AXI-ID's to monitor:

- PRF_AXI_ID defines which AXI IDs are taken for profiling. Default values is 16'h0.
- PRF_AXI_ID_MASK defines which bits from PRF_AXI_ID will be compared with AXI ID of read/write access. "1" means to monitor the associated bit and "0" means don't care. Default value is 16'h0000, meaning all IDs are not monitored

So the AXI-IDs to be monitored are calculated according to the following equation:

(AXI-ID & PRF_AXI_ID_MASK) Xnor (PRF_AXI_ID & PRF_AXI_ID_MASK)

For example if AXI ID's between A100 till A1FF are wished to be monitored then the following should be configured:

- PRF_AXI_ID = A100
- PRF_AXI_ID_MASK = FF00

33.8 LPDDR2 Refresh Rate Update and Timing Derating

LPDDR2 devices may have a temperature sensor that is used to determine an appropriate refresh rate and whether AC timing derating is required. The status of the temprature sensor can be read through MRR command from LPDDR2 MR4 register.

The MMDC supports refresh update and timing derating mechanism on the fly. The following steps specify how to use that mechanism:

- Perform periodic polling on MR4 LPDDR2 register using MRR command

- Read MDMRR register and analyze the MR4 indication
- In case refresh rate update and/or AC timing derating is required then it is needed to update MDREF and/or MDMR4[tRCD_DE, tRC_DE, tRAS_DE, tRP_DE, tRRD_DE] parameters

NOTE

MDMR4[tRCD_DE, tRC_DE, tRAS_DE, tRP_DE, tRRD_DE] are referred to the associated values configured at MDCFG3LP[tRC_LP, tRP_LP, tRCD_LP], MDCFG1[tRAS], MDCFG2[tRRD]

- Assert MDMR4[UPDATE_DE_REQ]
- When the MMDC switch to the new values then an acknowledge will be indicated at MDMR4[UPDATE_DE_ACK]

The enabled power saving features may be interfering with the MR4 reads. When these features are enabled the MMDC will automatically enter self-refresh and hence prevent the MR4 reads. Hence the Power Saving and refresh functionality should be disabled why SW performs the MR4 reads.

To disable the “Power Down” mode, set bit 0 of MAPSR (0x021B0404) to 1’b.
To disable the “Self-Refresh Power Down Timer” mode, set bits [15:8] of MDPDC (0x021B0004) to 0x00.

Overall Sequence to Perform MR4 reads

1. Set MAPSR to 0x00010107
2. Set MDPDC to 0x00020076
3. MRR command to read MR4
4. Write MDPDC to 0x00025576 to re-enable this feature
5. Write MAPSR to 0x00010106 to re-enable this feature

33.9 Changing MMDC SDCLK Frequency

Changing the MMDC SDCLK frequency when using either DDR3 or LPDDR2 can be done dynamically in software using the DVFS. Several important factors must be considered for each type of memory and whether transitioning between high and low frequency. The following sections highlight these factors and provide a step-by-step process when making frequency transitions on each type of memory.

33.9.1 Changing MMDC SDCLK Frequency Using DDR3/DDR3L Memories

This section provides the sequence of steps which should be followed to ensure a successful frequency transition when using DDR3/DDR3L memories.

NOTE

There are additional steps required to ensure that the ARM core and associated caches are in the correct state prior to any frequency transition or low power entry which are not detailed here. The user must assure that the ARM core or other bus masters are not accessing DDR during these transitions.

There are two general categories of frequency transitions – transitioning from high frequency to low frequency, and vice versa. High frequency is defined as all settable frequencies between 125 MHz and the maximum bus frequency, and low frequency is defined as all settable frequencies between 125 MHz and the low-power mode frequency of 24 MHz. Setting to a low frequency (below 125MHz) requires that the DDR3 device's delay line (DLL) be switched off, or be in DLL Off mode. Setting to a high frequency (above 125 MHz) requires that the DLL be switched on, or be in DLL On mode.

For further details refer to the DLL-off Mode chapter in the JEDEC standard.

A special consideration in changing the MMDC frequency on i.MX 6DualPlus/ 6QuadPlus is that all transitions are performed using the MMDC's Reorder Pass-through mode. Options for reordering and arbitration are selected by the ARCR_REO_DIS (bit 26) and ARCR_ARB_REO_DIS (bit 25) bits in the MMDC Core AXI Reordering Control Register (MMDC0_MAARCR). Two modes have been added in MMDC to disable the reorder function. The following table shows the selection of settings for reordering based on these bits (bit[26:25]) of the MMDC0_MAARCR register.

Table 33-10. Arbitration and Reordering Control in MMDC0_MAARCR

Register Bits	Settings	Notes
ARCR_REO_DIS MMDC0_MAARCR[25]	0 - MMDC reordering controls enabled 1 - MMDC reordering controls disabled (bypassed)	**MMDC Reorder Pass-through mode**: reordering is disabled when this bit is set.
ARCR_ARB_REO_DIS MMDC0_MAARCR[26]	0 - MMDC arbitration and reordering controls enabled 1 - MMDC arbitration and reordering controls disabled (Recommended)	**Adopt_Bypass mode**: MMDC reorder and arbitration pipeline is totally bypassed when this bit is set.

When the ARCR_REO_DIS bit (MMDC0_MAARCR[25]) is set, the MMDC Reorder Pass-through mode is enabled. In this mode the DRAM access commands are still processed by the MMDC reorder and arbitration pipeline, but the commands are not

reordered. When the ARCR_ARB_REO_DIS bit (MMDC0_MAARCR[26]) is set the MMDC reorder and arbitration pipeline is totally bypassed. In this Adopt_Bypass mode the DRAM access latency is reduced and performance is improved.

The MMDC Reorder Pass-through mode is used for all frequency transitions, and ARCR_REO_DIS is set prior to the transition. In addition, this mode is used after transition for all frequency settings except for the maximum setting which, for the i.MX 6DualPlus/6QuadPlus, is 528 MHz. For this frequency setting, both arbitration and reordering are bypassed in the Adopt_Bypass mode.

The below table shows the relationship between the ARCR_REO_DIS and ARCR_ARB_REO_DIS bits.

Table 33-11. ARCR_ARB_REO_DIS and ARCR_REO_DIS bits of the MMDC0_MAARCR Register

ARCR_ARB_REO_DIS	ARCR_REO_DIS	Function	Notes
0	0	Reset Value – Both arbitration and reordering enabled	This is default value out of reset
0	1	Reordering only disabled	Reorder Pass-through mode enabled
1	x	Both arbitration and reordering disabled	Adopt_Bypass mode enabled. ARCR_REO_DIS has no impact since all AXI transactions bypass the reordering logic.

The recommended setting of these two bits based on frequency transition is shown in the following table.

Table 33-12. Required ARCR_ARB_REO_DIS and ARCR_REO_DIS Settings before and after Frequency Transitions

Transition	Before Transition MMDC0_MAARCR [26:25][1]	After Transition MMDC0_MAARCR [26:25]	Comments
Initialized to 528 MHz at system boot	-	10[2]	Set to Adopt_Bypass mode after transition to 528 MHz during system boot
to other than 528MHz (including 24MHz)	01	01	Set to Reorder pass-through mode after transition
to 528MHz	01	10	Set to Adopt_Bypass mode after transition

1. Set to Reorder pass-through mode before frequency transition.
2. Set during MMDC Initialization at boot up for optimal performance.

In addition to setting the ARCR_REO_DIS bit prior to the MMDC frequency transition, the Step-by-Step (SBS) monitor (see section 46.6.2) is also enabled to block DDR accesses during the frequency transition. Setting the ARCR_ARB_REO_DIS bit disables the SBS function, therefore the Adopt_Bypass mode is used during transitions to allow the SBS logic to be enabled. The SBS function is only used during actual frequency transitions. Once frequency has switched the SBS is disabled to unblock DDR accesses.

NOTE

For DDR3 there is no need to perform any configuration of the MMDC1 registers for channel 1.

For further information please refer to EB828: MMDC and NoC Configuration for Optimal DDR3 Performance on the i.MX 6DualPlus/6QuadPlus available on NXP.com.

33.9.1.1 High Frequency to Low Frequency Transition (DLL On to DLL Off)

When switching from high frequency, including the maximum frequency, to low frequency the following steps should be executed.

NOTE

Unless specified otherwise, all registers cited in the switching procedures in this section and the following sections are in the MMDC0 bank.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Assert the MDSCR[CON_REQ] and wait for the MDSCR[CON_ACK] assertion.
3. Execute PRECHARGE ALL banks command (MDSCR[CMD] = 3b’101).
4. Execute MRW command to MR1 and disable RTT_Nom (A9, A6, A2 = 0) and DLL ON (A0 = 1, disabling the DLL)
5. Disable reordering (MAARCR[26:25] = 2b’01).
6. Execute MRW command to MR2 in order to update CWL to 6.
7. Execute MRW command to MR0 in order to update CL to 6.
8. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
9. De-assert MDSCR[CON_REQ] signal.
10. Wait for self-refresh entry acknowledge (MAPSR[LPACK] = 1).
11. Bypass the Measurement Unit (set MPMUR0[MU_BYP_EN]) and follow steps outlined in ERR005778.
12. Perform a force measure by setting MPMUR0[FRC_MSR]. Wait for force measurement acknowledge MPMUR0[FRC_MSR] =0.

13. Change to low frequency. (See Self-refresh and Frequency change entry/exit.)
14. Enable Step-by-Step Mode (MADPCR0[SBS_EN] = 1).
15. Keep reordering disabled (MAARCR[26:25] = 2b'01)
16. Exit self-refresh mode.
17. Assert MDSCR[CON_REQ] and wait for MDSCR[CON_ACK] assertion.
18. Update tCWL =6 and tCL =6 to meet the values configured in the DDR device. (MDCGFG0, MDCFG1)
19. Set read latency (MDMISC[RALAT] = 2).
20. Enable pull-down resistors on DQS (through the I/O-MUX).
21. Disable ODT resistor (MPODTCTRL = 0).
22. Disable DQS gating (MPDGCTRL0[DG_DIS] = 1).
23. Disable Step-by_Step Mode (MADPCR0[SBS_EN] = 0).
24. De-assert MDSCR[CON_REQ].
25. Enable required power-down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1] , MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].

33.9.1.2 Low Frequency to High Frequency Transition (DLL Off to DLL On)

When switching from low frequency, including 24MHz low power mode, to high frequency the following steps should be executed.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Assert MDSCR[CON_REQ] and wait for MDSCR[CON_ACK] assertion.
3. Execute PRECHARGE ALL banks command (MDSCR[CMD] = 3b'101).
4. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
5. De-assert MDSCR[CON_REQ].
6. Wait for self-refresh entry acknowledge (MMDCx_MAPSR[LPACK] = 1).
7. Disable reordering (MAARCR[26:25] = 2b'01).
8. Change to high frequency. (See Self-refresh and Frequency change entry/exit.)
9. Enable Step-by-Step Mode (MADPCR0[SBS_EN] = 1).
10. Exit self-refresh mode.
11. Optionally, force ZQ automatic calibration process by setting MPZQHWCTRL[ZQ_HW_FOR] = 1 and setting MPZQHWCTRL[ZQ_MODE] = 2b'11.)
12. Enable DQS gating (MPDGCTRL0[DG_DIS] = 0)
13. Restore ODT setting in MPODTCTRL to original value.
14. Enable Measurement Unit by clearing MPMUR0[MU_BYP_EN]) per ERR005778.

15. Perform a force measure by setting MPMUR0[FRC_MSR]. Wait for force measurement acknowledge MPMUR0[FRC_MSR] = 0.
16. Disable pull-down resistors on DQS (through the I/O-MUX).
17. Restore read latency (MISC[RALAT]) to original value.
18. Restore calibration registers of MMDC BLOCK (if they were changed).
19. Assert MDSCR[CON_REQ] and wait for MDSCR[CON_ACK] assertion.
20. Execute MRW command to MR1 and enable RTT Nom (A9, A6, A2) and DLL ON (A0 = 0).
21. Execute MRW command to MR0 to reset the DLL (A8) and revert to CL values prior to entry.
22. Execute MRW command to MR2 to update CWL value.
23. Update tCWL and tCL to meet the values configured in the memory. (MDCGFG0, MDCFG1)
24. Execute a ZQ command to the DDR3 device (MDSCR[CMD] = 3b'100).
25. Disable Step-by_Step Mode (MADPCR0[SBS_EN] = 0 .
26. Transition to Adopt_ByPass mode to disable both arbitration and reordering (MAARCR[26:25] = 2b'10) if transitioning to highest frequency; otherwise switch to Reorder Pass-through mode to disable only reordering (MAARCR[26:25] = 2b'01).
27. De-assert MDSCR[CON_REQ].
28. Enable required power-down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].

33.9.2 Changing MMDC Frequency Using LPDDR2

This section provides the sequence of steps which should be followed to ensure a successful frequency transition when using LPDDR2 memories.

NOTE

In the procedure sequence provided in the following sections, the user should take caution in adjusting the parameters MMDC MDCFG0[tCL] and MDCFG1[tCWL] to ensure that these parameters match the RL/WL parameter of the LPDDR2 memory devices mode register 2 (MR2). If the MDDC parameters do not match those programmed in the LPDDR2 memory device, the memory interface will become unstable.

33.9.2.1 High Frequency to Low Frequency Transition

When switching from high frequency, including the maximum frequency, to low frequency the following steps should be executed.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
3. Wait for self-refresh entry acknowledge (MMDCx_MAPSR[LPACK] = 1).
4. Disable reordering (MAARCR[26:25] = 2b'01).
5. Enable Step-by-Step Mode (MADPCR0[SBS_EN] = 1).
6. Set read latency (MDMISC[RALAT] = 2).
7. Adjust LPDDR2 timings for low frequency operation: set MDCFG0, MDCFG1, MDCFG2, MDCFG33LP.
8. Read and store the measure count value MU_VAL=MPMUR0[MU_BYP_VAL].
9. Bypass the Measurement Unit by setting MPMUR0[MU_BYP_EN] and follow steps outlined in ERR005778.
10. Double the measure count value for the reduced frequency operation MPMUR0[MU_BYP_VAL] = 2*MU_VAL.
11. Perform a force measurement by setting MPMUR0[FRC_MSR] =1. Wait for force measurement acknowledge MPMUR0[FRC_MSR] =0.
12. Change to low frequency (See 27.4.2. DVFS Change Request Sequence Diagrams)
13. Exit self-refresh mode.
14. Enable required power down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
15. Disable Step-by-Step Mode (MADPCR0[SBS_EN] = 0).
16. Keep reordering disabled (MAARCR[26:25] = 2b'01); at max frequency disable both arbitration and reordering (MAARCR[26:25] = 2b'10).

33.9.2.2 Low Frequency to High Frequency Transition

When switching from low frequency to high frequency the following steps should be executed.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
3. Wait for self-refresh entry acknowledge (MMDCx_MAPSR[LPACK] = 1).
4. Disable reordering (MAARCR[26:25] = 2b'01).
5. Enable SBS (MADPCR0[SBS_EN] = 1).
6. Change to high frequency (See 27.4.2. DVFS Change Request Sequence Diagrams)
7. Restore read latency (MISC[RALAT]) to original value.
8. Restore LPDDR2 timings for high frequency operation: set MDCFG0, MDCFG1, MDCFG2, MDCFG33LP.

9. Enable Measurement Unit by clearing MPMUR0[MU_BYP_EN]) per ERR005778.
10. Restore original MPMUR0[MU_BYP_VAL] =MU_VAL.
11. Perform a force measurement MPMUR0[FRC_MSR] =1. Wait for force measurement acknowledge MPMUR0[FRC_MSR] =0
12. Exit self-refresh mode.
13. Enable required power down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
14. Disable SBS (MADPCR0[SBS_EN] = 0).
15. Transition to Adopt_ByPass mode to disable both arbitration and reordering (MAARCR[26:25] = 2b'10) if transitioning to highest frequency; otherwise switch to Reorder Pass-through mode to disable only reordering (MAARCR[26:25] = 2b'01).

33.10 ODT Configuration

The MMDC supports one DRAM_ODT signal (DRAM_ODT for each DRAM_CS) in DDR3 mode in order to allow the DDR device to turn on/off its termination resistors. The MMDC suggests various configuration for the assertion of the ODT signal as well as configuration of several related timing.

MDOTC register controls the timing for the DRAM_ODT signals assertion.

NOTE

tODTLon determines the delay between DRAM_ODT signal and the associated RTT, where according to JEDEC standard it equals WL(write latency) - 2. Therefore, the value configured to MDOTC[tODTLon] field should correspond with the value configured to MDCGFG1[tCWL].

In precharge power down mode , when all banks are closed, the assertion of ODT corresponds with tAOFPD and tAONPD which are configured in MDOTC register.

The figure below shows timing diagram of DRAM_ODT and RTT signals while MPODTCTRL[0] is set to "1" (i.e. assertion of DRAM_ODT to the non active DRAM_CS in write access command) and MDOTC[tODTLon] is set to 4.

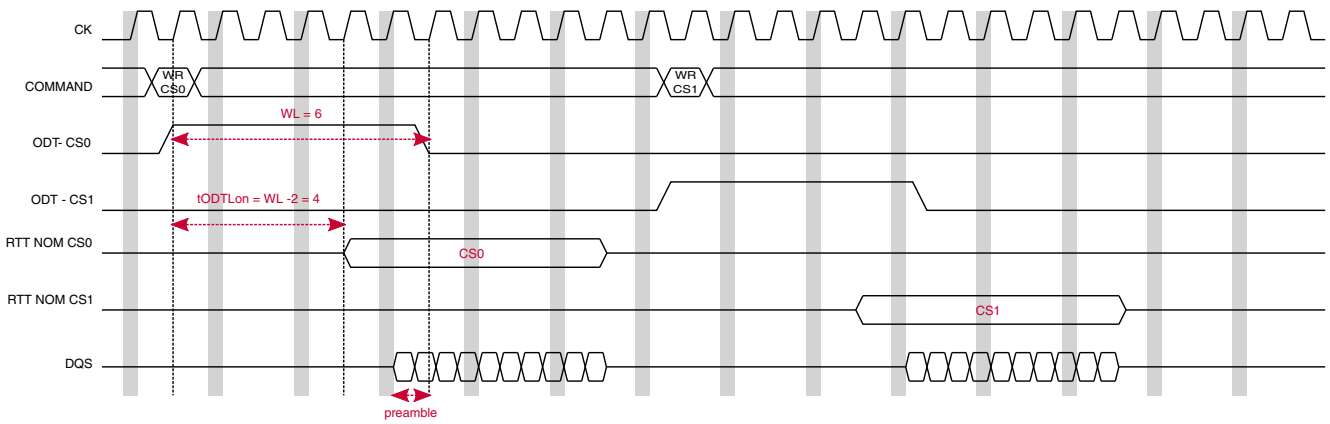

Figure 33-7. ODT - Timing Diagram DDR3 WL=6, BL=8

33.11 Calibration Process

The MMDC offers various calibration processes that are used to obtain better timing accuracy, board skew compensation and I/O pad driving strength adjustment. Each calibration process can be performed either automatically (hardware) or manually (software), though the manual method is typically reserved for debugging purposes. The following calibration processes are supported:

NOTE

Power saving features should be disabled before the calibration process begin. (Such as: MDPDC[PWDT#], MDPDC[PRCT#], MAPSR[PSD])

- ZQ calibration for external DDR device (in DDR3 through ZQ calibration command and in LPDDR2/LPDDR3 through MRW command)
  - Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh)
  - Can be handled manually at ZQ INIT
- ZQ calibration for i.MX DDR I/O pads for calibrating the DDR driving strength
  - The sequence can be handled automatically by hardware
  - The sequence can be handled step by step manually by software
- Read DQS gating calibration for DDR3 only. Adjustment of DQS gate with read preamble window. For further information refer to Read DQS Gating Calibration
- Read DQS gating calibration not supported for LPDDR2/LPDDR3
- Read data calibration. Adjustment of read DQS with read data byte. For further information refer to Read Calibration
- Write data calibration. Adjustment of write DQS with write data byte. For further information refer to Write Calibration

- Write leveling calibration. Adjustment of write DQS with CK (DDR differential clock). For further information refer to Write leveling Calibration
- Read fine tuning. Adjustment of up to 7 delay-line units for each read data bit.
- Write fine tuning. Adjustment of up to 3 delay-line units for each read data bit.

NOTE

Before starting any calibration process that involves the DDR3 device MPR mode or write leveling calibration, the following should be done:

- Disable the periodic refresh scheme (i.e. setting MDREF[REF_SEL] = "11") and then issue manual refresh command burst by configuring MDSCR[CMD]= 0x2. At the end of the calibration it is needed to enable the periodic refresh scheme.
- Disable the automatic power saving mode (i.e set MAPSR[PSD] = "1").

33.11.1 Delay-line

Each of the calibration processes controls several delay-lines for aligning data and strobes.

By default the delay-line is configured to generate 1/4 clock cycle of delay.

Moreover, when the operating clock is at the maximum allowed frequency, as appeared in the features list, then the delay-line is capable to issue a configurable delay of up to 1/2 clock cycle.

NOTE

At the beginning of the calibration process the initial value of the delay-line must be a valid value (i.e. the strobes must be somewhere among the associated data window) though it might not be the optimal value. The delay-line calibration should be done after Read DQS gating and write-leveling calibrations.

In order to generate an adequate delay during normal operation of the MMDC the delay-line is going through an automatic measurement process during the refresh period of the DDR device

33.11.2 ZQ calibration

The MMDC supports ZQ calibration process to calibrate the driving strength of the DDR I/O pads as well as driving ZQ commands to calibrate the external DDR device driving strength.

The first ZQ calibration (after booting the processor) is performed prior to turning on the MMDC. Subsequent ZQ calibrations may be executed in parallel to the DDR ZQ calibration. The MMDC supports 2 types of ZQ calibration commands: short and long.

The ZQ long calibration is executed during power up sequence, when existing self-refresh mode or when exiting slow precharge power down (DLL lock can be done in parallel). The ZQ short calibration is executed periodically according to a configurable timer defined by MPZQHWCTRL[ZQ_HW_PER].

The field MPZQHWCTRL[ZQ_MODE] determines whether the MMDC will execute ZQ calibration to DDR I/O pads and/or issue ZQ short/long command to the DDR device.

The MMDC supports both automatic (hardware) and manual (software) ZQ calibration process for the DDR I/O pads.

It is possible to perform automatic (hardware) ZQ calibration only once (i.e. non-periodical) by asserting MPZQHWCTRL[ZQ_HW_FOR].

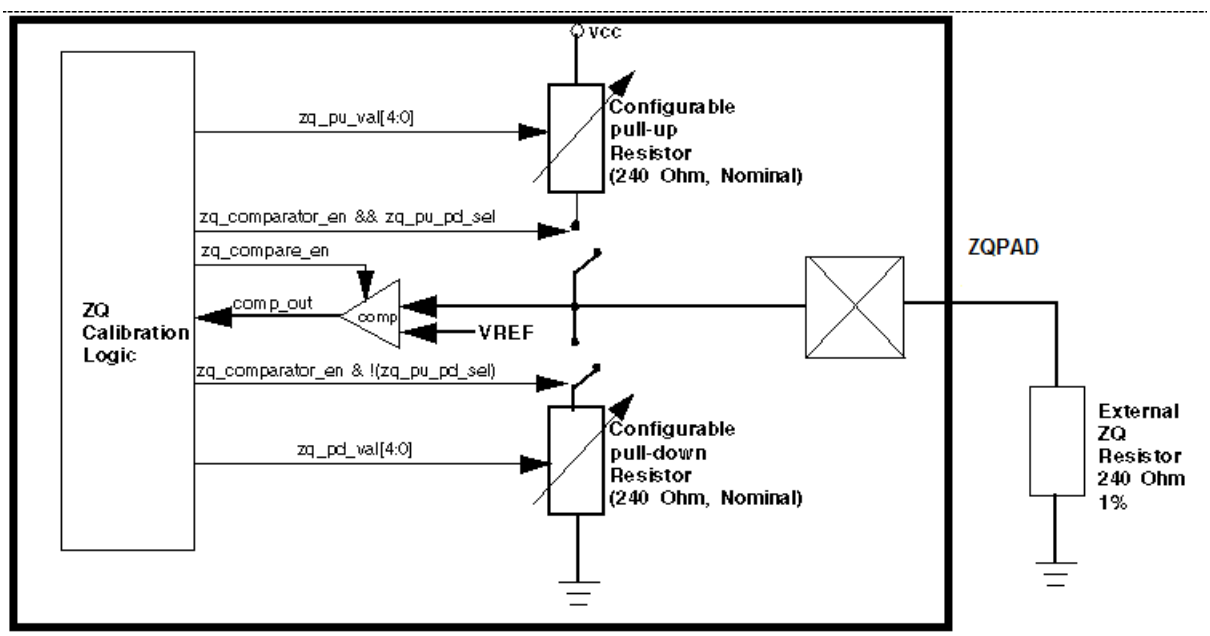

Figure 33-8. MMDC ZQ IF with PAD

33.11.2.1 ZQ automatic (hardware) calibration process

The ZQ automatic calibration lasts 11 steps. 5 steps for the pull up resistors calibration and 6 for the pull down resistors calibration.

The calibration control interface with ZQ pin is described below:

The calibration process is as follows:

33.11.2.1.1 ZQ automatic Pull-up calibration

The MMDC automatically performs a handshaking mechanism with the ZQ calibration pad as follows:

1. The MMDC drives zq_comparator_en to "1"
2. The MMDC waits few cycles according to MPZQHWCTRL[EARLY_COMPARATOR_EN_TIMER]
3. The MMDC drives zq_pu_pd_sel to "1" for indication of pull-up calibration and drives zq_pu_val[4:0] = 5'b00000
4. MMDC drives zq_pu_val[4] to "1"
5. MMDC asserts zq_compare_en
6. MMDC waits few cycles according to MPZQSWCTRL[ZQ_CMP_OUT_SMP] before sampling the comparator output (i.e zq_comp_out). If zq_comp_out is "1" then it means that the output voltage is greater than Vdd/2 (i.e. internal resistor is less than 240 ohm) and drives bit zq_pu_val[4] to "1" else it drives zq_pu_val[4] to "0"
7. MMDC deasserts zq_compare_en
8. MMDC repeats steps 4- 7for zq_pu_val bits 3 to 0
9. MMDC drives ZQ calibration result to MPZQHWCTRL[ZQ_HW_PU_RES]
10. MMDC advances to pull-down calibration

33.11.2.1.2 ZQ automatic Pull-down calibration

1. The MMDC drives zq_pu_pd_sel to "0" for indication of pull-down calibration and drives zq_pd_val[4:0] = 5'b00000
2. MMDC drives zq_pd_val[4] to "1"
3. MMDC asserts zq_compare_en
4. MMDC waits few cycles according to MPZQSWCTRL[ZQ_CMP_OUT_SMP] before sampling the comparator output (i.e zq_comp_out). If zq_comp_out is "1" then it means that the output voltage is greater than Vdd/2 (i.e. internal resistor is less than 240 ohm) and drives bit zq_pd_val[4] to "0" else it drives zq_pd_val[4] to "1"
5. MMDC deasserts zq_compare_en
6. MMDC repeats steps 12- 15 for zq_pd_val bits 3 to 0
7. MMDC drives ZQ calibration result to MPZQHWCTRL[ZQ_HW_PD_RES]
8. MMDC deassert zq_comparator_en to indicate the completion of the ZQ calibration

33.11.2.2 ZQ software calibration process

The ZQ calibration can be done also in software. However since software ZQ calibration is much slower than hardware calibration it should be used mainly for debugging.

Software should configure the ZQ calibration parameters (Pull-up or Pull-down and their value) then assert the MPZQSWCTRL[ZQ_SW_FOR] bit. Then software should wait till ZQ_SW_FOR is de-asserted and use ZQ_SW_RES status bit in order to calculate the next ZQ calibration parameters.

33.11.2.3 ZQ calibration commands

Before the MMDC can issue a ZQCL/ZQCS command to the memory it should precharge all memory banks and wait tRP period. A single ZQ command can be issued to all devices as long as the devices don't share the same ZQ resistor.

When the MMDC issues the ZQ command it should also drive A10 (long or short command) and CS (0, 1 or both).

The MMDC must keep the memory lines quiet (except for CK) for the ZQ calibration time as defined in the Jedec (512 cycles for ZQCL after reset, 256 for other ZQCL and 64 for ZQCS).

33.11.3 Read DQS Gating Calibration

The read DQS gating calibration is used to adjust the read DQS gating with the middle of the read DQS preamble. The DQS gating includes a delay of up to 7 cycles (The delay is chosen according to two fields MPDGCTRL#[DG_HC_DEL#] and MPDGCTRL#[DG_DL_ABS_OFFSET#]

Each DQS has its own delay-line. The DQS gating process can be done for all DQS in parallel.

NOTE

In LPDDR2/LPDDR3 mode hardware Read DQS gating should be disabled and Pull-up/pull-down resistors on DQS/DQS# should be enabled while ODT resistors must be disconnected.

33.11.3.1 Hardware DQS Gating Calibration

- There are two modes of operations:
  - Calibration with the MPR (Multi Purpose Register)
  - Calibration with MMDC pre-defined values

33.11.3.1.1 Hardware DQS Calibration with MPR

The following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as requried by the standard.
2. Enter the DDR device into MPR mode through MRS commands
3. Configure the MMDC to work with MPR mode by asserting MPPDCMPR2[MPR_CMP]
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting MPDGCTRL0[HW_DG_EN]

33.11.3.1.2 Hardware DQS Calibration with pre-defined value

In case pre-defined mode is used, (i.e. MPPDCMPR2[MPR_CMP]) is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access to the external DDR device by setting MPSWDAR0[SW_DUMMY_WR] = 1 (MMDC will generate internally write access without intervention of the system towards bank 0, row 0, column 0)
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting MPDGCTRL0[HW_DG_EN]

   The following steps will be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

6. MMDC waits till the read DQS delay-line is updated with the absolute delay value for all bytes at MPDGCTRL#[DG_HC_DEL#] and MPDGCTRL#[DG_DL_ABS_OFFSET#] and also satisfying the Tmod + 4 requirement

7. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
8. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point. If the comparison passes then MMDC advances to step 14
9. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
10. MMDC increments the read DQS gating delay of each byte by half cycle (i.e. MPDGCTRL#[DG_HC_DEL#] + 1)
11. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
12. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8).
13. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 9-12. If the comparison passes then MMDC stores the value of the temporary low boundary and advances to next step
14. MMDC increments the read DQS gating delay-line of each byte by half cycle (i.e. MPDGCTRL#[DG_HC_DEL#] + 1) and issue measurement process of the read DQS gating delay-line to update itself with the new value
15. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
16. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
17. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 14-16. If the comparison fails then MMDC stores the value of the temporary upper boundary and starts searching the adequate low and high boundaries
18. MMDC returns to the temporary low boundary minus half cycle and issue measurement process of the read DQS gating delay-line to update itself with the new value
19. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
20. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)

21. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 22-23. If the comparison passes then MMDC stores the value of the adequate low boundary and advances to step 24
22. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
23. MMDC increments the read DQS gating delay of each byte by 1 (i.e. MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1) and issue measurement process of the read DQS gating delay-line to update itself with the new value and advances to step 19
24. MMDC returns to the temporary upper boundary minus half cycle and issue measurement process of the read DQS gating delay-line to update itself with the new value
25. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
26. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
27. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 28-29. If the comparison fails then MMDC stores the value minus 1 of the adequate upper boundary and advances to step 30
28. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
29. MMDC increments the read DQS gating delay of each byte by 1 (i.e. MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1) and issue measurement process of the read DQS gating delay-line to update itself with the new value and advances to step 25
30. After the MMDC finds the window boundary (lower and upper) of each read data byte then it stores the average between lower and upper boundaries at the associated MPDGCTRL#[DG_DL_ABS_OFFSET#] and issue measurement process of the read DQS delay-line to update itself with the new value.
31. MMDC indicates that the read DQS gating calibration had finished by setting MPDGCTRL0[HW_DG_EN] = 0
32. Exit the DDR device from MPR mode through MRS command
33. Read the upper boundary that was found: MPDGHWST#[HW_DG_UP#]. This field is 11 bits, 7 LSB bits correspond to MPDGCTRL#[DG_DL_ABS_OFFSET#] upper limit value and 4 MSB bits correspond to MPDGCTRL#[DG_HC_DEL#] upper limit value.
34. Set MPDGHWST#[HW_DG_UP#][6:0] to MPDGCTRL#[DG_DL_ABS_OFFSET#].

35. Set (MPDGHWST#[HW_DG_UP#][10:7] - 1) to MPDGCTRL#[DG_HC_DEL#]. (We set the DQS gating value to be the upper limit value minus 1 half cycle)

33.11.3.2 SW read DQS gating Calibration

- There are two modes of operations:
- Calibration with the MPR (Multi Purpose Register)
- Calibration with MMDC pre-defined values

33.11.3.2.1 SW read Calibration with MPR

The following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Enter the DDR device into MPR mode through MRS commands
3. Configure the MMDC to work with MPR mode by asserting MPPDCMPR2[MPR_CMP]
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window

33.11.3.2.2 SW read Calibration with pre-defined value

In case pre-defined mode is used, (i.e. MPPDCMPR2[MPR_CMP]) is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calicration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access (with any legal DDR address) to external DDR device
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window

   The following steps should be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

5. Configure the read DQS delay-line to issue zero delay by setting MPDGCTRL#[DG_DL_ABS_OFFSET#] = 0 and MPDGCTRL#[DG_HC_DEL#] = 0

6. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
7. Wait 16 DDR cycles till the read DQS delay-line is updated with the absolute delay value for all bytes
8. Issue read command (with the legal DDR address chosen in step 3) from the external DDR device
9. Waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC]) assuming that the data has arrived from the DDR device.
10. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point. If the comparison passes then advance to step 15
11. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
12. Increment the read DQS gating delay of each byte by half cycle (i.e. MPDGCTRL#[DG_HC_DEL#] + 1)
13. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC]) assuming that the data has arrived from the DDR device.
14. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 11 - 14. If the comparison passes then advance to step 15
15. Store the temporary lower boundary and start searching the temporary upper boundary
16. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
17. Increment the read DQS gating delay of each byte by half cycle (i.e. MPDGCTRL#[DG_HC_DEL#] + 1)
18. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
19. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8).
20. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 16-19. If the comparison fails then it is needed to store the value of the temporary upper boundary and starts searching the adequate low and high boundaries
21. Load the temporary low boundary minus half cycle into the associated MPDGCTRL#[DG_HC_DEL#]

22. Reset the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
23. Increment the read DQS gating delay of each byte by 1 (i.e. MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1) and force the delay line to measure itself and to issue the requested read DQS delay by configuring MPMUR[FRC_MSR] = 1
24. Issue read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC]) assuming that the data has arrived from the DDR device.
25. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
26. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 22-26. If the comparisons passes then advance to the next step.
27. Store the adequate lower boundary
28. Load the temporary upper boundary minus half cycle into the associated MPDGCTRL#[DG_HC_DEL#]
29. Reset the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
30. Increment the read DQS gating delay of each byte by 1 (i.e. MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1) and force the delay line to measure itself and to issue the requested read DQS delay by configuring MPMUR[FRC_MSR] = 1
31. Issue read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
32. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
33. If the comparison passes then it is needed to repeat steps 29-32. If the comparisons fails then advance to the next step.
34. Reset the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
35. Store the adequate upper boundary.
36. Keep the MPDGCTRL#[DG_DL_ABS_OFFSET#] value of the upper limit.
37. Set MPDGCTRL#[DG_HC_DEL#] = (MPDGCTRL#[DG_HC_DEL#] - 1). (We set the DQS gating value to be the upper limit value minus 1 half cycle)
38. Issue the requested read DQS delay by configuring MPMUR[FRC_MSR] = 1
39. Exit the DDR device from MPR mode through MRS command

33.11.4 Read Calibration

The read calibration is used to adjust the read DQS with read data byte. It is assumed that the read DQS gating calibration process is completed prior to the read calibration.

NOTE

In DDR3 mode, the activation of the calibration is done by setting MPRDDLHWCTL[HW_RD_DL_EN].

NOTE

In LP2_x16 the activation of the calibration is done by setting MPRDDLHWCTL[HW_RD_DL_EN].

NOTE

In LP2/3_x16 the activation of the calibration is done by setting MPRDDLHWCTL[HW_RD_DL_EN].

33.11.4.1 Hardware (automatic) Read Calibration

- There are two modes of operations:
- Calibration with the MPR (Multi Purpose Register)/DQ calibration(LPDDR2)
- Calibration with MMDC pre-defined values

33.11.4.1.1 Hardware (automatic) Calibration with MPR (DDR3) /DQ Calibration (LPDDR2)

The following steps should be executed:

1. Precharge all active banks (can be done through MDSCR) as requried by the standard.
2. Enter the DDR device into MPR/DQ calibration mode through MRS/MRW commands.
3. Configure the MMDC to work with MPR/DQ calibration mode by asserting MPPDCMPR2[MPR_CMP].
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window.
5. Start the calibration process by asserting MPRDDLHWCTL[HW_RD_DL_EN].

33.11.4.1.2 Hardware (automatic) Calibration with pre-defined value

In case pre-defined mode is used, i.e. MPPDCMPR2[MPR_CMP] is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access to the external DDR device by setting MPSWDAR0[SW_DUMMY_WR] = 1 (MMDC will generate internally write access without intervention of the system towards bank 0, row 0, column 0)
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting MPRDDLHWCTL[HW_RD_DL_EN]

   The following steps will be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

6. MMDC waits till the read delay-line is updated with the absolute delay value for all bytes at MPRDDLCTL[RD_DL_ABS_OFFSET#] and also satisfying the Tmod + 4 requirement
7. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device.
8. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial read DQS isn't inside the read DQ window and the MMDC generates an error for the associated byte at MPRDDLHWCTL[HW_RD_DL_ERR#] . If the comparison passes then MMDC advances to next step.
9. MMDC resets the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
10. MMDC decrements the read delay line absolute offset of each byte by 1 (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) and issue measurement process of the read delay-line to update itself with the new value.
11. MMDC drives read command to the DDR external devices and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device
12. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the low read boundary of the associated byte for each byte at MPRDDLHWST0/1[HW_RD_DL_LOW#] . If the comparison passes then MMDC repeats steps 9-11. If all read data comparisons fail then the MMDC advances to the next step

13. The MMDC start seeking the upper boundary and sets the read delay line absolute offset of each byte to the initial value + 1 as determined at step 4 and issue measurement process of the read delay-line to update itself with the new value
14. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
15. MMDC drives read command to the DDR external devices and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device
16. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the upper read boundary of the associated byte for each byte at MPRDDLHWST0/1[HW_RD_DL_UP#] . If the comparison passes then MMDC increments the read delay line absolute offset of each byte by 1 (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) and issue measurement process of the read delay-line to update itself with the new value.
17. If all read data comparisons fail then the MMDC advances to the next step. otherwise, MMDC repeats steps 14-16.
18. After the MMDC finds the window boundary (lower and upper) of each read data byte then it stores the average between lower and upper boundaries at the associated MPRDDLCTL[RD_DL_ABS_OFFSET#] and issue measurement process of the read delay-line to update itself with the new value.
19. MMDC indicates that the read data calibration had finished by setting MPRDDLHWCTL[HW_RD_DL_EN] = 0
20. Exit the DDR device from MPR/DQ calibration mode through MRS/MRW commands

33.11.4.2 SW Read Calibration

- There are two modes of operations:
- Calibration with the MPR (Multi Purpose Register)/DQ calibration (LPDDR2)
- Calibration with MMDC pre-defined values

33.11.4.2.1 Calibration with MPR(DDR3)/DQ calibration(LPDDR2)

The following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Enter the DDR device into MPR/DQ calibration mode through MRS/MRW commands

3. Configure the MMDC to work with MPR/DQ calibration mode by asserting MPPDCMPR2[MPR_CMP]
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window

33.11.4.2.2 Calibration with pre-defined value

In case pre-defined mode is used, i.e. MPPDCMPR2[MPR_CMP] is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as requried by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access (with any legal DDR address) to external DDR device.
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window

   The following steps will be executed manually by SW for both modes (MPR/DQ calibration and Pre-defined value):

5. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
6. Wait 16 DDR cycles till the read delay-line is updated with the absolute delay value for all bytes
7. Issue read command (with any legal DDR address) from the external DDR device
8. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial read DQS isn't inside the read DQ window. If the comparison passes then advance to next step.
9. Reset the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
10. Decrement the read delay line absolute offset of each byte by 1 (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#])
11. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
12. Issue read command (with the legal DDR address chosen in step 7) from the external DDR device and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device

13. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the low read boundary of the associated byte at of each byte . If the comparison passes then repeat steps 9-12. If all read data comparisons fail then advance to the next step.
14. Start seeking the upper boundary and set the read delay line absolute offset of each byte to the initial value + 1 as determined at step 4
15. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
16. Resets the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
17. Issue read command (with the legal DDR address chosen in step 7) from the external DDR device
18. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the upper read boundary of the associated byte at of each byte. If the comparison passes then increment the read delay line absolute offset of each byte by 1 (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#])
19. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
20. If all read data comparisons fail then advance to the next step, else repeat steps 16-19
21. After finding the window boundary (lower and upper) of each read data byte then calculate the average between lower and upper boundaries and store the associated average at MPRDDLCTL[RD_DL_ABS_OFFSET#]
22. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
23. Exit the DDR device from MPR/DQ calibration mode through MRS/MRW commands.

33.11.5 Write Calibration

The write calibration is used to adjust the write DQS with write data byte. It is assumed that the read calibration process is completed prior to the write calibration.

NOTE

In DDR3_x64 and LP2_1ch_x64 modes, the activation of the calibration is done by setting MPWRDLHWCTL0[HW_WR_DL_EN]

NOTE

In LP2/3_2ch_x16, LP2/3_2ch_x32 the activation of the calibration of each channel is done by setting MPWRDLHWCTL0[HW_WR_DL_EN] and MPWRDLHWCTL0[HW_WR_DL_EN]

NOTE

In LP2_2ch_x16, LP2_2ch_x32 the activation of the calibration of each channel is done by setting MPWRDLHWCTL0[HW_WR_DL_EN] and MPWRDLHWCTL0[HW_WR_DL_EN]

33.11.5.1 HW (automatic) Write Calibration

The following steps should be executed:

1. Make sure that the initial value that is configured in the write delay line absolute offset of each byte (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#]) will place the write DQS somewhere inside the write DQ window
2. Configure the pre-defined value, which reflects the value that will be written and compared through the write calibration, to MPPDCMPR1[PDV1, PDV2]
3. Assert MPWRDLHWCTL0[HW_WR_DL_EN]

   The following steps will be executed automatically:

4. MMDC waits till the write delay-line is updated with the absolute delay value for all bytes at MPWRDCTL[WR_DL_ABS_OFFSET#]
5. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to MPWRDLHWCTL[HW_WR_DL_CMP_CYC]) assuming that the data has arrived to the DDR device.
6. MMDC drives read command to the same address from the external DDR
7. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial write DQS isn't inside the write DQ window and the MMDC generates an error for the associated byte at MPWRDLHWCTL[HW_WR_DL_ERR#] . If the comparison passes then MMDC advances to next step.
8. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
9. MMDC decrements the write delay line absolute offset of each byte by 1 (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#]) and issue measurement process of the write delay-line to update itself with the new value.

10. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to MPWRDLHWCTL[HW_WR_DL_CMP_CYC]) assuming that the data has arrived to the DDR device
11. MMDC drives read command to the same address from the external DDR
12. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the low write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_LOW#] . If the comparison passes then MMDC repeats steps 8-11. If all data comparisons fail then the MMDC advances to the next step
13. The MMDC start seeking the upper boundary and sets the write delay line absolute offset of each byte to the initial value + 1 as determined at step 4 and issue measurement process of the write delay-line to update itself with the new value
14. MMDC resets the rd fifo (to the inverted pre-defined value) and its pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
15. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to MPWRDLHWCTL[HW_WR_DL_CMP_CYC]) assuming that the data has arrived to the DDR device.
16. MMDC drives read command to the same address from the external DDR
17. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the upper write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_UP#] . If the comparison passes then MMDC increments the write delay line absolute offset of each byte by 1 (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#]) and issue measurement process of the write delay-line to update itself with the new value.
18. MMDC repeats steps 14-17. If all data comparisons fail then the MMDC advances to the next step
19. .After the MMDC finds the window boundary (lower and upper) of each write data byte then it stores the average between lower and upper boundaries at the associated MPWRDLCTL[WR_DL_ABS_OFFSET#] and issue measurement process of the write delay-line to update itself with the new value.
20. MMDC indicates that the write data calibration had finished by setting MPWRDLHWCTL[HW_WR_DL_EN] = 0

33.11.5.2 SW Write Calibration

The following steps should be executed:

NOTE

It is recommended to perform the write calibration using the HW method. The SW method is provided for debug purposes only.

1. Make sure that the initial value that is configured in the write delay line absolute offset of each byte (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#]) will place the write DQS somewhere inside the write DQ window
2. Configure the pre-defined value, which reflects the value that will be written and compared through the write calibration, to MPPDCMPR1[PDV1, PDV2]
3. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR[FRC_MSR] = 1
4. Wait 16 DDR cycles till the write delay-line is updated with the absolute delay value for all bytes
5. Issue write command to any legal DDR address of the external DDR device
6. Issue read command, to the address written previously, from the external DDR device
7. Compare the read data byte to the associated byte in the pre-defined value for all bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial write DQS isn't inside the write DQ window. If the comparison passes then advance to next step.
8. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
9. Decrement the write delay line absolute offset of each byte by 1 (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#])
10. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR[FRC_MSR] = 1
11. Issue write command to any legal DDR address of the external DDR device
12. Issue read command, to the address written previously, from the external DDR device
13. Compare the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the low write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_LOW#] . If the comparison passes then repeat steps 8-12. If all data comparisons fail then advance to the next step.
14. Start seeking the upper boundary and set the write delay line absolute offset of each byte to the initial value + 1
15. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR[FRC_MSR] = 1
16. Reset the rd fifo (to the inverted pre-defined value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
17. Issue write command to any legal DDR address of the external DDR device

18. Issue read command, to the address written previously, from the external DDR device
19. Compare the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the upper write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_UP#]. If the comparison passes then increment the write delay line absolute offset of each byte by 1.
20. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR[FRC_MSR] = 1
21. If all read data comparisons fail then advance to the next step else repeat steps 16-20.
22. .After finding the window boundary (lower and upper) of each write data byte then calculate the average between lower and upper boundaries and store the associated average at MPWRDLCTL[WR_DL_ABS_OFFSET#]
23. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR[FRC_MSR] = 1

33.11.6 Write leveling Calibration

The write leveling calibration can generate a delay between the clock and the associate DQS of up to 3 cycles as following: (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle). Write leveling calibration can be executed automatically(HW) or manually (SW).

The automatic calibration process can only detect the optimal DQS to clock delay to within 1 cycle. In extreme cases in which the DDR3 memory is placed far from the microcontroller (long address/command/clock trace lengths), the skew between the DQS and clock may exceed 1 cycle. If this is the case, it is the user's responsibility to both understand that their design causes the DQS to clock skew to exceed 1 cycle and to indicate this manually in the MPWLDECTRL0/1[WL_CYC_DEL#]. It is highly recommended to keep the DDR3 memory as close to the microcontroller as possible, especially in embedded system designs. When using fly-by topology, the user should calculate the PCB flight time of the clock signal to the furthest placed DDR3 memory to ensure less than 1 cycle skew between DQS and clock.

NOTE

In LPDDR2 mode Write-leveling calibration should be disabled.

33.11.6.1 Hardware Write Leveling Calibration

The following steps should be executed:

1. Configure the external DDR device to enter write leveling mode through MRS command
2. Activate the DQS output enable by setting MDSCR[WL_EN]
3. Active automatic calibration by setting MPWLGCR[HW_WL_EN]

   The following steps will be executed automatically by the MMDC:

4. MMDC enters write leveling mode, counts 25 + 15 cycles and drives the DQS pads as output while the DQ pads will remain inputs. In parallel the MMDC configures the write leveling delay line to "0" (i.e. MPWLDECTRL0[WL_DL_ABS_OFFSET#] = 0) and issue measurement process of the writ-leveling delay-line to update itself with the new value
5. MMDC drives one DQS pulse to the DDR external device
6. MMDC waits 16 cycles (to guarantee that the DQ prime data is stable) and samples the associated prime DQ bit (for example for DQS1 the MMDC samples DQ[8])
7. MMDC increments the write leveling delay line by 1/8 cycle and perform measurement process in order to load the updated value to the associated delay-line
8. MMDC repeates steps 5-7 till the write leveling delay is 1 cycle
9. MMDC checks the 8 bit prime DQ results for each DQS and finds the first transition from 0 to 1. If no transition is found then the MMDC indicates an error at MPWLGCR[HW_WL_ERR#]
10. MMDC stores the value that issues the last "0" on the prime DQ before the transition and loads it to the write leveling delay-line. The MMDC initiates a fine-tune process by incrementing the delay-line values by 1 step (which is 1/256 part of a cycle) till detecting the most accurate transition from 0 to 1
11. Upon completion of this process the MMDC de-asserts the MPWLGCR[HW_WL_EN] and update the most accurate value of the delay-line at the associated MPWLDECTRL#[WL_DL_ABS_OFFSET#]
12. MMDC perform measurement process in order to load the most accurate value to the associated delay-line
13. User should issue MRS command to exit write leveling mode
14. The user should read the results of the associated delay-line at MPWLDECTRL#[WL_DL_ABS_OFFSET#] and in case the user estimates that the reasonable delay may be above 1 cycle then the user should indicate it at MPWLDECTRL#[WL_CYC_DEL#]. Moreover the user should indicate it in MDMISC[WALAT] field. For example, if the result of the write leveling calibration is 100/256 parts of a cycle, but the user estimates that the delay is above 2 cycles then MPWLDECTRL#[WL_CYC_DEL#] should be configured to 2, so the total delay will be 2 and 100/256 parts of a cycle

15. Return the DQS output enable to functional mode by deasserting MDSCR[WL_EN]

33.11.6.2 SW Write Leveling Calibration

The following steps should be executed:

NOTE

It is recommended to perform the write calibration using the HW method. The SW method is provided for debug purposes only.

1. Configure the external DDR device to enter write leveling mode through MRS command
2. Activate the DQS output enable by setting MDSCR[WL_EN]
3. Set the write-leveling delay-line offset to "0" by configuring MPWLDECTRL0[WL_DL_ABS_OFFSET#] = 0
4. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
5. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1 together with MPWLGCR[SW_WL_CNT_EN] = 1
6. Issue an IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
7. Increment the write leveling delay line by 1/8 cycle (i.e add 0x20 to {MPWLDECTRL0[WL_HC_DEL#],MPWLDECTRL0[WL_DL_ABS_OFFSET#]})
8. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
9. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
10. Repeate steps 6-9 till the edge of CK was detected (i.e the write-leveling result switched from "0" to "1")
11. Store the value that issues the last "0" on the prime DQ before the transition and load it to the write leveling delay-line and start fine tuning process to detect the exact switch from "0" to "1"
12. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
13. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
14. Issue a IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].

15. Increment the write leveling delay line by 1 step (i.e add 0x01 to MPWLDECTRL0[WL_DL_ABS_OFFSET#])
16. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
17. Issue an IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
18. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
19. Repeates step 15-18 till the exact edge of CK was detected (i.e the write-leveling result switched from "0" to "1")
20. Issue MRS command to exit write leveling mode
21. Return the DQS output enable to functional mode by deasserting MDSCR[WL_EN]

33.11.7 Write fine tuning

Write fine tuning is an additional circuit that provides the ability to fine tune the timing of each of the DQ/DM bits (relative to DQS) by up to 100 ps. To use the write fine tuning, select the number of delay units in each DQ/DM I/O (maximum 3 delay units of around 30-35 ps each). The delay can be configured independently for each DQ/DM. This configuration is controlled by the MPWRDQBY#DL register.

33.11.8 Read fine tuning

Read fine tuning is an additional circuit that provides the ability to fine tune the timing of each coming dq bits (relative to coming dqs) by up to +/-100 ps.

This is done by reducing the delay between the incoming rd_dqs by 100 ps and adding a configurable delay of up to 200 ps (6 delay units of around 30-35 ps each) for each DQ input. The delay can be configured independently for each DQ. The calibration of this mechanism can be done only by writing & reading data from the memory. Controlled by register MPRDDQBY#DL.

33.11.9 ZQ Fine Tuning

An offset can be added to the PU /PD values determined by the ZQ calibration process. The offset range is programmable from -7 to +7, controlled by the MMDC_MPPDCMPR2[ZQ_PU_OFFSET] and

MMDC_MPPDCMPR2[ZQ_PD_OFFSET] fields. The offset is enabled/disabled by MMDC_MPPDCMPR2[ZQ_OFFSET_EN]. See MMDC_MPPDCMPR2 register for more information.

33.11.10 Duty cycle adjustment

Duty cycle adjustments can be made to the SDCLKx and SDQSx signals, see the MMDCx_MPDCCR register for more information.

Address: 21B_0000h base + 0h offset = 21B_0000h

MMDC_MDCTL field descriptions

Field	Description
31 SDE_0	MMDC Enable CS0. This bit enables/disables accesses from the MMDC toward Chip Select 0. The reset value of this bit is "0" (i.e No clocks and clock enable will be driven to the memory). At the enabling point the MMDC will perform an initialization process (including a delay on RESET and/or CKE) for both chip selects. The initialization length depends on the configured memory type. 0 Disabled 1 Enabled
30 SDE_1	MMDC Enable CS1. This bit enables/disables accesses from the MMDC toward Chip Select 1. The reset value of this bit is "0" (i.e No clocks and clock enable will be driven to the memory). At the enabling point the MMDC will perform an initialization process (including a delay on RESET and/or CKE) for both chip selects. The initialization length depends on the configured memory type. 0 Disabled 1 Enabled
29–27 Reserved	This read-only field is reserved and always has the value 0.
26–24 ROW	Row Address Width. This field specifies the number of row addresses used by the memory array. It will affect the way an incoming address will be decoded. Settings 110-111 are reserved 000 11 bits Row 001 12 bits Row 010 13 bits Row 011 14 bits Row 100 15 bits Row 101 16 bits Row
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 COL	Column Address Width. This field specifies the number of column addresses used by the memory array. It will determine how an incoming address will be decoded. 0x0 9 bits column 0x1 10 bits column 0x2 11 bits column 0x3 8 bits column 0x4 12 bits column 0x5-0xF Reserved
19 BL	Burst Length. This field determines the burst length of the DDR device. In LPDDR2 mode the MMDC supports burst length 4. In DDR3 mode the MMDC supports burst length 8. 0 Burst Length 4 is used 1 Burst Length 8 is used
18 Reserved	This read-only field is reserved and always has the value 0.
17–16 DSIZ	DDR data bus size. This field determines the size of the data bus of the DDR memory

	0 16-bit data bus — 1 Reserved — — 2-3 Reserved
Reserved	This read-only field is reserved and always has the value 0.

33.12.2 MMDC Core Power Down Control Register (MMDC_MDPDC)

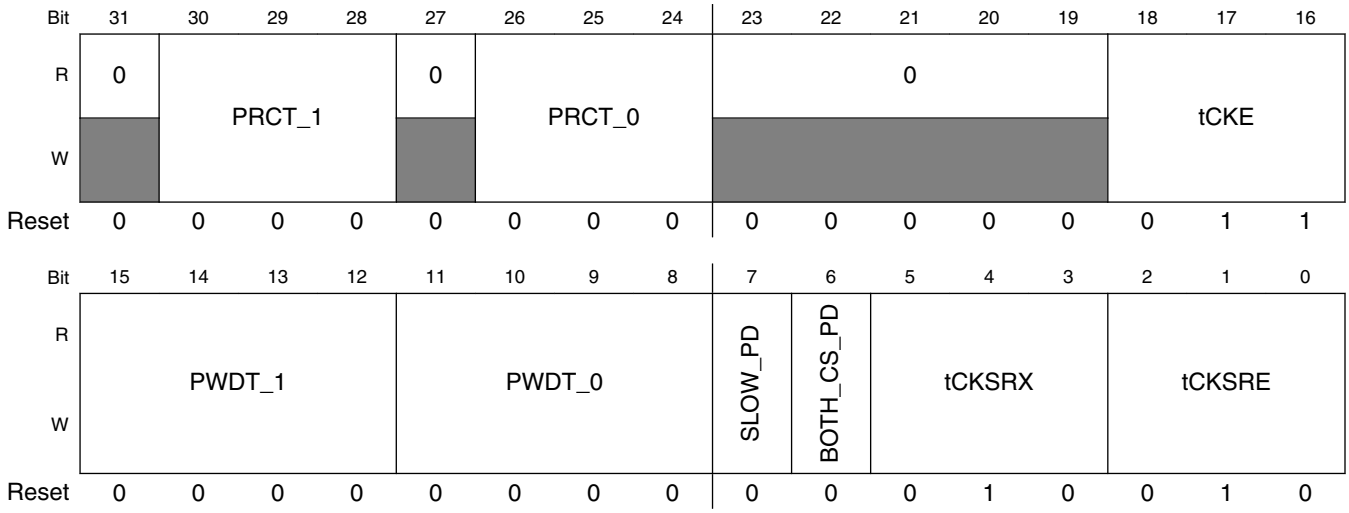

Table 33-13. PRCT field encoding

PRCT[2:0]	Precharge Timer
000	Disabled (Bit field reset value)
001	2 clocks
010	4 clocks
011	8 clocks
100	16 clocks
101	32 clocks
110	64 clocks
111	128 clocks

Table 33-14. PWDT field encoding

PWDT[3:0]	Power Down Time-out
0000	Disabled (bit field reset value)
0001	16 cycles
0010	32 cycles
0011	64 cycles
0100	128 cycles
0101	256 cycles
0110	512 cycles
0111	1024 cycles
1000	2048 cycles
1001	4096 cycles
1010	8196 cycles
1011	16384 cycles
1100	32768 cycles
1101-1111	Reserved

Address: 21B_0000h base + 4h offset = 21B_0004h

MMDC_MDPDC field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–28 PRCT_1	Precharge Timer - Chip Select 1. This field determines the amount of idle cycle for which chip select 1 will be automatically precharged. The amount of cycles are determined according to the PRCT Field Encoding table above.
27 Reserved	This read-only field is reserved and always has the value 0.
26–24 PRCT_0	Precharge Timer - Chip Select 0. This field determines the amount of idle cycle for which chip select 0 will be automatically precharged. The amount of cycles are determined according to the table below.
23–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 tCKE	CKE minimum pulse width. This field determines the minimum pulse width of CKE. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
15–12 PWDT_1	Power Down Timer - Chip Select 1. This field determines the amount of idle cycle for which chip select 1 will be automatically get into precharge/active power down. The amount of cycles are determined according to the PWDT Field Encoding table above.
11–8 PWDT_0	Power Down Timer - Chip Select 0. This field determines the amount of idle cycle for which chip select 0 will be automatically get into precharge/active power down. The amount of cycles are determined according to the PWDT Field Encoding table above.
7 SLOW_PD	Slow/fast power down. In DDR3 mode this field is referred to slow precharge power-down.

Table continues on the next page...

MMDC_MDPDC field descriptions (continued)

Field	Description
	In LPDDR2 mode this field is not relevant. **NOTE:** Memory should be configured the same. 0 Fast mode. 1 Slow mode.
6 BOTH_CS_PD	Parallel power down entry to both chip selects. When power down timer is used for both chip-selects (i.e PWDT_0 and PWDT1 don't equal "0") , then if this bit is enabled, the MMDC will enter power down only if the amount of idle cycles of both chip selects was obtained. 0 Each chip select can enter power down independently according to its configuration. 1 Chip selects can enter power down only if the amount of idle cycles of both chip selects was obtained.
5–3 tCKSRX	Valid clock cycles before self-refresh exit. This field determines the amount of clock cycles before self-refresh exit 0x0 0 cycle 0x1 1 cycles 0x6 6 cycles 0x7 7 cycles
tCKSRE	Valid clock cycles after self-refresh entry. This field determines the amount of clock cycles after self-refresh entry 0x0 0 cycle 0x1 1 cycles 0x6 6cycles 0x7 7cycles

33.12.3 MMDC Core ODT Timing Control Register (MMDC_MDOTC)

For further information see ODT Configuration .

Address: 21B_0000h base + 8h offset = 21B_0008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MDOTC field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
29–27 tAOFPD	Asynchronous RTT turn-off delay (power down with DLL frozen). This field determines the time between termination cuircuit starts to turn off the ODT resistance till termination has reached high impedance. In LPDDR2 this field is not relevant. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
26–24 tAONPD	Asynchronous RTT turn-on delay (power down with DLL frozen). This field determines the time between termination cuircuit gets out of high impedance and begins to turn on till ODT resistance are fully on. In LPDDR2 this field is not relevant. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
23–20 tANPD	Asynchronous ODT to power down entry delay. In DDR3 should be set to tCWL-1 In LPDDR2 this field is not relevant. 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF 16 clocks
19–16 tAXPD	Asynchronous ODT to power down exit delay. In DDR3 should be set to tCWL-1 In LPDDR2 this field is not relevant. 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF 16 clocks
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 tODTLon	ODT turn on latency. This field determines the delay between ODT signal and the associated RTT, where according to JEDEC standard it equals WL(write latency) - 2. Therefore, the value that is configured to tODTLon field should correspond the value that is configured to MDCGFG1[tCWL] In LPDDR2 this field is not relevant. 0x0 - 0x1 Reserved 0x2 2 cycles 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles

Table continues on the next page...

MMDC_MDOTC field descriptions (continued)

Field	Description
	0x6 6 cycles 0x7 Reserved
11–9 Reserved	This read-only field is reserved and always has the value 0.
8–4 tODT_idle_off	ODT turn off latency. This field determines the Idle period before turning memory ODT off. **NOTE:** This field is not relevant in LPDDR2 mode. 0x0 0 cycle (turned off at the earliest possible time) 0x1 1 cycle 0x2 2 cycles 0x1E 30 cycles 0x1F 31 cycles
Reserved	This read-only field is reserved and always has the value 0.

33.12.4 MMDC Core Timing Configuration Register 0 (MMDC_MDCFG0)

Address: 21B_0000h base + Ch offset = 21B_000Ch

33.12.7 MMDC Core Miscellaneous Register (MMDC_MDMISC)

Address: 21B_0000h base + 18h offset = 21B_0018h

MMDC_MDMISC field descriptions

Field	Description
31 CS0_RDY	External status device on CS0. This is a read-only status bit, that indicates whether the external memory is in wake-up period. 0 Device in wake-up period. 1 Device is ready for initialization.

Table continues on the next page...

MMDC_MDMISC field descriptions (continued)

Field	Description
30 CS1_RDY	External status device on CS1. This is a read-only status bit, that indicates whether the external memory is in wake-up period. 0 Device in wake-up period. 1 Device is ready for initialization.
29–22 Reserved	This read-only field is reserved and always has the value 0.
21 CK1_GATING	Gating the secondary DDR clock. When this bit is asserted then the MMDC will disable the secondary DDR clock 0 MMDC drives two clocks toward the DDR memory 1 MMDC drives only one clock toward the DDR memory (CK0)
20 CALIB_PER_CS	Number of chip-select for calibration process. This bit determines the chip-select index that the associated calibration is targetted to. Relevant for read, write, write leveling and read DQS gating calibrations 0 Calibration is targetted to CS0 1 Calibration is targetted to CS1
19 ADDR_MIRROR	Address mirroring. **NOTE:** This feature is not supported for LPDDR2/LPDDR3 memories. But only for DDR2/DDR3 memories. For further information see Address mirroring . 0 Address mirroring disabled. 1 Address mirroring enabled.
18 LHD	Latency hiding disable. This is a debug feature. When set to "1" the MMDC will handle one read/write access at a time. Meaning that the MMDC pipe-line will be limitted to 1 open access (next AXI address phase will be acknowledged if the current AXI data phase had finished) 0 Latency hiding on. 1 Latency hiding disable.
17–16 WALAT	Write Additional latency. In case the write-leveling calibration process indicates a delay of greater than one-eighth a clock cycle (between CK and any of the DQS strobe lines), then this field must be configured accordingly. This field will add delay on the obe I/O control, which will compensate on the additional write leveling delay on DQS and prevent the DQS from being cropped. **NOTE:** The purpose of WALAT is to add time delay at the end of a burst write operation to ensure that the JEDEC time specification for Write Post Amble Delay (tWPST) is met (DQS strobe is held low at the end of a write burst for > 30% a clock cycle before it is released). If the value of any of the WL_DL_ABS_OFFSETn register fields are greater than ‘1F’, WALAT should be set to ‘1’ (cycle additional delay). WALAT should be further increased for any full cycle delays added by the WL_CYC_DELn register fields. 0x0 No additional latency required. 0x1 1 cycle additional delay 0x2 2 cycles additional delay 0x3 3 cycles additional delay

Table continues on the next page...

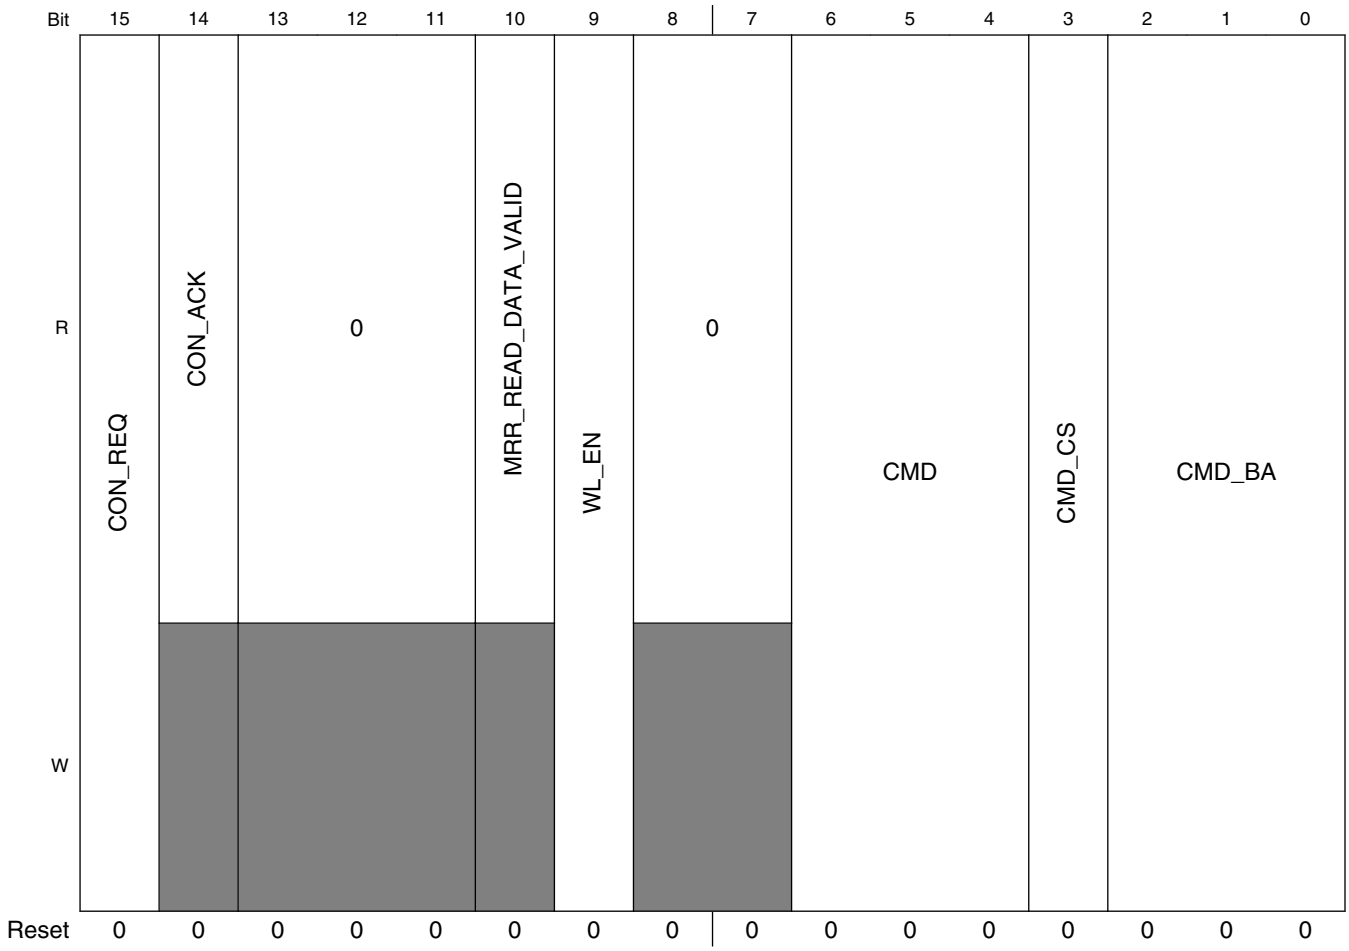
MMDC_MDMISC field descriptions (continued)

Field	Description
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 BI_ON	Bank Interleaving On. This bit controls the organization of the bank, row and column address bits. For further information see Address decoding . 0 Banks are not interleaved, and address will be decoded as bank-row-column 1 Banks are interleaved, and address will be decoded as row-bank-column
11 LPDDR2_S2	LPDDR2 S2 device type indication. In case LPDDR2 device is used (DDR_TYPE = 0x1), this bit will indicate whether S2 or S4 device is used. This bit should be cleared in DDR3 mode 0x0 LPDDR2-S4 device is used. 0x1 LPDDR2-S2 device is used.
10–9 MIF3_MODE	Command prediction working mode. This field determines the level of command prediction that will be used by the MMDC 00 Disable prediction. 01 Enable prediction based on : Valid access on first pipe line stage. 10 Enable prediction based on: Valid access on first pipe line stage, Valid access on axi bus. 11 Enable prediction based on: Valid access on first pipe line stage, Valid access on axi bus, Next miss access from access queue.
8–6 RALAT	Read Additional Latency. This field determines the additional read latency which is added to CAS latency and internal delays for which the MMDC will retrieve the read data from the internal FIFO. This field is used to compensate on board/chip delays. **NOTE:** In LPDDR2 mode 2 extra cycles will be added internally in order to compensate tDQSCK delay. 0x0 no additional latency. 0x1 1 cycle additional latency. 0x2 2 cycles additional latency. 0x3 3 cycles additional latency. 0x4 4 cycles additional latency. 0x5 5 cycles additional latency. 0x6 6 cycles additional latency. 0x7 7 cycles additional latency.
5 DDR_4_BANK	Number of banks per DDR device. When this bit is set to "1" then the MMDC will work with DDR device of 4 banks. 0 8 banks device is being used. (Default) 1 4 banks device is being used
4–3 DDR_TYPE	DDR TYPE. This field determines the type of the external DDR device. 0x0 DDR3 device is used. 0x1 LPDDR2 device is used. 0x1 Reserved 0x2 Reserved 0x3 Reserved
2 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MDMISC field descriptions (continued)

Field	Description
1 RST	Software Reset. When this bit is asserted then the internal FSMs and registers of the MMDC will be initialized. **NOTE:** This bit once asserted gets deasserted automatically. 0 Do nothing. 1 Assert reset to the MMDC.
0 Reserved	This read-only field is reserved and always has the value 0.



33.12.8 MMDC Core Special Command Register (MMDC_MDSCR)

This register is used to issue special commands manually toward the external DDR device (such as load mode register, manual self refresh, manual precharge and so on). Every write to this register will be interpreted as a command, and a read from this register will show the last command that was executed.

Every write to this register will result in one special command, and the IP bus will assert ips_xfr_wait as long as the special command is being carried out.

Address: 21B_0000h base + 1Ch offset = 21B_001Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	CMD_ADDR_MSB_MR_OP								CMD_ADDR_LSB_MR_ADDR							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDC_MDSCR field descriptions

Field	Description
31–24 CMD_ADDR_MSB_MR_OP	Command/Address MSB. This field indicates the MSB of the command/Address. In LPDDR2/LPDDR3 this field indicates the MRW operand
23–16 CMD_ADDR_LSB_MR_ADDR	Command/Address LSB. This field indicates the LSB of the command/Address In LPDDR2/LPDDR3 this field indicates the MRR/MRW address
15 CON_REQ	Configuration request. When this bit is set then the MMDC will clean the pending AXI accesses and will prevent from further AXI accesses to be acknowledged. This field guarantee safe configuration (or change configuration) of the MMDC while no access is in process and prevents an unexpected behaviour. After setting this bit, it is needed to poll on CON_ACK until it is set to "1". When CON_ACK is asserted then configuration is permitted. After configuration is completed then this bit must be deasserted in order to process further AXI accesses. **NOTE:** This bit is asserted at the end of the reset sequence, meaning that the MMDC is waiting to configure and intialize the external memory before accepting any AXI accesses. Configuration request/acknowledge mechanism should be used for the following procedures: changing of timing parameters , during calibration process or driving commands via MDSCR[CMD]

Table continues on the next page...

MMDC_MDSCR field descriptions (continued)

Field	Description
	0 No request to configure MMDC. 1 A request to configure MMDC is valid
14 CON_ACK	Configuration acknowledge. Whenever this bit is set, it is permitted to configure MMDC IP registers. 0 Configuration of MMDC registers is forbidden. 1 Configuration of MMDC registers is permitted.
13–11 Reserved	This read-only field is reserved and always has the value 0.
10 MRR_READ_ DATA_VALID	MRR read data valid. This field indicates that read data is valid at MDMRR register **NOTE:** This field is relevant only for LPDDR2/LPDDR3 mode 0 Cleared upon the assertion of MRR command 1 Set after MRR data is valid and stored at MDMRR register.
9 WL_EN	DQS pads direction. This bit controls the DQS pads direction during write-leveling calibration process. Before starting the write-leveling calibration process this bit should be set to "1". It should be set to "0" when sending write leveling exit command. For further information see Write leveling Calibration . 0 Exit write leveling mode or stay in normal mode. 1 Write leveling entry command was sent.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–4 CMD	Command. This field contains the command to be executed. This field will be automatically cleared after the command will be send to the DDR memory. **NOTE:** Only the 0x5 Precharge all command should be used, memory operation is unpredictable when using the 0x1 command 0x0 Normal operation 0x1 Reserved 0x2 Auto-Refresh Command (set correct CMD_CS). 0x3 Load Mode Register Command DDR2/DDR3, set correct CMD_CS, CMD_BA, CMD_ADDR_LSB, CMD_ADDR_MSB), MRW Command (LPDDR2/LPDDR3, set correct CMD_CS, MR_OP, MR_ADDR) 0x4 ZQ calibration (DDR2/DDR3, set correct CMD_CS, {CMD_ADDR_MSB,CMD_ADDR_LSB} = 0x400 or 0x0) 0x5 Precharge all, only if banks open (set correct CMD_CS). 0x6 MRR command (LPDDR2/LPDDR3, set correct CMD_CS, MR_ADDR) 0x7 Reserved
3 CMD_CS	Chip Select. This field determines which chip select the command is targeted to 0 to Chip-select 0 1 to Chip-select 1
CMD_BA	Bank Address. This field determines the address of the bank within the selected chip-select where the command is targetted to. 0x0 bank address 0

Table continues on the next page...

Field	Description
	0x1 bank address 1 0x2 bank address 2 0x7 bank address 7

33.12.9 MMDC Core Refresh Control Register (MMDC_MDREF)

This register determines the refresh scheme that will be executed toward the DDR device. It specifies how often a refresh cycle occurs and how many refresh commands will be executed every refresh cycle.

For further information see Refresh Scheme .

The following tables show examples of possible refresh schemes.

Table 33-15. Refresh rate example for REF_SEL = 0

REFR[2:0]	Number of refresh commands every 64KHz	Average periodic refresh rate (tREFI)	System Refresh period
0x0	1	15.6 µs	tRFC
0x1	2	7.8 µs	2*tRFC
0x3	4	3.9µs	4*tRFC
0x7	8	1.95 µs	8*tRFC

Table 33-16. Refresh rate example for REF_SEL = 1

REFR[2:0]	Number of refresh commands every 32KHz	Average periodic refresh rate (tREFI)	System Refresh period
0x1	2	15.6 µs	2*tRFC
0x3	4	7.8 µs	4*tRFC
0x7	8	3.9µs	8*tRFC

Table 33-17. Refresh rate example for REF_SEL = 2@ 400MHz

REFR[2:0]	Number of refresh commands every refresh cycle	REF_CNT	Average periodic refresh rate (tREFI)	System Refresh period
0x0	1	0x618	3.9 µs	tRFC
0x1	2	0xC30	3.9 µs	2*tRFC

Table continues on the next page...

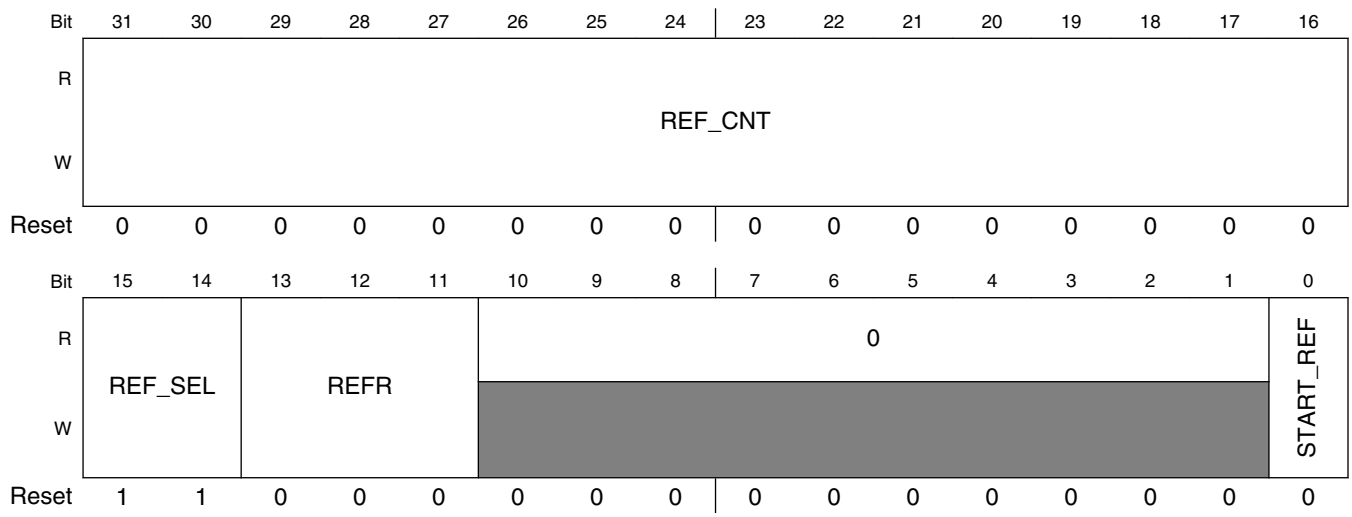

Table 33-17. Refresh rate example for REF_SEL = 2@ 400MHz (continued)

REFR[2:0]	Number of refresh commands every refresh cycle	REF_CNT	Average periodic refresh rate (tREFI)	System Refresh period
0x2	3	0x1248	3.9µs	3*tRFC
0x3	4	0x1860	3.9 µs	4*tRFC

Other refresh configurations are also allowed; the configuration values in the tables above are only examples for obtaining the desired average periodic refresh rate.

If the required average periodic refresh rate (tREFI) is kept, all of the rows will be refreshed in every refresh window. Because the memory device issues additional refresh commands for every refresh it receives, the tREFI remains the same across the device, regardless of its number of rows. This is particularly relevant in the tRFC parameter, which becomes bigger as the density increases.

Address: 21B_0000h base + 20h offset = 21B_0020h

MMDC_MDREF field descriptions

Field	Description
31–16 REF_CNT	Refresh Counter at DDR clock period If REF_SEL equals '2' a refresh cycle will begin every amount of DDR cycles configured in this field. 0x0 Reserved. 0x1 1 cycle. 0xFFFE 65534 cycles. 0xFFFF 65535 cycles.
15–14 REF_SEL	Refresh Selector. This bit selects the source of the clock that will trigger each refresh cycle:

Table continues on the next page...

MMDC_MDREF field descriptions (continued)

Field	Description
	0 Periodic refresh cycles will be triggered in frequency of 64KHz. 1 Periodic refresh cycles will be triggered in frequency of 32KHz. 2 Periodic refresh cycles will be triggered every amount of cycles that are configured in REF_CNT field. 3 No refresh cycles will be triggered.
13–11 REFR	Refresh Rate. This field determines how many refresh commands will be issued every refresh cycle. After every refresh command the MMDC won't drive any command to the DDR device untill satisfying tRFC period 0x0 1 refresh 0x1 2 refreshes 0x2 3 refreshes 0x3 4 refreshes 0x4 5 refreshes 0x5 6 refreshes 0x6 7 refreshes 0x7 8 refreshes
10–1 Reserved	This read-only field is reserved and always has the value 0.
0 START_REF	Manual start of refresh cycle. When this field is set to '1' the MMDC will start a refresh cycle immediately according to number of refresh commands that are configured in 'REFR' field. This bit returns to zero automatically. 0 Do nothing. 1 Start a refresh cycle.

33.12.10 MMDC Core Read/Write Command Delay Register (MMDC_MDRWD)

This register determines the delay between back to back read and write accesses. The register reset values are set to the minimum required value. As the default values are set to achieve optimal results, changing them is discouraged.

Address: 21B_0000h base + 2Ch offset = 21B_002Ch

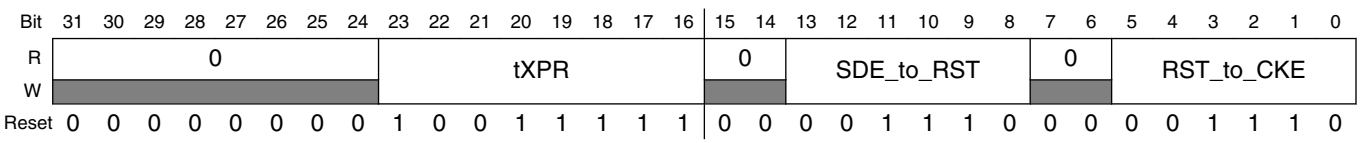
MMDC_MDRWD field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28–16 tDAI	Device auto initialization period.(maximum) **NOTE:** This field is relevant only to LPDDR2 mode 0x0 1 cycle 0xF9F 4000 cycles (Default, JEDEC value for LPDDR2, gives 10us at 400MHz clock). 0x1FFF 8192 cycles
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 RTW_SAME	Read to write delay for the same chip-select. This field controls the delay between read to write commands toward the same chip select. The total delay is calculated according to: BL/2 + RTW_SAME + (tCL-tCWL) + RALAT 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles (Default) 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles
11–9 WTR_DIFF	Write to read delay for different chip-select. This field controls the delay between write to read commands toward different chip select. The total delay is calculated according to: BL/2 + WTR_DIFF + (tCL-tCWL) + RALAT 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles 0x3 3 cycles (Default) 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles
8–6 WTW_DIFF	Write to write delay for different chip-select. This field controls the delay between write to write commands toward different chip select. The total delay is calculated according to: BL/2 + WTW_DIFF 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles 0x3 3 cycles (Default) 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles

Table continues on the next page...



MMDC_MDRWD field descriptions (continued)

Field	Description
5–3 RTW_DIFF	Read to write delay for different chip-select. This field controls the delay between read to write commands toward different chip select. The total delay is calculated according to: BL/2 + RTW_DIFF + (tCL - tCWL) + RALAT 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles (Default) 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles
RTR_DIFF	Read to read delay for different chip-select. This field controls the delay between read to read commands toward different chip select. The total delay is calculated according to: BL/2 + RTR_DIFF 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles (Default) 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles

33.12.11 MMDC Core Out of Reset Delays Register (MMDC_MDOR)

This register defines delays that must be kept when MMDC exits reset.

Address: 21B_0000h base + 30h offset = 21B_0030h

MMDC_MDOR field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MDOR field descriptions (continued)

Field	Description
23–16 tXPR	DDR2/DDR3: CKE HIGH to a valid command. LPDDR2: Not relevant to this mode. Please leave in default reset value. DDR3: As defined in timing parameter table. 0x0 Reserved 0x1 2 cycles 0x2 3 cycles 0xFE 255 cycles 0xFF 256 cycles
15–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SDE_to_RST	DDR3: Time from SDE enable until DDR reset# is high. In LPDDR2 mode this field is not relevant. **NOTE:** Each cycle in this field is 15.258 us. 0x0 Reserved 0x1 Reserved 0x2 Reserved 0x3 1 cycles 0x4 2 cycles 0x10 14 cycles (JEDEC value for DDR3) - total of 200 us 0x3E 60 cycles 0x3F 61 cycles
7–6 Reserved	This read-only field is reserved and always has the value 0.
RST_to_CKE	DDR3: Time from SDE enable to CKE rise. In case that DDR reset# is low, will wait until it's high and thenwait this period until rising CKE. (JEDEC value is 500 us) LPDDR2: Idle time ater first CKE assertion. (JEDEC value is 200 us) **NOTE:** Each cycle in this field is 15.258 us. 0x0 Reserved 0x1 Reserved 0x2 Reserved 0x3 1 cycles 0x10 14 cycles (JEDEC value for LPDDR2) - total of 200 us 0x23 33 cycles (JEDEC value for DDR3) - total of 500 us 0x3E 60 cycles 0x3F 61 cycles

33.12.12 MMDC Core MRR Data Register (MMDC_MDMRR)

This register contains data that was collected after issuing MRR command. The data in this register is valid only when MDSCR[MRR_READ_DATA_VALID] is set to "1".

This register is relevant only in LPDDR2 mode. For further information see LPDDR2 Refresh Rate Update and Timing Derating .

Address: 21B_0000h base + 34h offset = 21B_0034h

Bit	31–24	23–16	15–8	7–0
R	Reserved	Reserved	MRR_READ_DATA1	MRR_READ_DATA0

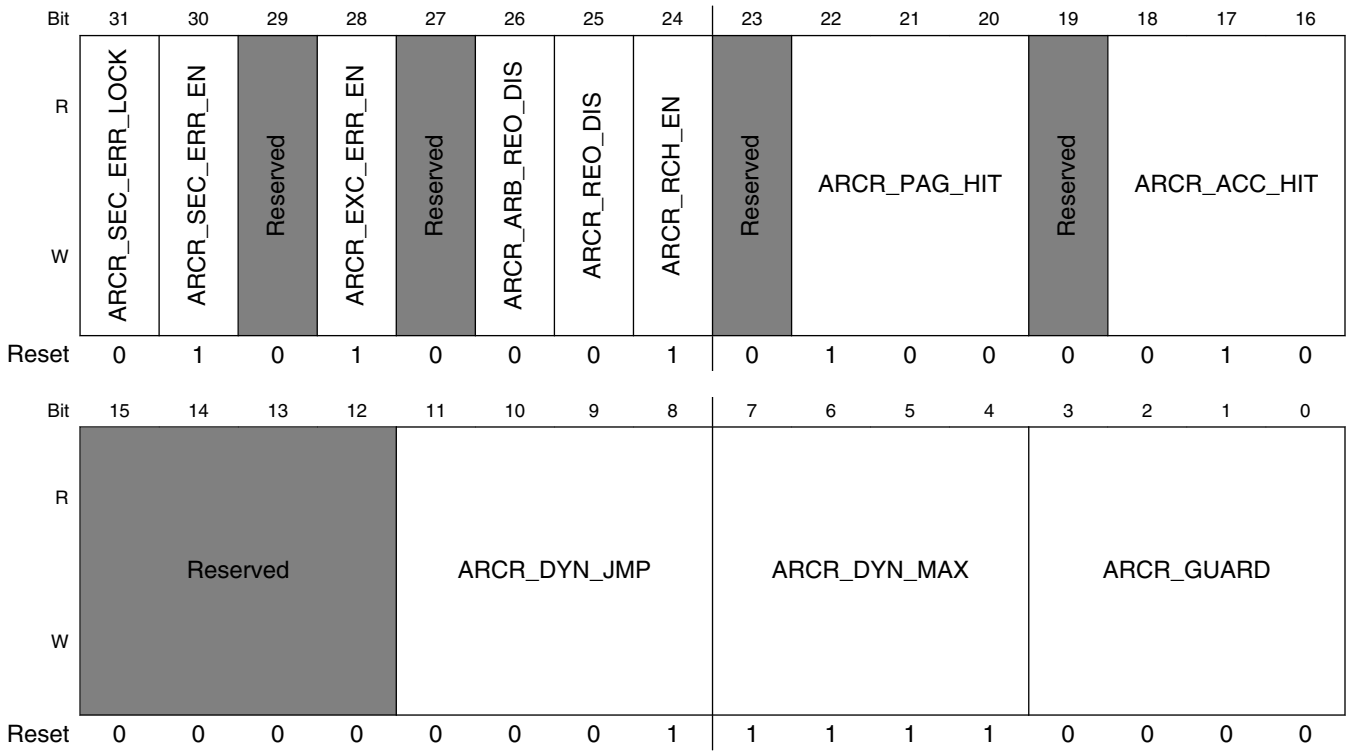
MMDC_MDMR4 field descriptions

Field	Description
31–9 Reserved	This read-only field is reserved and always has the value 0.
8 tRRD_DE	tRRD derating value. 0 Original tRRD is used. 1 tRRD is derated in 1 cycle.
7 tRP_DE	tRP derating value. 0 Original tRP is used. 1 tRP is derated in 1 cycle.
6 tRAS_DE	tRAS derating value. 0 Original tRAS is used. 1 tRAS is derated in 1 cycle.
5 tRC_DE	tRC derating value. 0 Original tRC is used. 1 tRC is derated in 1 cycle.
4 tRCD_DE	tRCD derating value. 0 Original tRCD is used. 1 tRCD is derated in 1 cycle.
3–2 Reserved	This read-only field is reserved and always has the value 0.
1 UPDATE_DE_ACK	Update Derated Values Acknowledge. This read only bit will be cleared upon UPDATE_DE_REQ assertion and will be set after the new values are taken.
0 UPDATE_DE_REQ	Update Derated Values Request. This read modify write field is automatically cleared after the request is issued. 0 Do nothing. 1 Request to update the following values: tRRD, tRCD, tRP, tRC, tRAS and refresh related fields(MDREF register): REF_CNT, REF_SEL, REFR

33.12.15 MMDC Core Address Space Partition Register (MMDC_MDASP)

This register defines the partitioning between chip select 0 and chip select 1. For further information see Chip select settings .

Address: 21B_0000h base + 40h offset = 21B_0040h



MMDC_MDASP field descriptions

Field	Description
31–7 Reserved	This read-only field is reserved and always has the value 0.
CS0_END	CS0_END. Defines the absolute last address associated with CS0 with increments of 256Mb. CS0_END=AXI_ADDRESS[31:25] bits. MMDC0_MDASP[CS0_END] should be set to DDR_CS_SIZE/32M + 0x3f (channel 0 base address begins at 0x80000000)

33.12.16 MMDC Core AXI Reordering Control Register (MMDC_MAARCR)

This register determines the values of the weights used for the re-ordering arbitration engine. For further information see Performance .

Address: 21B_0000h base + 400h offset = 21B_0400h

MMDC_MAARCR field descriptions

Field	Description
31 ARCR_SEC_ ERR_LOCK	Once set, this bit locks ARCR_SEC_ERR_EN and prevents from its updating. This bit can be only cleared by reset Default value is 0x0 - encoding 0 (unlocked) 0 ARCR_SEC_ERR_EN is unlocked, so can be updated any moment 1 ARCR_SEC_ERR_EN is locked, so it can't be updated
30 ARCR_SEC_ ERR_EN	This bit defines whether security read/write access violation result in SLV Error response or in OKAY response Default value is 0x1 - encoding 1(response is SLV Error, rresp/bresp=2'b10) 0 security violation results in OKAY response (rresp/bresp=2'b00) 1 security violation results in SLAVE Error response (rresp/bresp=2'b10)

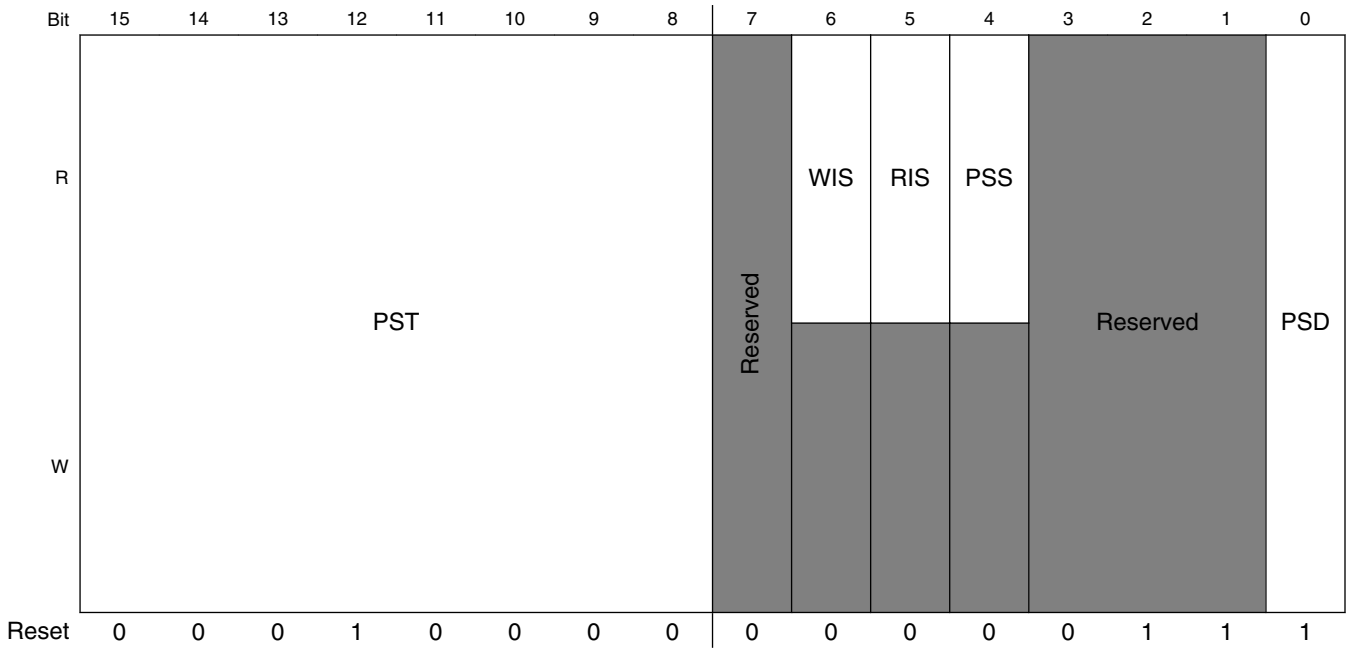
Table continues on the next page...

MMDC_MAARCR field descriptions (continued)

Field	Description
29 -	This field is reserved. Reserved
28 ARCR_EXC_ERR_EN	This bit defines whether exclusive read/write access violation of AXI 6.2.4 rule result in SLV Error response or in OKAY response Default value is 0x1 - encoding 1(response is SLV Error) 0 violation of AXI exclusive rules (6.2.4) result in OKAY response (rresp/bresp=2'b00) 1 violation of AXI exclusive rules (6.2.4) result in SLAVE Error response (rresp/bresp=2'b10)
27 -	This field is reserved. Reserved
26 ARCR_ARB_REO_DIS	0 MMDC arbitration and reordering controls enabled 1 MMDC arbitration and reordering controls disabled
25 ARCR_REO_DIS	0 MMDC reordering controls only enabled 1 MMDC reordering controls only disabled
24 ARCR_RCH_EN	This bit defines whether Real time channel is activated and bypassed all other pending accesses, So accesses with QoS=='F' will be granted the highest priority in the optimization/reordering mechanism Default value is 0x1 - encoding 1 (Enabled) 0 normal prioritization, no bypassing 1 accesses with QoS=='F' bypass the arbitration
23 -	This field is reserved. Reserved
22–20 ARCR_PAG_HIT	ARCR Page Hit Rate. This value will be added by the optimization/reordering mechanism to any pending access that is targeted to an open DDR row. Default value of ARCR_PAG_HIT is 0x00100 - encoding 4.
19 -	This field is reserved. Reserved
18–16 ARCR_ACC_HIT	ARCR Access Hit Rate. This value will be added by the optimization/reordering mechanism to any pending access that has the same access type (read/write) as the previous access. Default value of is ARCR_ACC_HIT 0x0010 - encoding 2.
15–12 -	This field is reserved. Reserved
11–8 ARCR_DYN_JMP	ARCR Dynamic Jump. Each time an access wan't chosen by the optimization/reordering mechanism then its dynamic score will be incremented by ARCR_DYN_JMP value. **NOTE:** Setting ARCR_DYN_JMP may cause starvation of low priority accesses **NOTE:** ARCR_DYN_JMP must be smaller than ARCR_DYN_MAX Default ARCR_DYN_JMP value is 0x0001 - encoding 1
7–4 ARCR_DYN_MAX	ARCR Dynamic Maximum. ARCR_DYN_MAX is the maximum dynamic score value that each access inside the optimization/reordering mechanism can get. 0000 0 0001 1 1111 15 (default)

Table continues on the next page...

MMDC_MAARCR field descriptions (continued)



Field	Description
ARCR_GUARD	ARCR Guard. After an access reached the maximum dynamic score value, it will wait additional ARCR_GUARD arbitration cycles and then will gain the highest priority in the optimization/reordering mechanism. 0000 15 (default) 0001 16 1111 30

33.12.17 MMDC Core Power Saving Control and Status Register (MMDC_MAPSR)

The MAPSR determines the power saving features of MMDC. For further information see Power Saving and Clock Frequency Change modes .

Address: 21B_0000h base + 404h offset = 21B_0404h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved						DVACK	LPACK	Reserved		DVFS	LPMD	Reserved			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDC_MAPSR field descriptions

Field	Description
31–26 -	This field is reserved. Reserved
25 DVACK	General DVFS acknowledge. This read only bit indicates whether a dvfs acknowledge was asserted and that MMDC is in self-refresh mode
24 LPACK	General low-power acknowledge. This read only bit indicates whether a low-power acknowledge was asserted and that MMDC is in self-refresh mode
23–22 -	This field is reserved. Reserved
21 DVFS	General DVFS request. SW request for DVFS. Assertion of this bit will yield in self-refresh entry sequence 0 no dvfs request 1 dvfs request
20 LPMD	General LPMD request. SW request for LPMD. Assertion of this bit will yield in self-refresh entry sequence 0 no lpmd request 1 lpmd request
19–16 -	This field is reserved. Reserved
15–8 PST	Automatic Power saving timer. Valid only when PSD is set to "0". When the MMDC is idle for amount of cycles specified in that field then the DDR device will be entered automatically into self-refresh mode. The real value which is used is register-value multiplied by 64. 00000000 Reserved - this value is forbidden. 00000001 timer is configured to 64 clock cycles. 00000010 timer is configured to 128 clock cycles.

Table continues on the next page...

MMDC_MAPSR field descriptions (continued)

Field	Description
	00010000 (Default)- 1024 clock cycles. 11111111 timer clock is configured to 16320 clock cycles.
7 -	This field is reserved. Reserved.
6 WIS	Write Idle Status. This read only bit indicates whether write request buffer is idle (empty) or not. 0 idle 1 not idle
5 RIS	Read Idle Status. This read only bit indicates whether read request buffer is idle (empty) or not. 0 idle 1 not idle
4 PSS	Power Saving Status. This read only bit indicates whether the MMDC is in automatic power saving mode. 0 not in power saving 1 power saving
3–1 -	This field is reserved. Reserved.
0 PSD	Automatic Power Saving Disable. When the value of PSD is "0" (i.e automatic power saving is enabled) then the PST is activated and MMDC will enter automatically to self-refresh while the number of idle cycle reached. **NOTE:** This bit must be disabled (i.e set to "1") during calibration process 0 power saving enabled 1 power saving disabled (default)

33.12.18 MMDC Core Exclusive ID Monitor Register0 (MMDC_MAEXIDR0)

This register defines the ID to be monitored for exclusive accesses of monitor0 and monitor1. For further information see Exclusive accesses handling .

Address: 21B_0000h base + 408h offset = 21B_0408h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MMDC_MAEXIDR1 field descriptions

Field	Description
31–16 EXC_ID_ MONITOR3	This field defines ID for Exclusive monitor#3. Default value is 0x0060
EXC_ID_ MONITOR2	This field defines ID for Exclusive monitor#2. Default value is 0x0040

33.12.20 MMDC Core Debug and Profiling Control Register 0 (MMDC_MADPCR0)

Address: 21B_0000h base + 410h offset = 21B_0410h

MMDC_MADPCR0 field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9 SBS	Step By Step trigger. If SBS_EN is set to "1" then dispatching AXI pending access toward the DDR will done only if this bit is set to "1", otherwise no access will be dispatched toward the DDR. This bit is cleared when the pending access has been issued toward the DDR device. 1 Launch AXI pending access toward the DDR 0 No access will be launched toward the DDR
8 SBS_EN	Step By Step debug Enable. Enable step by step mode. Every time this mechanism is enabled then setting SBS to "1" will dispatch one pending AXI access to the DDR and in parallel its attributes will be observed in the status registes (MASBS0 and MASBS1). For further information see Step By Step (SBS) software monitor . 0 disable 1 enable
7–4 Reserved	This read-only field is reserved and always has the value 0.

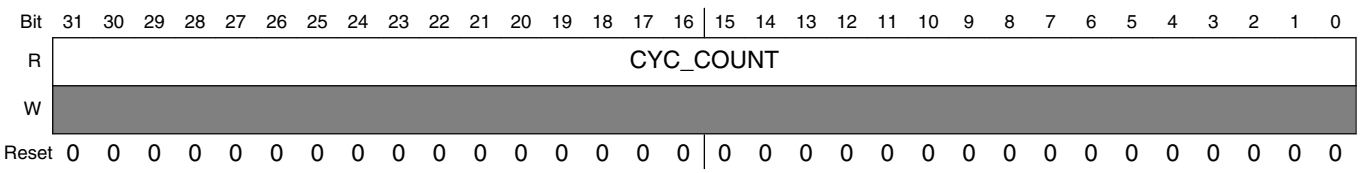
Table continues on the next page...

MMDC_MADPCR0 field descriptions (continued)

Field	Description
3 CYC_OVF	Total Profiling Cycles Count Overflow. When profiling mechanism is enabled (DBG_EN is set to "1") then this bit is asserted when overflow of CYC_COUNT occurred. Cleared by writing 1 to it. 0 no overflow 1 overflow
2 PRF_FRZ	Profiling freeze. When this bit is asserted then the profiling mechanism will be froze and the associated status registers (MADPSR0-MADPSR5) will hold the the current profiling values. 0 profiling counters are not frozen 1 profiling counters are frozen
1 DBG_RST	Debug and Profiling Reset. Reset all debug and profiling counters and components. 0 no reset 1 reset
0 DBG_EN	Debug and Profiling Enable. Enable debug and profiling mechanism. When this bit is asserted then the MMDC will perform a profiling based on the ID that is configured to MADPCR1. Upon assertion of PRF_FRZ the profiling will be froze and the profiling results will be sampled to the status registers (MADPSR0-MADPSR5). For further information see MMDC Profiling . default is "disable" 0 disable 1 enable

33.12.21 MMDC Core Debug and Profiling Control Register 1 (MMDC_MADPCR1)

Address: 21B_0000h base + 414h offset = 21B_0414h



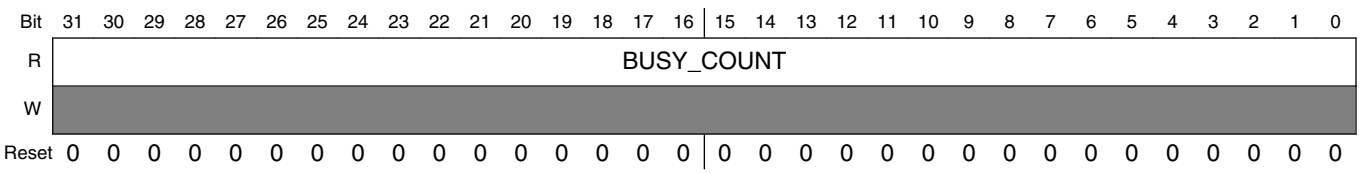
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	PRF_AXI_ID_MASK																PRF_AXI_ID															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDC_MADPCR1 field descriptions

Field	Description
31–16 PRF_AXI_ID_ MASK	Profiling AXI ID Mask. AXI ID bits which masked by this value are chosen for profiling. 1 AXI ID specific bit is chosen for profiling 0 AXI ID specific bit is ignored (don't care)
PRF_AXI_ID	Profiling AXI ID. AXI IDs that matches a bit-wise AND logic operation between PRF_AXI_ID and PRF_AXI_ID_MASK are chosen for profiling. Default value is 0x0, to choose any ID-s for profiling

33.12.22 MMDC Core Debug and Profiling Status Register 0 (MMDC_MADPSR0)

Address: 21B_0000h base + 418h offset = 21B_0418h



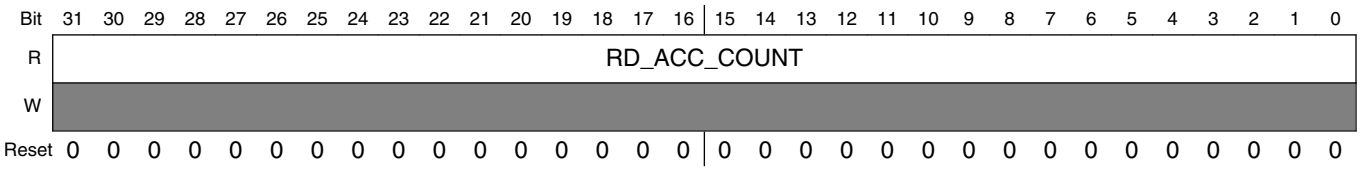
MMDC_MADPSR0 field descriptions

Field	Description
CYC_COUNT	Total Profiling cycle Count. This field reflects the total cycle count in case the profiling mechanism is enabled from assertion of DBG_EN and until PRF_FRZ is asserted

33.12.23 MMDC Core Debug and Profiling Status Register 1 (MMDC_MADPSR1)

The register reflects the total cycles during which the MMDC state machines were busy (both writes and reads). This information can be used for DDR Utilization calculation.

Address: 21B_0000h base + 41Ch offset = 21B_041Ch



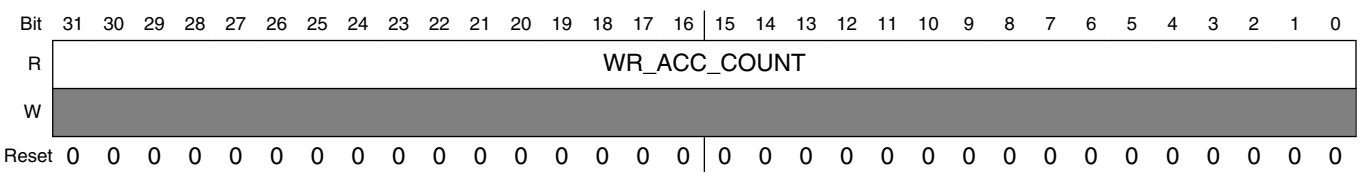
MMDC_MADPSR1 field descriptions

Field	Description
BUSY_COUNT	Profiling Busy Cycles Count. This field reflects the total number of cycles where the MMDC read and write state machines were busy during the profiling period. Can be used for DDR utilization calculations. Busy cycles are any MMDC clock cycles where the internal state machine is not idle. If any read or write requests are pending in the FIFOs, the MMDC is not idle.

33.12.24 MMDC Core Debug and Profiling Status Register 2 (MMDC_MADPSR2)

This register reflects the total number of read accesses (per AXI ID) toward MMDC.

Address: 21B_0000h base + 420h offset = 21B_0420h



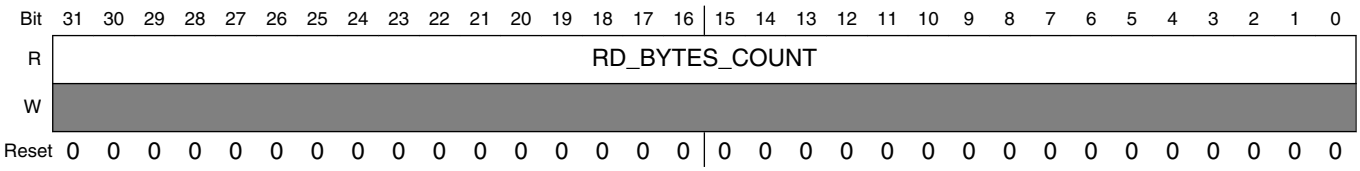
MMDC_MADPSR2 field descriptions

Field	Description
RD_ACC_ COUNT	Profiling Read Access Count. This register reflects the total number of read accesses (per AXI ID) toward MMDC.

33.12.25 MMDC Core Debug and Profiling Status Register 3 (MMDC_MADPSR3)

This register reflects the total number of write accesses (per AXI ID) toward MMDC.

Address: 21B_0000h base + 424h offset = 21B_0424h



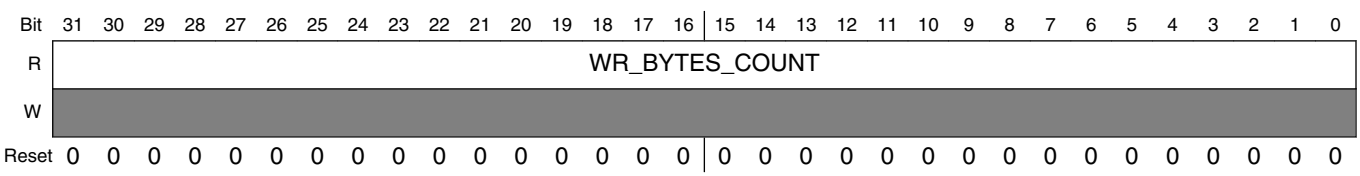
MMDC_MADPSR3 field descriptions

Field	Description
WR_ACC_ COUNT	Profiling Write Access Count. This register reflects the total number of write accesses (per AXI ID) toward MMDC.

33.12.26 MMDC Core Debug and Profiling Status Register 4 (MMDC_MADPSR4)

This register reflects the total number of bytes that were transferred during read access (per AXI ID) toward MMDC.

Address: 21B_0000h base + 428h offset = 21B_0428h



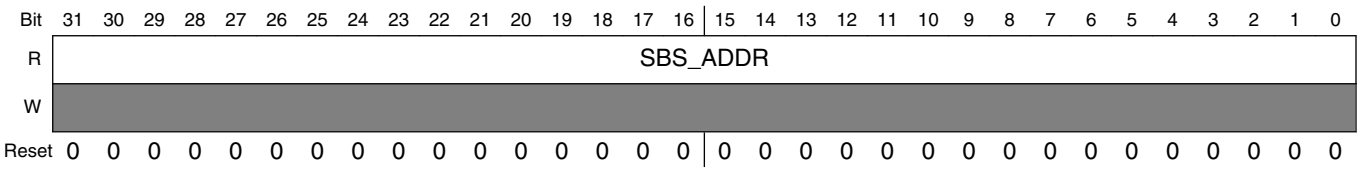
MMDC_MADPSR4 field descriptions

Field	Description
RD_BYTES_ COUNT	Profiling Read Bytes Count. This register reflects the total number of bytes that were transferred during read access (per AXI ID) toward MMDC.

33.12.27 MMDC Core Debug and Profiling Status Register 5 (MMDC_MADPSR5)

This register reflects the total number of bytes that were transferred during write access (per AXI ID) toward MMDC.

Address: 21B_0000h base + 42Ch offset = 21B_042Ch

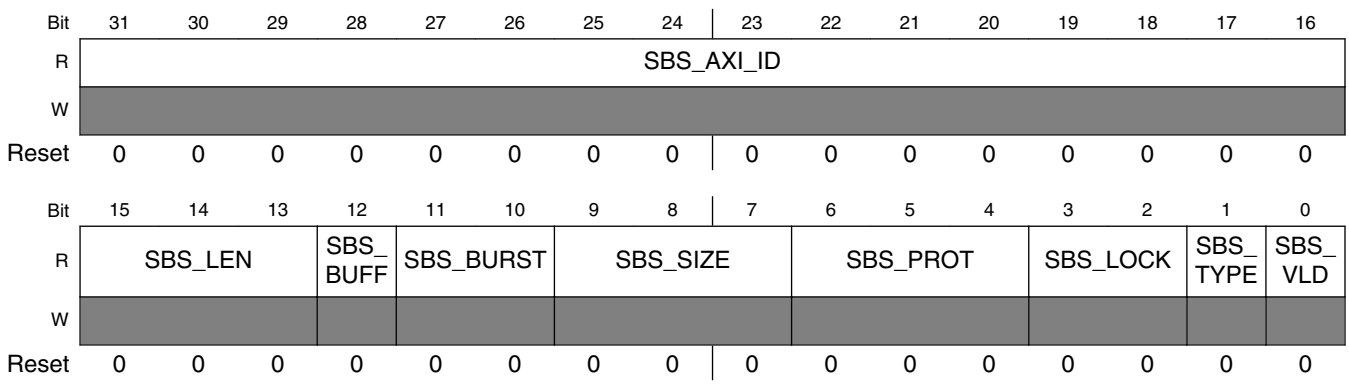


MMDC_MADPSR5 field descriptions

Field	Description
WR_BYTES_ COUNT	Profiling Write Bytes Count. This register reflects the total number of bytes that were transferred during write access (per AXI ID) toward MMDC.

33.12.28 MMDC Core Step By Step Address Register (MMDC_MASBS0)

Address: 21B_0000h base + 430h offset = 21B_0430h



MMDC_MASBS0 field descriptions

Field	Description
SBS_ADDR	Step By Step Address. These bits reflect the address of the pending request in case of step by step mode.

33.12.29 MMDC Core Step By Step Address Attributes Register (MMDC_MASBS1)

Address: 21B_0000h base + 434h offset = 21B_0434h

MMDC_MASBS1 field descriptions

Field	Description
31–16 SBS_AXI_ID	Step By Step AXI ID. These bits reflect the AXI ID of the pending request in case of step by step mode.
15–13 SBS_LEN	Step By Step Length. These bits reflect the AXI LENGTH of the pending request in case of step by step mode. 000 burst of length 1 001 burst of length 2 111 burst of length 8
12 SBS_BUFF	Step By Step Buffered. This bit reflect the AXI CACHE[0] of the pending request in case of step by step mode. Relevant only for write requests

Table continues on the next page...

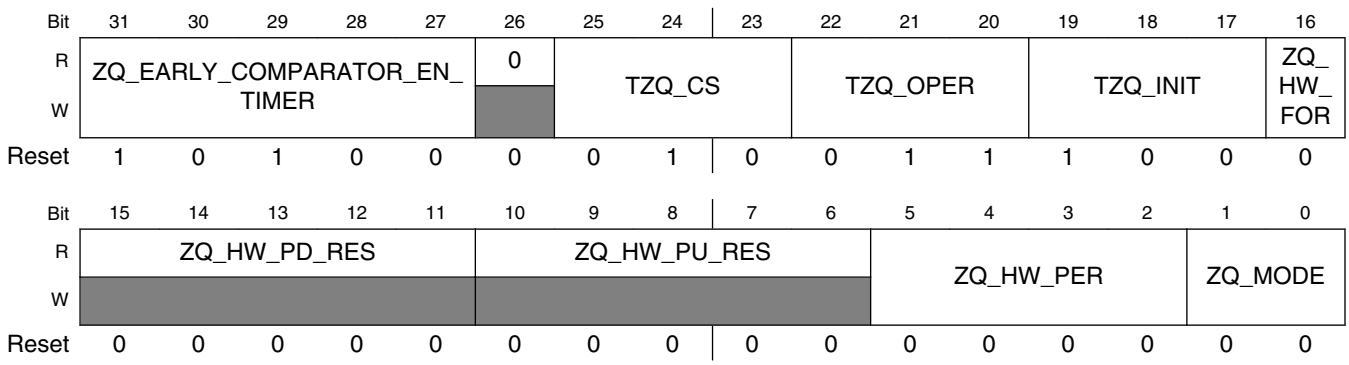
MMDC_MASBS1 field descriptions (continued)

Field	Description
11–10 SBS_BURST	Step By Step Burst. These bits reflect the AXI BURST of the pending request in case of step by step mode. 00 FIXED 01 INCR burst 10 WRAP burst 11 reserved
9–7 SBS_SIZE	Step By Step Size. These bits reflect the AXI SIZE of the pending request in case of step by step mode. 000 8 bits 001 16 bits 010 32 bits 011 64 bits 100 128bits 101-111 Reserved
6–4 SBS_PROT	Step By Step Protection. These bits reflect the AXI PROT of the pending request in case of step by step mode.
3–2 SBS_LOCK	Step By Step Lock. These bits reflect the AXI LOCK of the pending request in case of step by step mode.
1 SBS_TYPE	Step By Step Request Type. These bits reflect the type (read/write) of the pending request in case of step by step mode. 0 write 1 read
0 SBS_VLD	Step By Step Valid. This bit reflects whether there is a pending request in case of step by step mode. 0 not valid 1 valid

33.12.30 MMDC Core General Purpose Register (MMDC_MAGENP)

This register is a general 32 bit read/write register.

Address: 21B_0000h base + 440h offset = 21B_0440h



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	GP31_GP0																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDC_MAGENP field descriptions

Field	Description
GP31_GP0	General purpose read/write bits.

33.12.31 MMDC PHY ZQ HW control register (MMDC_MPZQHWCTRL)

Address: 21B_0000h base + 800h offset = 21B_0800h

MMDC_MPZQHWCTRL field descriptions

Field	Description
31–27 ZQ_EARLY_COMPARATOR_EN_TIMER	ZQ early comparator enable timer. This timer defines the interval between the warming up of the comparator of the i.MX ZQ calibration pad and the beginning of the ZQ calibration process with the pad 0x0 - 0x6 Reserved 0x7 8 cycles 0x14 21 cycles (Default) 0x1E 31 cycles 0x1F 32 cycles
26 Reserved	This read-only field is reserved and always has the value 0.
25–23 TZQ_CS	Device ZQ short time. This field holds the number of cycles that are required by the external DDR device to perform ZQ short calibration. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time. **NOTE:** In LPDDR2 the ZQ short time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQCS] **NOTE:** This field should not be update during ZQ calibration. 000 Reserved 001 Reserved 010 128 cycles (Default) 011 256 cycles 100 512 cycles 101 1024 cycles 110- 111 Reserved
22–20 TZQ_OPER	Device ZQ long/oper time. This field holds the number of cycles that are required by the external DDR device to perform ZQ long calibration except the first ZQ long command that is issued after reset. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time. **NOTE:** In LPDDR2 the ZQ oper time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQCL]

Table continues on the next page...

MMDC_MPZQHWCTRL field descriptions (continued)

Field	Description
	NOTE: This field should not be update during ZQ calibration. 000 Reserved 001 Reserved 010 128 cycles 011 256 cycles - Default (JEDEC value for DDR3) 100 512 cycles 101 1024 cycles 110- 111 Reserved
19–17 TZQ_INIT	Device ZQ long/init time. This field holds the number of cycles that are required by the external DDR device to perform ZQ long calibration right after reset. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time. **NOTE:** In LPDDR2 the ZQ init time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQINIT] **NOTE:** This field should not be update during ZQ calibration. 000 Reserved 001 Reserved 010 128 cycles 011 256 cycles 100 512 cycles - Default (JEDEC value for DDR3) 101 1024 cycles 110- 111 Reserved
16 ZQ_HW_FOR	Force ZQ automatic calibration process with the i.MX ZQ calibration pad. When this bit is asserted then the MMDC will issue one ZQ automatic calibration process with the i.MX ZQ calibration pad. It is the user responsibility to make sure that all the accesses to DDR will be finished before asserting this bit using CON_REQ/CON_ACK mechanism. HW will negate this bit upon completion of the ZQ calibration process. Upon negation of this bit the ZQ HW calibration pull-up and pull-down results (ZQ_HW_PU_RES and ZQ_HW_PD_RES respectively) are valid **NOTE:** In order to enable this bit ZQ_MODE must be set to either "1" or "3"
15–11 ZQ_HW_PD_ RES	ZQ HW calibration pull-down result. This field holds the pull-down resistor value calculated at the end of the ZQ automatic calibration process with the i.MX ZQ calibration pad. **NOTE:** An offset can be applied to this result, see MMDC_MPPDCMPR2[ZQ_PD_OFFSET]. 00000 Max. resistance. 11111 Min. resistance.
10–6 ZQ_HW_PU_ RES	ZQ automatic calibration pull-up result. This field holds the pull-up resistor value calculated at the end of the ZQ automatic calibration process with the i.MX ZQ calibration pad. **NOTE:** An offset can be applied to this result, see MMDC_MPPDCMPR2[ZQ_PU_OFFSET] 00000 Min. resistance. 11111 Max. resistance.
5–2 ZQ_HW_PER	ZQ periodic calibration time. This field determines how often the periodic ZQ calibration is performed. This field is applied for both ZQ short calibration and ZQ automatic calibration process with i.MX ZQ calibration pad. Whenever this timer is expired then according to ZQ_MODE the ZQ automatic calibration process with the i.MX ZQ calibration pad will be issued and/or short/long command will be issued to the external DDR device.

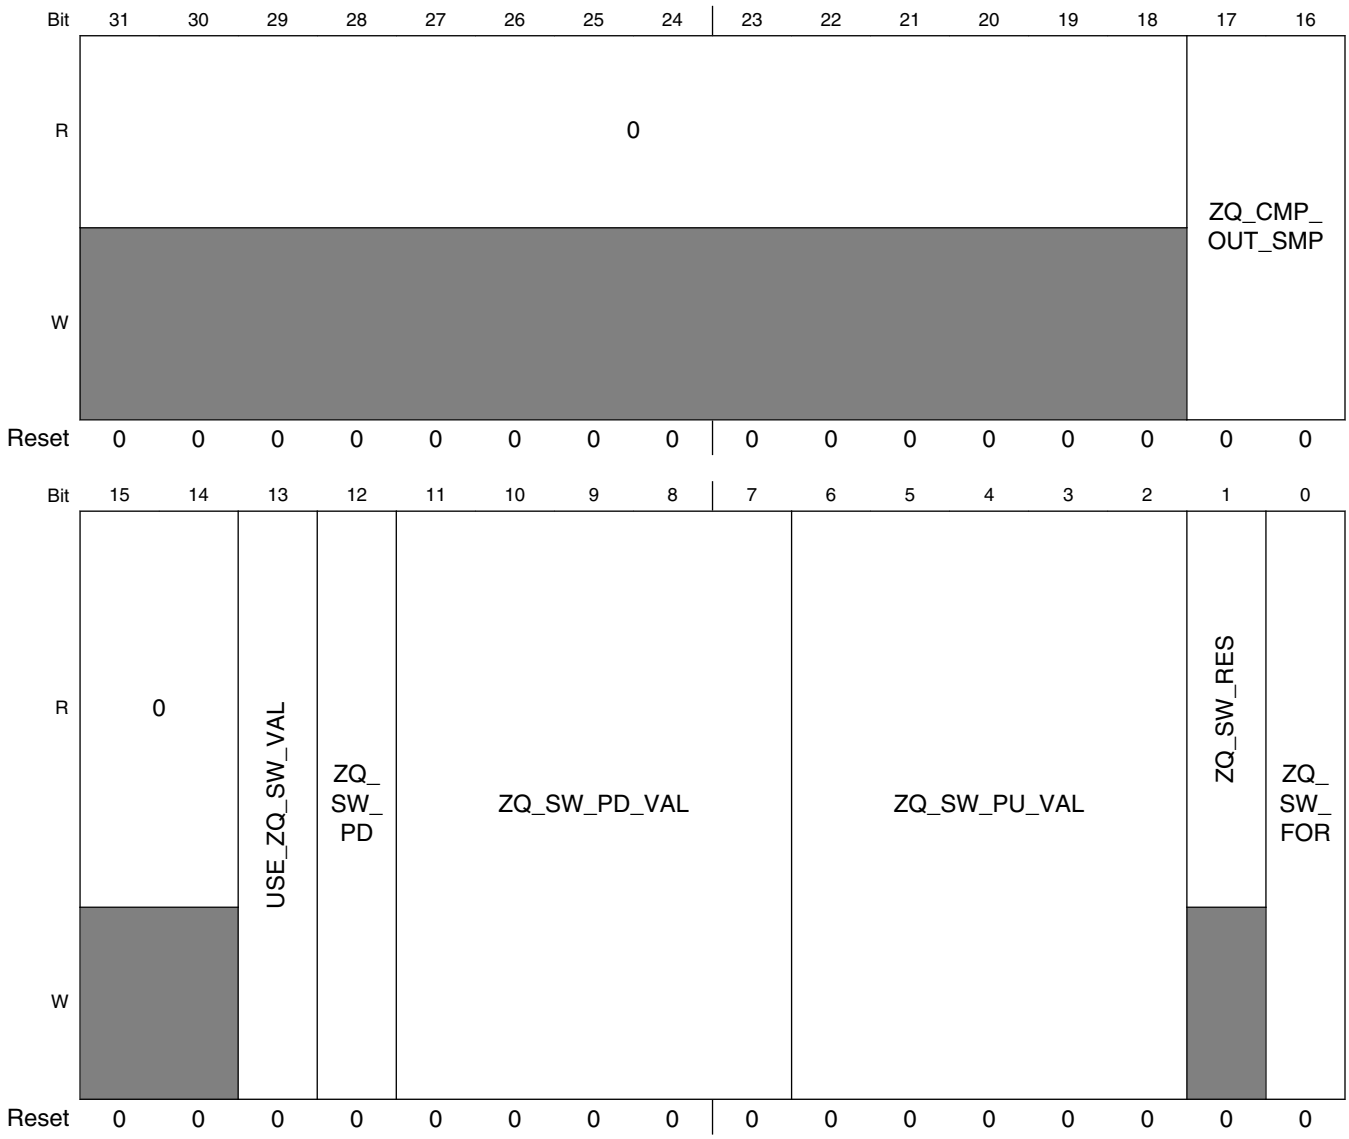


Table continues on the next page...

MMDC_MPZQHWCTRL field descriptions (continued)

Field	Description
	This field is ignored if ZQ_MODE equals "00" 0000 ZQ calibration is performed every 1 ms. 0001 ZQ calibration is performed every 2 ms. 0010 ZQ calibration is performed every 4 ms. 1010 ZQ calibration is performed every 1 sec. 1110 ZQ calibration is performed every 16 sec. 1111 ZQ calibration is performed every 32 sec.
ZQ_MODE	ZQ calibration mode: 0x0 No ZQ calibration is issued. (Default) 0x1 ZQ calibration is issued to i.MX ZQ calibration pad together with ZQ long command to the external DDR device only when exiting self refresh. 0x2 ZQ calibration command long/short is issued only to the external DDR device periodically and when exiting self refresh 0x3 ZQ calibration is issued to i.MX ZQ calibration pad together with ZQ calibration command long/ short to the external DDR device periodically and when exiting self refresh

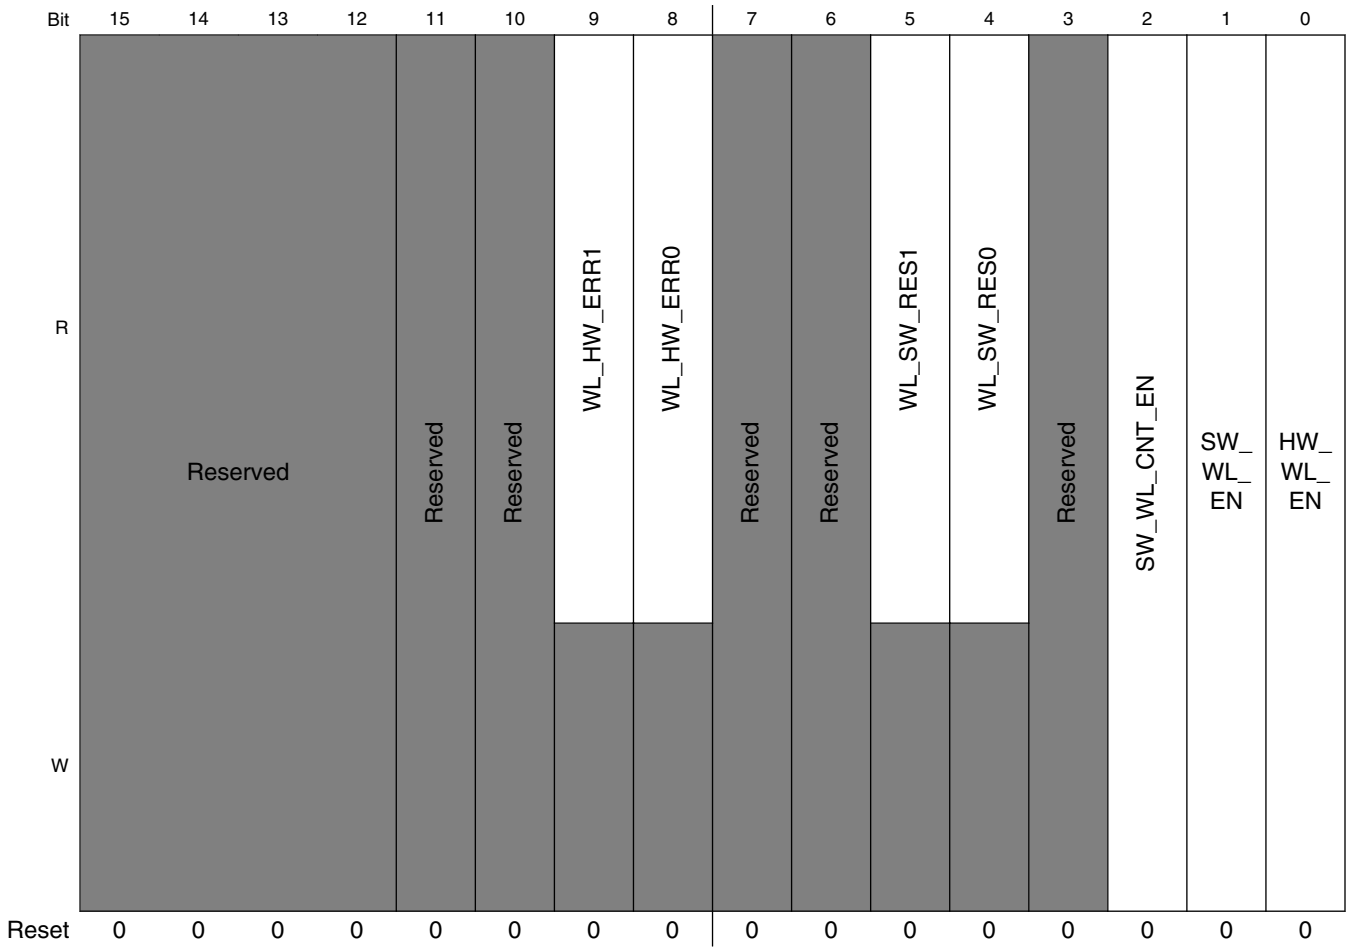
33.12.32 MMDC PHY ZQ SW control register (MMDC_MPZQSWCTRL)

Address: 21B_0000h base + 804h offset = 21B_0804h

MMDC_MPZQSWCTRL field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 ZQ_CMP_OUT_SMP	Defines the amount of cycles between driving the ZQ signals to the ZQ pad and till sampling the comparator enable output while performing ZQ calibration process with the i.MX ZQ calibration pad 00 7 cycles 01 15 cycles

Table continues on the next page...



MMDC_MPZQSWCTRL field descriptions (continued)

Field	Description
	10 23 cycles 11 31 cycles
15–14 Reserved	This read-only field is reserved and always has the value 0.
13 USE_ZQ_SW_VAL	Use SW ZQ configured value for I/O pads resistor controls. This bit selects whether ZQ SW value or ZQ HW value will be driven to the I/O pads resistor controls. By default this bit is cleared and MMDC drives the HW ZQ status bits on the resistor controls of the I/O pads. **NOTE:** This bit should not be updated during ZQ calibration. 0 Fields ZQ_HW_PD_VAL & ZQ_HW_PU_VAL will be driven to I/O pads resistor controls. 1 Fields ZQ_SW_PD_VAL & ZQ_SW_PU_VAL will be driven to I/O pads resistor controls.
12 ZQ_SW_PD	ZQ software PU/PD calibration. This bit determines the calibration stage (PU or PD). 0 PU resistor calibration 1 PD resistor calibration
11–7 ZQ_SW_PD_VAL	ZQ software pull-down resistence. This field determines the value of the PD resistor during SW ZQ calibration. 00000 Max. resistance. 11111 Min. resistance.
6–2 ZQ_SW_PU_VAL	ZQ software pull-up resistence. This field determines the value of the PU resistor during SW ZQ calibration. 00000 Min. resistance. 11111 Max. resistance.
1 ZQ_SW_RES	ZQ software calibration result. This bit reflects the ZQ calibration voltage comparator value. 0 Current ZQ calibration voltage is less than VDD/2. 1 Current ZQ calibration voltage is more than VDD/2
0 ZQ_SW_FOR	ZQ SW calibration enable. This bit when asserted enables ZQ SW calibration. HW negates this bit upon completion of the ZQ SW calibration. Upon negation of this bit the ZQ SW calibration result (i.e ZQ_SW_RES) is valid

33.12.33 MMDC PHY Write Leveling Configuration and Error Status Register (MMDC_MPWLGCR)

Address: 21B_0000h base + 808h offset = 21B_0808h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDC_MPWLGCR field descriptions

Field	Description
31–12 -	This field is reserved. Reserved
11 -	This field is reserved. Reserved
10 -	This field is reserved. Reserved
9 WL_HW_ERR1	Byte1 write-leveling HW calibration error. This bit is asserted when an error was found on byte1 during write-leveling HW calibration. This bit is valid only upon completion of the write-leveling HW calibration (i.e. HW_WL_EN bit is de-asserted) 0 No error was found on byte1 during write-leveling HW calibration. 1 An error was found on byte1 during write-leveling HW calibration.
8 WL_HW_ERR0	Byte0 write-leveling HW calibration error. This bit is asserted when an error was found on byte0 during write-leveling HW calibration. This bit is valid only upon completion of the write-leveling HW calibration (i.e. HW_WL_EN bit is de-asserted)

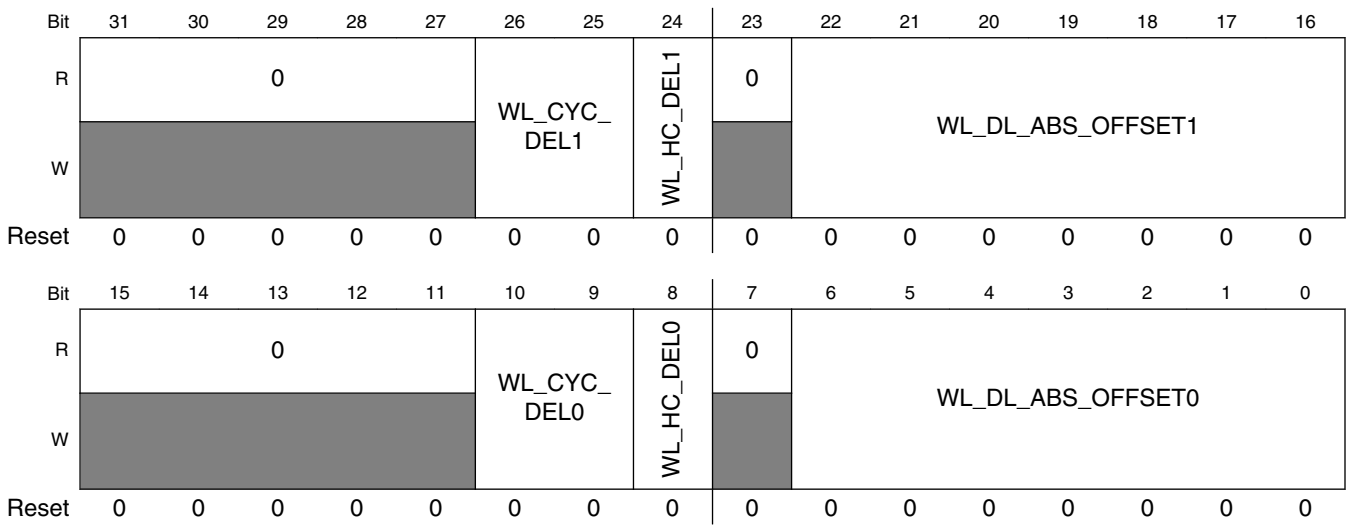


Table continues on the next page...

MMDC_MPWLGCR field descriptions (continued)

Field	Description
	0 No error was found on byte0 during write-leveling HW calibration. 1 An error was found on byte0 during write-leveling HW calibration.
7 -	This field is reserved. Reserved
6 -	This field is reserved. Reserved
5 WL_SW_RES1	Byte1 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ8 during SW write-leveling. 0 DQS1 sampled low CK during SW write-leveling. 1 DQS1 sampled high CK during SW write-leveling.
4 WL_SW_RES0	Byte0 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ0 during SW write-leveling. 0 DQS0 sampled low CK during SW write-leveling. 1 DQS0 sampled high CK during SW write-leveling.
3 -	This field is reserved. Reserved
2 SW_WL_CNT_EN	SW write-leveling count down enable. This bit when asserted set a certain delay of (25+15) cycles from the setting of SW_WL_EN and before driving the DQS to the DDR device. This bit should be asserted before the first SW write-leveling request and after issuing the write leveling MRS command 0 MMDC doesn't count 25+15 cycles before issuing write-leveling DQS. 1 MMDC counts 25+15 cycles before issuing write-leveling DQS.
1 SW_WL_EN	Write-Leveling SW enable. If this bit is asserted then the MMDC will perform one write-leveling iteration with the DDR device (assuming that Write-Leveling procedure is already enabled in the DDR device through MRS command). HW negate this bit upon completion of the SW write-leveling. Negation of this bit also points that the write-leveling SW calibration result is valid **NOTE:** If this bit and the SW_WL_CNT_EN are enabled the MMDC counts 25 + 15 cycles before issuing the SW write-leveling DQS.
0 HW_WL_EN	Write-Leveling HW (automatic) enable. If this bit is asserted then the MMDC will perform the whole Write-Leveling sequence with the DDR device (assuming that Write-Leveling procedure is already enabled in the DDR device through MRS command). HW negates this bit upon completion of the HW write-leveling. Negation of this bit also points that the write-leveling HW calibration results are valid **NOTE:** Before issuing the first DQS the MMDC counts 25 + 15 cycles automatically as required by the standard.

33.12.34 MMDC PHY Write Leveling Delay Control Register 0 (MMDC_MPWLDECTRL0)

Address: 21B_0000h base + 80Ch offset = 21B_080Ch

MMDC_MPWLDECTRL0 field descriptions

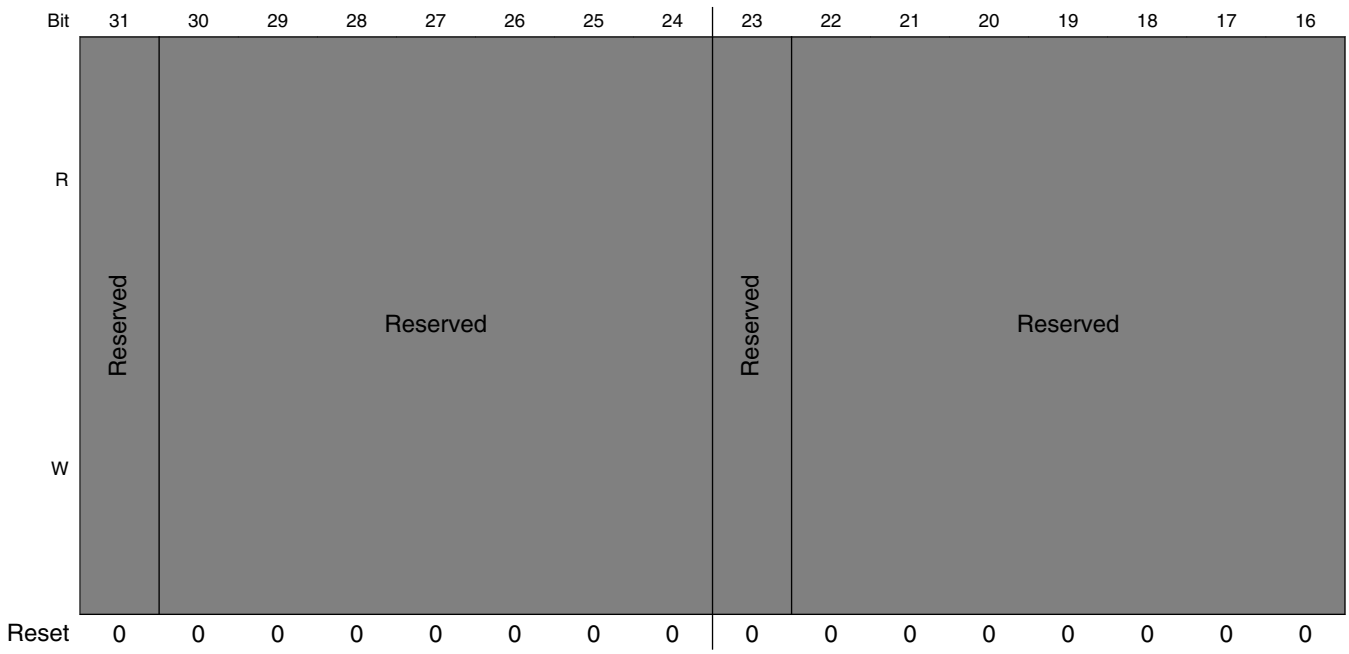
Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–25 WL_CYC_DEL1	Write leveling cycle delay for Byte 1. This field indicates whether a delay of 1 or 2 cycles between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_HC_DEL. So the total delay is the sum of (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle). When both SW write-leveling is enabled (i.e. SW_WL_EN = 1) or HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_HC_DEL. Note that in HW write-leveling this field is not used for indication, as in WL_DL_OFFSET and WL_HC_DEL, but for configuration. 0 No delay is added. 1 1 cycle delay is added. 2 2 cycles delay is added. 3 Reserved.
24 WL_HC_DEL1	Write leveling half cycle delay for Byte 1. This field indicates whether a delay of half cycle between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_CYC_DEL. So the total delay is the sum of (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle). When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_CYC_DEL. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) whether a delay of half cycle was added or not to the associated WL_DL_OFFSET and WL_CYC_DEL.

Table continues on the next page...

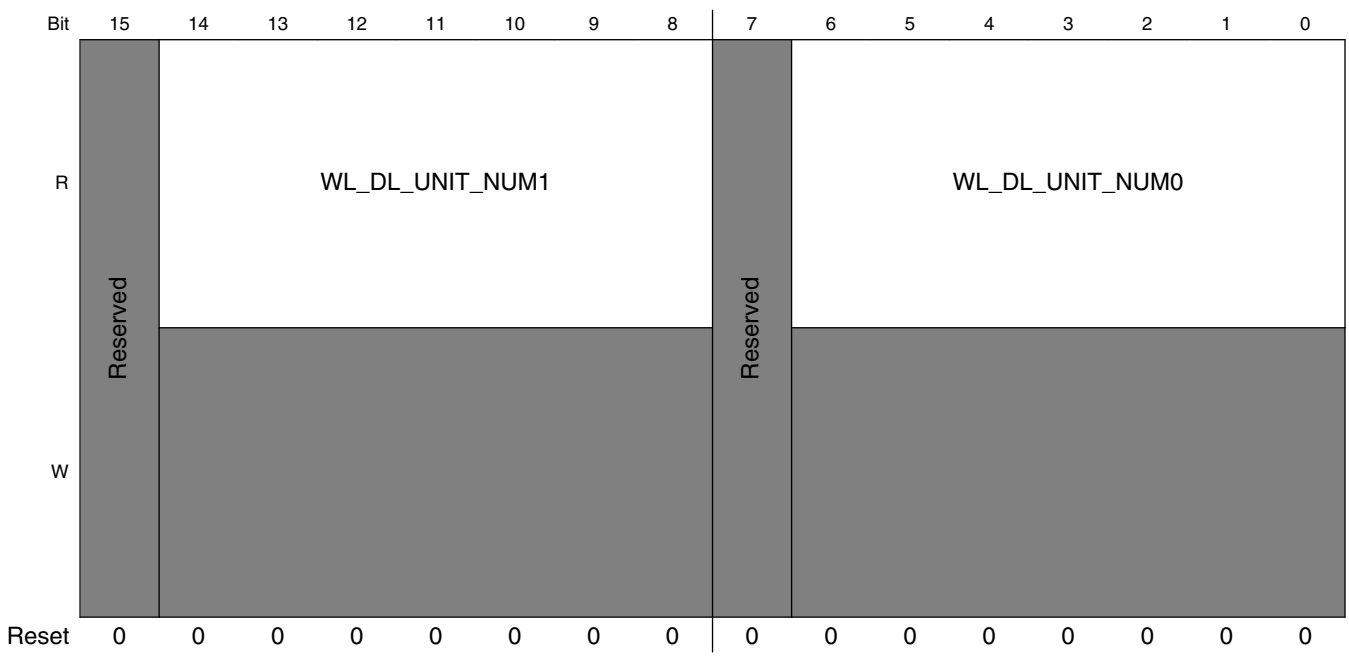
MMDC_MPWLDECTRL0 field descriptions (continued)

Field	Description
	0 No delay is added. 1 Half cycle delay is added.
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 WL_DL_ABS_ OFFSET1	Absolute write-leveling delay offset for Byte 1. This field indicates the absolute delay between CK and write DQS of Byte1 with fractions of a clock period and up to half cycle. This value is process and frequency independent. The value of the delay can be calculated using the following equation (WR_DL_ABS_OFFSET1 / 256) * clock period When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is to the associated delay-line. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) the value that is taken to the associated delay-line at the end of the write-leveling calibration. **NOTE:** The delay-line has a resolution that may vary between device to device, therefore is some cases an increment of the delay by 1 step may be smaller than the delay-line resolution.
15–11 Reserved	This read-only field is reserved and always has the value 0.
10–9 WL_CYC_DEL0	Write leveling cycle delay for Byte 0. This field indicates whether a delay of 1 or 2 cycles between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_HC_DEL. So the total delay is the sum of (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle). When both SW write-leveling is enabled (i.e. SW_WL_EN = 1) or HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_HC_DEL. Note that in HW write-leveling this field is not used for indication, as in WL_DL_OFFSET and WL_HC_DEL, but for configuration. 0 No delay is added. 1 1 cycle delay is added. 2 2 cycles delay is added. 3 Reserved.
8 WL_HC_DEL0	Write leveling half cycle delay for Byte 0. This field indicates whether a delay of half cycle between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_CYC_DEL. So the total delay is the sum of (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle). When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_CYC_DEL. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) whether a delay of half cycle was added or not to the associated WL_DL_OFFSET and WL_CYC_DEL. 0 No delay is added. 1 Half cycle delay is added.
7 Reserved	This read-only field is reserved and always has the value 0.
WL_DL_ABS_ OFFSET0	Absolute write-leveling delay offset for Byte 0. This field indicates the absolute delay between CK and write DQS of Byte0 with fractions of a clock period and up to half cycle. This value is process and frequency independent. The value of the delay can be calculated using the following equation (WR_DL_ABS_OFFSET1 / 256) * clock period

Table continues on the next page...



MMDC_MPWLDECTRL0 field descriptions (continued)



Field	Description
	When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is to the associated delay-line. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) the value that is taken to the associated delay-line at the end of the write-leveling calibration. **NOTE:** The delay-line has a resolution that may vary between device to device, therefore is some cases an increment of the delay by 1 step may be smaller than the delay-line resolution.

33.12.35 MMDC PHY Write Leveling delay-line Status Register (MMDC_MPWLDLST)

This register holds the status of the four write leveling delay-lines.

Address: 21B_0000h base + 814h offset = 21B_0814h

MMDC_MPWLDLST field descriptions

15 Reserved	This read-only field is reserved and always has the value 0.
14–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT1_INT_RES	On chip ODT byte1 resistor - This field determines the Rtt_Nom of the on chip ODT byte1 resistor during read accesses. 0000 Rtt_Nom Disabled. 001 Rtt_Nom 120 Ohm 010 Rtt_Nom 60 Ohm 011 Rtt_Nom 40 Ohm 100 Rtt_Nom 30 Ohm 101 Rtt_Nom 24 Ohm 110 Rtt_Nom 20 Ohm 111 Rtt_Nom 17 Ohm
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 ODT0_INT_RES	On chip ODT byte0 resistor - This field determines the Rtt_Nom of the on chip ODT byte0 resistor during read accesses. 000 Rtt_Nom Disabled. 001 Rtt_Nom 120 Ohm 010 Rtt_Nom 60 Ohm 011 Rtt_Nom 40 Ohm 100 Rtt_Nom 30 Ohm 101 Rtt_Nom 24 Ohm 110 Rtt_Nom 20 Ohm 111 Rtt_Nom 17 Ohm
3 ODT_RD_ACT_EN	Active read CS ODT enable. The bit determines if ODT pin of the active CS will be asserted during read accesses. 0 Active CS ODT pin is disabled during read access. 1 Active CS ODT pin is enabled during read access.
2 ODT_RD_PAS_EN	Inactive read CS ODT enable. The bit determines if ODT pin of the inactive CS will be asserted during read accesses. 0 Inactive CS ODT pin is disabled during read accesses to other CS. 1 Inactive CS ODT pin is enabled during read accesses to other CS.
1 ODT_WR_ACT_EN	Active write CS ODT enable. The bit determines if ODT pin of the active CS will be asserted during write accesses.

Table continues on the next page...

MMDC_MPODTCTRL field descriptions (continued)

Field	Description
	0 Active CS ODT pin is disabled during write access. 1 Active CS ODT pin is enabled during write access.
0 ODT_WR_PAS_EN	Inactive write CS ODT enable. The bit determines if ODT pin of the inactive CS will be asserted during write accesses. 0 Inactive CS ODT pin is disabled during write accesses to other CS. 1 Inactive CS ODT pin is enabled during write accesses to other CS.

33.12.37 MMDC PHY Read DQ Byte0 Delay Register (MMDC_MPRDDQBY0DL)

This register is used to add fine-tuning adjustment to every bit in the read DQ byte0 relative to the read DQS. This delay is in addition to the read data calibration. If operating in 64-bit mode, there is an identical register that is mapped at the second base address.

Address: 21B_0000h base + 81Ch offset = 21B_081Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MPRDDQBY0DL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–28 rd_dq7_del	Read dqs0 to dq7 delay fine-tuning. This field holds the number of delay units that are added to dq7 relative to dqs0. 000 No change in dq7 delay 001 Add dq7 delay of 1 delay unit 010 Add dq7 delay of 2 delay units. 011 Add dq7 delay of 3 delay units. 100 Add dq7 delay of 4 delay units. 101 Add dq7 delay of 5 delay units. 110 Add dq7 delay of 6 delay units. 111 Add dq7 delay of 7 delay units.

Table continues on the next page...

MMDC_MPRDDQBY0DL field descriptions (continued)

Field	Description
27 Reserved	This read-only field is reserved and always has the value 0.
26–24 rd_dq6_del	Read dqs0 to dq6 delay fine-tuning. This field holds the number of delay units that are added to dq6 relative to dqs0. 000 No change in dq6 delay 001 Add dq6 delay of 1 delay unit 010 Add dq6 delay of 2 delay units. 011 Add dq6 delay of 3 delay units. 100 Add dq6 delay of 4 delay units. 101 Add dq6 delay of 5 delay units. 110 Add dq6 delay of 6 delay units. 111 Add dq6 delay of 7 delay units.
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 rd_dq5_del	Read dqs0 to dq5 delay fine-tuning. This field holds the number of delay units that are added to dq5 relative to dqs0. 000 No change in dq5 delay 001 Add dq5 delay of 1 delay unit 010 Add dq5 delay of 2 delay units. 011 Add dq5 delay of 3 delay units. 100 Add dq5 delay of 4 delay units. 101 Add dq5 delay of 5 delay units. 110 Add dq5 delay of 6 delay units. 111 Add dq5 delay of 7 delay units.
19 Reserved	This read-only field is reserved and always has the value 0.
18–16 rd_dq4_del	Read dqs0 to dq4 delay fine-tuning. This field holds the number of delay units that are added to dq4 relative to dqs0. 000 No change in dq4 delay 001 Add dq4 delay of 1 delay unit 010 Add dq4 delay of 2 delay units. 011 Add dq4 delay of 3 delay units. 100 Add dq4 delay of 4 delay units. 101 Add dq4 delay of 5 delay units. 110 Add dq4 delay of 6 delay units. 111 Add dq4 delay of 7 delay units.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 rd_dq3_del	Read dqs0 to dq3 delay fine-tuning. This field holds the number of delay units that are added to dq3 relative to dqs0. 000 No change in dq3 delay 001 Add dq3 delay of 1 delay unit 010 Add dq3 delay of 2 delay units. 011 Add dq3 delay of 3 delay units.

Table continues on the next page...

MMDC_MPRDDQBY0DL field descriptions (continued)

Field	Description
	100 Add dq3 delay of 4 delay units. 101 Add dq3 delay of 5 delay units. 110 Add dq3 delay of 6 delay units. 111 Add dq3 delay of 7 delay units.
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 rd_dq2_del	Read dqs0 to dq2 delay fine-tuning. This field holds the number of delay units that are added to dq2 relative to dqs0. 000 No change in dq2 delay 001 Add dq2 delay of 1 delay unit 010 Add dq2 delay of 2 delay units. 011 Add dq2 delay of 3 delay units. 100 Add dq2 delay of 4 delay units. 101 Add dq2 delay of 5 delay units. 110 Add dq2 delay of 6 delay units. 111 Add dq2 delay of 7 delay units.
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 rd_dq1_del	Read dqs0 to dq1 delay fine-tuning. This field holds the number of delay units that are added to dq1 relative to dqs0. 000 No change in dq1 delay 001 Add dq1 delay of 1 delay unit 010 Add dq1 delay of 2 delay units. 011 Add dq1 delay of 3 delay units. 100 Add dq1 delay of 4 delay units. 101 Add dq1 delay of 5 delay units. 110 Add dq1 delay of 6 delay units. 111 Add dq1 delay of 7 delay units.
3 Reserved	This read-only field is reserved and always has the value 0.
rd_dq0_del	Read dqs0 to dq0 delay fine-tuning. This field holds the number of delay units that are added to dq0 relative to dqs0. 000 No change in dq0 delay 001 Add dq0 delay of 1 delay unit 010 Add dq0 delay of 2 delay units. 011 Add dq0 delay of 3 delay units. 100 Add dq0 delay of 4 delay units. 101 Add dq0 delay of 5 delay units. 110 Add dq0 delay of 6 delay units. 111 Add dq0 delay of 7 delay units.

33.12.38 MMDC PHY Read DQ Byte1 Delay Register (MMDC_MPRDDQBY1DL)

This register is used to add fine-tuning adjustment to every bit in the read DQ byte1 relative to the read DQS

Address: 21B_0000h base + 820h offset = 21B_0820h

MMDC_MPWRDQBY1DL field descriptions

Field	Description
31–30 wr_dm1_del	Write dm1 delay fine-tuning. This field holds the number of delay units that are added to dm1 relative to dqs1. 00 No change in dm1 delay 01 Add dm1 delay of 1 delay unit. 10 Add dm1 delay of 2 delay units. 11 Add dm1 delay of 3 delay units.
29–28 wr_dq15_del	Write dq15 delay fine-tuning. This field holds the number of delay units that are added to dq15 relative to dqs1. 00 No change in dq15 delay 01 Add dq15 delay of 1 delay unit. 10 Add dq15 delay of 2 delay units. 11 Add dq15 delay of 3 delay units.
27–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 wr_dq14_del	Write dq14 delay fine-tuning. This field holds the number of delay units that are added to dq14 relative to dqs1. 00 No change in dq14 delay

Table continues on the next page...

MMDC_MPWRDQBY1DL field descriptions (continued)

Field	Description
	01 Add dq14 delay of 1 delay unit. 10 Add dq14 delay of 2 delay units. 11 Add dq14 delay of 3 delay units.
23–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 wr_dq13_del	Write dq13 delay fine-tuning. This field holds the number of delay units that are added to dq13 relative to dqs1. 00 No change in dq13 delay 01 Add dq13 delay of 1 delay unit. 10 Add dq13 delay of 2 delay units. 11 Add dq13 delay of 3 delay units.
19–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 wr_dq12_del	Write dq12 delay fine-tuning. This field holds the number of delay units that are added to dq12 relative to dqs1. 00 No change in dq12 delay 01 Add dq12 delay of 1 delay unit. 10 Add dq12 delay of 2 delay units. 11 Add dq12 delay of 3 delay units.
15–14 Reserved	This read-only field is reserved and always has the value 0.
13–12 wr_dq11_del	Write dq11 delay fine-tuning. This field holds the number of delay units that are added to dq11 relative to dqs1. 00 No change in dq11 delay 01 Add dq11 delay of 1 delay unit. 10 Add dq11 delay of 2 delay units. 11 Add dq11 delay of 3 delay units.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 wr_dq10_del	Write dq10 delay fine-tuning. This field holds the number of delay units that are added to dq10 relative to dqs1. 00 No change in dq10 delay 01 Add dq10 delay of 1 delay unit. 10 Add dq10 delay of 2 delay units. 11 Add dq10 delay of 3 delay units.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–4 wr_dq9_del	Write dq9 delay fine-tuning. This field holds the number of delay units that are added to dq9 relative to dqs1. 00 No change in dq9 delay 01 Add dq9 delay of 1 delay unit. 10 Add dq9 delay of 2 delay units. 11 Add dq9 delay of 3 delay units.

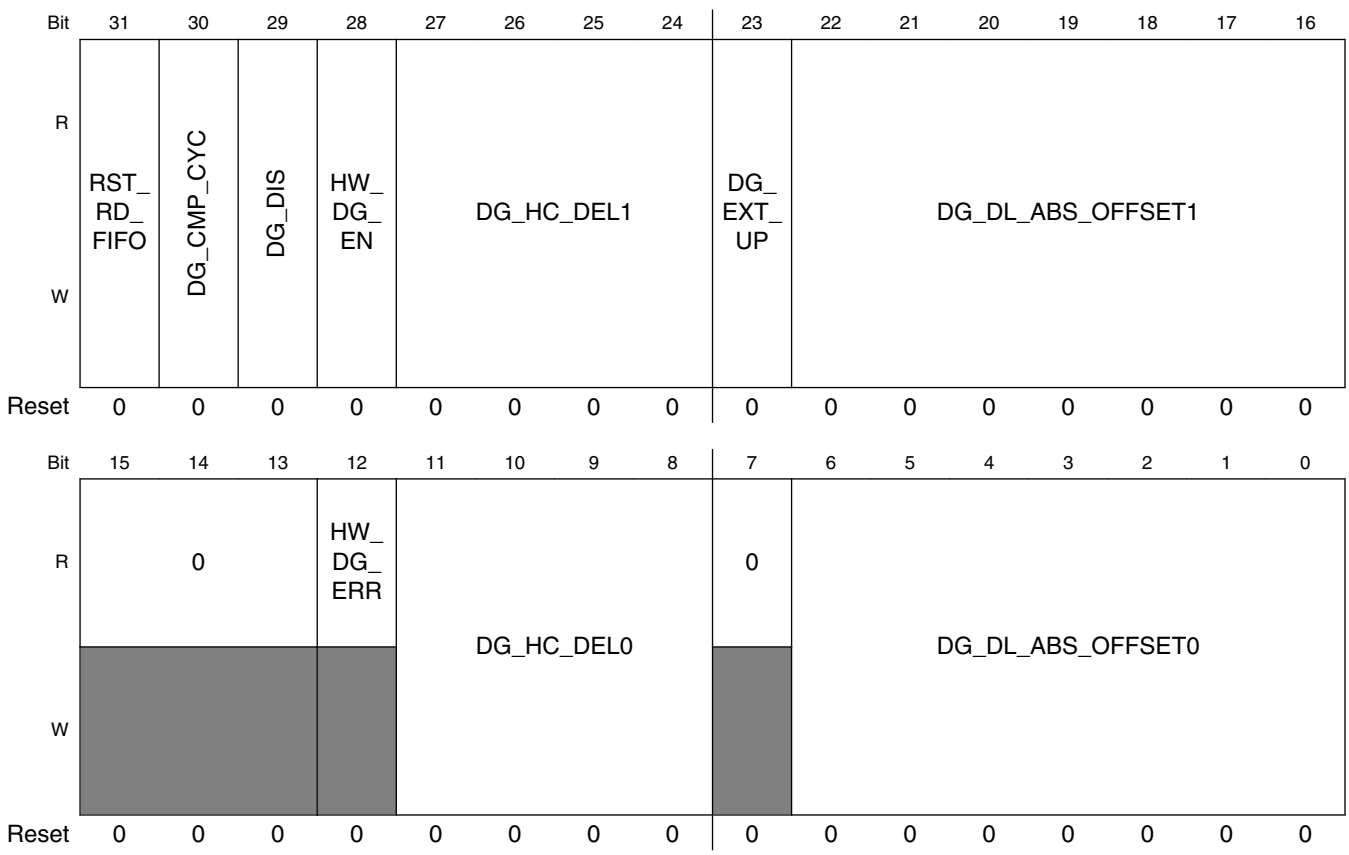

Table continues on the next page...

MMDC_MPWRDQBY1DL field descriptions (continued)

Field	Description
3–2 Reserved	This read-only field is reserved and always has the value 0.
wr_dq8_del	Write dq8 delay fine-tuning. This field holds the number of delay units that are added to dq8 relative to dqs1. 00 No change in dq8 delay 01 Add dq8 delay of 1 delay unit. 10 Add dq8 delay of 2 delay units. 11 Add dq8 delay of 3 delay units.

33.12.41 MMDC PHY Read DQS Gating Control Register 0 (MMDC_MPDGCTRL0)

Address: 21B_0000h base + 83Ch offset = 21B_083Ch

MMDC_MPDGCTRL0 field descriptions

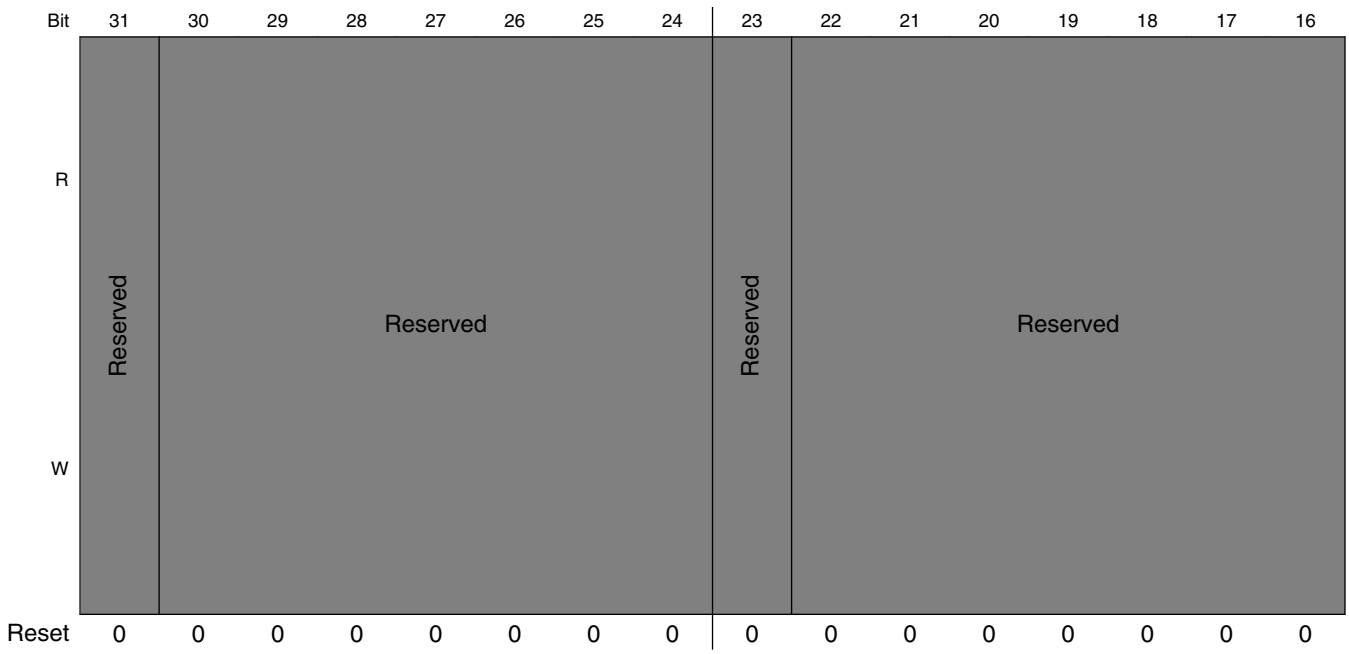
Field	Description
31 RST_RD_FIFO	Reset Read Data FIFO and associated pointers. If this bit is asserted then the MMDC resets the read data FIFO and the associated pointers. This bit is self cleared after the FIFO reset is done.

Table continues on the next page...

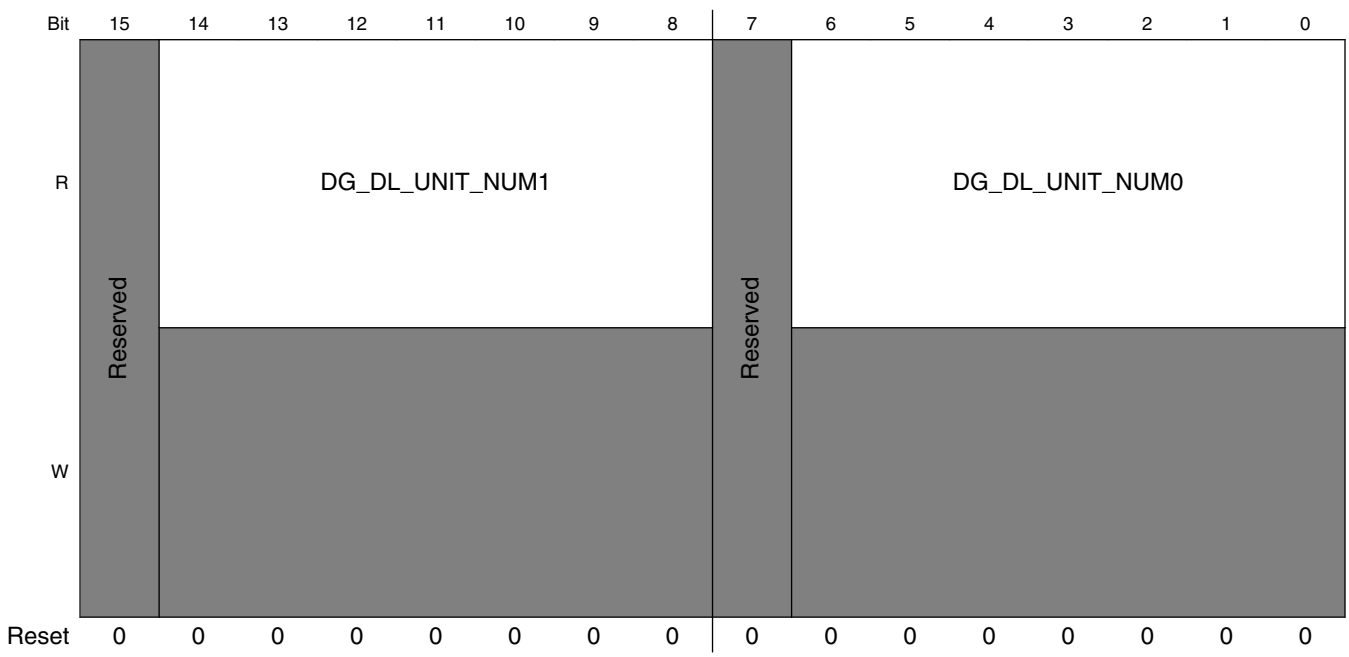
MMDC_MPDGCTRL0 field descriptions (continued)

Field	Description
30 DG_CMP_CYC	Read DQS gating sample cycle. If this bit is asserted then the MMDC waits 32 cycles before comparing the read data, Otherwise it waits 16 DDR cycles. 0 MMDC waits 16 DDR cycles 1 MMDC waits 32 DDR cycles
29 DG_DIS	Read DQS gating disable. If this bit is asserted then the MMDC disables the read DQS gating mechanism. If this bits is asserted (read DQS gating is disabled) then pulll-up and pull-down resistors suppose to be used on DQS and DQS# respectively 0 Read DQS gating mechanism is enabled 1 Read DQS gating mechanism is disabled
28 HW_DG_EN	Enable automatic read DQS gating calibration. If this bit is asserted then the MMDC performs automatic read DQS gating calibration. HW negates this bit upon completion of the automatic read DQS gating. Note: Before issuing the first read command the MMDC counts 12 cycles. In LPDDR2 mode automatic (HW) read DQS gating should be disabled and Pull-up/pull-down resistors on DQS/DQS# should be enabled while ODT resistors must be disconnected. 0 Disable automatic read DQS gating calibration 1 Start automatic read DQS gating calibration
27–24 DG_HC_DEL1	Read DQS gating half cycles delay for Byte1 . This field indicates the delay in half cycles between read DQS gate and the middle of the read DQS preamble of Byte1. This delay is added to the delay that is generated by the read DQS1 gating delay-line, So the total read DQS gating delay is (DG_HC_DEL#)*0.5*cycle + (DG_DL_ABS_OFFSET#)*1/256*cycle Upon completion of the automatic read DQS gating calibration this field gets the value of the 4 MSB of ((HW_DG_LOW1 + HW_DG_UP1) /2). 0000 0 cycles delay. 0001 Half cycle delay. 0010 1 cycle delay 1101 6.5 cycles delay 1110 Reserved 1111 Reserved
23 DG_EXT_UP	DG extend upper boundary. By default the upper boundary of DQS gating HW calibration is set according to first failing comparison after at least one passing comparison. If this bit is asserted then the upper boundary is set according to the last passing comparison.
22–16 DG_DL_ABS_ OFFSET1	Absolute read DQS gating delay offset for Byte1. This field indicates the absolute delay between read DQS gate and the middle of the read DQS preamble of Byte1 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (DG_DL_ABS_OFFSET1 / 256)* MMDC AXI clock (fast clock). This field can also bit written by HW. Upon completion of the automatic read DQS gating calibration this field gets the value of the 7 LSB of ((HW_DG_LOW1 + HW_DG_UP1) /2). Note that not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.
15–13 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...



MMDC_MPDGCTRL0 field descriptions (continued)



Field	Description
12 HW_DG_ERR	HW DQS gating error. This bit valid is asserted when an error was found during the read DQS gating HW calibration process. Error can occur when no valid value was found during HW calibration. This bit is valid only after HW_DG_EN is de-asserted. 0 No error was found during the DQS gating HW calibration process. 1 An error was found during the DQS gating HW calibration process.
11–8 DG_HC_DEL0	Read DQS gating half cycles delay for Byte0 . This field indicates the delay in half cycles between read DQS gate and the middle of the read DQS preamble of Byte0/4. This delay is added to the delay that is generated by the read DQS1 gating delay-line, So the total read DQS gating delay is (DG_HC_DEL#)*0.5*cycle + (DG_DL_ABS_OFFSET#)*1/256*cycle Upon completion of the automatic read DQS gating calibration this field gets the value of the 4 MSB of ((HW_DG_LOW1 + HW_DG_UP1) /2). 0000 0 cycles delay. 0001 Half cycle delay. 0010 1 cycle delay 1101 6.5 cycles delay 1110 Reserved 1111 Reserved
7 Reserved	This read-only field is reserved and always has the value 0.
DG_DL_ABS_ OFFSET0	Absolute read DQS gating delay offset for Byte0. This field indicates the absolute delay between read DQS gate and the middle of the read DQS preamble of Byte0 with fractions of a clock period and up to half cycle.The fraction is process and frequency independent. The delay of the delay-line would be (DG_DL_ABS_OFFSET0 / 256)* MMDC AXI clock (fast clock). This field can also bit written by HW. Upon completion of the automatic read DQS gating calibration this field gets the value of the 7 LSB of ((HW_DG_LOW0 + HW_DG_UP0) /2). Note that not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.

33.12.42 MMDC PHY Read DQS Gating delay-line Status Register (MMDC_MPDGDLST0)

This register holds the status of the 4 dqs gating delay-lines.

Address: 21B_0000h base + 844h offset = 21B_0844h

MMDC_MPRDDLCTL field descriptions (continued)

Field	Description
14–8 RD_DL_ABS_ OFFSET1	Absolute read delay offset for Byte1. This field indicates the absolute delay between read DQS strobe and the read data of Byte1 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (RD_DL_ABS_OFFSET1 / 256) * MMDC AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay. This field can also bit written by HW. Upon completion of the read delay-line HW calibration this field gets the value of (HW_RD_DL_LOW1 + HW_RD_DL_UP1) /2 Note that not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.
7 Reserved	This read-only field is reserved and always has the value 0.
RD_DL_ABS_ OFFSET0	Absolute read delay offset for Byte0. This field indicates the absolute delay between read DQS strobe and the read data of Byte0 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (RD_DL_ABS_OFFSET0 / 256) * MMDC AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay. This field can also bit written by HW. Upon completion of the read delay-line HW calibration this field gets the value of (HW_RD_DL_LOW0 + HW_RD_DL_UP0) /2 Note that not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.

33.12.44 MMDC PHY Read delay-lines Status Register (MMDC_MPRDDLST)

This register holds the status of the 4 read delay-lines.

Address: 21B_0000h base + 84Ch offset = 21B_084Ch

MMDC_MPZQLP2CTL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 ZQ_LP2_HW_ ZQCS	This register defines the period in cycles that it takes the memory device to perform a long ZQ calibration. This is the period of time that the MMDC has to wait after sending a short ZQ calibration and before sending other commands. This delay will also be used if ZQ reset is sent. 0x0-0x1A Reserved 0x1B 112 cycles (default) 0x1C 116 cycles

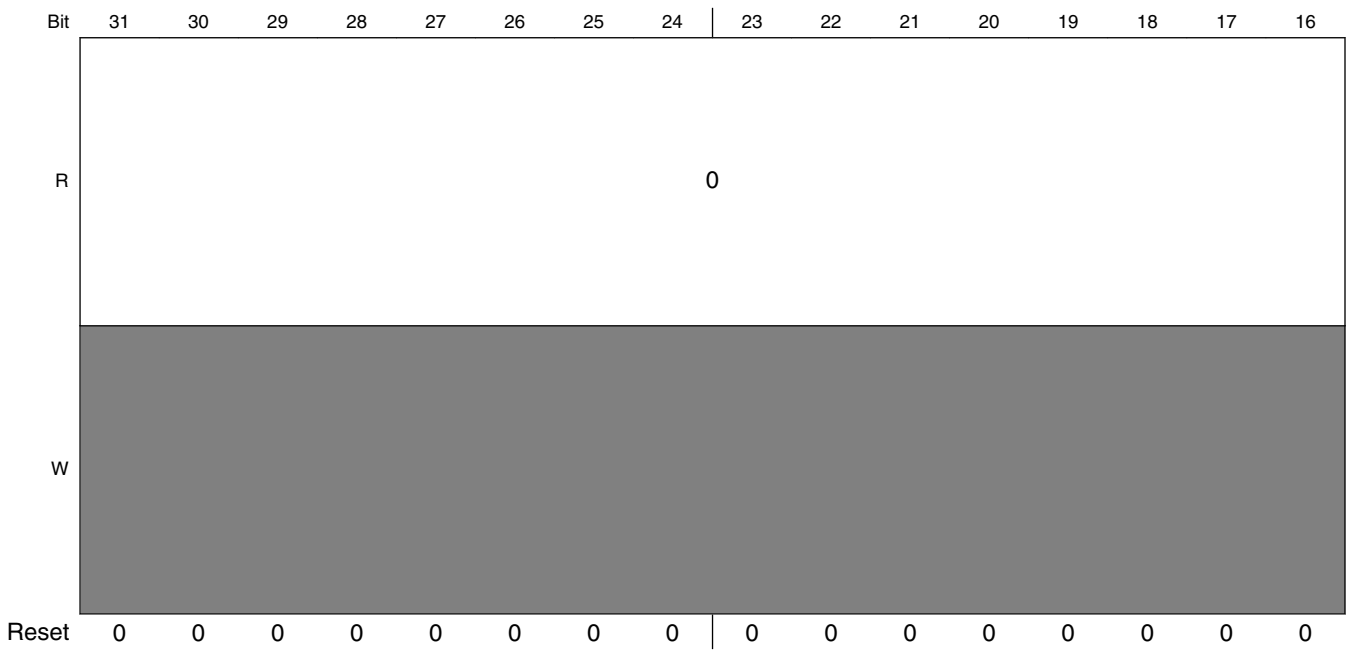

Table continues on the next page...

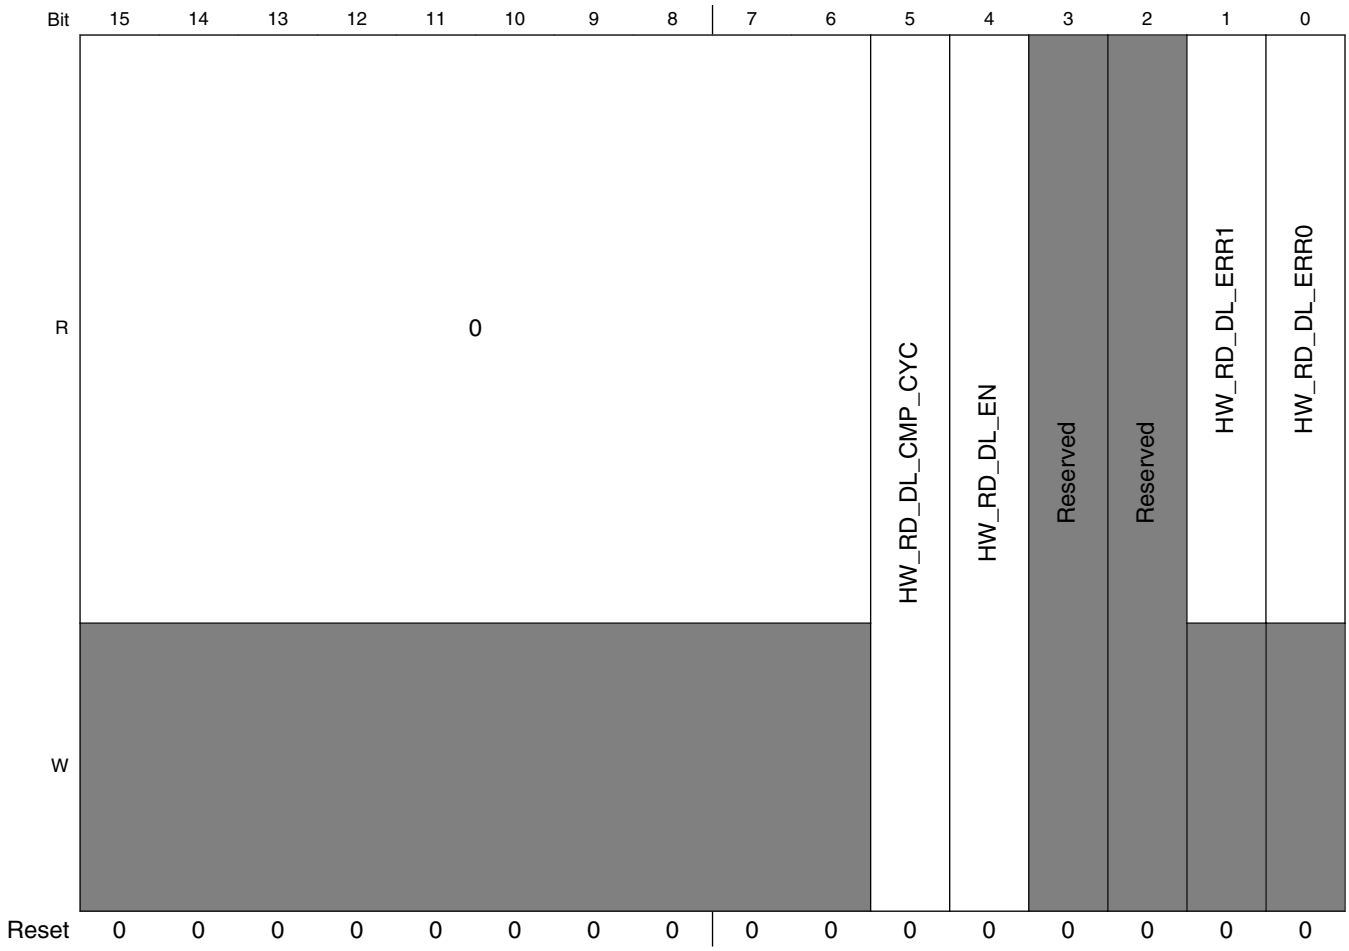


MMDC_MPZQLP2CTL field descriptions (continued)

Field	Description
	0x7E 508 cycles 0x7F 512 cycles
23–16 ZQ_LP2_HW_ZQCL	This register defines the period in cycles that it takes the memory device to perform a short ZQ calibration. This is the period of time that the MMDC has to wait after sending a long ZQ calibration and before sending other commands. 0x0-0x36 Reserved 0x37 112 cycles 0x38 114 cycles 0x5F 192 cycles (Default, JEDEC value, tZQCL, for LPDDR2, 360ns @ clock frequency 533MHz) 0xFE 510 cycles 0xFF 512 cycles
15–9 Reserved	This read-only field is reserved and always has the value 0.
ZQ_LP2_HW_ZQINIT	This register defines the period in cycles that it takes the memory device to perform a Init ZQ calibration. This is the period of time that the MMDC has to wait after sending a init ZQ calibration and before sending other commands. 0x0-0x36 Reserved 0x37 112 cycles 0x38 114 cycles 0x109 532 cycles (Default, JEDEC value, tZQINIT, for LPDDR2, 1us @ clock frequency 533MHz) 0x1FE 1022 cycles 0x1FF 1024 cycles

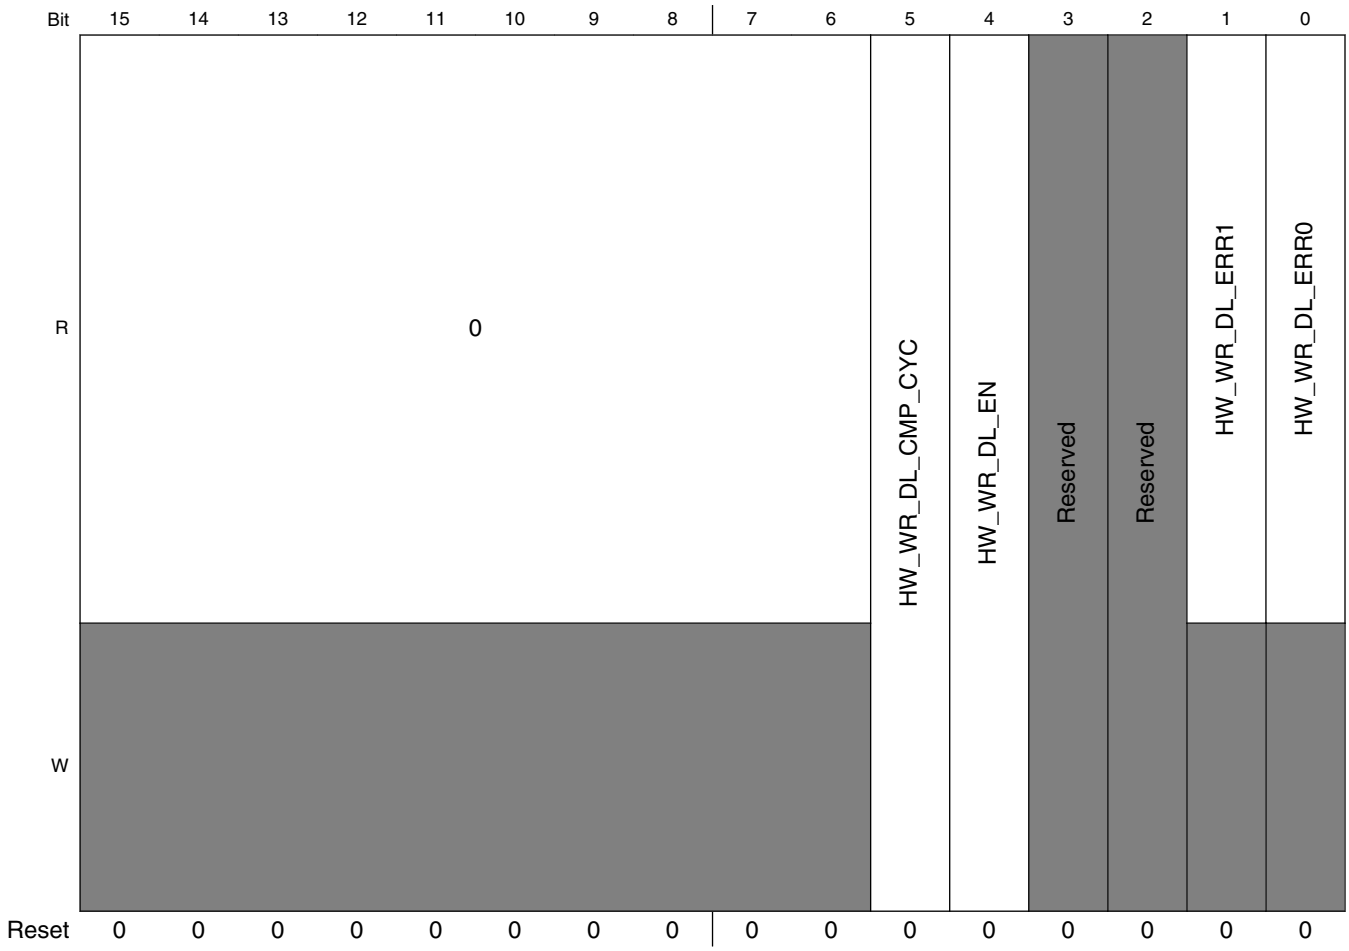
33.12.49 MMDC PHY Read Delay HW Calibration Control Register (MMDC_MPRDDLHWCTL)

Address: 21B_0000h base + 860h offset = 21B_0860h

MMDC_MPRDDLHWCTL field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 HW_RD_DL_ CMP_CYC	Automatic (HW) read sample cycle. If this bit is asserted then the MMDC will compare the read data 32 cycles after the MMDC sent the read command enable pulse else it compares the data after 16 cycles.
4 HW_RD_DL_EN	Enable automatic (HW) read calibration. If this bit is asserted then the MMDC will perform an automatic read calibration. HW should negate this bit upon completion of the calibration. Negation of this bit also points that the read calibration results are valid Note: Before issuing the first read command MMDC counts 12 cycles.
3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
1 HW_RD_DL_ ERR1	Automatic (HW) read calibration error of Byte1. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 1. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST0 register. This bit is valid only after HW_RD_DL_EN is de-asserted.

Table continues on the next page...



MMDC_MPRDDLHWCTL field descriptions (continued)

Field	Description
	0 No error was found in read delay-line 1 during the automatic (HW) read calibration process of read delay-line 1. 1 An error was found in read delay-line 1 during the automatic (HW) read calibration process of read delay-line 1.
0 HW_RD_DL_ERR0	Automatic (HW) read calibration error of Byte0. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 0. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST0 register. This bit is valid only after HW_RD_DL_EN is de-asserted. 0 No error was found in read delay-line 0 during the automatic (HW) read calibration process of read delay-line 0. 1 An error was found in read delay-line 0 during the automatic (HW) read calibration process of read delay-line 0.

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
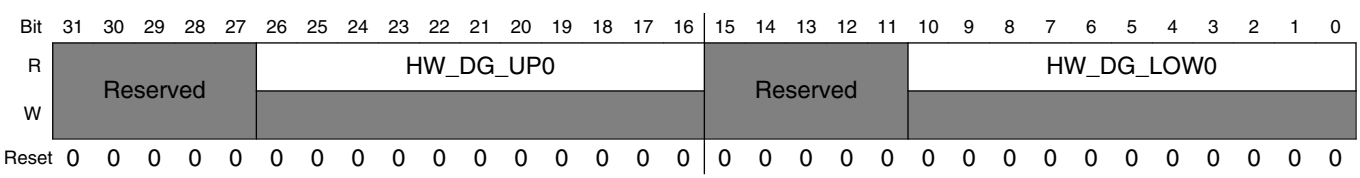
30–24 HW_WR_DL_UP1	Automatic (HW) write automatic (HW) write calibration result of the upper boundary of Byte1. This field holds the automatic (HW) write calibration result of the upper boundary of Byte1.
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 HW_WR_DL_LOW1	Automatic (HW) write calibration result of the lower boundary of Byte1. This field holds the automatic (HW) write calibration result of the lower boundary of Byte1.
15 Reserved	This read-only field is reserved and always has the value 0.
14–8 HW_WR_DL_UP0	Automatic (HW) write calibration result of the upper boundary of Byte0. This field holds the automatic (HW) write calibration result of the upper boundary of Byte0.
7 Reserved	This read-only field is reserved and always has the value 0.
HW_WR_DL_LOW0	Automatic (HW) write calibration result of the lower boundary of Byte0. This field holds the automatic (HW) write calibration result of the lower boundary of Byte0.

33.12.53 MMDC PHY Write Leveling HW Error Register (MMDC_MPWLHWERR)

Address: 21B_0000h base + 878h offset = 21B_0878h

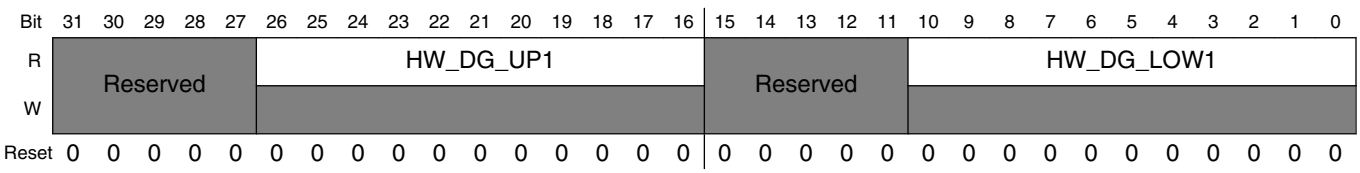


MMDC_MPWLHWERR field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23–16 -	This field is reserved. Reserved
15–8 HW_WL1_DQ	HW write-leveling calibration result of Byte1. This field holds the results for all the 8 write-leveling steps of Byte1. i.e. bit 0 holds the result of the write-leveling calibration of 0 delay, bit 1holds the result of the write-leveling calibration of 1/8delay till bit 7 that holds the result of the write-leveling calibration of 7/8 delay
HW_WL0_DQ	HW write-leveling calibration result of Byte0. This field holds the results for all the 8 write-leveling steps of Byte0. i.e. bit 0 holds the result of the write-leveling calibration of 0 delay, bit 1holds the result of the write-leveling calibration of 1/8delay till bit 7 that holds the result of the write-leveling calibration of 7/8 delay

33.12.54 MMDC PHY Read DQS Gating HW Status Register 0 (MMDC_MPDGHWST0)

Address: 21B_0000h base + 87Ch offset = 21B_087Ch

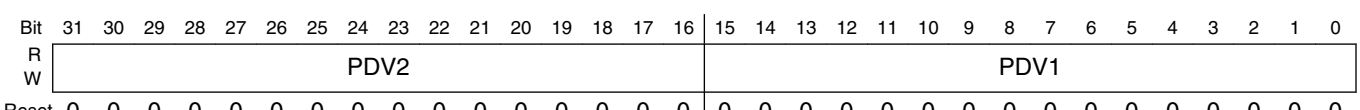


MMDC_MPDGHWST0 field descriptions

Field	Description
31–27 -	This field is reserved. Reserved
26–16 HW_DG_UP0	HW DQS gating calibration result of the upper boundary of Byte0. This field holds the HW DQS gating calibration result of the upper boundary of Byte0.
15–11 -	This field is reserved. Reserved
HW_DG_LOW0	HW DQS gating calibration result of the lower boundary of Byte0. This field holds the HW DQS gating calibration result of the lower boundary of Byte0.

33.12.55 MMDC PHY Read DQS Gating HW Status Register 1 (MMDC_MPDGHWST1)

Address: 21B_0000h base + 880h offset = 21B_0880h



MMDC_MPDGHWST1 field descriptions

Field	Description
31–27 -	This field is reserved. Reserved
26–16 HW_DG_UP1	HW DQS gating calibration result of the upper boundary of Byte1. This field holds the HW DQS gating calibration result of the upper boundary of Byte1.
15–11 -	This field is reserved. Reserved
HW_DG_LOW1	HW DQS gating calibration result of the lower boundary of Byte1. This field holds the HW DQS gating calibration result of the lower boundary of Byte1.

33.12.56 MMDC PHY Pre-defined Compare Register 1 (MMDC_MPPDCMPR1)

This register holds the MMDC pre-defined compare value that will be used during automatic read, read DQS gating and write calibration process. The compare value can be the MPR value (as defined in the JEDEC) or can be programmed by the PDV1 and PDV2 fields.In case of DDR3 (BL=8) the MMDC will duplicate PDV1,PDV2 and drive that data on Beat4-7 of the same byte

Address: 21B_0000h base + 88Ch offset = 21B_088Ch

MMDC_MPPDCMPR1 field descriptions

Field	Description
31–16 PDV2	MMDC Pre defined compare value2. This field holds the 2 MSB of the data that will be driven to the DDR device during automatic read, read DQS gating and write calibrations in case MPR(DDR3)/ DQ calibration

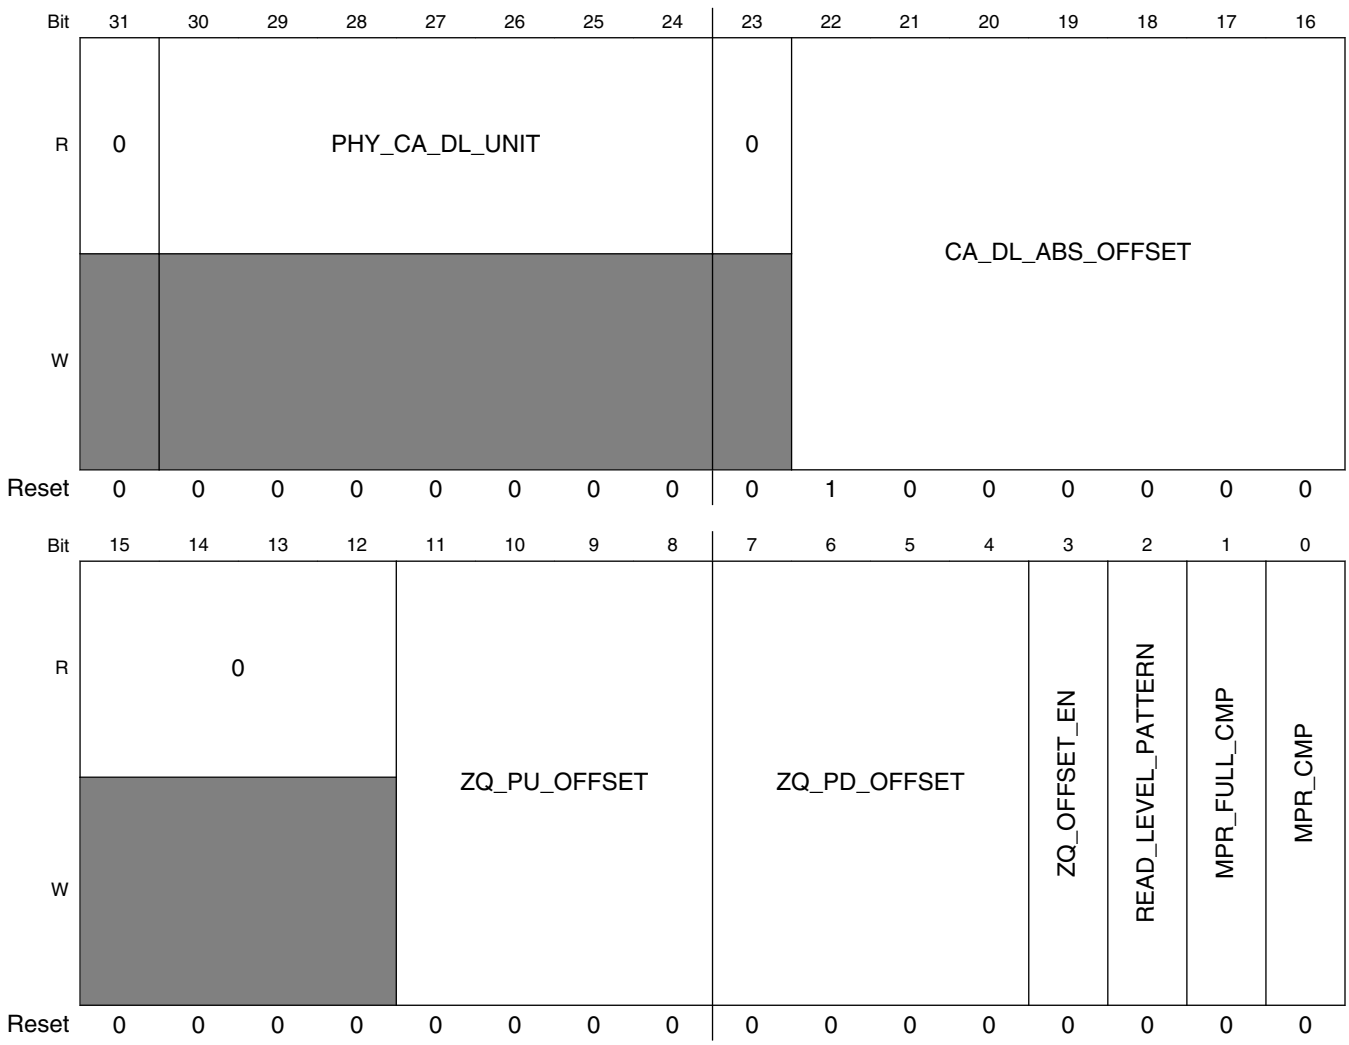


Table continues on the next page...

MMDC_MPPDCMPR1 field descriptions (continued)

Field	Description
	(LPDDR2/LPDDR3) mode are disabled (MPR_CMP is disabled). Upon read access during the calibration the MMDC will compare the read data with the data that is stored in this field. Note : Before issue the read access the MMDC will invert the value of this field and drive it to the associate entry in the read comparison FIFO. For further information see Section 19.14.3.1.2, "Calibration with pre-defined value , Section 19.14.4.1.2, "Calibration with pre-defined value and Section 19.14.5.1, "HW (automatic) Write Calibration
PDV1	MMDC Pre defined compare value2. This field holds the 2 LSB of the data that will be driven to the DDR device during automatic read, read DQS gating and write calibrations in case MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) mode are disabled (MPR_CMP is disabled). Upon read access during the calibration the MMDC will compare the read data with the data that is stored in this field. **NOTE:** Before issuing the read access, the MMDC will invert the value of this field and drive it to the associated entry in the read comparison FIFO.

33.12.57 MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDC_MPPDCMPR2)

Address: 21B_0000h base + 890h offset = 21B_0890h

MMDC_MPPDCMPR2 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 PHY_CA_DL_ UNIT	This field reflects the number of delay units that are actually used by CA(Command/Address of LPDDR2) delay-line
23 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MPPDCMPR2 field descriptions (continued)

Field	Description
22–16 CA_DL_ABS_OFFSET	Absolute CA (Command/Address of LPDDRR2) offset. This field indicates the absolute delay between CA (Command/Address) bus and the DDR clock (CK) with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (CA_DL_ABS_OFFSET / 256) * MMDC AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay.
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–8 ZQ_PU_OFFSET	Programmable offset from -7 to 7 added to the MMDC_MPZQHWCTRL[ZQ_HW_PU_RES] field when ZQ_OFFSET_EN is enabled. Bit[11] determines direction: 'b0 = Offset is added to ZQ_HW_PU_RES field 'b1 = Offset is subtracted from ZQ_HW_PU_RES field Bits[10:8] = Amount of change to apply. 0000 **0** — Offset is added to ZQ_HW_PU_RES field 0001 **1** — Offset is added to ZQ_HW_PU_RES field 0010 **2** — Offset is added to ZQ_HW_PU_RES field 0011 **3** — Offset is added to ZQ_HW_PU_RES field 0100 **4** — Offset is added to ZQ_HW_PU_RES field 0101 **5** — Offset is added to ZQ_HW_PU_RES field 0110 **6** — Offset is added to ZQ_HW_PU_RES field 0111 **7** — Offset is added to ZQ_HW_PU_RES field 1000 **0** — Offset is subtracted from ZQ_HW_PU_RES field 1001 **1** — Offset is subtracted from ZQ_HW_PU_RES field 1010 **2** — Offset is subtracted from ZQ_HW_PU_RES field 1011 **3** — Offset is subtracted from ZQ_HW_PU_RES field 1100 **4** — Offset is subtracted from ZQ_HW_PU_RES field 1101 **5** — Offset is subtracted from ZQ_HW_PU_RES field 1110 **6** — Offset is subtracted from ZQ_HW_PU_RES field 1111 **7** — Offset is subtracted from ZQ_HW_PU_RES field
7–4 ZQ_PD_OFFSET	Programmable offset from -7 to 7 added to the MMDC_MPZQHWCTRL[ZQ_HW_PD_RES] field when ZQ_OFFSET_EN is enabled. Bit[7] determines direction: 'b0 = Offset is added to ZQ_HW_PD_RES field 'b1 = Offset is subtracted from ZQ_HW_PD_RES field Bits[6:4] = Amount of change to apply. 0000 **0** — Offset is added to ZQ_HW_PD_RES field 0001 **1** — Offset is added to ZQ_HW_PD_RES field 0010 **2** — Offset is added to ZQ_HW_PD_RES field 0011 **3** — Offset is added to ZQ_HW_PD_RES field 0100 **4** — Offset is added to ZQ_HW_PD_RES field 0101 **5** — Offset is added to ZQ_HW_PD_RES field 0110 **6** — Offset is added to ZQ_HW_PD_RES field 0111 **7** — Offset is added to ZQ_HW_PD_RES field 1000 **0** — Offset is subtracted from ZQ_HW_PD_RES field

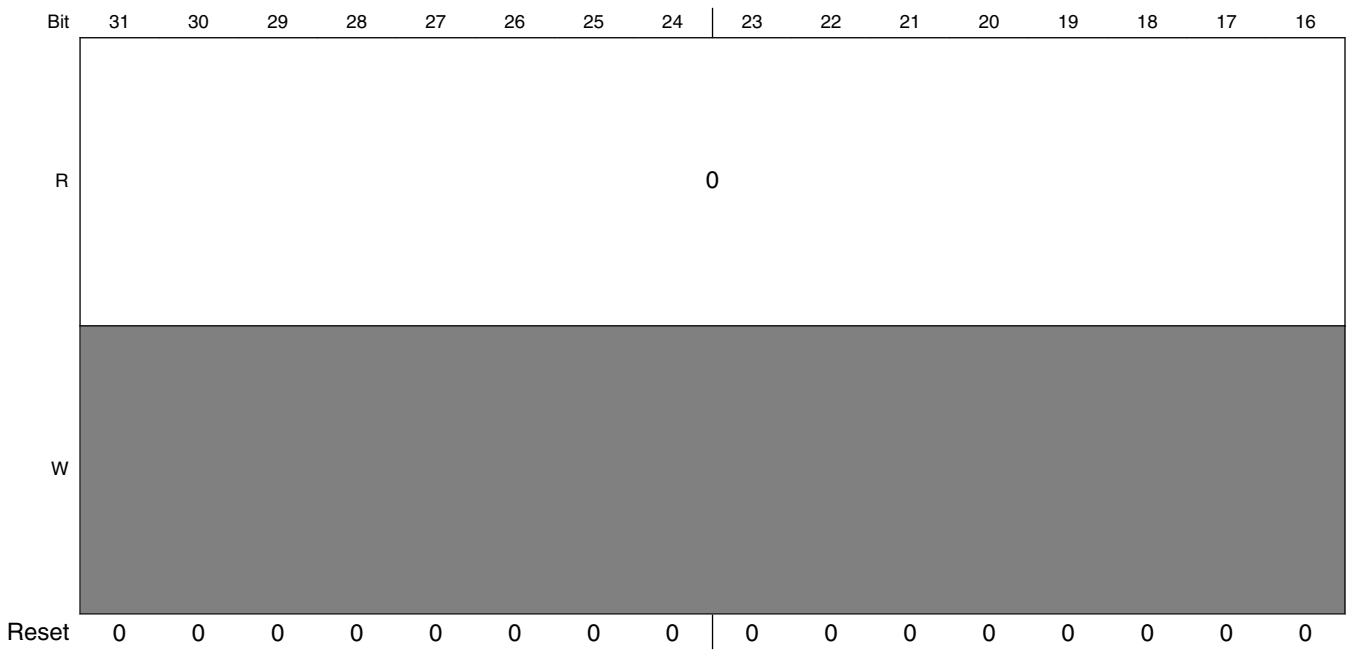

Table continues on the next page...

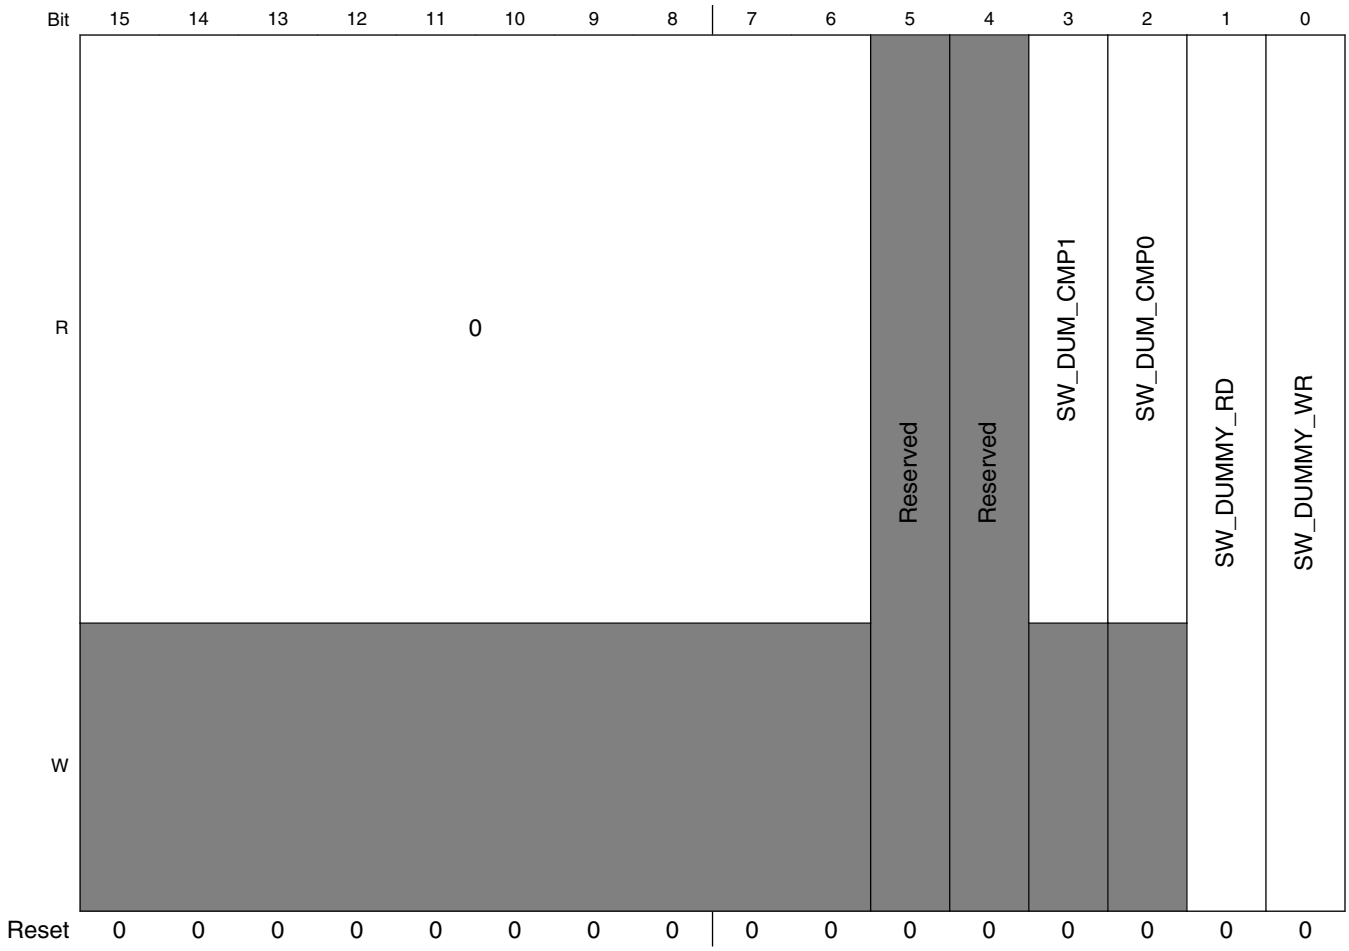

MMDC_MPPDCMPR2 field descriptions (continued)

Field	Description
	1001 **1** — Offset is subtracted from ZQ_HW_PD_RES field 1010 **2** — Offset is subtracted from ZQ_HW_PD_RES field 1011 **3** — Offset is subtracted from ZQ_HW_PD_RES field 1100 **4** — Offset is subtracted from ZQ_HW_PD_RES field 1101 **5** — Offset is subtracted from ZQ_HW_PD_RES field 1110 **6** — Offset is subtracted from ZQ_HW_PD_RES field 1111 **7** — Offset is subtracted from ZQ_HW_PD_RES field
3 ZQ_OFFSET_EN	0 Hardware ZQ offset disabled 1 Hardware ZQ offset enabled
2 READ_LEVEL_ PATTERN	MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) read compare pattern. In case MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) modes are used during the calibration process (MPR_CMP is asserted) then this field indicates the read pattern for the comparison. 0 Compare with read pattern 1010 1 Compare with read pattern 0011 (Used only in LPDDR2/LPDDR3 mode)
1 MPR_FULL_ CMP	MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) full compare enable. In case MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) modes are used during the calibration process (MPR_CMP is asserted) then this field indicates whether the MMDC will compare all the bits of the data that is read from the DDR device to the MPR pre-defined pattern. When this bit is de-asserted only LSB of each byte is compared.
0 MPR_CMP	MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) compare enable. This bit indicates whether the MMDC will compare the read data during automatic read and read DQS calibration processes to the pre-defined patterns that are driven by the DDR device (READ_LEVEL_PATTERN as defined by JEDEC) or general pre-defined value that are stored in PDV1 and PDV2. When this bit is disabled data is compared to the data of the pre defined compare value field For further information see Read DQS Gating Calibration and Read Calibration .

33.12.58 MMDC PHY SW Dummy Access Register (MMDC_MPSWDAR0)

Address: 21B_0000h base + 894h offset = 21B_0894h

MMDC_MPSWDAR0 field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 -	This field is reserved. Reserved
4 -	This field is reserved. Reserved
3 SW_DUM_CMP1	SW dummy read byte1 compare results. This bit indicates the result of the read data comparison of Byte1 at the completion of SW_DUMMY_RD. This bit is valid only when SW_DUMMY_RD is de-assrted. 0 Dummy read fail 1 Dummy read pass
2 SW_DUM_CMP0	SW dummy read byte0 compare results. This bit indicates the result of the read data comparison of Byte0 at the completion of SW_DUMMY_RD. This bit is valid only when SW_DUMMY_RD is de-assrted. 0 Dummy read fail 1 Dummy read pass
1 SW_DUMMY_RD	SW dummy read. When this bit is asserted the MMDC will generate internally read access without intervention of the system toward bank 0, row 0, column 0. If MPR_CMP = 1then the read data will be compared to MPPDCMPR2[READ_LEVEL_PATTERN] . If MPR_CMP =0 then the read data will be

Table continues on the next page...

MMDC_MPSWDAR0 field descriptions (continued)

Field	Description
	compared to MPPDCMPR1[PDV1], MPPDCMPR1[PDV2]. Upon completion of the access this bit is de-asserted automatically and the read data and comparison results are valid at MPSWDAR0[SW_DUM_CMP#] and MPSWDRDR0-MPSWDRDR7 respectively.
0 SW_DUMMY_WR	SW dummy write. When this bit is asserted the MMDC will generate internally write access without intervention of the system toward bank 0, row 0, column 0, while the data is driven from MPPDCMPR1[PDV1] and MPPDCMPR1[PDV2]. The bit is de-asserted automatically upon completion of the access.

33.12.59 MMDC PHY SW Dummy Read Data Register 0 (MMDC_MPSWDRDR0)

Address: 21B_0000h base + 898h offset = 21B_0898h

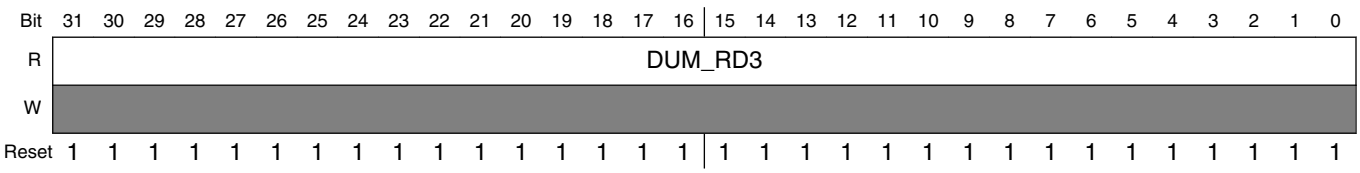
MMDC_MPSWDRDR1 field descriptions

Field	Description
DUM_RD1	Dummy read data1. This field holds the second data that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-assrted

33.12.61 MMDC PHY SW Dummy Read Data Register 2 (MMDC_MPSWDRDR2)

Address: 21B_0000h base + 8A0h offset = 21B_08A0h

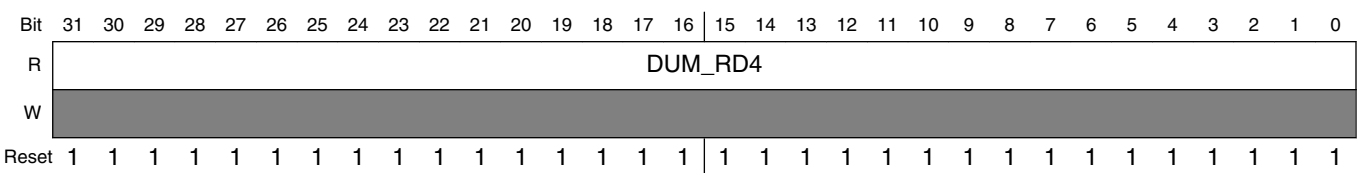


MMDC_MPSWDRDR2 field descriptions

Field	Description
DUM_RD2	Dummy read data2. This field holds the third data that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-assrted.

33.12.62 MMDC PHY SW Dummy Read Data Register 3 (MMDC_MPSWDRDR3)

Address: 21B_0000h base + 8A4h offset = 21B_08A4h



MMDC_MPSWDRDR3 field descriptions

Field	Description
DUM_RD3	Dummy read data3. This field holds the forth data that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-assrted.

33.12.63 MMDC PHY SW Dummy Read Data Register 4 (MMDC_MPSWDRDR4)

Address: 21B_0000h base + 8A8h offset = 21B_08A8h

MMDC_MPSWDRDR4 field descriptions

Field	Description
DUM_RD4	Dummy read data4. This field holds the fifth data (only in case of burst length 8 (BL =1)) that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-assrted.

33.12.64 MMDC PHY SW Dummy Read Data Register 5 (MMDC_MPSWDRDR5)

Address: 21B_0000h base + 8ACh offset = 21B_08ACh

MMDC_MPMUR0 field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–16 MU_UNIT_DEL_NUM	Number of delay units measured per cycle. This field is used in debug mode and holds the number of delay units that were measured by the measure unit per DDR clock cycle. The delay-lines that are used in every calibration process use that number for generating the desired delay.
15–12 Reserved	This read-only field is reserved and always has the value 0.
11 FRC_MSR	Force measurement on delay-lines. When this bit is asserted then a measurement process will be performed, where at the completion of the process the delay-lines will issue the desired delay. Upon completion of the measurement process the measure unit and the delay-lines will return to functional mode. This bit is self cleared.

Table continues on the next page...

MMDC_MPMUR0 field descriptions (continued)

Field	Description
	NOTE: This bit should be used only during manual (SW) calibration and not while the DDR is functional (being accessed). After initial calibration is done the hardware performs periodic measurements to track any operating conditions changes. Hence, force measurements (FRC_MSR) should not be used. See Calibration Process for more information. **NOTE:** User should make sure that there is no active accesses to/from DDR before asserting this bit. 0 No measurement is performed 1 Perform measurement process
10 MU_BYP_EN	Measure unit bypass enable. This field is used in debug mode and when it is asserted then the delay-lines will use the number of delay units that are indicated at MU_BYP_VAL, otherwise the delay-lines will use the number of delay units that was measured by the measurement unit and are indicated at MU_UNIT_DEL_NUM 0 The delay-lines use delay units as indicated at MU_UNIT_DEL_NUM. 1 The delay-lines use delay units as indicated at MU_BYPASS_VAL.
MU_BYP_VAL	Number of delay units for measurement bypass. This field is used in debug mode and holds the number of delay units that will be used by the delay-lines when MU_BYP_EN is asserted.

33.12.68 MMDC Write CA delay-line controller (MMDC_MPWRCADL)

This register is used to add fine-tuning adjustment to the CA (command/Address of LPDDR2 bus) relative to the DDR clock

Address: 21B_0000h base + 8BCh offset = 21B_08BCh

Field	Description
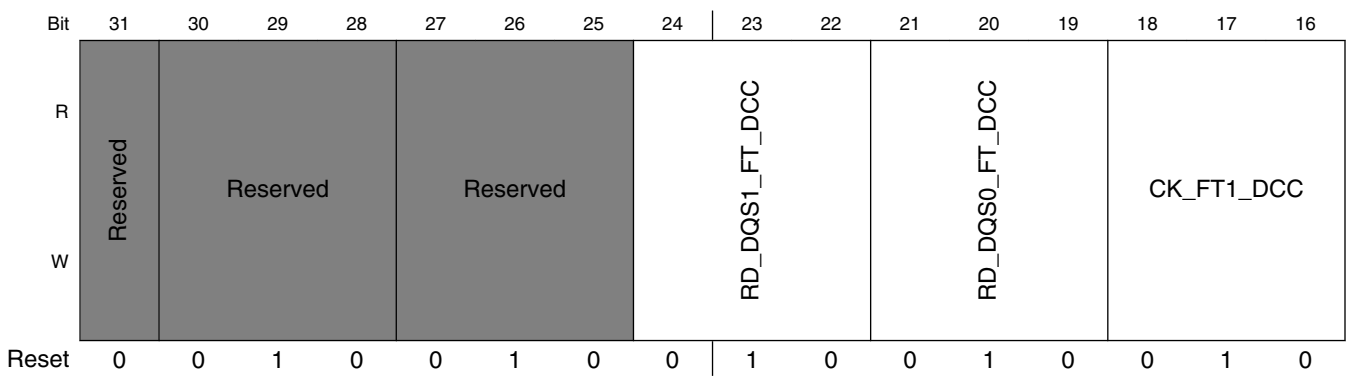
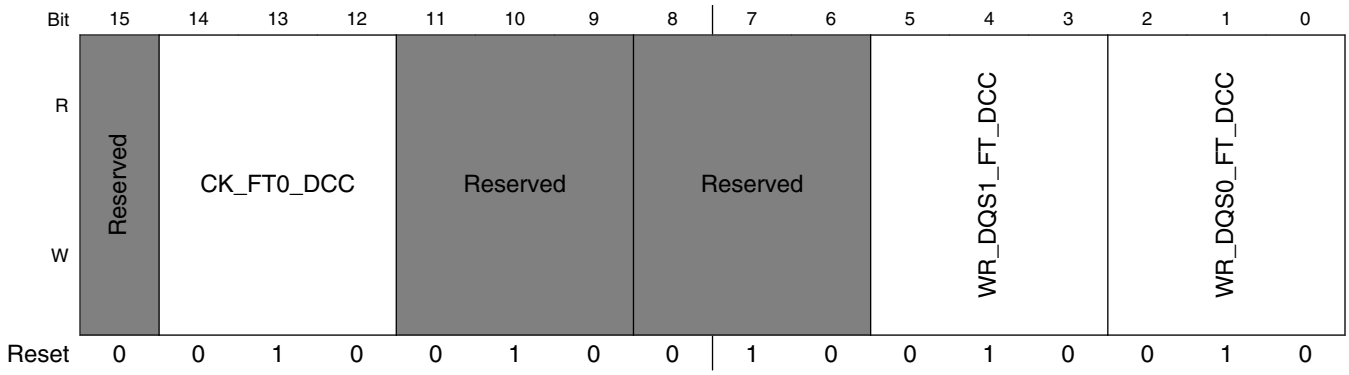
	00 No change in CA2 delay 01 Add CA2 delay of 1 delay unit 10 Add CA2 delay of 2 delay units. 11 Add CA2 delay of 3 delay units.
3–2 WR_CA1_DEL	CA (Command/Address LPDDR2 bus) bit 1 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 1 relative to the clock. 00 No change in CA1 delay 01 Add CA1 delay of 1 delay unit 10 Add CA1 delay of 2 delay units. 11 Add CA1 delay of 3 delay units.
WR_CA0_DEL	CA(Command/Address LPDDR2 bus) bit 0 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 0 relative to the clock. 00 No change in CA0 delay 01 Add CA0 delay of 1 delay unit 10 Add CA0 delay of 2 delay units. 11 Add CA0 delay of 3 delay units.

33.12.69 MMDC Duty Cycle Control Register (MMDC_MPDCCR)

This register is used to control the duty cycle of the DQS and the primary clock (CK0) . Programming of that register is permitted by entering the DDR device into self-refresh mode through LPMD/DVFS mechanism



NOTE



If the duty cycle is modified after DDR initialization, the DDR will have to be placed in self-refresh mode.

NOTE

The duty cycle may be changed during initial DDR initialization without having to be placed in self-refresh mode.

Address: 21B_0000h base + 8C0h offset = 21B_08C0h

Chapter 34
Medium Quality Sound (MQS)

34.1 Overview

Medium quality sound (MQS) is used to generate medium quality audio via a standard GPIO in the pinmux, allowing the user to connect stereo speakers or headphones to a power amplifier without an additional DAC chip.

MQS accepts 2-channel, LSB-valid 16bit, MSB shift-out first; frame sync asserting with the first bit of the frame, data shifted with the posedge of bit clock, 44.1 kHz or 48 kHz signals from SAI1 in left_justified format; and it provides the SNR target as no more than 20dB for the signals below 10 kHz. The signals above 10 kHz will have worse THD+N values.

MQS provides only simple audio reproduction. No internal pop, click or distortion artifact reduction methods are provided.

34.2 Block Diagram

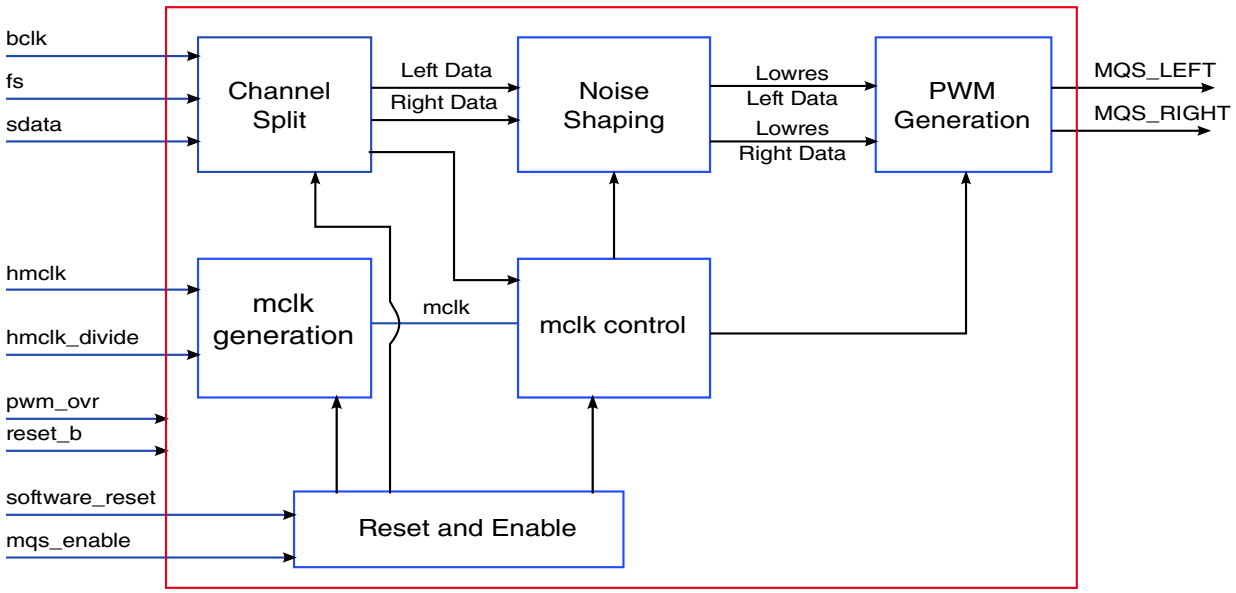

Figure 34-1. Block Diagram

MQS has the following sub-modules:

1. Channel Split: Splits the I2S signals into separate left channel and right channel audio data.
2. Noise Shaping: Uses the sigma-delta algorithm to generate low-resolution, very high sampling audio, while the audio sampling rate is increased.
3. PWM generation: Generates the bit stream to the GPIO, which is then used to drive the amplifier and then to drive the external speakers or headphones.
4. mclk generation: Used to generate the master clock (mclk). The frequency of mclk is determined by the final bit duration of PWM generation module.
5. mclk control:Used as a metronome to co-ordinate the different functional blocks working synchronously.
6. Reset and Enable: Used to generate the reset and enable logic to different clock domains.

34.3 External Signals

The following table describes the external signals of MQS:

Table 34-1. MQS External Signals

Signal	Description	Pad	Mode	Direction
MQS_LEFT	Left signal output	GPIO1_IO01	ALT4	O
		JTAG_TDI	ALT6	

Table continues on the next page...

Table 34-1. MQS External Signals (continued)

Signal	Description	Pad	Mode	Direction
		LCD_DATA23	ALT1	
MQS_RIGHT	Right signal output	GPIO1_IO00	ALT4	O
		JTAG_TDO	ALT6	
		LCD_DATA22	ALT1	

34.4 Programmability

MQS has no internal programmable registers. But it does have some programmability from IOMUXC_GPR2.

Register Bits	Name	Description
IOMUXC_GPR2[26]	MQS_OVERSAMPLE	Used to control the PWM oversampling rate compared with mclk. 1—64, 0—32.
IOMUXC_GPR2[25]	MQS_EN	MQS enable. 1—Enable MQS, 0—Disable MQS
IOMUXC_GPR2[24]	MQS_SW_RST	MQS software reset. 1—Enable software reset for MQS 0—Exit software reset for MQS
IOMUXC_GPR2[23:16]	MQS_CLK_DIV[7:0]	Divider ration control for mclk from hmclk. 0—mclk frequency = hmclk frequency; 1—mclk frequency = ½*hmclk frequency; 2—mclk frequency = 1/3*hmclk frequency; …; n—mclk frequency = 1/(n+1)*hmclk frequency

34.5 Usage Model

The user needs to program SAI1 to output 2-channel MSB-16bit active I2S signal, and then to program the related IOMUXC_GPR2 bits.

Due to the different devices connected to MQS, and different high frequency behaviors of the connected analog circuits, customer need choose the appropriate MQS_CLK_DIV and MQS_OVERSAMPLE values for the best audible effects.

Chapter 35
On-Chip OTP Controller (OCOTP_CTRL)

35.1 Overview

This section contains information describing the requirements for the on-chip eFuse OTP controller along with details about the block functionality and implementation.

In this document, the words "eFuse" and "OTP" are interchangeable. OCOTP refers to the hardware block itself.

35.1.1 Features

The OCOTP provides the following features :

- Loading and housing of fuse content into shadow registers.
- Generation of HWV_FUSE (hardware visible fuse bus) and the HWV_REG bus which is made of up of volatile PIO register based "fuses". The HWV_REG bits come from the SCS (Software Controllable Signals) register.
- Generation of STICKY_REG which is consist of sticky register bits.
- Provide program-protect and read-protect eFuse.
- Provide override and read protection of shadow register.
- CRC32 test for read-lock fuse content.

35.2 Clocks

The table found here describes the clock sources for OCOTP.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 35-1. OCOTP Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

35.3 Top-Level Symbol and Functional Overview

The figure found here shows the OCOTP system level diagram.

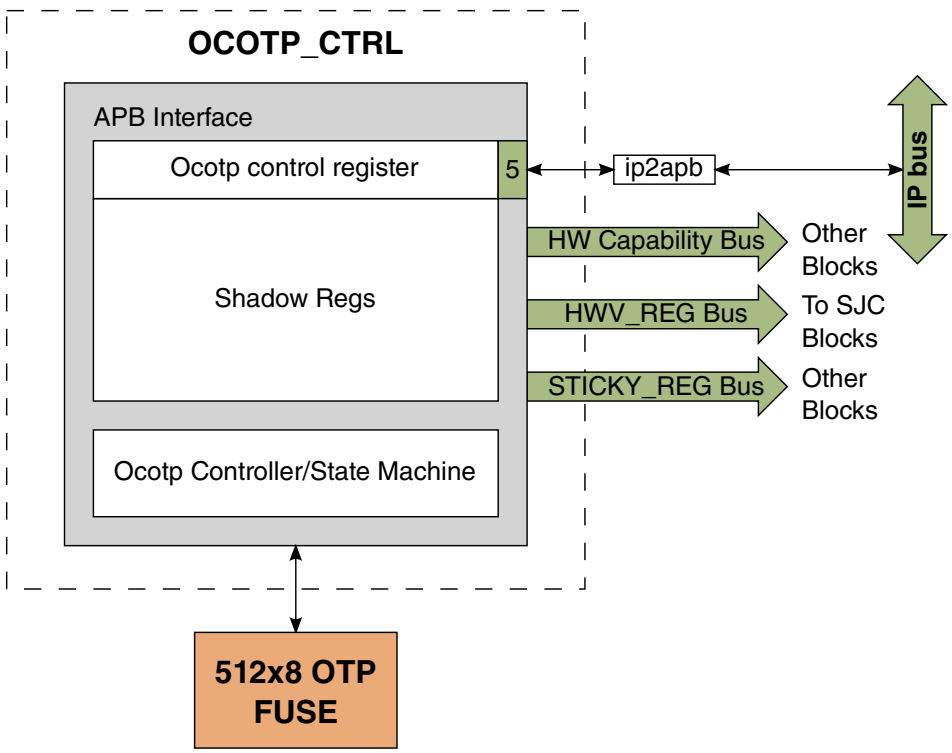

Figure 35-1. OCOTP System Level Diagram

35.3.1 Operation

The IP bus interface of the OCOTP provides two functions.

- Configure control registers for programming and reading fuse .
- Override and read shadow registers.

35.3.1.1 Shadow Register Reload

All fuse words in are shadowed. Therefore, fuse information is available through memory mapped shadow registers. If fuses are subsequently programmed, the shadow registers should be reloaded to keep them coherent with the fuse bank arrays.

The "reload shadows" feature allows the user to force a reload of the shadow registers (including HW_OCOTP_LOCK) without having to reset the device. To force a reload, complete the following steps:

1. Check that HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write , read or reload must be completed before a new access can be requested.
2. Set the HW_OCOTP_CTRL[RELOAD_SHADOWS] bit. OCOTP will read all the fuse one by one and put it into corresponding shadow register.
3. Wait for HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[RELOAD_SHADOWS] to be cleared by the controller.

The controller will automatically clear the HW_OCOTP_CTRL[RELOAD_SHADOWS] bit after the successful completion of the operation.

35.3.1.2 Fuse and Shadow register read

All shadow registers are always readable through the APB bus except some secret keys regions. When their corresponding fuse lock bits are set, the shadow registers also become read locked. After read locking, reading from these registers will return 0xBADABADA.

In addition HW_OCOTP_CTRL[ERROR] will be set. It must be cleared by software before any new write , read or reload access can be issued. Subsequent reads to unlocked shadow locations will still work successfully however.

To read fuse words directly from correctly complete the following steps:

1. Check that HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write, read or reload must be completed before a read access can be requested.
2. Write the requested to HW_OCOTP_CTRL[ADDR].

35.3.1.3 Fuse and Shadow Register Writes

Shadow register bits can be overridden by software until the corresponding fuse lock bit for the region is set. When the lock shadow bit is set, the shadow registers for that lock region become write locked. The LOCK shadow register also has no shadow or fuse lock bits but it is always read only.

In order to avoid "rogue" code performing erroneous writes to OTP, a special unlocking sequence is required for writes to the fuse banks. To program fuse bank correctly complete the following steps:

1. Program HW_OCOTP_TIMING[STROBE_PROG] and HW_OCOTP_TIMING[RELAX] fields with timing values to match the current frequency of the ipg_clk. OTP writes will work at maximum bus frequencies as long as the parameters are set correctly.
2. Check that HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write or reload must be completed before a write access can be requested.
3. Write the requested to HW_OCOTP_CTRL[ADDR] and program the unlock code into HW_OCOTP_CTRL[WR_UNLOCK]. This must be programmed for each write access. The lock code is documented in the register description. Both the unlock code and address can be written in the same operation.
4. Write the data to the HW_OCOTP_DATA register. This will automatically set HW_OCOTP_CTRL[BUSY] and clear HW_OCOTP_CTRL[WR_UNLOCK]. To protect programming same OTP bit twice, before program OCOTP will automatically read fuse value in OTP and use read value to mask program data. The controller will use masked program data to program a 32-bit word in the OTP per the address in HW_OCOTP_CTRL[ADDR]. Bit fields with 1's will result in that OTP bit being programmed. Bit fields with 0's will be ignored. At the same time that the write is accepted, the controller makes an internal copy of HW_OCOTP_CTRL[ADDR] which cannot be updated until the next write sequence is initiated. This copy guarantees that erroneous writes to HW_OCOTP_CTRL[ADDR] will not affect an active write operation. It should also be noted that during the programming HW_OCOTP_DATA will shift right (with zero fill). This shifting is required to program the OTP serially. During the write operation, HW_OCOTP_DATA cannot be modified.
5. Once complete, the controller will clear BUSY. A write request to a protected or locked region will result in no OTP access and no setting of HW_OCOTP_CTRL[BUSY]. In addition HW_OCOTP_CTRL[ERROR] will be set. It must be cleared by software before any new write access can be issued.

It should be noted that write latencies to OTP are numbers of 10 micro-seconds. Write latencies is based on amount of bit filed which is 1. For example : program half fuse bits in one word need 10 us x 16.

For further details of OTP read/write operations see [eFUSE].

HW_OCOTP_CTRL[ERROR] will be set under the following conditions:

- A write is performed to a shadow register during a shadow reload (essentially, while HW_OCOTP_CTRL[RELOAD_SHADOWS] is set. In addition, the contents of the shadow register shall not be updated.
- A write is performed to a shadow register which has been locked.
- A read is performed to from a shadow register which has been read locked.
- A program is performed to a fuse which has been .
- A read is performed to from a fuse which has been read locked.

35.3.1.4 Write Postamble

Due to internal electrical characteristics of the OTP during writes, all OTP operations following a write must be separated by 2 us after the clearing of HW_OCOTP_CTRL_BUSY following the write. This guarantees programming voltages on-chip to reach a steady state when exiting a write sequence. This includes reads, shadow reloads, or other writes.

A recommended software sequence to meet the postamble requirements is as follows:

- Issue the write and poll for BUSY (as per Fuse Shadow Memory Footprint).
- Once BUSY is clear, use HW_DIGCTL_MICROSECONDS to wait 2 us.
- Perform the next OTP operation.

35.3.2 Fuse Shadow Memory Footprint

The OTP memory footprint shows in the following figure. The registers are grouped by lock region. Their names correspond to the PIO register and fusemap names.

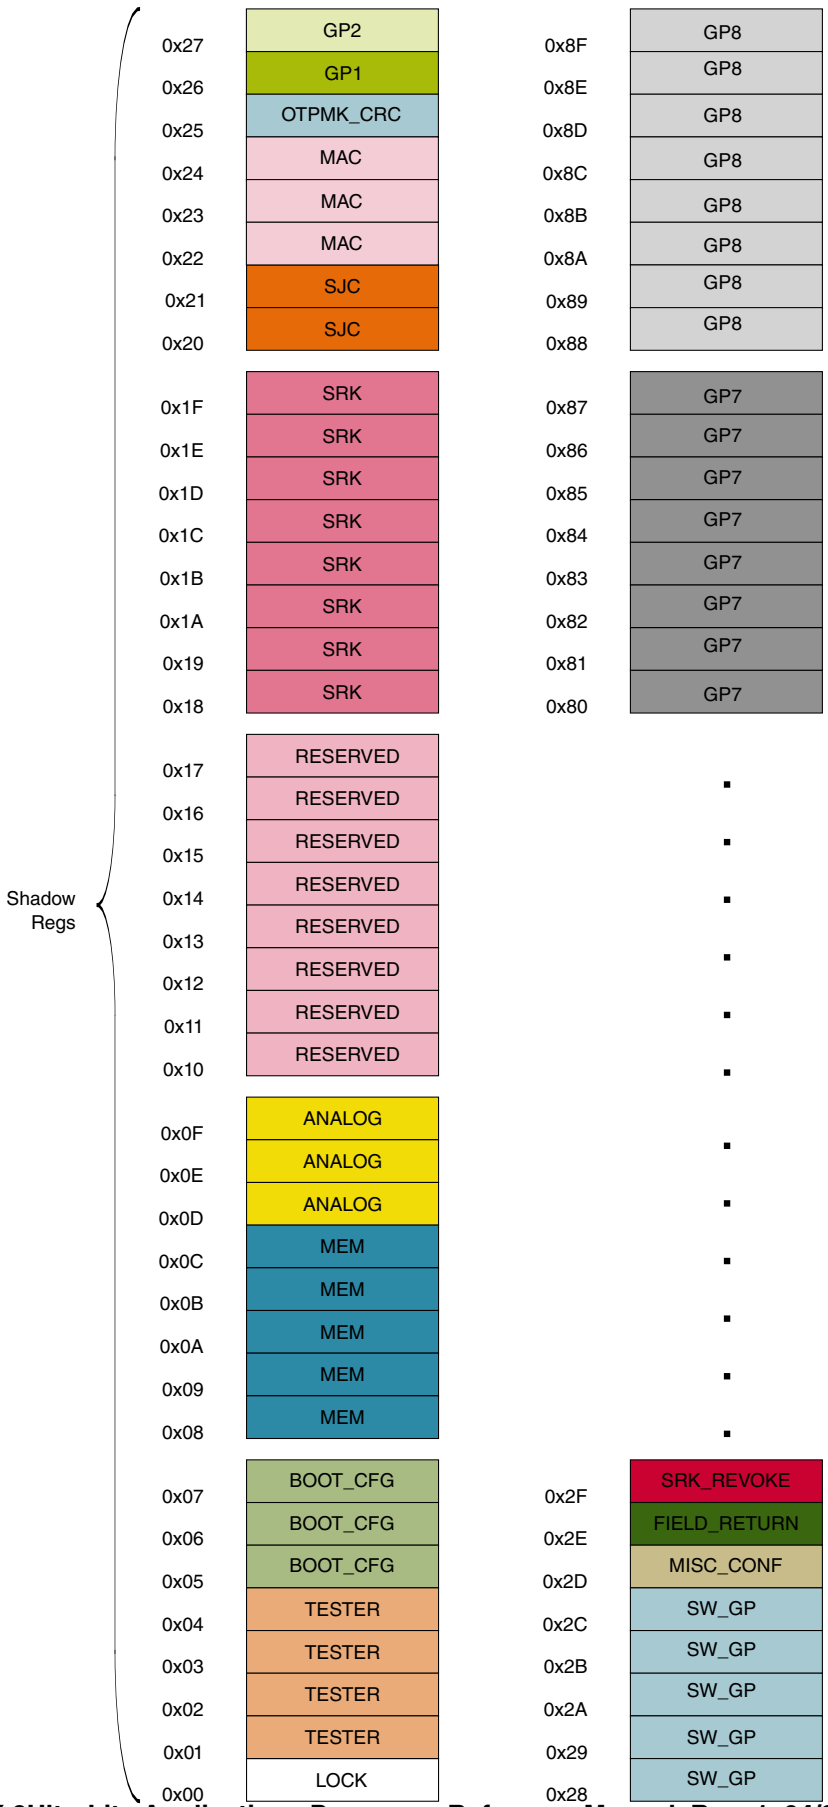

Figure 35-2. OTP Memory Footprint

35.3.3 OTP Read/Write Timing Parameters

There are three timing fields contained in the HW_OCOTP_TIMING register that specify counter limit values, which are used to specify the signal timing.

Both two timing parameters are specified in ipg_clk cycles. Since the ipg_clk frequency can be set to a range of values, these parameters must be adjusted with the clock to yield the appropriate delay.

35.3.4 Hardware Visible Fuses

The hwv_fuse bus emanates from the OCOTP block and goes to various other blocks inside the chip. This bus is made up of the shadow register bits for .

Only a subset of these fuse bits are currently used by the hardware. The fuse bits are initially copied from the banks after reset is deasserted. When all fuse bits are loaded into their shadow registers, the OCOTP asserts the fuse_latched output signal.

The hwv_reg bus also comes from the OCOTP. Its source is the HW_OCOTP_SCS register. This register has 1 defined bit, the HAB_JDE bit, that is connected to the SJC block. The SCS bits are intended to be used as volatile fuse bits under software control. Additional bits will be defined as needed in future implementations.

The system-wide reset sequence must be coordinated by the system reset controller, so that the hwv_fuse and hwv_reg buses are stable and reflect the values of the fuses before they are used by the rest of the system.

35.3.5 Behavior During Reset

The OCOTP is always active. The shadow registers automatically load the appropriate OTP contents after reset is deasserted. During this load-time HW_OCOTP_CTRL_BUSY is set. The load time is similar to that of a "reload shadow" operation.

35.3.6 Secure JTAG control

The JTAG control fuses are used to allow or disallow JTAG access to secured resources.

Three JTAG security levels are envisioned, as shown in the table below.

Table 35-2. JTAG Security Level Control Bits

Security Mode	JTAG_SMODE	Description
No Debug	2'b11	The highest security level.
Secure JTAG	2'b01	Limit the JTAG access by using key based authentication mechanism.
JTAG Enable	2'b00	Low Security, all JTAG features are enabled.

35.4 Fuse Map

See the Fusemap chapter of this reference manual for more information.

35.5 OCOTP Memory Map/Register Definition

OCOTP Hardware Register Format Summary

OCOTP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21B_C000	OTP Controller Control Register (OCOTP_CTRL)	32	R/W	0000_0000h	35.5.1/2190
21B_C004	OTP Controller Control Register (OCOTP_CTRL_SET)	32	R/W	0000_0000h	35.5.1/2190
21B_C008	OTP Controller Control Register (OCOTP_CTRL_CLR)	32	R/W	0000_0000h	35.5.1/2190

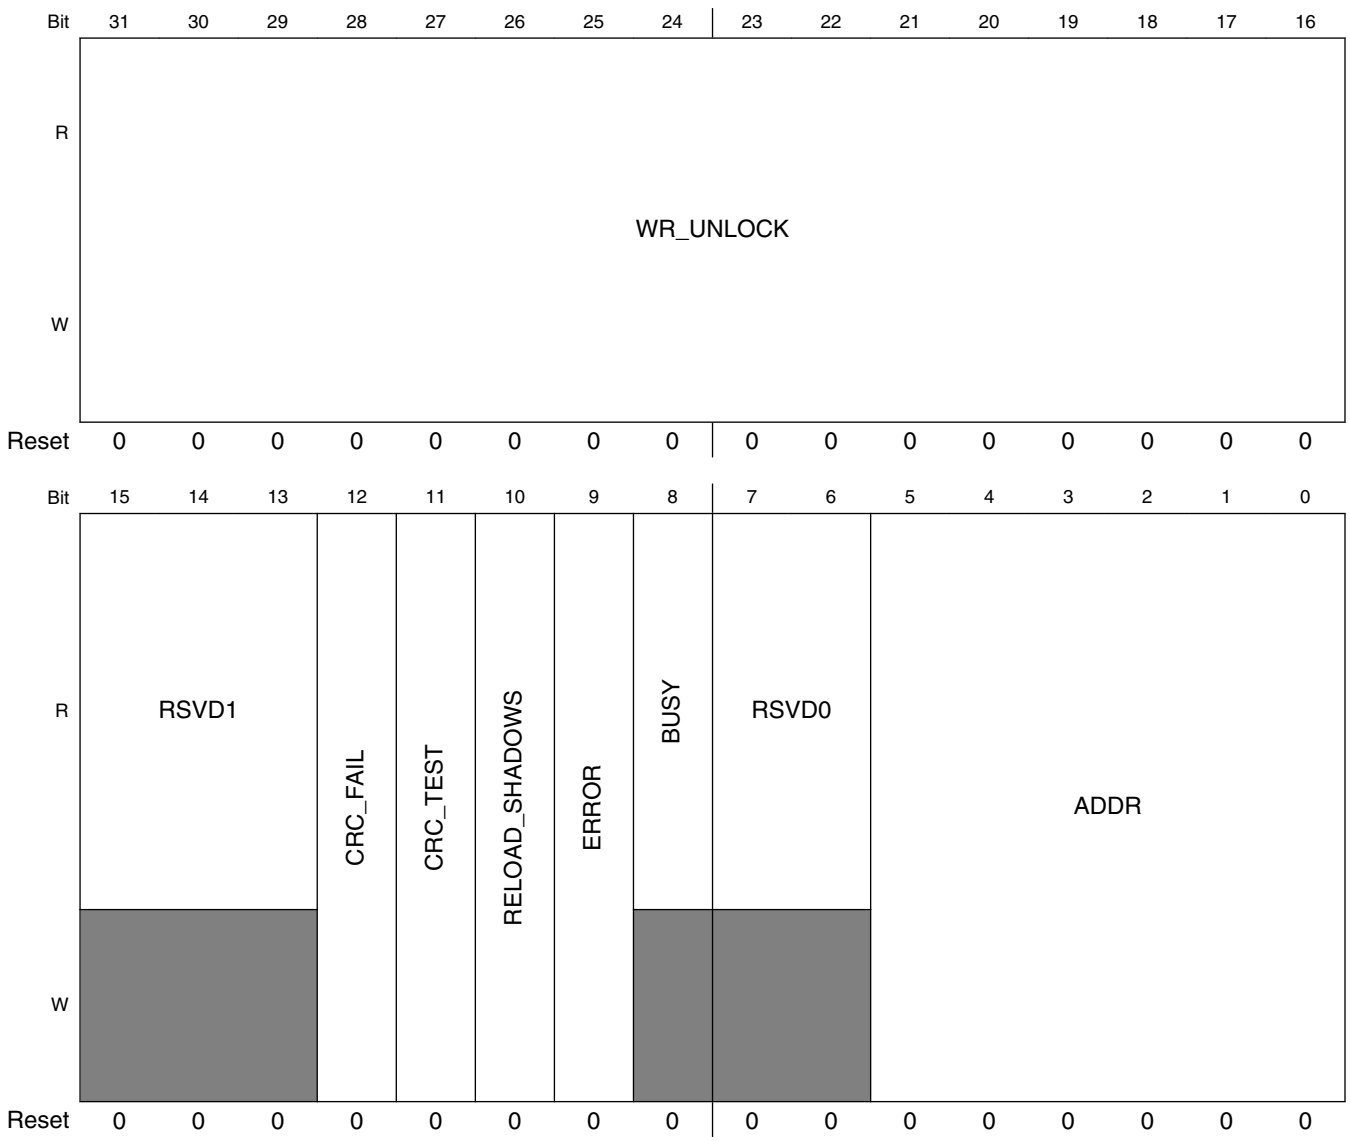
35.5.1 OTP Controller Control Register (OCOTP_CTRL*n*)

The OCOTP Control and Status Register specifies the copy state, as well as the control required for random access of the OTP memory

OCOTP_CTRL: 0x000



OCOTP_CTRL_SET: 0x004

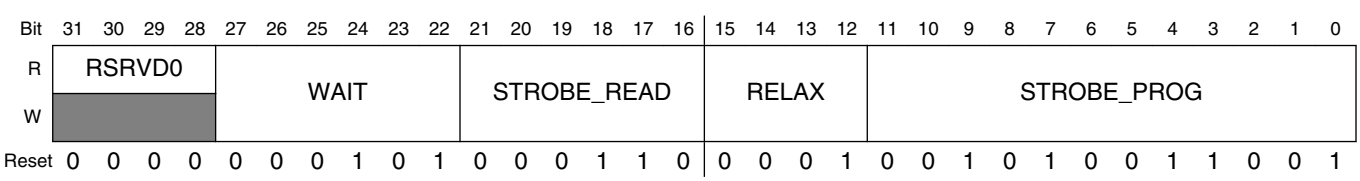
OCOTP_CTRL_CLR: 0x008

OCOTP_CTRL_TOG: 0x00C

The OCOTP Control and Status Register provides the necessary software interface for performing read and write operations to the On-Chip OTP (One-Time Programmable ROM). The control fields such as WR_UNLOCK, ADDR and BUSY/ERROR may be used in conjuction with the OCOTP_DATA register to perform write operations. Read operations to the On-Chip OTP are involving ADDR, BUSY/ERROR bit field and OCOTP_READ_CTRL register. Read value is saved in OCOTP_READ_FUSE_DATA register.

Address: 21B_C000h base + 0h offset + (4d × i), where i=0d to 3d

OCOTP_CTRL*n* field descriptions



Field	Description
31–16 WR_UNLOCK	Write 0x3E77 to enable OTP write accesses. NOTE: This register must be unlocked on a write-by-write basis (a write is initiated when HW_OCOTP_DATA is written), so the UNLOCK bitfield must contain the correct key value during all writes to HW_OCOTP_DATA, otherwise a write shall not be initiated. This field is automatically cleared after a successful write completion (clearing of BUSY). 0x3E77 **KEY** — Key needed to unlock HW_OCOTP_DATA register.
15–13 RSVD1	Reserved
12 CRC_FAIL	Set by controller when calculated CRC value is not equal to appointed CRC fuse word
11 CRC_TEST	Set to calculate CRC according to start address and end address in CRC_ADDR register.And compare with CRC fuse word according CRC address in CRC_ADDR register to generate CRC_FAIL flag
10 RELOAD_ SHADOWS	Set to force re-loading the shadow registers (HW/SW capability and LOCK). This operation will automatically set BUSY. Once the shadow registers have been re-loaded, BUSY and RELOAD_SHADOWS are automatically cleared by the controller.
9 ERROR	Set by the controller when an access to a locked region(OTP or shadow register) is requested. Must be cleared before any further access can be performed. This bit can only be set by the controller. This bit is also set if the Pin interface is active and software requests an access to the OTP. In this instance, the ERROR bit cannot be cleared until the Pin interface access has completed. Reset this bit by writing a one to the SCT clear address space and not by a general write.
8 BUSY	OTP controller status bit. When active, no new write access or read access to OTP(including RELOAD_SHADOWS) can be performed. Cleared by controller when access complete. After reset (or after setting RELOAD_SHADOWS), this bit is set by the controller until the HW/SW and LOCK registers are successfully copied, after which time it is automatically cleared by the controller.
7–6 RSVD0	Reserved
ADDR	OTP write and read access address register. Specifies one of 64 word address locations (0x00 - 0x3f). If a valid access is accepted by the controller, the controller makes an internal copy of this value. This internal copy will not update until the access is complete.

35.5.2 OTP Controller Timing Register (OCOTP_TIMING)

The OCOTP Data Register is used for OTP Programming

This register specifies timing parameters for programming and reading the OCOTP fuse array.

Address: 21B_C000h base + 10h offset = 21B_C010h

OCOTP_TIMING field descriptions

Field	Description
31–28 RSRVD0	These bits always read back zero.
27–22 WAIT	This count value specifies time interval between auto read and write access in one time program. It is given in number of ipg_clk periods.
21–16 STROBE_READ	This count value specifies the strobe period in one time read OTP. Trd = ((STROBE_READ+1)- 2 * (RELAX + 1)) / ipg_clk_freq. It is given in number of IPG_CLK periods.
15–12 RELAX	This count value specifies the time to add to all default timing parameters other than the Tpgm and Trd. It is given in number of ipg_clk periods.
STROBE_PROG	This count value specifies the strobe period in one time write OTP. Tpgm = ((STROBE_PROG+1)- 2 * (RELAX + 1)) / ipg_clk_freq. It is given in number of ipg_clk periods.

35.5.3 OTP Controller Write Data Register (OCOTP_DATA)

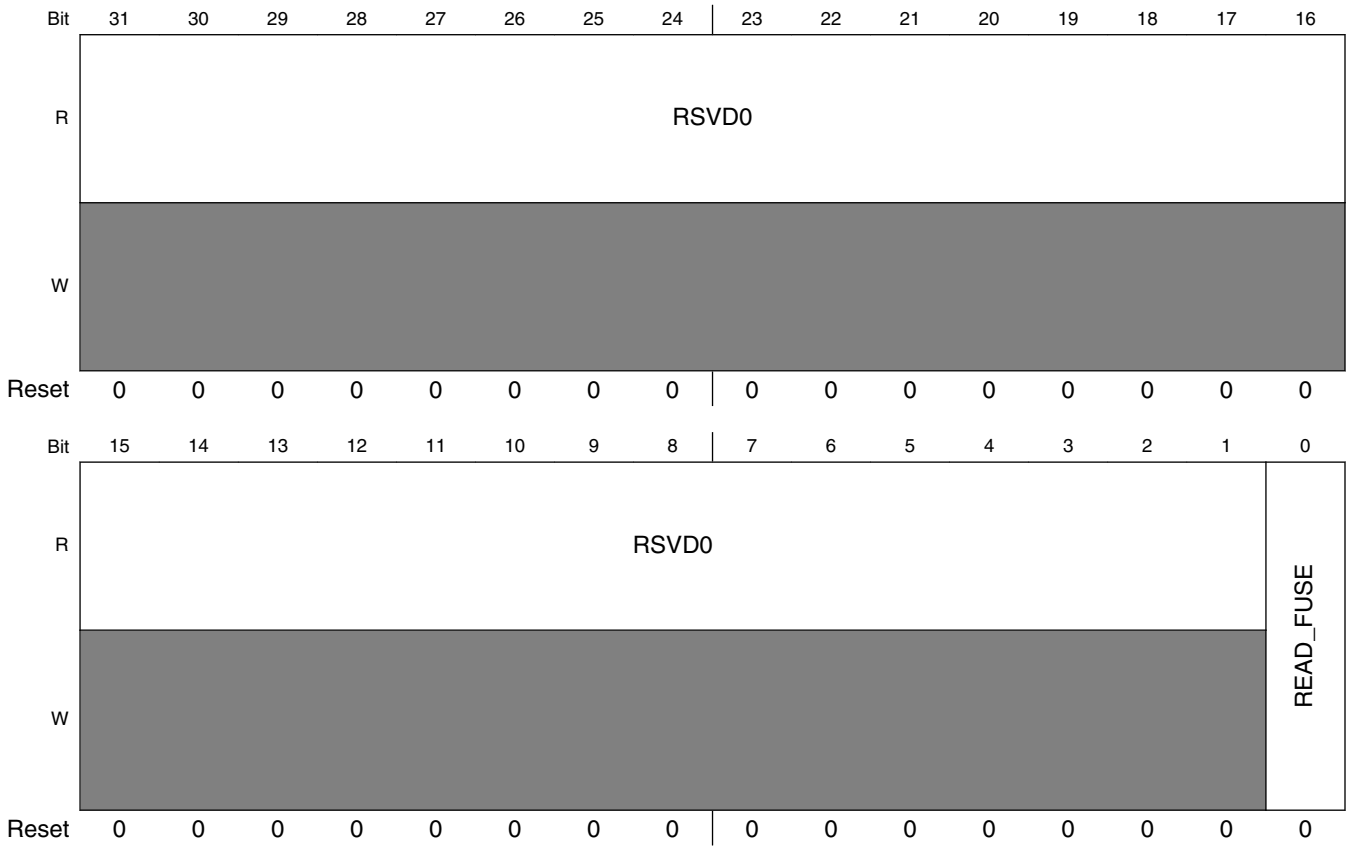
The OCOTP Data Register is used for OTP Programming

This register is used in conjuction with OCOTP_CTRL to perform one-time writes to the OTP. Please see the "Software Write Sequence" section for operating details.

Address: 21B_C000h base + 20h offset = 21B_C020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DATA																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_DATA field descriptions



Field	Description
DATA	Used to initiate a write to OTP. Please see the "Software Write Sequence" section for operating details.

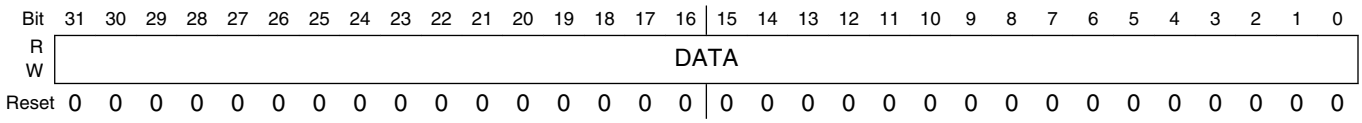
35.5.4 OTP Controller Write Data Register (OCOTP_READ_CTRL)

The OCOTP Register is used for OTP Read

This register is used in conjuction with OCOTP_CTRL to perform one time read to the OTP. Please see the "Software read Sequence" section for operating details.

Address: 21B_C000h base + 30h offset = 21B_C030h

OCOTP_READ_CTRL field descriptions



Field	Description
31–1 RSVD0	Reserved
0 READ_FUSE	Used to initiate a read to OTP. Please see the "Software read Sequence" section for operating details.

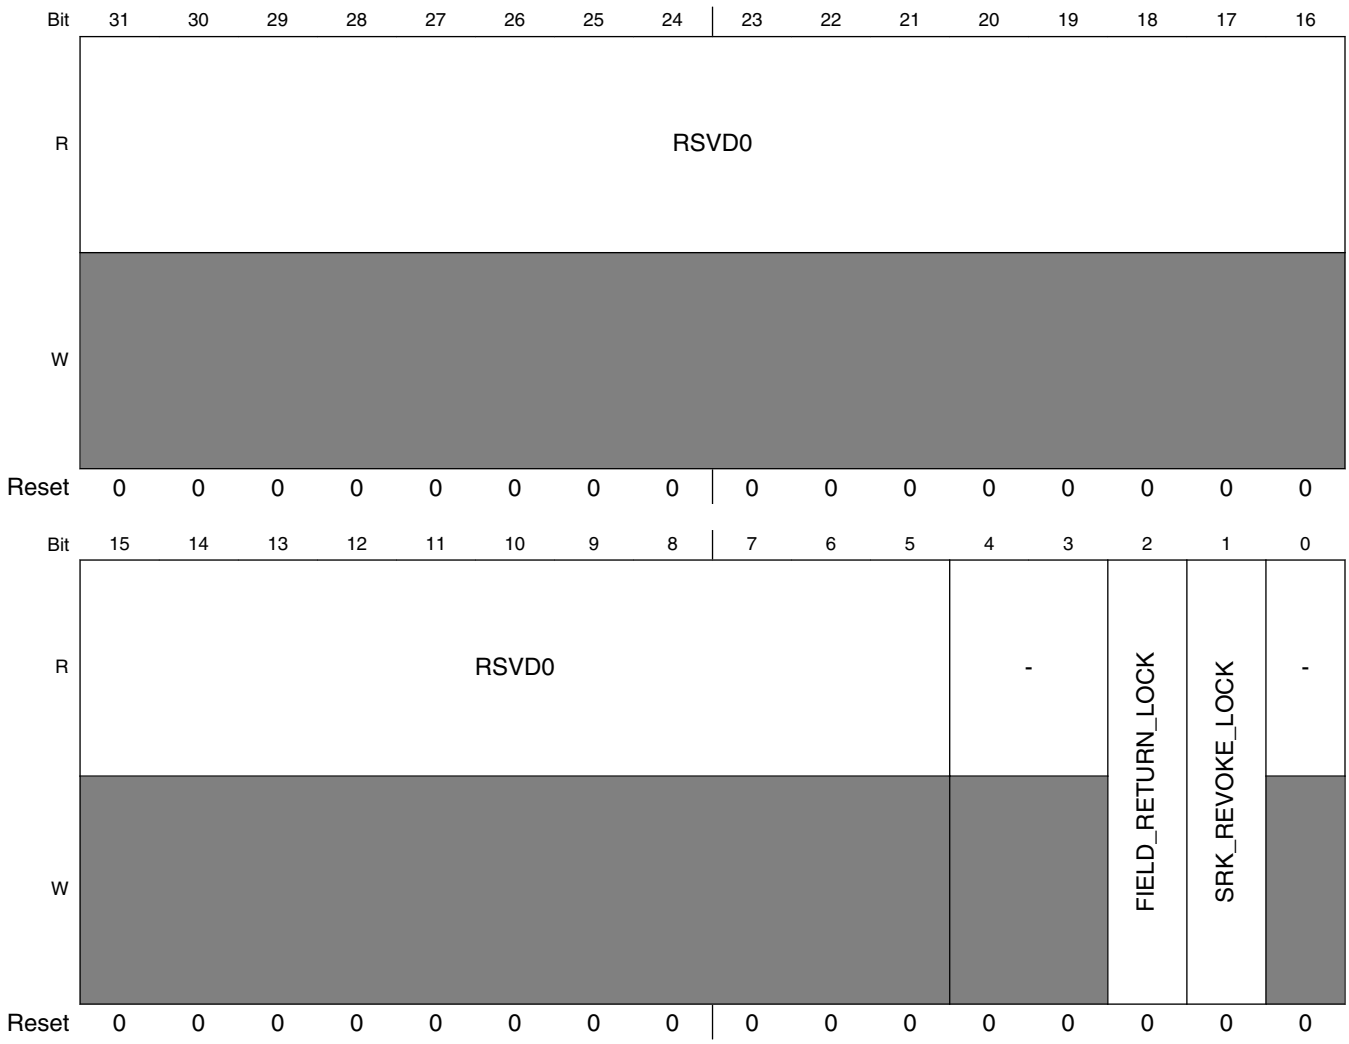
35.5.5 OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA)

The OCOTP Data Register is used for OTP Read

The data read from OTP

Address: 21B_C000h base + 40h offset = 21B_C040h

OCOTP_READ_FUSE_DATA field descriptions



Field	Description
DATA	The data read from OTP

35.5.6 Sticky bit Register (OCOTP_SW_STICKY)

Some SW sticky bits .

Some sticky bits are used by SW to lock some fuse area, shadow registers and other features.

Address: 21B_C000h base + 50h offset = 21B_C050h

OCOTP_SW_STICKY field descriptions

Field	Description
31–5 RSVD0	Reserved
4–3 -	Reserved
2 FIELD_ RETURN_LOCK	Shadow register write and OTP write lock for FIELD_RETURN region. When set, the writing of this region's shadow register and OTP fuse word are blocked.Once this bit is set, it is always high unless a POR is issued.
1 SRK_REVOKE_ LOCK	Shadow register write and OTP write lock for SRK_REVOKE region. When set, the writing of this region's shadow register and OTP fuse word are blocked. Once this bit is set, it is always high unless a POR is issued.
0 -	Reserved

35.5.7 Software Controllable Signals Register (OCOTP_SCS*n*)

OCOTP_SCS: 0x060

OCOTP_SCS_SET: 0x064

OCOTP_SCS_CLR: 0x068

OCOTP_SCS_TOG: 0x06C

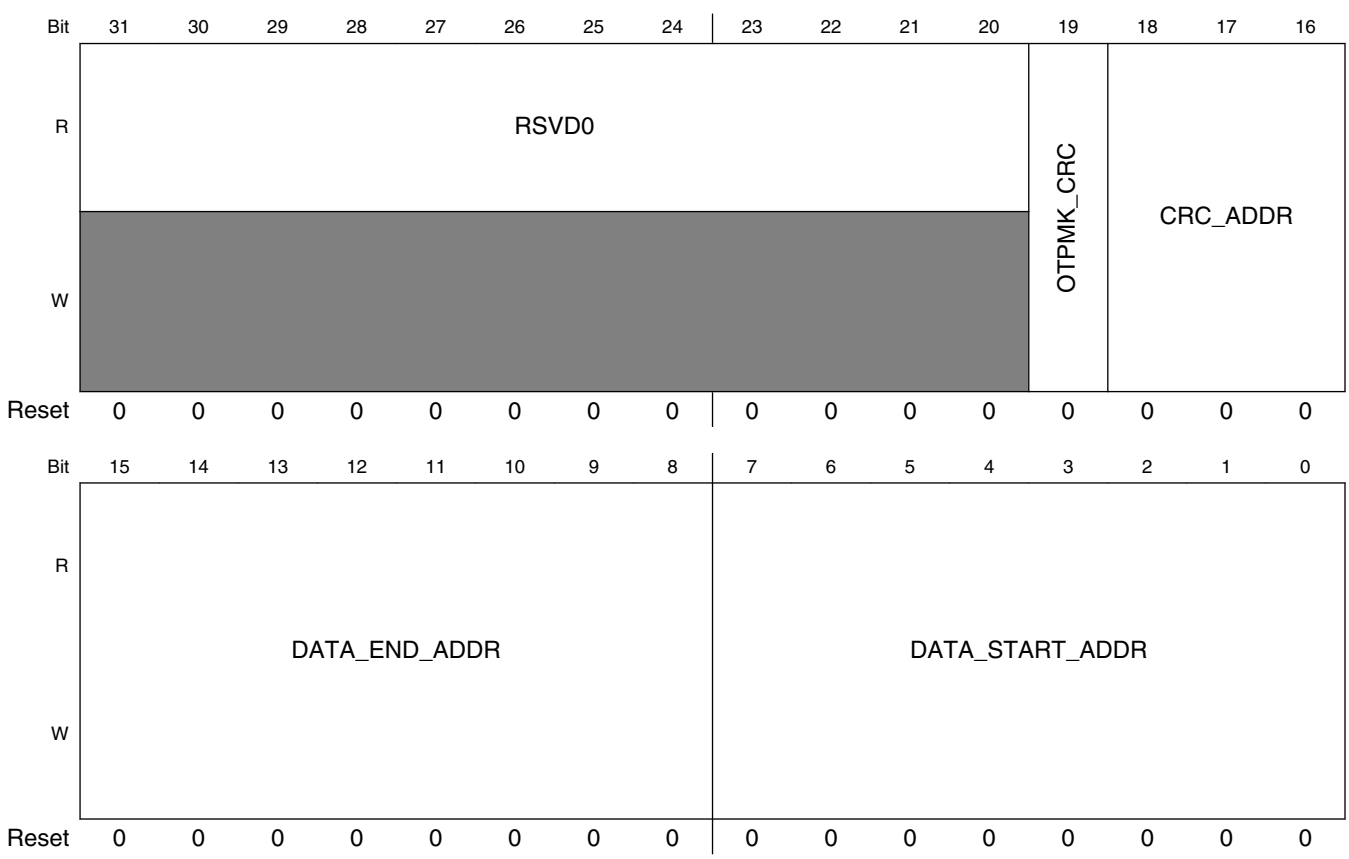
This register holds volatile configuration values that can be set and locked by trusted software. All values are returned to their defualt values after POR.

Address: 21B_C000h base + 60h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	LOCK	SPARE														
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	SPARE															HAB_JDE
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_SCS*n* field descriptions



Field	Description
31 LOCK	When set, all of the bits in this register are locked and can not be changed through SW programming. This bit is only reset after a POR is issued.
30–1 SPARE	Unallocated read/write bits for implementation specific software use.
0 HAB_JDE	HAB JTAG Debug Enable. This bit is used by the HAB to enable JTAG debugging, assuming that a properlay signed command to do so is found and validated by the HAB. The HAB must lock the register before passing control to the OS whether or not JTAG debugging has been enabled. Once JTAG is enabled by this bit, it can not be disabled unless the system is reset by POR. 0: JTAG debugging is not enabled by the HAB (it may still be enabled by other mechanisms). 1: JTAG debugging is enabled by the HAB (though this signal may be gated off).

35.5.8 OTP Controller CRC test address (OCOTP_CRC_ADDR)

The OCOTP Data Register is used for OTP Read

The address for CRC calculation

Address: 21B_C000h base + 70h offset = 21B_C070h

OCOTP_CRC_ADDR field descriptions

Field	Description
31–20 RSVD0	Reserved
19 OTPMK_CRC	Enable bit for CRC32 calculation address When OTPMK_CRC_ADDR_OTPMK_CRC bit sets to 1, calculation address sets to OTPMK_CRC (recommend). Otherwise address sets to GP7 or GP8.
18–16 CRC_ADDR	Address of 32-bit CRC result for comparing
15–8 DATA_END_ADDR	Start address of fuse location for CRC calculation
DATA_START_ADDR	End address of fuse location for CRC calculation

35.5.9 OTP Controller CRC Value Register (OCOTP_CRC_VALUE)

The OCOTP Data Register is used for OTP Read

The CRC32 value is based on CRC_ADDR.

Address: 21B_C000h base + 80h offset = 21B_C080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DATA																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_CRC_VALUE field descriptions

Field	Description
DATA	The crc32 value based on CRC_ADDR

35.5.10 OTP Controller Version Register (OCOTP_VERSION)

This register always returns a known read value for debug purposes it indicates the version of the block.

This register indicates the RTL version in use.

Address: 21B_C000h base + 90h offset = 21B_C090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MAJOR								MINOR								STEP															
W																																
Reset	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

35.5.11 Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 0 (ADDR = 0x00).

Address: 21B_C000h base + 400h offset = 21B_C400h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

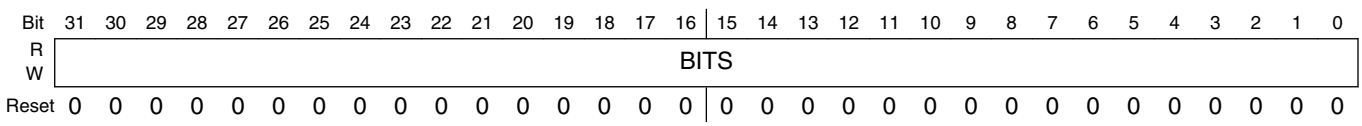
OCOTP_LOCK field descriptions

Field	Description
31–30 GP6	Status of shadow register and OTP write lock for GP6 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
29–28 GP8	Status of shadow register and OTP write lock for gp8 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked. 27-26 GP7 Status of shadow register and OTP write lock for GP7 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
27–26 GP7	Status of shadow register and OTP write lock for GP7 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
25 PIN	Status of Pin access lock bit. When set, pin access is disabled.
24 GP5	Status of shadow register and OTP write lock for GP5 region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
23 GP4	Status of shadow register and OTP write lock for GP4 region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
22 MISC_CONF	Status of shadow register and OTP write lock for misc_conf region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
21 ROM_PATCH	Status of shadow register and OTP write lock for rom_patch region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
20 OTPMK_CRC	Status of shadow register and OTP write lock for otpmk crc region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
19–18 ANALOG	Status of shadow register and OTP write lock for analog region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
17 OTPMK	Status of shadow register and OTP write lock for OTPMK region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
16 SW_GP	Status of shadow register and OTP write lock for SW_GP region. When set, the writing of this region's shadow register and OTP fuse word are blocked.

Table continues on the next page...

OCOTP_LOCK field descriptions (continued)



Field	Description
15 GP3	Status of shadow register and OTP write lock for GP3 region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
14 SRK	Status of shadow register and OTP write lock for srk region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
13–12 GP2	Status of shadow register and OTP write lock for gp2 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
11–10 GP1	Status of shadow register and OTP write lock for gp2 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
9–8 MAC_ADDR	Status of shadow register and OTP write lock for mac_addr region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
7 RSVD0	Reserved
6 SJC_RESP	Status of shadow register read and write, OTP read and write lock for sjc_resp region. When set, the writing of this region's shadow register and OTP fuse word are blocked. The read of this region's shadow register and OTP fuse word are also blocked.
5–4 MEM_TRIM	Status of shadow register and OTP write lock for mem_trim region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
3–2 BOOT_CFG	Status of shadow register and OTP write lock for boot_cfg region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
TESTER	Status of shadow register and OTP write lock for tester region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.

35.5.12 Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 1 (ADDR = 0x01).

Address: 21B_C000h base + 410h offset = 21B_C410h

OCOTP_CFG0 field descriptions

Field	Description
BITS	This register contains 32 bits of the Unique ID and SJC_CHALLENGE field. Reflects value of OTP Bank 0, word 1 (ADDR = 0x01). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

35.5.13 Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 2 (ADDR = 0x02).

Address: 21B_C000h base + 420h offset = 21B_C420h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

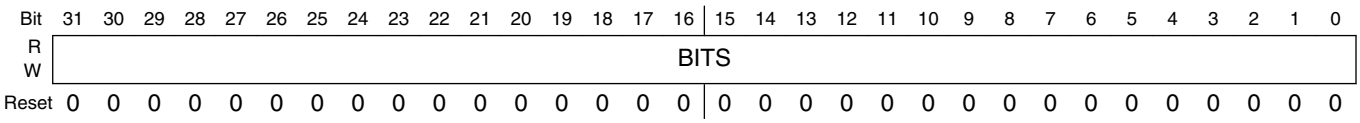
OCOTP_OTPMK3 field descriptions



Field	Description
BITS	Shadow register for the OTPMK Key word0 (Copy of OTP Bank 2, word 3 (ADDR = 0x13)). These bits can not be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

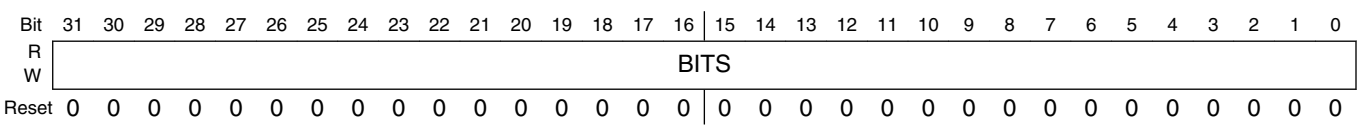
35.5.31 Value of OTP Bank2 Word4 (OTPMK Key) (OCOTP_OTPMK4)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 2, word 4 (ADDR = 0x14).

Address: 21B_C000h base + 540h offset = 21B_C540h

OCOTP_OTPMK4 field descriptions



Field	Description
BITS	Shadow register for the OTPMK Key word0 (Copy of OTP Bank 2, word 4 (ADDR = 0x14)). These bits can not be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

35.5.32 Value of OTP Bank2 Word5 (OTPMK Key) (OCOTP_OTPMK5)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 2, word 5 (ADDR = 0x15).

Address: 21B_C000h base + 550h offset = 21B_C550h

OCOTP_OTPMK5 field descriptions

Field	Description
BITS	Shadow register for the OTPMK Key word0 (Copy of OTP Bank 2, word 4 (ADDR = 0x14)). These bits can not be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

35.5.33 Value of OTP Bank2 Word6 (OTPMK Key) (OCOTP_OTPMK6)

Copied from the OTP automatically after reset. Can be re-loaded by setting OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP bank 2, word 6 (ADDR = 0x16).

Address: 21B_C000h base + 560h offset = 21B_C560h

Chapter 36
On-Chip RAM Memory Controller (OCRAM)

36.1 Overview

There is 1 OCRAM controller implemented in i.MX 6UltraLite. One controller is for the 128KB on-chip RAM.

The on-chip RAM block is implemented as a slave module on the 64-bit system AXI bus. Designed as a simple on-chip memory controller, it supports only one AXI port with memory banks. For the AXI port, the read and write transactions are handled by two independent modules. As it is possible to have simultaneous read and write requests from the AXI bus, each memory bank has an arbiter with a round-robin scheme. After arbitration, the granted read or write access command can then be issued to the memory cell through a read/write MUX.

The 4 memory banks are organized with the lower 2 bits of the address which is the AXI bus address and is 64 bits aligned interleaved. This allows a read access and a write access to be processed at the same time if they are targeted to different memory banks.

Various options are provided for adding a pipeline or wait-states in a read/write access, in order to ensure flexible timing control at both high and low frequencies.

The internal block diagram is shown in the figure below.

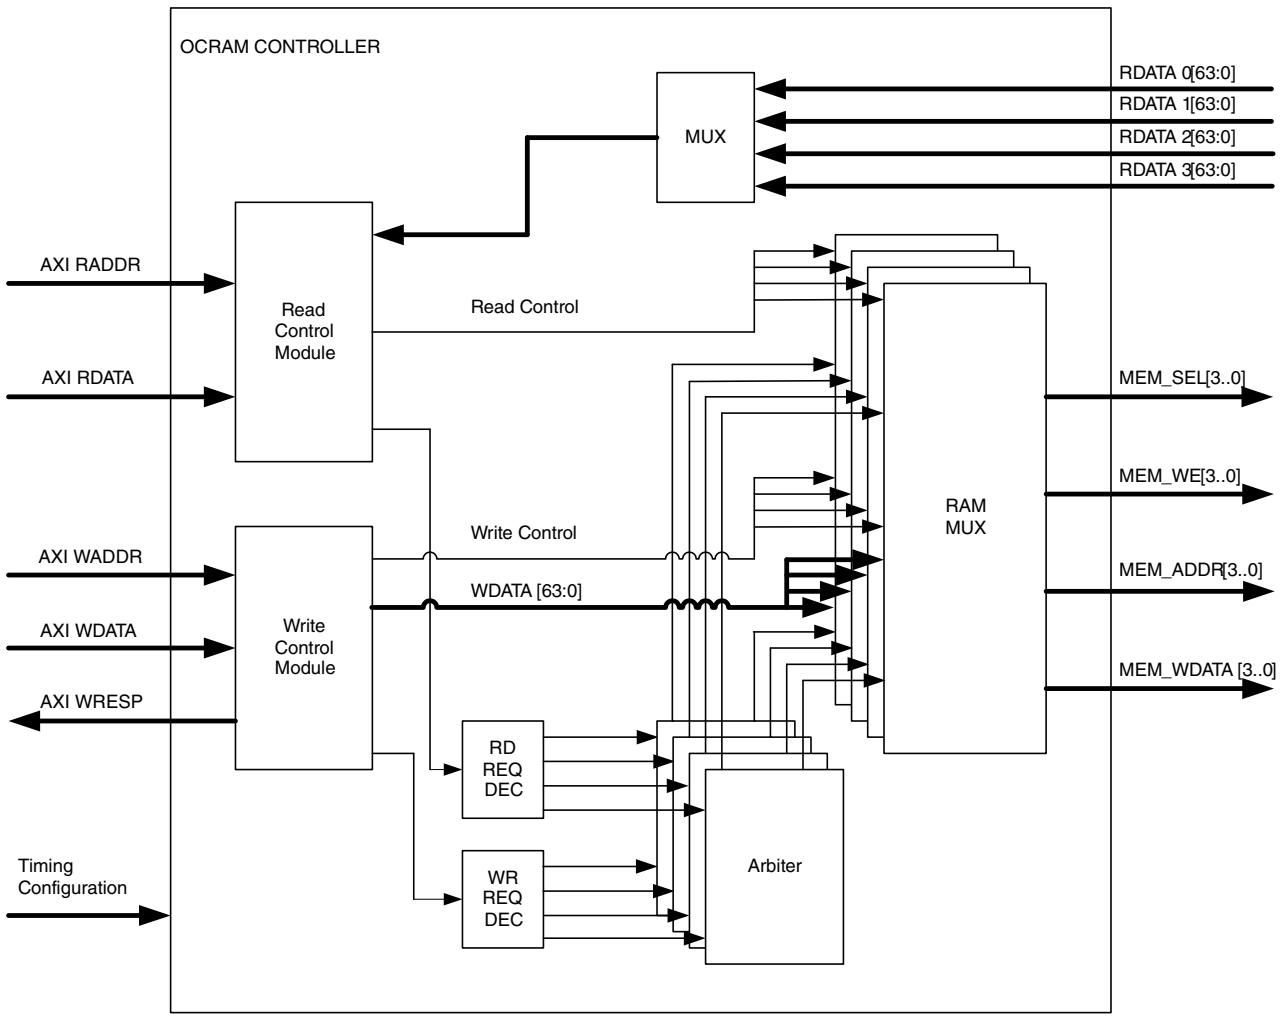

Figure 36-1. On-chip RAM Block Diagram

36.2 Basic Functions

36.2.1 Read/Write Arbitration

The detailed rules used in arbitration are as follows:

- If there is no granted read or write in the last cycle, and there is only a read request or a write request, the request will be granted.
- If there is no granted read or write in the last cycle, and there are both read or write requests coming in at the same time, the read request will be granted first.

- If a granted read/write transaction has just finished, the write/read request will have the higher priority in the next cycle.
- If the first read/write access request in a transaction is granted, all the data transfer in this burst will be finished before the next arbitration begins, that is, the round-robin arbitration mechanism is based on AXI transaction, not data access.

36.3 Advanced Features

This section describes some advanced features designed to avoid timing issues when the on-chip RAM is working at high frequency.

All of the features can be disabled/enabled by programming the corresponding fields of the General Purpose Register (IOMUXC.GPR3) bits [24:21] and bits [3:0] in the IOMUX chapter.

36.3.1 Read Data Wait State

When the wait state is enabled, it will take 2 cycles for each read access (each beat of a read burst).

This can avoid the potential timing problem caused by the longer memory access time at higher frequency.

When this feature is disabled, it only takes 1 clock cycle to finish a read transaction. That is, read data is available in the next cycle of read request becomes valid on the bus.

For the normal OCRAM, the read data wait state is configurable via IOMUXC.GPR3[21]. For the L2 cache as OCRAM, the read data wait state is configurable via IOMUXC.GPR3[0].

36.3.2 Read Address Pipeline

When this feature is enabled, the read address from the AXI master is delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issues for the read access on the memory cell at high frequency. Enabling this feature can cost, at most, 1 more clock cycle for each AXI read transaction, that is, at most 1 more clock cycle for each read burst with multiple beats of data.

When this feature is disabled, the read address from the AXI master can be accepted by the on-chip RAM without delay, and data can become ready for master at next clock cycle (if no other access and no read data wait).

For the normal OCRAM, the read address pipeline is configurable via IOMUXC.GPR3[22]. For the L2 cache as OCRAM, the read address pipeline is configurable via IOMUXC.GPR3[1].

36.3.3 Write Data Pipeline

When this feature is enabled, the write data from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI write transaction, that is, at most 1 more clock cycle for each write burst with multiple beats of data.

When this feature is disabled, the write data from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write address is also ready at this cycle).

For the normal OCRAM, the write data pipeline is configurable via IOMUXC.GPR3[23]. For the L2 cache as OCRAM, the write data pipeline is configurable via IOMUXC.GPR3[2].

36.3.4 Write Address Pipeline

When this feature is enabled, the write address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would take at most 1 more clock cycle for each AXI write transaction, that is, at most 1 more clock cycle for each write burst with multiple beats of data.

When this feature is disabled, the write address from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write data is also ready at this cycle).

For the normal OCRAM, the write address pipeline is configurable via IOMUXC.GPR3[24]. For the L2 cache as OCRAM, the write address pipeline is configurable via IOMUXC.GPR3[3]

36.4 Programmable Registers

There are no programmable registers in this block; however, OCRAM configurable bits can be found in the IOMUX Controller (IOMUXC) general purpose registers found here.

- TrustZone bits: IOMUXC_GPR10
- WAIT state / Pipeline bits: IOMUXC_GPR3

Chapter 37
Power Management Unit (PMU)

37.1 Overview

The power management unit (PMU) is designed to simplify the external power interface. The power system can be split into the input power sources and their characteristics, the integrated power transforming and controlling elements, and the final load interconnection and requirements.

A typical power system utilizing the PMU is depicted below.

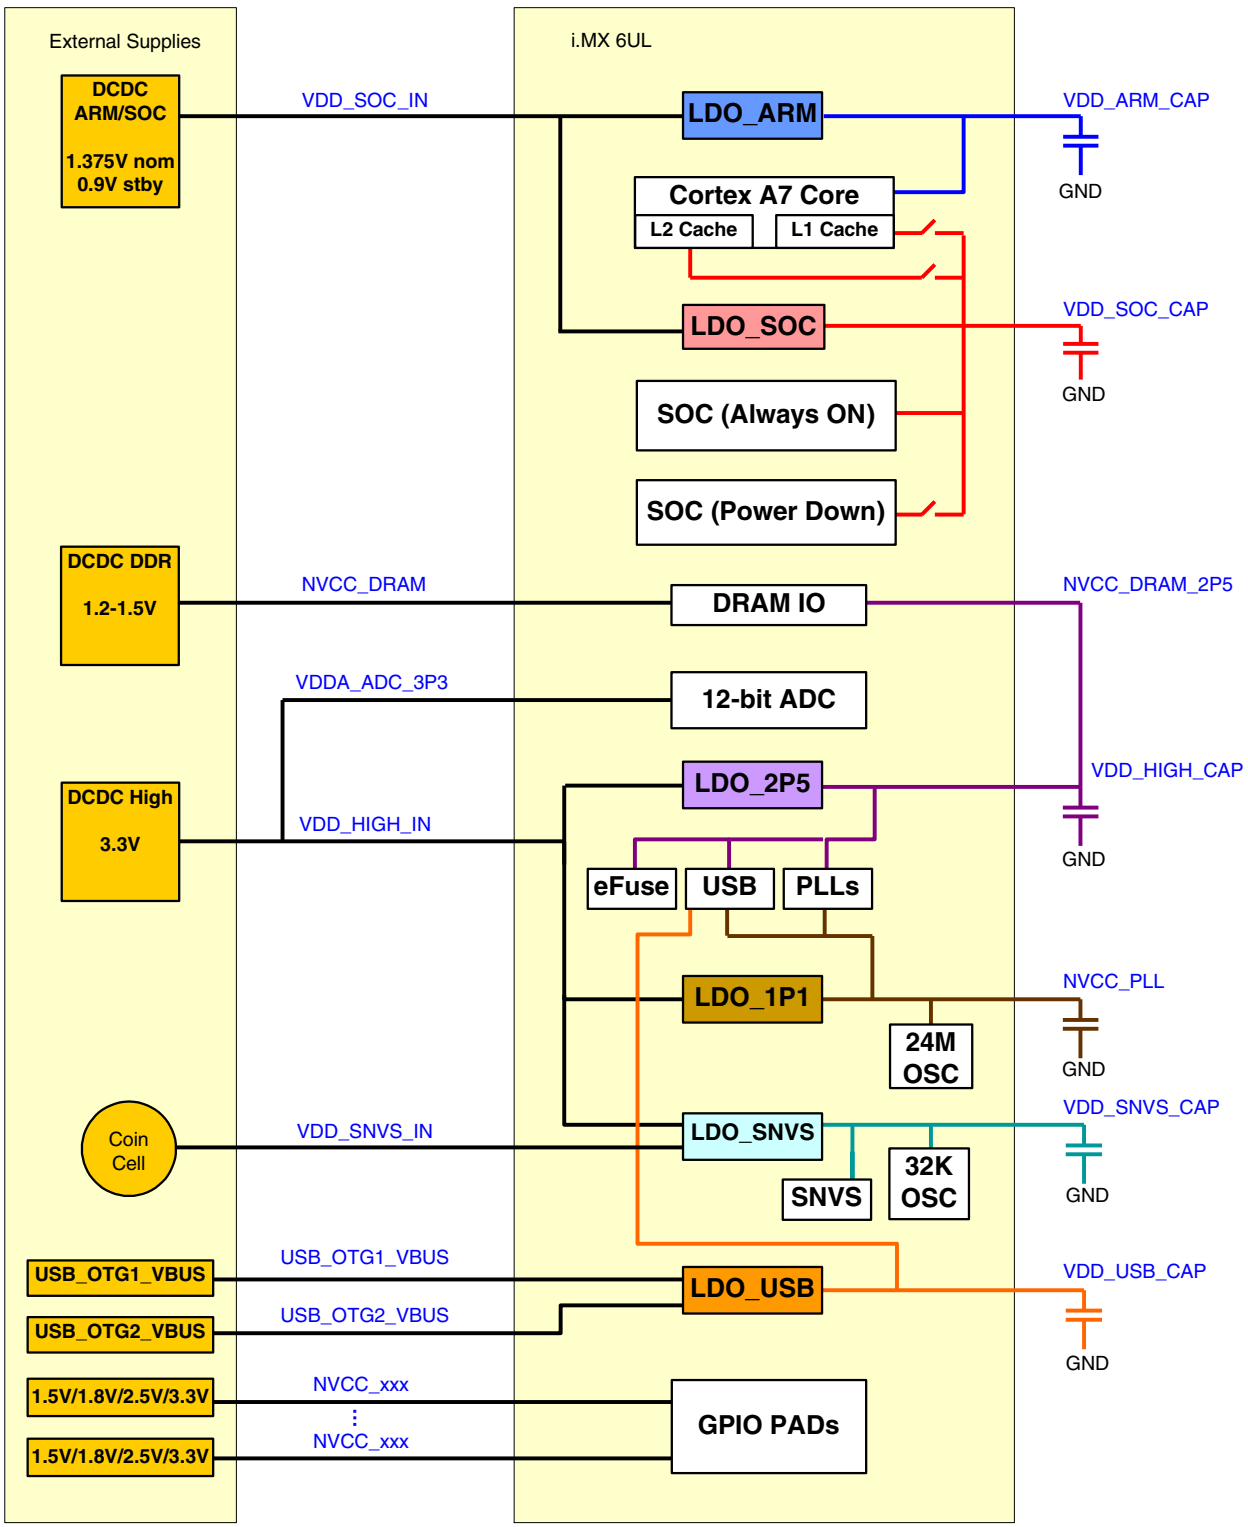

Figure 37-1. Power system overview

Utilizing seven LDO regulators, the number of external supplies is greatly reduced. Not counting the backup coin and USB inputs, the number of external supplies is reduced to two. Missing from this external supply total is the number of necessary external supplies to power the desired memory interface; that number varies depending on the type of external memory selected. Other supplies may also be necessary to supply the voltage to the different I/O power segments if their I/O voltages have to be different from what is provided above.

37.2 Digital LDO Regulators

The PMU has three digital LDO regulators. They are referred to as "digital" because of the logic loads they drive, not because of their construction. These regulators have three basic modes that are unique to the digital regulators.

- Power Gate—The regulation FET is switched off fully, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage falls to a level at which the residual leakage of the power FET balances with the leakage of the load. (TARG = 0x00)
- Analog regulation mode—The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating and allow bypass. With the bypass feature, all of the accuracy and control requirements can be shifted to the external supply source if capable and desired.

These digital regulators also feature brownout detection which is helpful when supplies are starting to collapse. The voltage value where brownout is signaled is programmable as an offset from the programmed target voltage. The controls are located in the PMU_MISC2 register. The core is interrupted on a brownout.

The two digital regulators are known as LDO_ARM, , and LDO_SOC. As shown in the power system overview figure, the ARM regulator powers the ARM cores. All regulators support generous programming ranges in 25mV steps. It is possible to program voltages above the process limit for the chip, thus causing permanent damage. Likewise, it is possible to program the voltage so low that the chip cannot continue to operate or even retain state without clocks. Care should be taken with these settings.

Care must be taken when raising the output voltage of the regulator rapidly. This can cause large currents to flow into the output cap of the regulator up to the limits of the input supply. When the input supply capability is exceeded, this can cause an input supply dip that may affect other regulators on the same supply. Therefore, the rate of

voltage change on the output of the regulator should be limited. When powering up the regulator, the integrated current limiter controls the ramp rate. This limiter is only effective when transitioning from the off state of the regulator (bypassed or power gated).

However, in a DVFS situation, the same high rate of change can occur if the target voltage is raised rapidly by software. To limit the rate of change, the hardware controlling the regulator effects a piecewise linear ramp by stepping the output voltage in 25mV steps until the desired output voltage is reached. The slope of the ramp is controlled by the time spent at each 25mV step and is controlled by the step time field in the PMU_MISC2 register. The same situation is not a problem when the output voltage is dropped as the load pulls down the output cap. As a result, any reduction in the programmed regulator target voltage is immediately effective with the actual supply voltage falling at a rate controlled by the load on the regulator.

37.3 Analog LDO Regulators

There are two analog regulators described here.

37.3.1 LDO 1P1

The LDO_1P1 module on the chip implements a programmable linear-regulator function from a higher analog supply voltage (2.8 V–3.3 V) to produce a nominal 1.1 V output voltage.

The output of the regulator can be programmed in 25 mV steps from 0.8 V to 1.4 V. The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitance, though the actual capacitance required should be determined by the application. A programmable brownout detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded, so the necessary steps can be taken.

Current limiting can be enabled by setting the PMU_REG_1P1[ENABLE_ILIMIT] bit to allow for in-rush current requirements during startup if needed. Active pulldown can also be enabled by setting the PMU_REG_1P1[ENABLE_PULLDOWN] bit for systems requiring this feature.

37.3.2 LDO 2P5

The LDO_2P5 module on the chip implements a programmable linear-regulator function from a higher analog supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage.

The output of the regulator can be programmed in 25mV steps from 2.0V to 2.75V. The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitance, though the actual capacitance required should be determined by the application. A programmable brown-out detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps.

Current-limiting can be enabled by setting the REG_PMU_2P5[ENABLE_ILIMIT] bit to allow for in-rush current requirements during start-up if needed. Active-pulldown can also be enabled by setting the REG_PMU_2P5[ENABLE_PULLDOWN] bit for systems requiring this feature.

37.3.3 Low Power Operation

The 1.1 V and 2.5 V LDO includes an alternate, self-biased, low-precision, weak regulator which can be enabled for applications needing to keep the 1.1 V and 2.5 V output voltage alive during low-power modes where the main regulator and its associated global bandgap reference module are disabled.

The output of this weak regulator is not programmable and is a function of its input power supply as well as load current. The low-power mode is enabled by setting high the PMU_REG_1P1[ENABLE_WEAK_LINREG] and PMU_REG_2P5[ENABLE_WEAK_LINREG] bit of the regulator. It is recommended that the following sequence be followed to enable this mode:

1. Throttle down the 1.1 V / 2.5 V attached load to its low-power maintain state.
2. Disable the main 1.1 V / 2.5 V regulator driver by clearing the PMU_REG_1P1[ENABLE_LINREG] / PMU_REG_2P5[ENABLE_LINREG] bit.
3. Enable the weak 1.1 V / 2.5 V regulator by setting the PMU_REG_1P1[ENABLE_WEAK_LINREG] / PMU_REG_2P5[ENABLE_WEAK_LINREG] bit.

To go back to full-power operation, reverse the steps outlined above. Note that the external decoupling cap is supporting the power supply between steps 2 and 3. Therefore step 3 should happen appropriately in time relative to the discharge of the supporting capacitor.

37.4 USB LDO Regulator

The USB_LDO module on the chip implements a programmable linear-regulator function from the USB VBUS voltages (typically 5 V) to produce a nominal 3.0 V output voltage.

The output of the regulator can be programmed in 25 mV steps, from 2.625V to 3.4 V . The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitor of 4.7 μF, though the actual capacitance required should be determined by the application. A programmable brownout detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded, so the necessary steps can be taken. This regulator has a built-in power mux which allows the user to choose to run the regulator from either VBUS supply when both are present. If only one of the VBUS voltages is present, then the regulator automatically selects this supply. Current limit is also included to help the system meet in-rush current targets.

Upon attachment of VBUS, this regulator starts up in a low-power, self-preservation mode to prevent over-voltage conditions on the chip. It is expected that the user transition to full regulation by enabling the regulator and disabling the in-rush current limits via its control registers. Upon VBUS removal, it is further expected that the regulator controls are returned to their reset state.

37.5 SNVS Regulator

The SNVS regulator takes the SNVS_IN supply and generates the SNVS_CAP supply, which powers the real time clock and SNVS blocks.

If VDDHIGH_IN is present, then the SNVS_IN supply is internally shorted to the VDDHIGH_IN supply to allow coin cell recharging if necessary. The output voltage is roughly one third of SNVS_IN.

37.6 PMU Memory Map/Register Definition

The register definitions that affect the behavior of the digital LDO regulators follow.

NOTE

Some of the registers are collections of bits that affect multiple components on the chip. Those that are not pertinent to this chapter have comments in the related register bitfields.

If a full description is desired, please consult the full register programming reference in the related block.

PMU_MISC0 field descriptions

Field	Description
31 VID_PLL_ PREDIV	Predivider for the source clock of the PLL's. 0 Divide by 1 1 Divide by 2
30 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true.
29 RTC_XTAL_ SOURCE	This field indicates which chip source is being used for the rtc clock. 0 Internal ring oscillator 1 RTC_XTAL
28–26 CLKGATE_ DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block. **NOTE:** Do not change the field during a low power event. This is not a field that the user would normally need to modify. **NOTE:** Not related to PMU. 000 0.5ms 001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms 101 5.0ms 110 6.0ms 111 7.0ms
25 CLKGATE_CTRL	This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block. **NOTE:** Do not change the field during a low power event. This is not a field that the user would normally need to modify. **NOTE:** Not related to PMU. 0 **ALLOW_AUTO_GATE** — Allow the logic to automatically gate the clock when the XTAL is powered down. 1 **NO_AUTO_GATE** — Prevent the logic from ever gating off the clock.
24–17 -	This field is reserved. Always set to zero.
16 OSC_XTALOK_ EN	This bit enables the detector that signals when the 24MHz crystal oscillator is stable. **NOTE:** Not related to PMU, Clocking content
15 OSC_XTALOK	Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency. **NOTE:** Not related to PMU, clocking content.
14–13 OSC_I	This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable.

Table continues on the next page...

PMU_MISC0 field descriptions (continued)

Field	Description
	NOTE: Not related to PMU. 00 **NOMINAL** — Nominal 01 **MINUS_12_5_PERCENT** — Decrease current by 12.5% 10 **MINUS_25_PERCENT** — Decrease current by 25.0% 11 **MINUS_37_5_PERCENT** — Decrease current by 37.5%
12 DISCON_HIGH_SNVS	This bit controls a switch from VDD_HIGH_IN to VDD_SNVS_IN. 0 Turn on the switch 1 Turn off the switch
11–10 STOP_MODE_CONFIG	Configure the analog behavior in stop mode. 00 **SUSPEND (DSM)** — All analog except rtc powered down on stop mode assertion. 01 **STANDBY** — Analog regulators are ON. 10 **STOP (lower power)** — Analog regulators are ON. 11 **STOP (very lower power)** — Analog regulators are OFF.
9–8 -	This field is reserved. Reserved
7 REFTOP_VBGUP	Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable.
6–4 REFTOP_VBGADJ	000 Nominal VBG 001 VBG+0.78% 010 VBG+1.56% 011 VBG+2.34% 100 VBG-0.78% 101 VBG-1.56% 110 VBG-2.34% 111 VBG-3.12%
3 REFTOP_SELFBIASOFF	Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap. **NOTE:** Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit. 0 Uses coarse bias currents for startup 1 Uses bandgap-based bias currents for best performance.
2–1 -	This field is reserved.
0 REFTOP_PWD	Control bit to power-down the analog bandgap reference circuitry. **NOTE:** A note of caution, the bandgap is necessary for correct operation of most of the LDO, pll, and other analog functions on the die.

37.6.6 Miscellaneous Register 1 (PMU_MISC1*n*)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 20C_8000h base + 160h offset + (4d × i), where i=0d to 3d

Field	Description
11 DISPLAY_ PWRGATE	Display logic power gate control. Used as software override.
10 CPU_PWRGATE	CPU power gate control. Used as software override. **Attention:** Test purpose only
9 L2_PWRGATE	L2 power gate control. Used as software override.
8 L1_PWRGATE	L1 power gate control. Used as software override.
7 REFTOP_IBIAS_ OFF	Low power reftop ibias disable.
6 LPBG_TEST	Low power bandgap test bit.
5 LPBG_SEL	Bandgap select. 0 Normal power bandgap 1 Low power bandgap
4 OSC_SEL	Select the source for the 24MHz clock. **NOTE:** Not related to PMU. 0 XTAL OSC 1 RC OSC
3–1 RC_OSC_PROG	RC osc. tuning values. **NOTE:** Not related to PMU.
0 RC_OSC_EN	RC Osc. enable control. **NOTE:** Not related to PMU. 0 Use XTAL OSC to source the 24MHz clock 1 Use RC OSC

Chapter 38
Pulse Width Modulation (PWM)

38.1 Overview

The Pulse Width Modulation (PWM) has a 16-bit counter, and is optimized to generate sound from stored sample audio images and it can also generate tones. It uses 16-bit resolution and a 4 x 16 data FIFO.

This section presents an overview of the PWM. A block diagram of the PWM module is shown in the figure below.

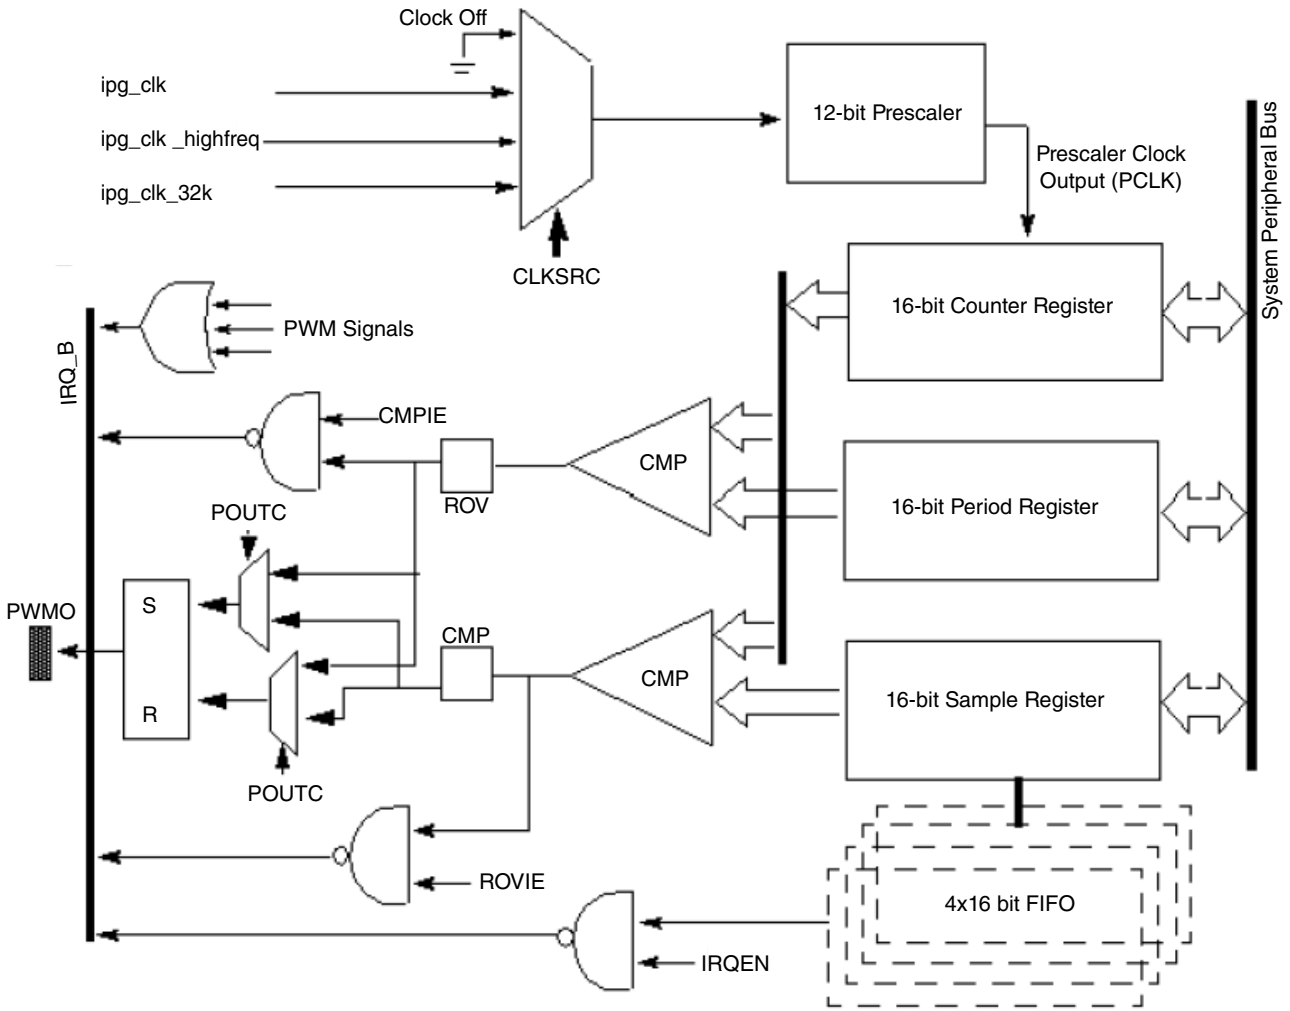

Figure 38-1. Pulse-Width Modulator Block Diagram

The following features characterize the PWM:

- 16-bit up-counter with clock source selection
- 4 x 16 FIFO to minimize interrupt overhead
- 12-bit prescaler for division of clock
- Sound and melody generation
- Active high or active low configured output
- Can be programmed to be active in low-power mode
- Can be programmed to be active in debug mode
- Interrupts at compare and rollover

38.2 External Signals

The PWM follows IP Bus protocol when interfacing with the processor core. PWM does not have any interface signals with any other block inside the chip except for clock and reset inputs from the Clock Control Module (CCM), System Reset Controller (SRC), and interrupt signals to the processor interrupt handler. There is a single output signal.

The following table outlines the external signals.

Table 38-1. PWM External Signals

Signal	Description	Pad	Mode	Direction
PWM1_OUT	This is the PWM1 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	ENET1_RX_DATA0	ALT2	O
		GPIO1_IO08	ALT0	
		LCD_DATA00	ALT1	
PWM2_OUT	This is the PWM2 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	ENET1_RX_DATA1	ALT2	O
		GPIO1_IO09	ALT0	
		LCD_DATA01	ALT1	
PWM3_OUT	This is the PWM3 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	GPIO1_IO04	ALT1	O
		LCD_DATA02	ALT1	
		NAND_ALE	ALT3	
PWM4_OUT	This is the PWM4 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	GPIO1_IO05	ALT1	O
		LCD_DATA03	ALT1	
		NAND_WP_B	ALT3	
PWM5_OUT	This is the PWM5 functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	ENET1_TX_DATA1	ALT2	O
		LCD_DATA18	ALT1	
		NAND_DQS	ALT3	
PWM6_OUT	This is the PWM6functional output of the PWM. A modulated signal of the block is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the cycle of 50%.	ENET1_TX_EN	ALT2	O
		JTAG_TDI	ALT4	
		LCD_DATA19	ALT1	
PWM7_OUT	This is the PWM7 functional output of the PWM. A modulated signal of	CSI_VSYNC	ALT6	O
		ENET1_TX_CLK	ALT2	

Table continues on the next page...

		JTAG_TRST_B	ALT4	

38.3 Clocks

The table found here describes the clock sources for PWM.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 38-2. PWM Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	low-frequency reference clock (32 kHz)
ipg_clk_highfreq	perclk_clk_root	high-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

The clock that feeds the prescaler can be selected from:

- High-frequency reference clock (ipg_clk_highfreq) pat_ref or CKIH

  This is a high frequency clock, provided by the Clock Control Module (CCM). This clock should be on in the low power mode when the ipg_clk is turned off. Thus, the PWM can be run on this clock in the low power mode.

- Low-frequency reference clock (ipg_clk_32k, CKIL)

  This is the 32 KHz low reference clock which is provided by the CCM. This clock should be on in the low power mode when ipg_clk is turned off. Thus, PWM can be run on this clock in the low power mode.

- Peripheral clock (ipg_clk)

This clock should be on in normal operations. In low power mode, it can be switched off.

- Peripheral access clock (ipg_clk_s)

  This clock is used for register read/write.

The clock input source is determined by the PWM control register field PWM_CR[CLKSRC]. The CLKSRC value should only be changed when the PWM is disabled.

A change in the value of the PRESCALER field of the control register is immediately reflected on its output clock frequency.

38.4 Functional Description

The following sections detail the PWM operation and function.

38.4.1 Operation

The output of the PWM is a toggling signal whose frequency and duty cycle can be modulated by programming the appropriate registers. It has a 16-bit up counter which counts from 0x0000 until the counter value equals the PWM_PR + 1. After this match occurs the counter is reset to 0x0000.

At the beginning of a count period cycle, the PWMO pin is set to one (default) and the counter begins counting up from 0x0000. The sample value in the sample FIFO is compared on each count of prescaler clock. When the sample and count values match, the PWMO signal is cleared to zero (default). The counter continues counting until the period match occurs and subsequently another period cycle begins.

When the PWM is enabled, the counter starts running and generates an output with the reset values in the period and sample registers. It is recommended that the programming of these registers be done before PWM is enabled.

A hardware reset results in all the PWM count and sample registers being cleared and the FIFO being flushed. The control register shows that FIFO is empty and it can be written into, and the PWM is disabled. A software reset has the same results, however the state of the STOPEN, DOZEN, WAITEN, and DBGEN bits in the control register are not affected. Software reset can be asserted even when the PWM is in disabled state.

38.4.1.1 FIFO

Digital sample values can be loaded into the pulse-width modulator as 16-bit words. The endianess can be changed using the BCTR and HCTR bits of the control register. A 4-word (16-bit) FIFO minimizes interrupt overhead. A maskable interrupt is generated when the number of data words fall below the water level set by the FWM field in the control register.

A write to the PWM_SAR sample register results in the value being stored into the FIFO if it is not full. A write when the FIFO is full sets FWE (FIFO write error) bit in the status register and the FIFO contents remain unchanged. The FIFO can be written at any time, but can be read only when the PWM is enabled. The PWM_SR[FIFOAV] field shows how many data words are currently contained in the FIFO and whether or not it can be written into.

A read on the sample register yields the current FIFO value that is being used, or will be used, by the PWM for generation on the output signal. Therefore, a write and a subsequent read on the sample register may result in different values being obtained.

38.4.1.2 Rollover and Compare Event

The counter is reset to 0x0000 after its value equals the PWM_PR[PERIOD] + 1 and resumes counting thereafter. This event is referred to as a rollover. For example, if PWM_PR[PERIOD] = 0x0000, the counter is reset when it equals 0x0001. When PWM_PR[PERIOD] = 0xFFFF or 0xFFFE, the counter is reset when it equals 0xFFFF. For more information, see the PWM Period Register (PWM_PR) description.

During a rollover event the output is either set (default), reset or has no effect according to the programming of the POUTC field in the control register. This event can also generate an interrupt if the respective interrupt enable bit is set in the control register.

When the counter value reaches the sample value, the output of the PWM is reset (default), set or has no effect according to the programming of the POUTC field of control register. This event is referred to as a compare event. This event can also generate an interrupt if the respective interrupt enable bit is set in the control register.

If the rollover event sets the PWM output signal, the compare event will reset it and vice versa for a particular programming configuration of POUTC field.

38.4.1.3 Low Power Mode Behavior

In low power mode, if the clock from the selected clock source is available, the PWM counter continues to run and an output is produced, depending on whether the control bit for that mode is set or not. In the absence of the clock itself, or if the corresponding low power bit in the control register is 0, the counter is reset and resumes counting when it exits the low power mode.

38.4.1.4 Debug Mode Behavior

In debug mode, PWM has the option of continuing to run or be halted. If the DBGEN bit is not set in the PWM_PWMCR, the PWM is halted. If the DBGEN bit is set, then the PWM will continue to run in the debug mode.

38.5 Enable Sequence for the PWM

The sequence found here should be used to enable the PWM.

1. Configure the desired settings for the PWM Control Register (PWMx_PWMCR) while keeping the PWM disabled (PWMx_PWMCR[0]=0).
2. Enable the desired interrupts in the PWM Interrupt Register (PWMx_PWMIR).
3. One to three initial samples may be written to the PWM Sample Register (PWMx_PWMSAR). The initial sample values will be loaded into the PWM FIFO even if the PWM is not yet enabled. Do not write a 4th sample because the FIFO will become full and trigger a FIFO Write Error (FWE). This error will prevent the PWM from starting once it is enabled.
4. Check the FIFO Write Error status bit (FWE), the Compare status bit (CMP) and the Roll-over status bit (ROV) in the PWM Status Register (PWMx_PWMSR) to make sure they are all zero. Any non-zero status bits should be cleared by writing a 1 to them.
5. Write the desired period to the PWM Period Register (PWMx_PWMPR).
6. Enable the PWM by writing a 1 to the PWM Enable bit, PWMx_PWMCR[0], while maintaining the other register bits in their previously configured state.

38.6 Disable Sequence for the PWM

The PWM can be disabled at any time by clearing the PWM enable bit, PWMx_PWMCR[0] to 0.

Any data remaining in the FIFO will not be produced at the PWM output after the PWM has been disabled and will remain in the FIFO until the PWM is enabled again. A software reset (setting PWMx_PWMCR[3] to 1) or a hardware reset will clear the FIFO and any remaining data will be lost.

38.7 PWM Memory Map/Register Definition

The PWM includes six user-accessible 32-bit registers.

PWM memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
208_0000	PWM Control Register (PWM1_PWMCR)	32	R/W	0000_0000h	38.7.1/2304

PWMx_PWMCR field descriptions

Field	Description
31–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–26 FWM	FIFO Water Mark. These bits are used to set the data level at which the FIFO empty flag will be set and the corresponding interrupt generated 00 FIFO empty flag is set when there are more than or equal to 1 empty slots in FIFO 01 FIFO empty flag is set when there are more than or equal to 2 empty slots in FIFO 10 FIFO empty flag is set when there are more than or equal to 3 empty slots in FIFO 11 FIFO empty flag is set when there are more than or equal to 4 empty slots in FIFO
25 STOPEN	Stop Mode Enable. This bit keeps the PWM functional while in stop mode. When this bit is cleared, the input clock is gated off in stop mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in stop mode 1 Active in stop mode
24 DOZEN	Doze Mode Enable. This bit keeps the PWM functional in doze mode. When this bit is cleared, the input clock is gated off in doze mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in doze mode 1 Active in doze mode
23 WAITEN	Wait Mode Enable. This bit keeps the PWM functional in wait mode. When this bit is cleared, the input clock is gated off in wait mode. This bit is not affected by software reset. It is cleared by hardware reset.

Table continues on the next page...

PWMx_PWMCR field descriptions (continued)

Field	Description
	0 Inactive in wait mode 1 Active in wait mode
22 DBGEN	Debug Mode Enable. This bit keeps the PWM functional in debug mode. When this bit is cleared, the input clock is gated off in debug mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in debug mode 1 Active in debug mode
21 BCTR	Byte Data Swap Control. This bit determines the byte ordering of the 16-bit data when it goes into the FIFO from the sample register. 0 byte ordering remains the same 1 byte ordering is reversed
20 HCTR	Half-word Data Swap Control. This bit determines which half word data from the 32-bit IP Bus interface is written into the lower 16 bits of the sample register. 0 Half word swapping does not take place 1 Half words from write data bus are swapped
19–18 POUTC	PWM Output Configuration. This bit field determines the mode of PWM output on the output pin. 00 Output pin is set at rollover and cleared at comparison 01 Output pin is cleared at rollover and set at comparison 10 PWM output is disconnected 11 PWM output is disconnected
17–16 CLKSRC	Select Clock Source. These bits determine which clock input will be selected for running the counter. After reset the system functional clock is selected. The input clock can also be turned off if these bits are set to 00. This field value should only be changed when the PWM is disabled 00 Clock is off 01 ipg_clk 10 ipg_clk_highfreq 11 ipg_clk_32k
15–4 PRESCALER	Counter Clock Prescaler Value. This bit field determines the value by which the clock will be divided before it goes to the counter. 0x000 Divide by 1 0x001 Divide by 2 0xfff Divide by 4096
3 SWR	Software Reset. PWM is reset when this bit is set to 1. It is a self clearing bit. A write 1 to this bit is a single wait state write cycle. When the block is in reset state this bit is set and is cleared when the reset procedure is over. Setting this bit resets all the registers to their reset values except for the STOPEN, DOZEN, WAITEN, and DBGEN bits in this control register. 0 PWM is out of reset 1 PWM is undergoing reset
2–1 REPEAT	Sample Repeat. This bit field determines the number of times each sample from the FIFO is to be used. 00 Use each sample once 01 Use each sample twice 10 Use each sample four times 11 Use each sample eight times

Table continues on the next page...

PWMx_PWMCR field descriptions (continued)

Field	Description
0 EN	PWM Enable. This bit enables the PWM. If this bit is not enabled, the clock prescaler and the counter is reset. When the PWM is enabled, it begins a new period, the output pin is set to start a new period while the prescaler and counter are released and counting begins. To make the PWM work with softreset and disable/enable, users can do software reset by seting the SWR bit, wait software reset done, configure the registers, and then enable the PWM by setting this bit to "1" Users can also disable/enable the PWM if PWM would like to be stopped and resumed with same registers configurations . 0 PWM disabled 1 PWM enabled

38.7.2 PWM Status Register (PWMx_PWMSR)

The PWM status register (PWM_PWMSR) contains seven bits which display the state of the FIFO and the occurrence of rollover and compare events. The FIFOAV bit is read-only but the other four bits can be cleared by writing 1 to them. The FE, ROV, and CMP bits are associated with FIFO-Empty, Roll-over, and Compare interrupts, respectively.

Address: Base address + 4h offset

PWMx_PWMSR field descriptions

Field	Description
31–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6 FWE	FIFO Write Error Status. This bit shows that an attempt has been made to write FIFO when it is full. 0 FIFO write error not occurred 1 FIFO write error occurred
5 CMP	Compare Status. This bit shows that a compare event has occurred. 0 Compare event not occurred 1 Compare event occurred

Table continues on the next page...

PWMx_PWMSR field descriptions (continued)

Field	Description
4 ROV	Roll-over Status. This bit shows that a roll-over event has occurred. 0 Roll-over event not occurred 1 Roll-over event occurred
3 FE	FIFO Empty Status Bit. This bit indicates the FIFO data level in comparison to the water level set by FWM field in the control register. 0 Data level is above water mark 1 When the data level falls below the mark set by FWM field
FIFOAV	FIFO Available. These read-only bits indicate the data level remaining in the FIFO. An attempted write to these bits will not affect their value and no transfer error is generated. 000 No data available 001 1 word of data in FIFO 010 2 words of data in FIFO 011 3 words of data in FIFO 100 4 words of data in FIFO 101 unused 110 unused 111 unused

38.7.3 PWM Interrupt Register (PWMx_PWMIR)

The PWM Interrupt register (PWM_PWMIR) contains three bits which control the generation of the compare, rollover and FIFO empty interrupts.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMIR field descriptions

Field	Description
31–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 CIE	Compare Interrupt Enable. This bit controls the generation of the Compare interrupt.

Table continues on the next page...

PWMx_PWMIR field descriptions (continued)

Field	Description
	0 Compare Interrupt not enabled 1 Compare Interrupt enabled
1 RIE	Roll-over Interrupt Enable. This bit controls the generation of the Rollover interrupt. 0 Roll-over interrupt not enabled 1 Roll-over Interrupt enabled
0 FIE	FIFO Empty Interrupt Enable. This bit controls the generation of the FIFO Empty interrupt. 0 FIFO Empty interrupt disabled 1 FIFO Empty interrupt enabled

38.7.4 PWM Sample Register (PWMx_PWMSAR)

The PWM sample register (PWM_PWMSAR) is the input to the FIFO. 16-bit words are loaded into the FIFO. The FIFO can be written at any time, but can be read only when the PWM is enabled. The PWM will run at the last set duty-cycle setting if all the values of the FIFO has been utilized, until the FIFO is reloaded or the PWM is disabled. When a new value is written, the duty cycle changes after the current period is over.

A value of zero in the sample register will result in the PWMO output signal always being low/high (POUTC = 00 it will be low and POUTC = 01 it will be high), and no output waveform will be produced. If the value in this register is higher than the PERIOD + 1, the output will never be set/reset depending on POUTC value.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																SAMPLE															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMSAR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
SAMPLE	Sample Value. This is the input to the 4x16 FIFO. The value in this register denotes the value of the sample being currently used.

38.7.5 PWM Period Register (PWMx_PWMPR)

The PWM period register (PWM_PWMPR) determines the period of the PWM output signal. After the counter value matches PERIOD + 1, the counter is reset to start another period.

PWMO (Hz) = PCLK(Hz) / (period +2)

A value of zero in the PWM_PWMPR will result in a period of two clock cycles for the output signal. Writing 0xFFFF to this register will achieve the same result as writing 0xFFFE.

A change in the period value due to a write in PWM_PWMPR results in the counter being reset to zero and the start of a new count period.

NOTE

Settings PWM_PWMPR to 0xFFFF when PWMx_PWMCR REPEAT bits are set to non-zero values is not allowed.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																PERIOD															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0

PWMx_PWMPR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
PERIOD	Period Value. These bits determine the Period of the count cycle. The counter counts up to [Period Value] +1 and is then reset to 0x0000.

38.7.6 PWM Counter Register (PWMx_PWMCNR)

The read-only pulse-width modulator counter register (PWM_PWMCNR) contains the current count value and can be read at any time without disturbing the counter.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMCNR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Counter Value. These bits are the counter register value and denotes the current count state the counter register is in.

Chapter 39
Pixel Pipeline (PXP)

39.1 Overview

This document describes the micro-architecture for the Pixel Processing Pipeline used to process graphics buffers or composite video and graphics data before sending to an LCD display or TV encoder.

It is used to minimize the memory footprint required for the display pipeline and provide an area and performance optimized to both SDRAM-less and SRAM-based systems.

The PXP integrates of several independent processing stages into a cohesive strategy to create flexible pixel pipeline.

The PXP combines scaling, color space conversion (or CSC), alpha-blending, secondary color space conversion (or CSC2), pixel conversion lookup memory table (or LUT) and rotation into a single processing engine, as shown in Figure 39-1. By integrating multiple blocks, intermediate buffer operations to external memory are removed, reducing external memory bandwidth, power, and software control complexity.

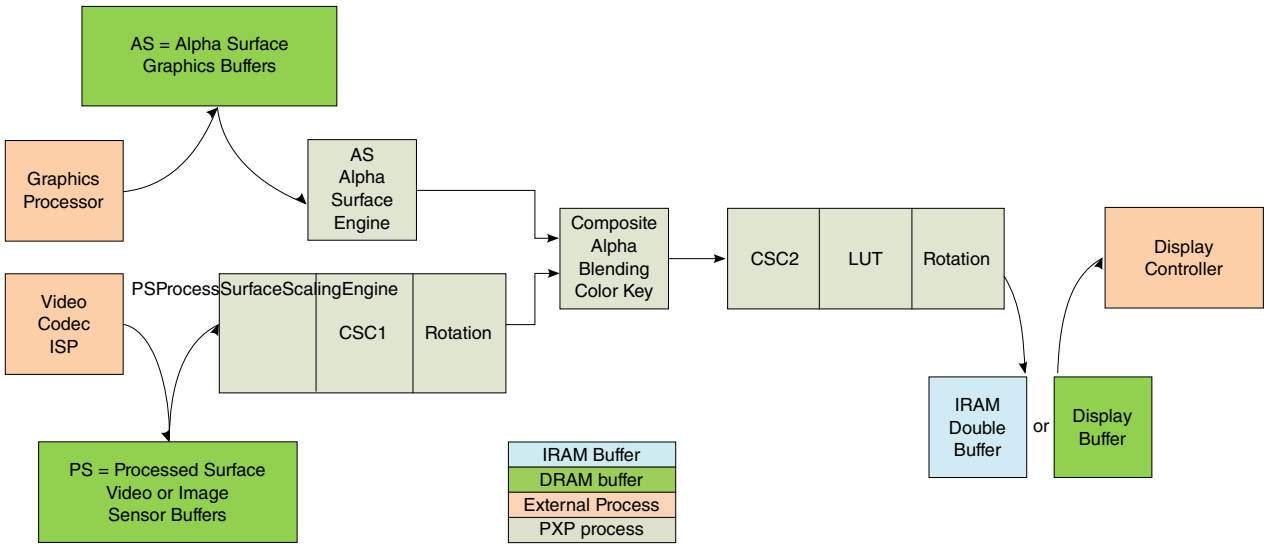

Figure 39-1. PXP Architecture

39.2 Clocks

The following table describes the clock sources for PXP. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 39-1. PXP Clocks

Clock name	Clock Root	Description
clk	axi_clk_root	PXP clock

39.3 Top-level architecture

The PXP consist of several pipelined blocks that perform the video source frame scaling, color space conversion, alpha-blending/color key algorithm, secondary CSC, pixel correction.

The entire pipeline operate within the requirements of the PXP architecture, and perform operations on either 8x8 or 16x16 pixel blocks in the representative source buffers. The entire pipeline operate within the context of two iteration counters that iterate through the appropriate grid of input blocks to produce the rotated output grid blocks in scan-line order.

Figure 39-1 shows the high-level architecture of the scaling, color space conversion, blending, pixel correction,rotation engines.The Alpha Surface Engine fetches one RGB graphics plane alpha surface (AS). The scaling engine fetches a single processed surface (PS), which can be blended with the AS surface.Although the PXP processes NxN pixel macro blocks, each of the AS or PS surfaces can have any pixel alignment within the output buffer. There are no restrictions and any pixel coordinates within the output buffer are valid. The upper left origin of the output buffer is defined as pixel 0,0. The upper left and lower right coordinates for each of the AS and PS are inclusive within the output buffer.

Figure 39-2 represents a sample output buffer configuration with both an AS and PS included. The alignment of each AS and PS within the output buffer can be at any arbitrary pixel locations. For example, the PS has an upper left coordinate (ULC) of 2,2 and a lower right coordinate (LRC) at pixel 13,13. The maximum value for the ULC and LRC for each of the AS and PS is bounded by the LRC of the output buffer, 15,15 for this example.

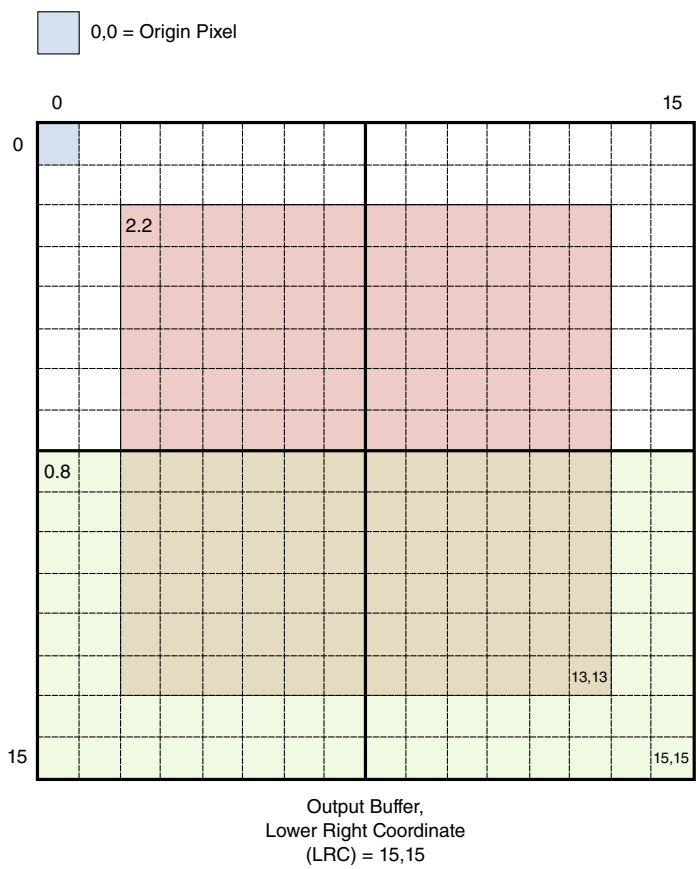

Figure 39-2. Sample output buffer configuration

The AS engine supports RGB pixel formats, and the PS engine supports RGB, YUV, and YCbCr pixel formats. The CSC1 can be used to convert to RGB pixel formats so that the PS surface can be blended with the AS surfaces in the compositing engine in the RGB color space. There is a single rotation engine in the PXP with a programmable location with two possible rotations, one after PS processing, other just before the transfer to display buffer. Rotation can occur after image composition or at the output of the PS engine. In the first scenario, all the data produced by the AS and PS engines is rotated. When the rotation module is programmed to rotate only PS images, the AS is not rotated, and AS pixels are combined with rotated PS surfaces. The CSC2 unit can convert to any RGB, YUV, or YCbCr color spaces for final output. Pixels can be corrected using a programmable LUT resource to achieve any desired pixels effects. For detailed information, please refer to Output Modes to RGBW4444CFA.

39.3.1 Processing Details

The PXP architecture has been driven primarily by the requirement that the output buffer must be processed and rotated without intermediate frame buffer stored in external memory.

This reduces the use of external memory bandwidth requirements thus reducing overall system power consumed.

Since the output of the rotation block must be NxN pixel blocks in scan order, the entire pipeline will operate on NxN pixel blocks. In essence, the pipeline will be able to operate on blocks in a random access fashion, but the entire pipeline will operate within the context of two iteration counters that will iterate through the horizontal and vertical input blocks to generate the required output block.

Processing Pipeline

The control block will coordinate the processing of the pixel blocks within the source and destination image buffers. It begins by issuing a command to each stage of the pipeline requesting that operations be done for the block at offset x, y. When the block accepts the command, it asserts its acknowledge signal for a single cycle to indicate the acceptance and allow the control unit to move to the next block.

When the PS and AS fetch engines have received a command, they will fetch the required data and place it into their fetch buffers. If compositing the RGB AS surface with the PS surface, then the output of the PS engine needs to be converted to the RGB color space using CSC1, since all compositing occurs in the RGB color space. For YUV output pixel formats, the CSC1 unit can be enabled to convert pixels into the RGB space for subsequent compositing with AS pixels. Then, the CSC2 module can convert the resulting pixels back into the YUV output color space. If the final output color space is

YUV and there is no compositing required (AS not present, for example), then both the CSC units can be bypassed and the pixel data path will pass the YUV pixels to the rotation engine. For YUV output formats, scaling operations, LUT, and rotation operations are still valid, but blending RGB AS surfaces with YUV PS surfaces is NOT supported. The two CSC units in the overall pixel data path must be used to achieve the desired source frame compositing and output pixel formatting.

The alpha blender/color key module will process a pixel any time that both inputs present valid data.

A handshake will be created between each stage and a pipeline controller to handle the advance of the pipeline and generation of the iteration counters. The pipeline controller will also maintain the interlocks with the LCD interface for the case where the LCD display and pixel processing pipeline use the SRAM to maintain the double buffer block intermediate buffer.

39.3.2 Scaling Operation

The scaling engine operates on YUV (or YCbCr) 422 or 420 and any RGB formatted pixels. Each color plane is sourced from color planes indicated by different base address registers.

The scaling source data can be stored as 3 individual planes for each Y, U, and V data, stored as two planes as a single Y and interleaved UV plane, or stored as a single plane with YUV/RGB interleaved on a per byte basis.

The scaled output image is presented to the CSC module as YUV444 or RGB888 pixels with a single byte for each color channel. The scaler can reduce an input image by a maximum factor of 16. In this case, the output image will be 1/16 the dimension of the input image in each of the X and Y axis. There are no limits, essentially, on increasing the source image size. The theoretical maximum increase is 4096 since a 12 bit fractional step function is used when scaling an input image. Scaling in either axis, X or Y is independent, so a source image can appear stretched in either direction.

All source images pass through the scale engine. The PXP alpha blend module and AS pixel streams are in the RGB888 format, so PS pixel buffers must be converted to the RGB888 format for alpha blending. The scaling engine works with the CSC1 module to translate YUV/YCbCr pixel formats to RGB888 for output frame buffer compositing using the alpha blender. The CSC2 module can by bypassed or enabled to convert pixels to any output color space. In the case of processing RGB pixels in the PS engine, the CSC1 unit can be bypassed so compositing can occur in the alpha engine.

The scaling operation is divided into two scaling steps. The first step is a decimation scaler, and the second step is a bilinear filter. The decimation filter provide a maximum down scaling factor of 8, and the subsequent bilinear filter provides a maximum scaling factor of 2. Combined, the maximum scaling factor can be up to 16. The decimation and bilinear scaling engines are independently programmable. There is also an initial offset that is programmable to allow more source data to be considered in the bilinear scaling engine.

39.3.3 Decimation Image Scaling

The first of two scaling engines is the decimation filter.

The intent of the decimation filter is to use as much source data as is possible to create the output image frame buffer. The decimation filter simply discards certain pixels from the source PS image depending on the reduction selected.

For RGB pixel formats, each color channel is treated equally since there is the same amount of pixel data within each color plane. For YUV422/420 formats, the chroma samples are already subsampled by 2. In these decimation scenarios, the chroma decimation factor is adjusted to account for the pre-decimation of the chroma samples. For example, since YUV422 is already sub-sampled by 2 horizontally, an X decimation factor of 2 does not apply to the YUV422 pixels in the X direction. All the chroma samples are passed on to the bilinear filter in this case. As another example, an X decimation factor of 4 will decimate the chroma samples by 2, since this factor combined with the pre-decimation factor of 2 in the pixel source buffers totals an overall decimation factor of 4.

The following example will show which pixels (in green) in a source RGB buffer that are passed to the bilinear filter for an X decimation factor of 2 and a Y decimation factor of 4. All pixels coincident with dashed lines are discarded.

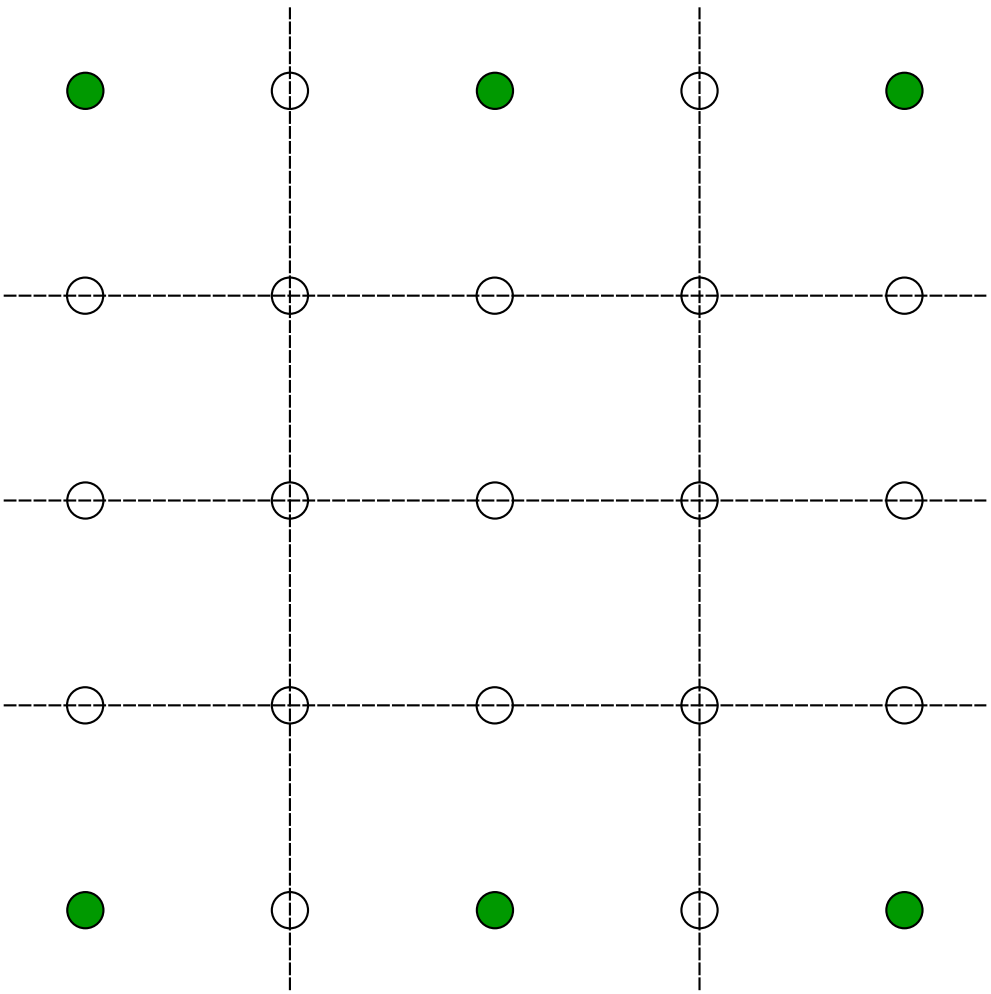

Figure 39-3. RGB decimation X /2, Y /4

Using the same decimation factor as the above scenario for RGB pixels, but using YUV420 source buffers, it can be shown that the decimation factor for the Y and UV components of data are decimated differently. This is due to the pre-decimation of the chroma samples in the source frame buffers. Figure 4: YUV420 decimation X /2, Y /4 indicates that the U/V samples in the X direction are not decimated, but the Y samples in the X direction are decimated by the factor of 2.

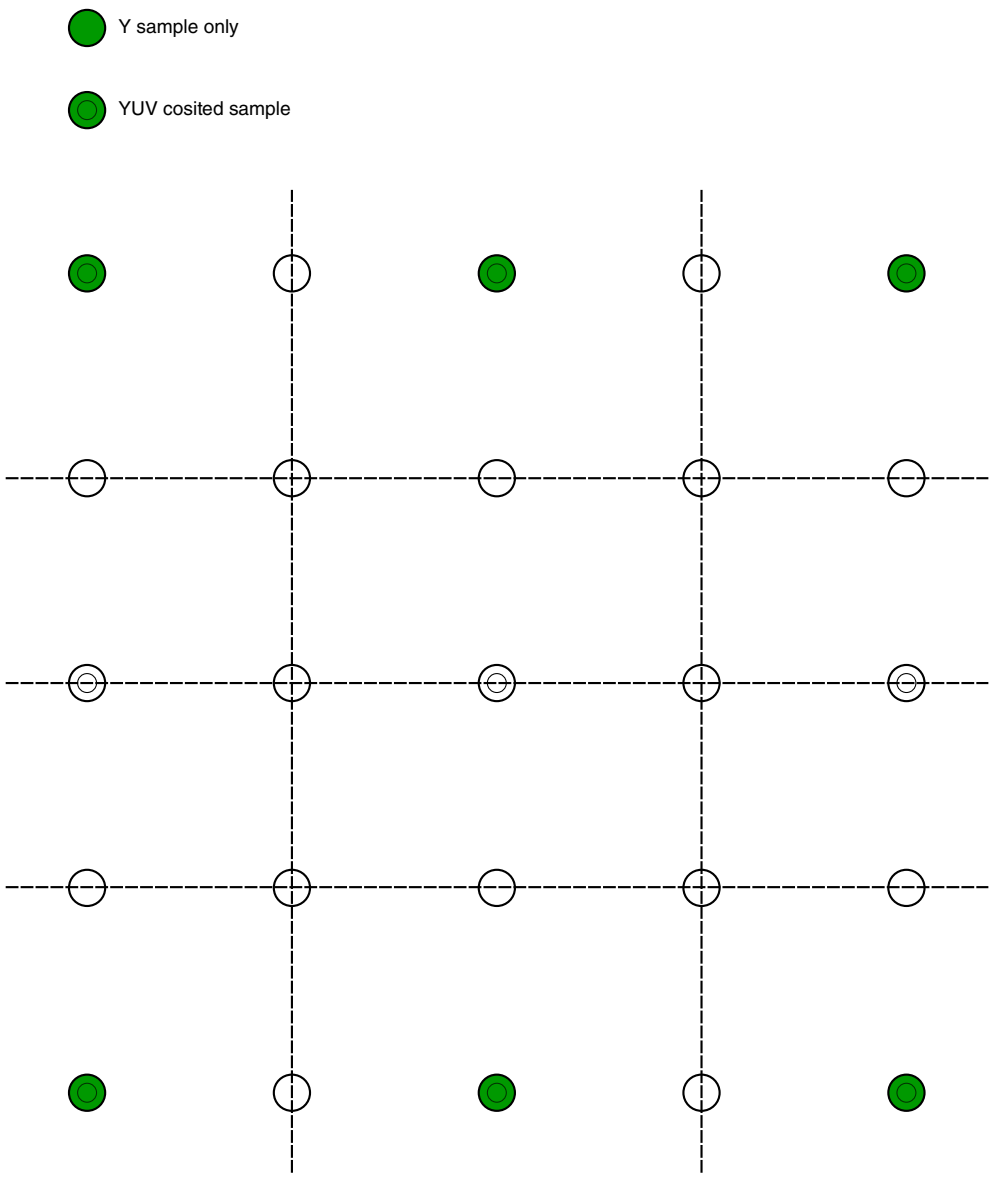

Figure 39-4. YUV420 decimation X /2, Y /4

39.3.4 Bilinear Image Scaling Filter

The PXP implements a bilinear scaling filter to resize an input image to a different resolution for display output.

The bilinear filter is a weighted average of the four nearest pixels that can be sourced to approximate the pixel in the output frame buffer.

When scaling YUV data, the UV values are offset by 0x80 (top bit inverted) to shift the signed UV bits into an unsigned equivalent with a range of 0 to 255. YCbCr data does not have to be shifted since it is defined as an unsigned byte. The REG_CSC1_COEF0[YCBCR_MODE] bit controls whether this operation is applied to the input UV bytes.

After scaling, the offset is removed so that the range for UV data is signed from -128 to 127.

The reason for this adjustment is based on the implementation of an unsigned scaling engine, and therefore, is to ensure that the scaled values are handled properly. Consider the following table:

Format	pixel0	pixel1	average	Result
decimal	-2	+2	0	Correct
CbCr	0x7E	0x82	0x80	Correct (0x80 is 0 in CbCr)
UV	0xFE	0x02	0x80	Incorrect (0x80 is -128 in UV)
decimal	-32	+16	-8	Correct
CbCr	0x60	0x90	0x78	Correct (0x78 is -8 in CbCr)
UV	0xE0	0x10	0x78	Incorrect (0x78 is +120 in UV)

To compute the output pixel value at position as indicated by P, consider the diagram below.

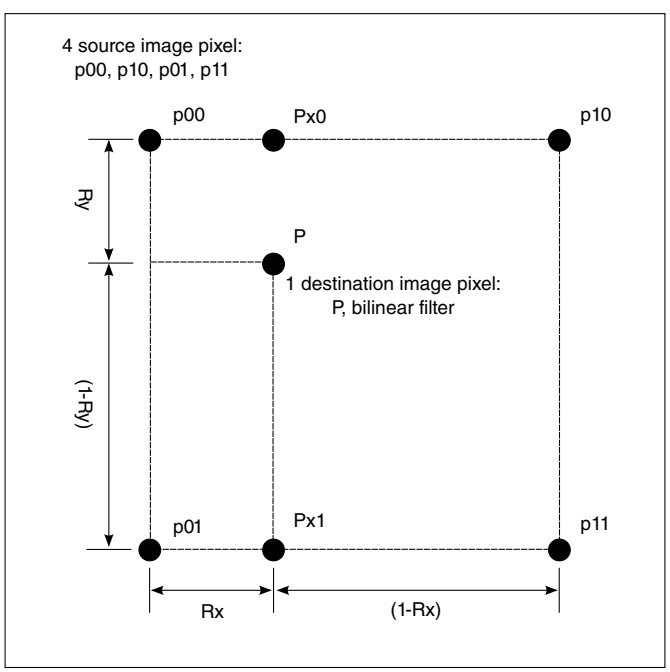

Figure 39-5. Output Pixel Value

A step function is used to indicate the position of the pixel "P" in the output frame. This position may not coincide with a single pixel position in the input frame buffer. In this case, the four closest pixels in the input frame are used to approximate the value of the pixel in the output frame.

The PXP scaler first computes a linear filter in the X axis to create the two intermediate pixel values Px0 and Px1. The step function's X fractional component is used to provide the weighting factor for blending p00 with p10 to provide Px0. Likewise, Px1 is also derived from a linear filter using p01 and p11.

The equations for Px0 and Px1 are as follows:

Px0 = p00*(1-Rx) + p10*Rx

Px1 = p01*(1-Rx) + p11*Rx

The PXP scaler uses the intermediate X pixels Px0 and Px1 and implements a bilinear filter on these two pixel values to produce the final pixel value at position P. The remainder of the step function for the Y axis is used to compute the weighted average pixel result. The equation for final filtered pixel is:

P = Px0*(1-Ry) + Px1*Ry

39.3.5 YUV 4:2:2 Image Scaling

The following figure illustrates the positioning of YUV samples for the 4:2:2 formats. There are twice as many Y luma samples then U and V chroma samples horizontally.

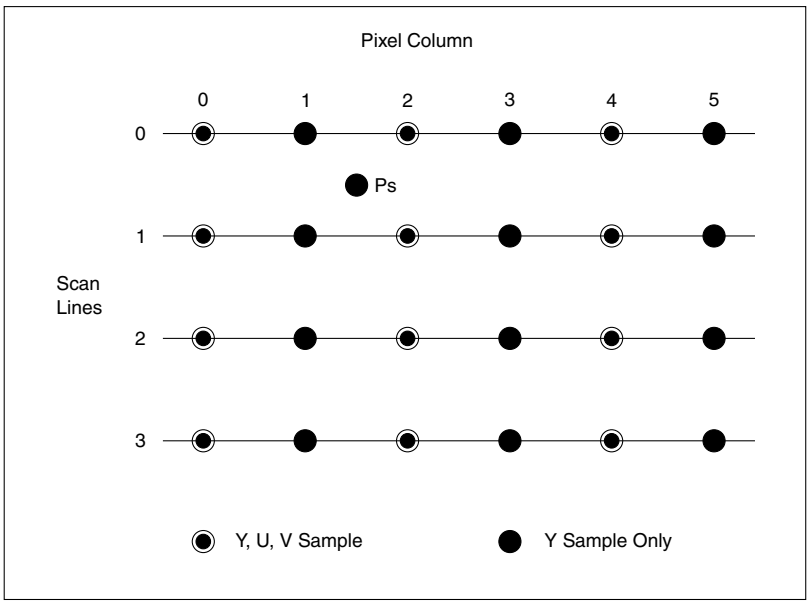

Figure 39-6. YUV Sample Positioning, 4:2:2

Consider the scaled output pixel Ps (pixel scaled) which has an accumulated step function of X=1.5 and Y=0.5. The remainder for the step function is Rx = 0.5 and Ry = 0.5. Or, the sub pixel position of output pixel Ps is half way between line 0 and 1 and half way between column 1 and 2.

The Y output component of Ps is simply the bilinear function of the four nearest Y samples from the input image. Specifically, the Y values at [1,0], [2,0], [1,1], and [2,1] are used to compute the Y for Ps.

For the U and V components of Ps, there are no samples present in the column position 1. The bilinear filter uses chroma components located at [0,0], [2,0], [0,1] and [2,1]. Since the chroma components are not sub sampled vertically, the remainder used to combine pixels vertically is Ry=0.5 (the same as for Y). However, horizontally, the scaling engine shifts the remainder by a factor of 2. So an X axis step function value of X=1.5 has a remainder Rx=0.75. Source chroma values are not replicated, they are completely interpolated using the four nearest chroma samples to approximate U and V at Ps.

39.3.6 YUV 4:2:0 Image Scaling

The following figure illustrates the positioning of YUV samples for the 4:2:0 formats. Chroma is sub sampled both horizontally and vertically. In this format, the chroma frame buffers contain ¼ the data that the luma frame buffers store.

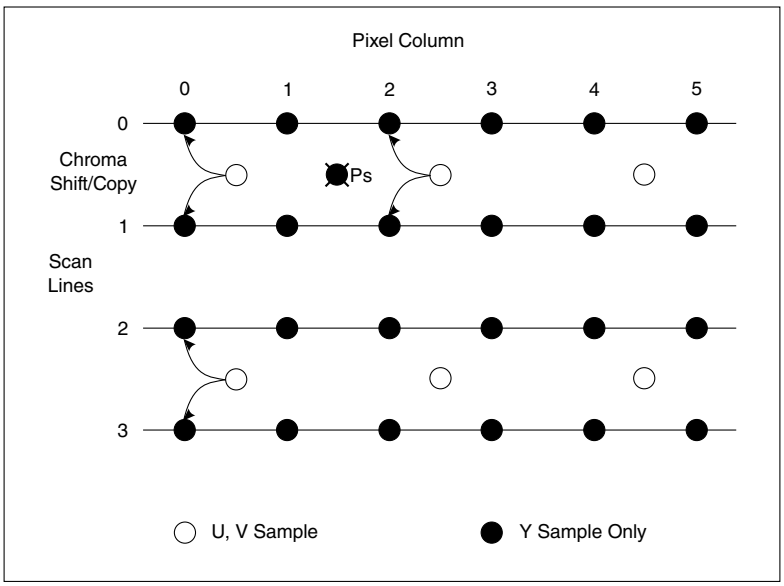

Figure 39-7. YUV Sample Positioning, 4:2:0

The Y output component for all scaled pixels in 4:2:0 formats are the same as for the 4:2:2 pixel formats.

The U and V output components have two considerations when computing the output pixel Ps.

1. All chroma samples from the input source image are shifted left and up by ½ a sample position of the input pixel matrix.
2. Odd scan lines are replicated using the previous even chroma scan line values. So, output image chroma values that map between even to odd scan lines are replicated in the vertical axis. In contrast, output image chroma values between odd to even scan lines are interpolated vertically.

The chroma values are interpolated horizontally as in the 4:2:2 pixel format.

As an example, consider the interpolated pixel Ps in the 4:2:0 diagram above. For the Y component, the interpolated output luma is a function of the Y values in the source frame buffer at position [1,0], [2,0], [1,1], [2,1].

For the U and V interpolated samples, the chroma values on scan line position 0.5 are shifted so that they coincide with the even luma sample points. They are also replicated so that a single chroma scan line is used twice. The chroma scan line at 0.5 is replicated to represent the 4:2:2 sample points for scan line 0 and 1. The chroma scan line at 2.5 is replicated to represent the 4:2:2 sample points for scan line 2 and 3. This pattern of chroma replication occurs for the entire source frame buffer during the scaling operation.

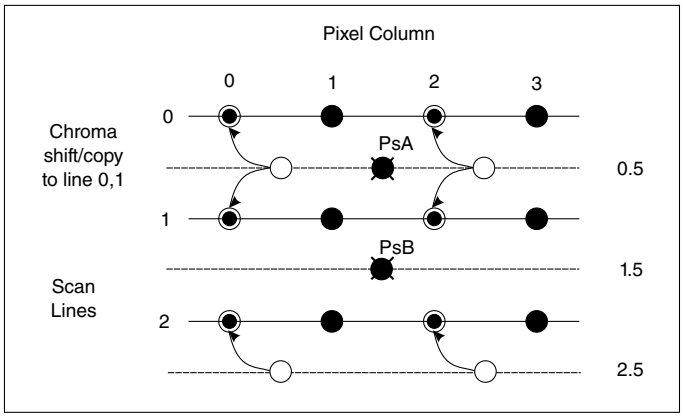

Figure 39-8. Scaled Chroma Computation Examples

The preceding diagram has two examples for the computation of the scaled chroma output pixel. For chroma at output position PsA (vertical position 0.5), interpolation occurs in the X axis using chroma values at column 0 and column 2. However, since line 0 and line 1 have equal chroma values due to chroma line replication, scaling in the Y axis results in replication of chroma values.

For chroma at output position PsB (vertical position 1.5), interpolation occurs in both the X and Y axis. The Y axis is an interpolation since the chroma values copied to scan line 1 and 2 and not the same.

In summary, any output image pixels that map to an odd scan line above and an even scan line below are interpolated vertically. Output image pixels that map to an even scan line above and an odd scan line below are replicated vertically.

39.3.7 RGB/YUV444 Image Scaling

For all RGB formats, the RGB pixels are converted up to RGB888 with 8 bits per each color component.

Then each color component is passed to the scaling engine and each component is treated in the same manor. The RGB scaling operation is the same as for the Y scaling operation described in the preceding sections. Also, YUV444 contains a byte for each color plane at each pixel location, so all three color components are scaled in the same manor.

39.3.8 Color Space Conversion (CSC)

There are two modules in the PXP to convert pixels between color spaces. They are referred to as CSC1 and CSC2 (for lack of a better naming convention).

CSC1 exists after the scaling unit and is dedicated to converting from YUV to RGB. CSC2 is a full duplex color space converter in that is can convert into either RGB or YUV (or YCbCr) color spaces depending on the desired output pixel format. All coefficients are programmed as two's compliment numbers and both CSC units can be bypassed if CSC is not desired at either position of these CSC units in the pixel data path.

39.3.9 CSC1 Operation

The CSC1 module receives scaled YUV/YCbCr444 pixels from the scale engine and converts the pixels to the RGB888 color space only if CSC1 is enabled.

The CSC1 module will convert only to the RGB color space and it can be bypassed to allow YUV pixels through the data path. These pixels are loaded into the pixel FIFO for processing by subsequent modules in the pixel data path.

The following equations are used to perform YUV/YCbCr -> RGB conversion. The constants will be stored in the PXP control registers as two's compliment values to allow flexibility in the implementation and to allow for differences in the video encode and decode operations. In addition, this provides a software mechanism to manipulate brightness or contrast.

R = C0(Y+Yoffset) + C1(V+UVoffset)

G = C0(Y+Yoffset) + C3(U+UVoffset) + C2(V+UVoffset)

B = C0(Y+Yoffset) + C4(U+UVoffset)

Note: In the equations above, U and V are synonymous with Cb and Cr in regards to the color space format of the source frame buffer.

Saturation of each color channel is checked and corrected for excursions outside the nominal YUV/YCbCr color spaces. Overflow for the three channels are saturated at 0x255 and underflow is saturated at 0x00.

The table below indicates the expected coefficients for YUV and YCbCr modes of operation:

Coefficient	YUV	YCbCr
Yoffset	0x000	0x1F0 (-16)
UVoffset	0x000	0x180 (-128)
C0	0x100 (1.00)	0x12A (1.164)
C1	0x123 (1.140)	0x198 (1.596)
C2	0x76B (-0.581)	0x730 (-0.813)
C3	0x79B (-0.394)	0x79C (-0.392)
C4	0x208 (2.032)	0x204 (2.017)

39.3.10 YUV versus YCbCr Support

By default, the PXP color space coefficients are set to support the conversion of YUV data to RGB data.

If YCbCr input is present, software must change the coefficient registers appropriately (see the register definitions for values). Software must also set the YCBCR_MODE bit in the COEFF0 register to ensure proper conversion of YUV versus YCBCR data.

39.3.11 CSC2 operation

The CSC2 module receives pixels in any color space and can convert the pixels into any of RGB, YUV, or YCbCr color spaces.

All coefficients are programmable and in the two's compliment notation. The output pixels are passed onto the LUT and rotation engine for further processing.

The following equations indicate the CSC2 modules ALU architecture.

Selecting RGB output in REG_CSC2_CTRL[CSC_MODE] configures the ALU in the following manor:

R = A1(Y-D1) + A2(U-D2) + A3(V-D3)

G = B1(Y-D1) + B2(U-D2) + B3(V-D3)

B = C1(Y-D1) + C2(U-D2) + C3(V-D3)

Selecting YUV output configures the ALU in the alternate manor:

Y = A1*R + A2*G + A3*B + D1

U = B1*R + B2*G + B3*B + D2

V = C1*R + C2*G + C3*B + D3

Saturation of each color channel is checked and corrected for excursions outside the nominal color space. Overflow for the three channels are saturated at 0x255 and underflow is saturated at 0x00.

39.3.12 Alpha Blending/Color Key

Regardless of pixel input format, the PS and AS pixels are normalized to 32-bits, organized as one alpha and three data bytes.

Alpha blending occurs in the RGB space, if blending is required, PS pixels should be converted to RGB space. If no alpha blending is required, then YUV pixels can bypass the alpha blending ALU without color space conversion.

All pixels are processed by the pixel ALU, but the ALU operations can be disabled to achieve pixel pass through for either PS or AS source pixels.

39.3.13 Alpha Blend

The alpha value for an individual pixel represents a mathematical weighting factor applied to the AS pixel.

An alpha value of 0x00 corresponds to a transparent pixel and a value of 0xFF corresponds to an opaque pixel.

The effective alpha value for an AS pixel is determined by the REG_AS_CTRL[ALPHA] and REG_AS_CTRL[ALPHA_CTRL] register fields. If REG_AS_CTRL[ALPHA_CTRL] = ALPHA_OVERRIDE , the alpha value for the pixel is taken from the REG_AS_CTRL[ALPHA] . This can be useful for applying a constant alpha to an entire image or for image formats that don't include an alpha value. If REG_AS_CTRL[ALPHA_CTRL] = ALPHA_MULTIPLY, the pixel's alpha value will be multiplied by the pixel's ALPHA value in order to allow scaling of the pixel's alpha or to provide better control for pixel formats such as RGB1555, which only contains a single bit of alpha.

For each color channel, the equation used to blend two source pixels is defined below:

Gá = PIO programmed global alpha (8-bit value).

Eá = Embedded alpha associated with AS pixel.

á = Gá * Eá + 0x80

The result for the red channel as an example:

R[7:0] = (á * PS.r) + ((1 - á) * AS.r)

When á is 0xff, the PS pixel will not be blended with the AS pixel, but PS will be passed as the output pixel and will not be blended with AS. In this case, AS will be discarded. Likewise, if á is 0x00 for a given pixel, PS will be loaded as the output pixel.

REG_AS_CTRL[ALPHA_INVERT] provides the option to invert the final alpha value. This essentially inverts the effect the alpha value has on the AS and PS blending operation.

39.3.14 Color Key

The color key function is provided to create transparent effects on the output pixel.

Color keying is applied on the input pixels after they are converted to 8-bits for each red, green, and blue color channels (color keys are not applied directly to 16-bit pixel formats but to their corresponding 24-bit representation). A color key range is programmable for both PS and AS pixels. If the PS 24-bit pixel is within the PS color key range, then AS is passed through the pixel pipeline. In this case, alpha blending does NOT occur. Conversely, if PS is within the AS color key range, then PS is passed via the PXP data pipeline. If both PS and AS color key tests pass, then the back ground color register is passed onto following PXP processing components in the pipeline.

The condition for color keying to be satisfied is:

CK0.r.low <= PS.r <= CK0.r.high

CK0.g.low <= PS.g <= CK0.g.high

CK0.b.low <= PS.b <= CK0.b.high

For example, if the "red" 8-bit value for the PS pixel (or PS.r) is between the color key low and high values (CK0.r.l and CK0.r.h), the condition is true for the red color plane. When ALL three color planes meet this condition, then only the PS pixel is loaded into the output register.

To disable color keying, program the low color key register value to 0xff and the high value to 0x00. This will guarantee that the color key range test will never be true.

39.3.15 LUT

The lookup table (LUT) is used to modify pixels in a manner that is not linear and that cannot be achieved by the color space conversion modules.

Nonlinear response to the input pixels can be achieved based on how the lookup table is programmed.

Programming of the direct access LUT table can be facilitated by single PIO register writes or DMA access. For efficient loading of the LUT, DMA access should be used.

39.3.16 Lookup Modes

The LUT has four lookup modes. The lookup modes determine how the src_pixel is used to address the LUT memory.

The four lookup modes are:

1. DIRECT_Y8
2. DIRECT_RGB444
3. DIRECT_RGB454
4. CACHE_RGB565

The DIRECT modes access the LUT memory as a monolithic SRAM. The CACHE_RGB565 will access the memory as a 2-way set associative cache.

39.3.17 DIRECT_Y8

DIRECT_Y8 is used for a 256-byte lookup. In DIRECT_Y8, the most significant byte of the pixel is used to address the LUT entry.

This byte reflects the Y/R channel of the pixel data path. Luma, or monochrome, transformations are possible with this lookup mode. The address is generated as: src_pixel[23:16]. In DIRECT_Y8 operation, the memory is byte addressable.

39.3.18 DIRECT_RGB444

DIRECT_RGB444 is used for a 8KB (4K pixel) RGB444 to RGB565 lookup.

Pixel formats that are in the YUV color space at the position of the LUT in the PXP data path can also be converted. To take advantage of the full 16KBmemory, the REG_LUT_CTRL[SEL_8KB] bit can be used to select the upper or lower 8KB memory, thus facilitating the use of 2 separate 444 LUT tables. In DIRECT_RGB444, the src_pixel is RGB/YUV[23;0] data is used to generate the lookup address. The address is generated as: {R/Y[23:20],G/U[15:12],B/V[7:4]}. In DIRECT_RGB444, the memory is pixel (2 byte) addressable.

39.3.19 DIRECT_RGB454

DIRECT_RGB454 is used for a 16KB (8K pixel) RGB454 to RGB565 lookup.

Pixel formats that are in the YUV color space at the position of the LUT in the PXP data path can also be converted. In DIRECT_RGB454, the src_pixel is RGB/YUV[23;0] data is used to generate the lookup address. The address is generated as: {R/Y[23:20],G/U[15:11],B/V[7:4]}. In DIRECT_RGB454, the memory is pixel (2 byte) addressable.

39.3.20 CACHE_RGB565

The CACHE_RGB565 lookup is used for a 128KB (65K pixel) RGB/YUV565 to RGB/YUV565 lookup.

The 128KB memory requirement is too costly from an area perspective to implement a complete lookup table in the LUT's on chip memory. For this reason, a LRU (least recently used) 16KB 2-way set associative cache has been implemented to reference the full 128KB lookup table stored in external memory.

The 2-way set associative cache is organized in the following way:

- 16KB total data storage
- 512 entries split between 256 ways
- 6 pixels/entry cache line

Cache efficiency is very critical. For a cache miss, the PXP will be stalled until the cache line can be filled. For a 32 bit DDR memory interface, the latency can be calculated as follows:

cycles latency for read command through DDR controller + CAS Latency + # burst cycles for read data to be returned + # cycles latency for data through DDR controller to LUT + 1 cycle for cache access of new data

The src_pixel is RGB[23:0] data used to generate the lookup address. To improve the cache efficiency the RGB/YUV565 address and the lookup table must be formatted in the following way:

Address: A[15:0] = $R_7G_7G_6B_7$ $R_6G_5B_6$ $R_5G_4B_5$ $R_4G_3B_4$ $R_3G_2B_3$

The address is organized as follows:

- A[15:12] tag address, used to compare a hit between cache ways
- A[11:4] index address, used to select cache set (i.e. row of memory)
- A[3:0] block address, used to select Pixel in the cache line

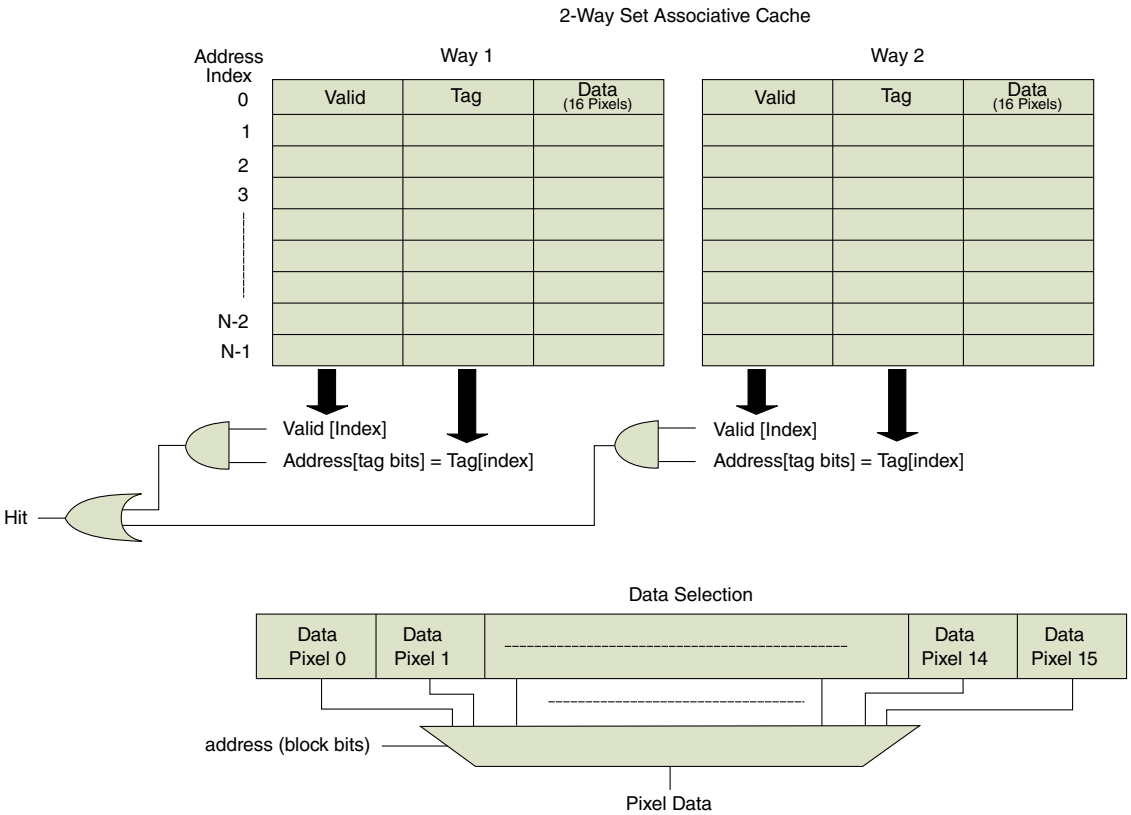

Figure 39-9. 2-Way Set Associative Cache and Data Selection

39.3.21 Output Modes

The LUT has three output modes for color space conversion.

1. Y8
2. RGBW4444CFA
3. RGB888

39.3.22 Y8

With out_mode set to Y8, in conjunction with DIRECT_Y8 lookup mode, the intended operation is Gama Correction.

Only the third byte is processed by the lookup table. The third byte is represented by the Y value or the R value in the data path since pixel data is either YUV[23:0] or RGB[23:0] where the Y or R byte encompass bits [23:16] respectfully. So, bits 15:0 are

always bypassed and left unchanged. Currently, the LUT is intended to process Y data when any YUV, Y8, or Y4 output pixel formats are selected. However, this resource can be enabled and used for any conceivable purpose.

Note: When the DIRECT_RGB444, DIRECT_RGB454 or CACHE_RGB565 lookup mode is selected in conjunction with the Y8 output mode the low order byte of the two bytes read from the LUT memory will be used as the Gama Correction value.

39.3.23 RGBW4444CFA

With REG_LUT_CTRL[OUT_MODE] set to RGBW4444CFA, the REG_CFA[DATA] is used to select one nibble from the LUT 16 bit output value.

The LUT memory lookup will contain a RGBW4444 value. The REG_CFA[DATA] will select the R,G,B or W nibble as the pixel value to present to the PXP data path based on the matrix defined by the REG_CFA[DATA] register. The 4 bit value is presented in the Y, or third byte lane, of the PXP data path. The final pixel transferred to the next PXP stage is {CFA[3:0],CFA[3:0],LUT[15:0]}

39.3.23.1 CFA Correction

The 32-bit REG__CFA[DATA] register is used to encode 16 CFA correction values.

The CFA correction values are encoded as follows:

- 00 selects R
- 01 selects G
- 10 selects B
- 11 selects W

The CFA correction uses 4x4 block processing. Figure 5; CFA mapping translation shows how CFA 4x4 blocks will iterate over the PXP's 8x8 or 16x16 pixel block being processed:

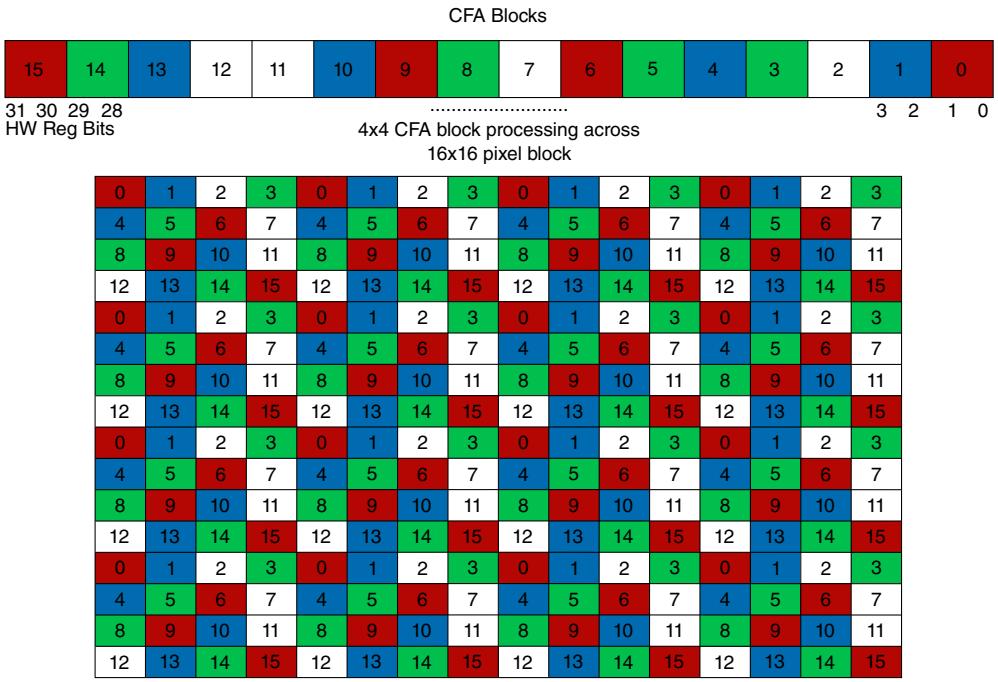

Figure 39-10. CFA mapping translation

39.3.24 RGB888

With out_mode set to RGB888, the memory output data is interpolated from RGB565 to RGB888.

The RGB[23:0] data is formatted as follows: R[7:3]R[7:5],G[7:2]G[7:6],B[7:3]B[7:5].

39.3.25 Rotation

There is a single rotation resource integrated into the PXP. The location of this resource within the PXP data path is programmable. Rotation can occur after compositing the AS and PS buffers in the output stage.

As an alternative configuration, the PS buffer can be rotated and later composited with the AS surface that is not rotated. There is a single configuration bit that provides the configuration of where rotation is implemented within the PXP.

To rotate graphics, the hardware must read pixels in one direction across a frame buffer and write them in a alternate orientation. For the 90 and 270 degree cases, this means that lines of pixels must either be read or written vertically in a frame buffer.

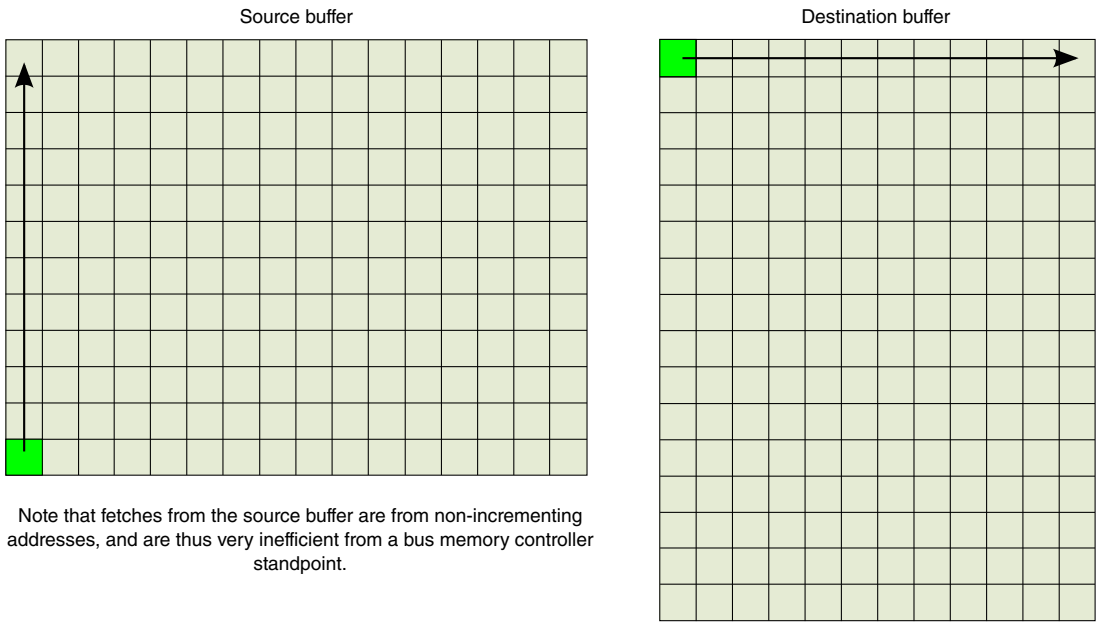

Figure 39-11. Rotation Read and Write

In order to rotate efficiently, multiple columns must be rotated to enable the engine to both fetch and store bursts of pixels, thus improving memory performance. The simplest method of doing this is to operate on square blocks of pixels. To rotate the image, each sub-block of pixels must be rotated by the required rotation angle.

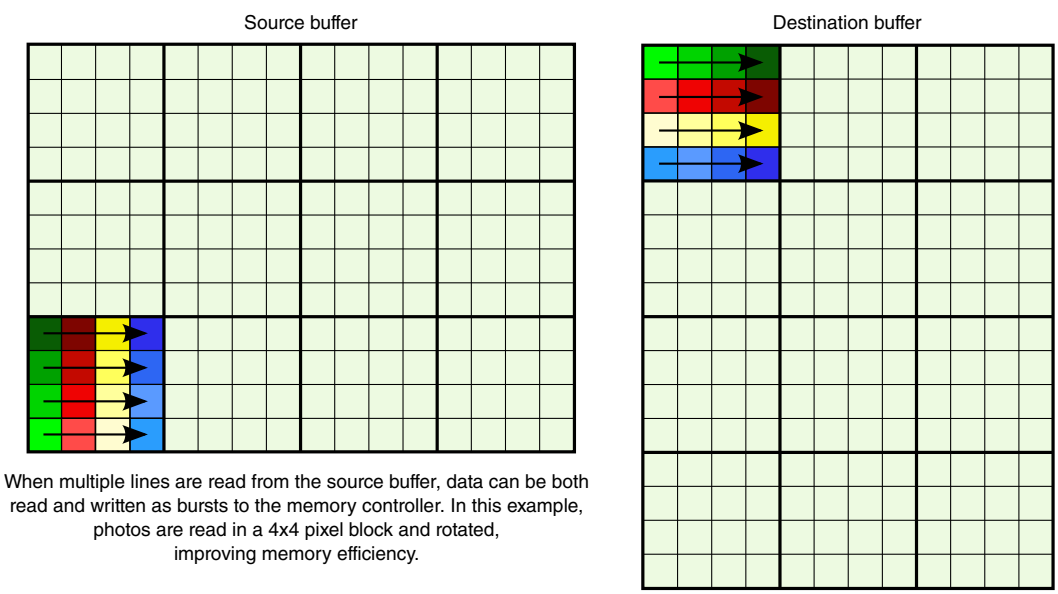

Figure 39-12. Rotated Sub-blocks

To manage the rotation process, the source image can be broken into a grid of sub-blocks that have coordinates as shown in the diagram below. In addition to rotating the sub-block, each block must be translated to a new coordinate location. For each of the rotation angles (0, 90, 180, 270), it is possible to define a simple algorithm for computing the new translated grid address. The hardware must then simply compute the memory address from the base grid address for both load and store operations.

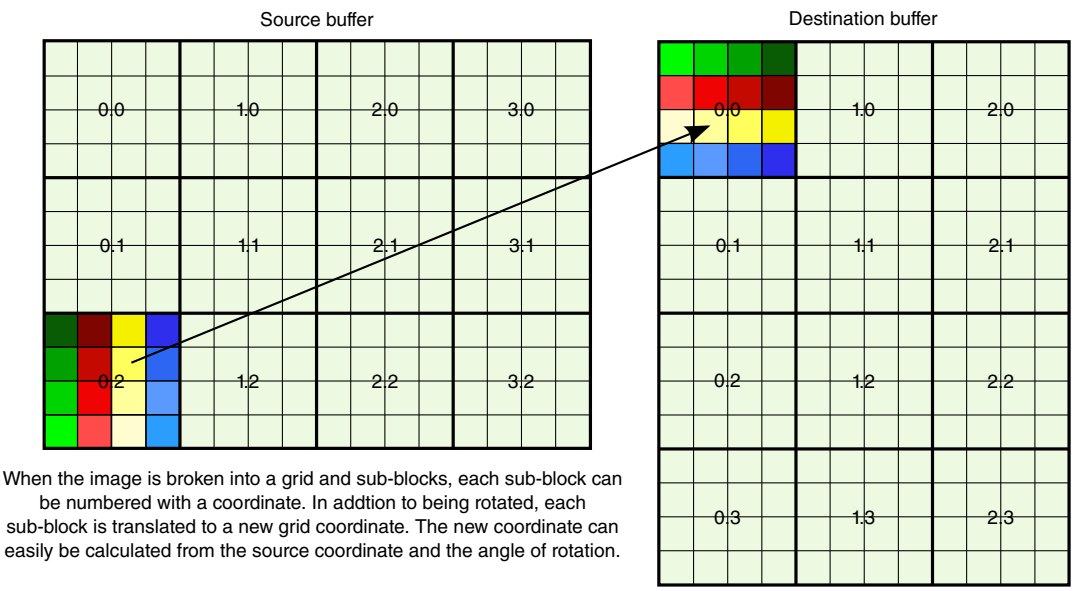

Figure 39-13. Grid of Sub-Blocks with Coordinates

In order to balance the requirements of reasonable burst sizes to the memory controller as well as keep the hardware storage requirements to a minimum, the blending/rotation engine will operate on either 8x8 or 16x16 pixel blocks. When using the Rotate engine with the input fetch engine, you need to program the input fetch engine to work in 8x8 block mode.

NOTE

An important artifact of the PXP is when rotating a source image and the output is NOT divisible by the block size selected. The output engine essentially truncates any output pixels after the desired number of pixels has been written. Since the output buffer is written as a horizontal row of blocks, the incorrect pixels could be truncated and the final output image can look shifted. In the case where the block size is programmed to 8x8, and the output size that is programmed is 12x12, then there is a remainder of 4 pixels that will be truncated in either the X and/or Y axis when the PXP operation

is complete. The output will be shifted by 4 pixels in this example. To compensate for this, the source base address needs to be adjusted so the correct pixels get truncated and the image does not look shifted. In this example, with 90 degrees of rotation, the PS base address should be adjusted by 4 times the actual PS base address -(4*pitch).

39.3.26 Output Buffer

The output buffer engine accepts data from the PXP pixel pipeline and issues requests to transfer the output pixels to external DRAM or the internal SRAM double buffer row of blocks.

39.3.27 Address calculator

Each of the blocks will manage its own fetch address using a common address calculator block that computes real addresses from a base address and relative block offset from the base.

Each block will then perform the multiple line fetches (or stores) required to perform the operation. This hides all the address buffer computations from the processing blocks and allows each block to simply track the coordinate of the block it is working on.

39.3.28 Block size selection

The PXP can be configured to process blocks that are either 8x8 pixels or 16x16 pixels with the REG_CTRL[BLOCK_SIZE] control bit.

When selecting a 16x16 pixel block size, the accesses to fetch AS and PS images and write the final frame buffer are more efficient since twice as much data is requested and processed per memory request.

When optimizing the system for memory bandwidth and image processing time, configure the PXP to process 16x16 pixel blocks.

39.3.29 Interlaced Video Support

The PXP has some minimal ability to generate interlaced video content from a progressive source. There two available options, based on the bandwidth requirements and how software is managing video frames.

The PXP can either interlace on the input side (by reading every other line of input data) or on the output side (by writing the individual lines of video into two separate fields). Generally, output interleaving should be used since it is the most flexible mode (it allows scaling and full overlay support) and it only requires a single pass of the PXP to generate two separate output fields.

Input interleaving can be beneficial in cases where the PXP is running at 60fps, since it requires fewer fetches to produce the output data. There is no direct hardware support for input interleaving, in that, there is no configuration bit that can be set to alter how the PXP processes a frame for input interleaving. Input interleaving is achieved by simply setting the source frame buffer pitch value to twice the value it would normally be set to for the equivalent progressive frame. The output parameters also need to be consistent with the desired processing effect. For example, the vertical resolution would be set to account for the reduced resolution to process the interlaced input buffers.

39.3.30 LCDIF Handshake

The PXP and LCDIF support a mode where the internal SRAM can be used for the frame buffer to minimize external memory bandwidth required.

This is accomplished by creating two buffers in SRAM, a double buffer row of blocks, where each correspond to 8/16-lines of the frame buffer. The buffers must be consecutive and allocated as a single block of data.

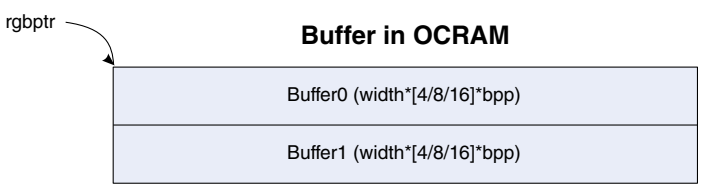

Figure 39-14. Buffer in OCRAM

The storage required can be calculated for an 8x8 block size as

- storage = 16 (lines) * rotated_row_length * pixel_size

and for 16x16 block size as

- storage = 32 (lines) * rotated_row_length * pixel_size

where pixel_size = 4 for 32bpp or 2 for 16bpp modes. The following table lists the storage requirements for common image sizes using 8x8 block size:

Image Size	Storage (16bpp)	Storage (24bpp)	Storage (32bpp)
320x240 (QVGA) - 0/180 rotation	10KB	15KB	20KB
320x240 (QVGA) - 90/270 rotation	7.5KB	11.5KB	15KB
640x480 (VGA) - 0/180 rotation	20KB	30KB	40KB
640x480 (VGA) - 90/270 rotation	15KB	22.5KB	30KB

The following diagram shows how the minimal rotation buffer would be organized. As the engine and LCD progress down the image, they continually swap roles of filling and emptying each eight-line buffer.

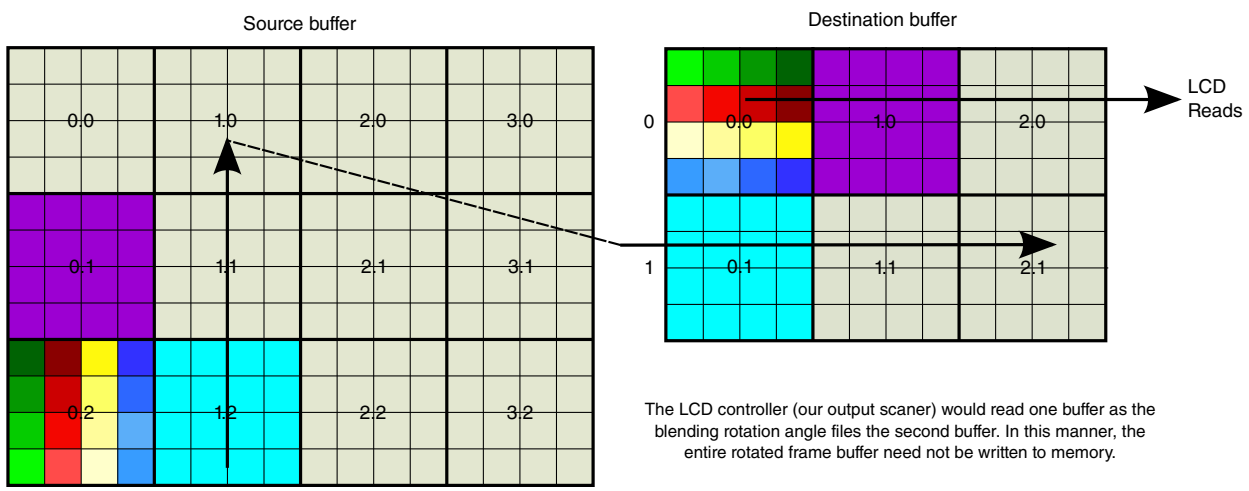

Figure 39-15. Minimal Rotation Buffer Organization

When this mode is enabled, the PXP will process one row of pixel blocks and write the results to the first SRAM buffer (buffer 0). The PXP will then alternate between writing subsequent rows to buffer 0 and buffer 1. After the PXP generates the data for one buffer, the LCDIF will begin reading that buffer and send the contents to the display device. Once the LCDIF finishes reading a buffer, it will start displaying from the other buffer while the PXP continues filling the previously processed buffer.

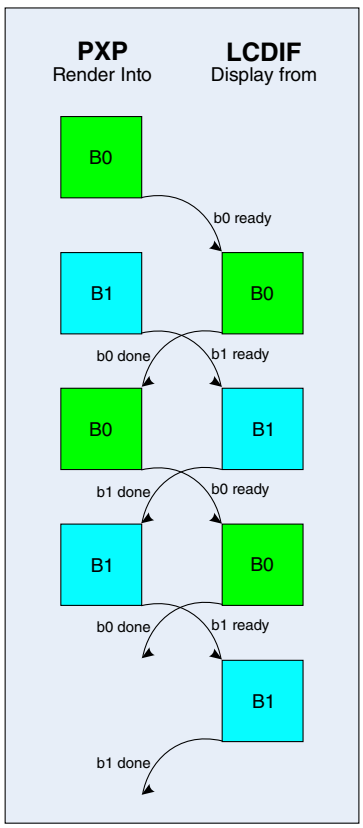

Figure 39-16. PXP and LCDIF Buffer Sharing

To accomplish the buffer sharing, the PXP and LCDIF will maintain buffer status using a pair of handshake signals. When a buffer is filled by the PXP, it will assert the pxp_lcdif_bx_ready (where x is 0 or 1) signal to indicate to the LCDIF that the buffer has valid data. The LCDIF will then release the buffer by asserting the lcdif_pxp_bx_done signal.

The basic protocol is shown in the diagram below:

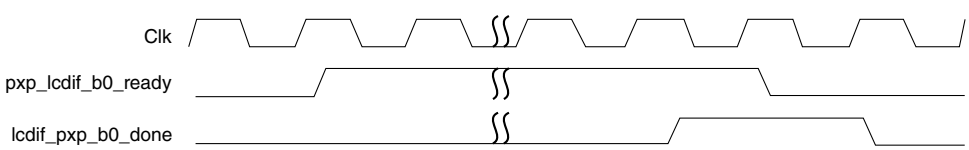

Figure 39-17. Buffer Sharing Protocol

The PXP will continue to assert the bx_ready signal until the corresponding bx_done signal is sampled high for one clock cycle. It will then deassert the bn_ready until the next time the buffer has been filled. After the PXP samples the bx_done signal asserted, it is free to begin filling the buffer with the next block size lines of display data. If a buffer has not been released when the PXP is ready to process data for that buffer, it will suspend rendering operations until the buffer has been released by the LCDIF.

39.3.31 LCDIF Abort

When the memory subsystem is not loaded, the PXP should be able to render the buffers faster than the LCDIF can drain the buffers.

It is possible under some scenarios (high LCDIF output rates with high memory latency) that the PXP may not be able to keep up with the LCDIF, even in the SRAM mode of operation. When this happens, the LCDIF will signal that it has completed one of the buffers before the other has been rendered by the PXP. This condition will be detected by the PXP's control logic as an "LCDIF Abort", which will cause the PXP to abort processing in the current row and proceed to the following row. It will acknowledge the abort to the LCDIF by raising the buffer_ready signal for the current buffer to enable the LCDIF to begin displaying the partially-filled buffer. While an abort will create artifacts in the video display, it does minimize the artifacts by limiting them to the remaining pixels blocks in the current row versus ruining the entire frame buffer.

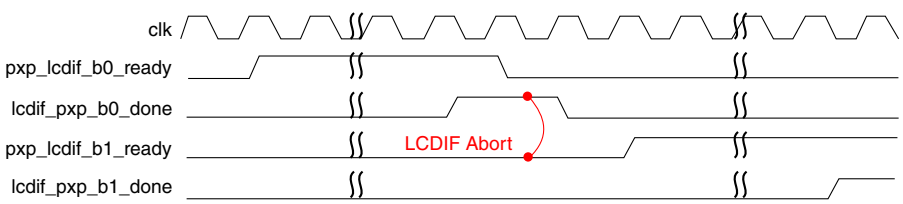

Figure 39-18. LCDIF Abort

39.3.32 Theory of Operation

The PXP can be used to accelerate graphics operations by offloading graphics processing from the processor. The block can perform alpha blending and color key substitution on two RGB graphics buffers.

The PXP is organized as having a processed surface (PS) and an alpha surface (AS) that can be blended with the processed surface. There are no restrictions on the location of the AS or PS within the output surface (OS). As the PXP processes NxN blocks, operations

are performed on a pixel by pixel basis. The AS and PS pixels are alpha blended, color keyed, process by CSC and LUT resources as individual pixel components. This allows efficient block processing with supporting arbitrary alignment for both the AS and PS surfaces. The resulting pixel block is then written to the corresponding block in the output buffer.

39.3.33 Pixel Handling

All pixels are internally represented as 24-bit values regardless of input or output pixel formats.

The pixels get converted in the AS and PS buffer engines to 24-bit pixel values.. There is also an 8-bit alpha value at stages up to the alpha blender within the PXP for blending within the RGB color space. Compositing of AS and PS images can only occur in the RGB color space. If composting is not required, then YUV pixels can be transferred and processed at all PXP pixel resource components.. The color orientation of pixels within the PXP can be controlled by the CSC1, CSC2, and LUT resources.

For RGB, input pixels are converted into 24-bit pixel values using the following rules:

1. 32-bit ARGB8888 pixels are read directly with no conversion for both the AS and PS.
2. 32-bit RGB888 pixels are assumed to have an alpha value of 0xFF (full opaque).
3. 6-bit RGB565 and RGB555 values are expanded into the corresponding 24-bit color space and assigned an alpha value of 0xFF (opaque). The expansion process replicates the upper pixel bits into the lower pixel bits (for instance a 16-bit RGB555 triplet of 0x1F/0x10/0x07 would be expanded to 0xFF/0x84/0x39).
4. 16-bit RGB1555 values are expanded into the corresponding 24-bit color space and assigned an alpha value of either 0x00 or 0xFF, based on the 1-bit alpha value in the pixel. The ALPHA_MULTIPLY function is useful in this scenario to allow scaling of the opaque pixels to a semi-transparent value.

Alpha values can be passed through the entire PXP data path and output in ARGB888 and ARGB555 pixel modes. Also, output pixels can be assigned an alpha value using the REG_OUT_CTRL[ALPHA] register. 16-bit pixels values are formed from the most significant bits of the 24-bit pixel values.

When YUV/YCbCr output formats are selected, all pixels are internally represented as either RGB or YUV pixels values. The CSC2 or LUT can convert internal RGB/YUV pixels into the correct output format. In this way, any PS color space can be blended with AS RGB pixels and output in any color space.

39.3.34 Output Buffer Composition

The output buffer will be rendered by composing each pixel block from the associated PS and AS buffers.

The AS pixel buffer can be blended or color-keyed with the associated data from the PS buffer (either the PS image pixels or REG_PS_BACKGROUND register based on PS programmed coordinates).

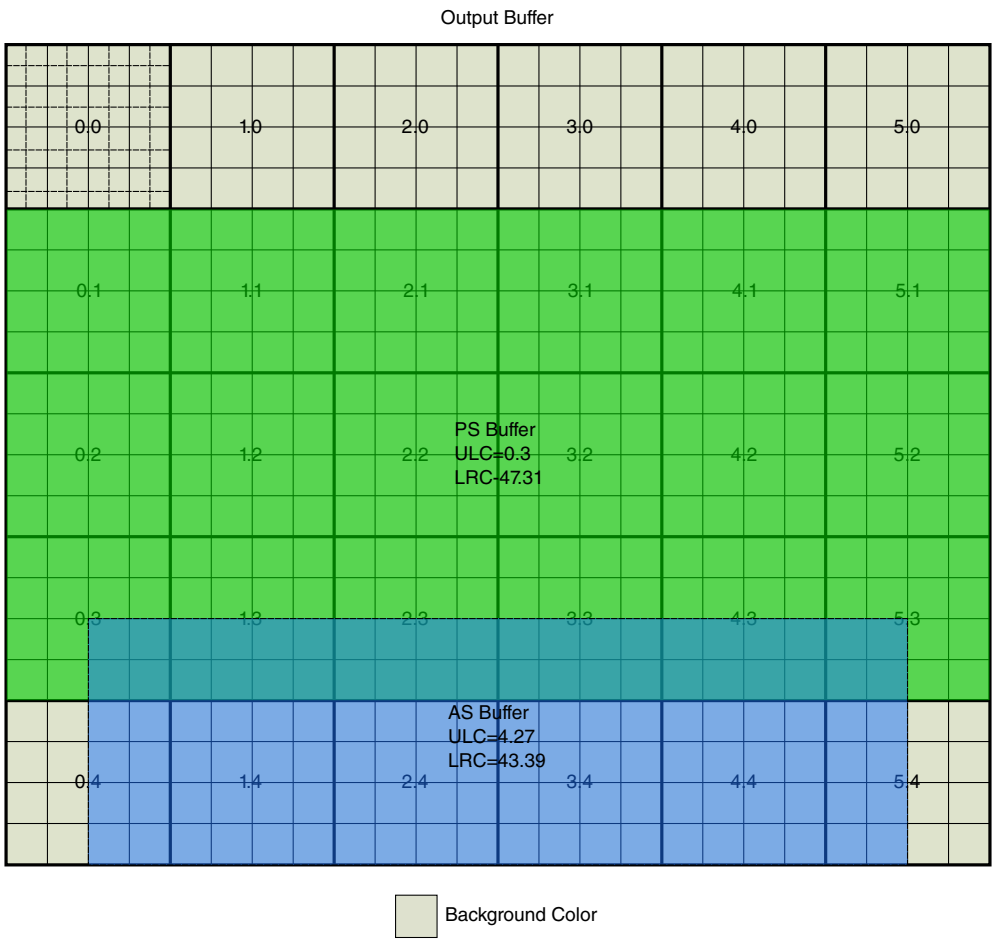

Figure 39-19. Output Buffer Composition

39.3.35 PS Image Processing

As the PXP processes image buffers, it iterates over the output buffer by fetching the corresponding input buffer blocks and processing the pixels embedded in these.

39.3.36 Letterboxing

At each pixel coordinate, the control logic determines if the PS pixel (argument also applies to AS pixels) will be used in rendering the output pixel.

This is determined by checking the output pixel's coordinates against the REG_OUT_PS_ULC and REG_OUT_PS_LRC (ULC and LRC in short) register contents. For pixels outside this region, the PS pixel will be loaded with the pixel value from REG_PS_BACKGROUND, which can be used to effectively control the letterboxing color. There are no block size or block boundary restrictions when setting the ULC or LRC for either the AS or PS. The only restriction is that the ULC and LRC are within the OUT LRC extents.

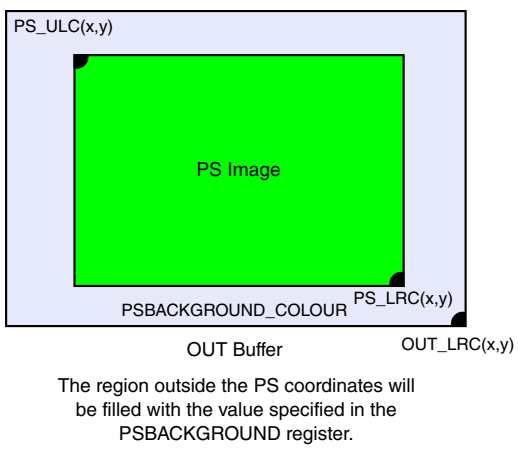

Figure 39-20. OUT Buffer

39.3.37 Clipping source images

A subset of the PS buffer can be used in rendering the output buffer. The PXP_PS_BUF register can indicate an offset into the PS buffer that will be used for display within the OUTPUT buffer.

The pixel at the address defined in the PXP_PS_BUF register will be the pixel that is displayed at the pixel coordinate indicated by PXP_OUT_PS_ULC within the output buffer. Essentially, the PXP_PS_BUF register can be used to establish an offset into the PS buffer thus clipping all PS buffer pixels that are at a lower address. The PXP_PS_PITCH will always indicate the number of bytes that are vertically adjacent in

the PS buffer. The settings in the PXP_PS_BUF, PXP_OUT_PS_ULC, and PXP_OUT_PS_LRC will determine the subset of the PS buffer, or clipped PS source buffer, that will be used in the output buffer.

It is important to note that when scaling the PS buffer, the coordinates of the PS buffer within the output buffer need to be consistent with the scaling factors and original PS buffer size.

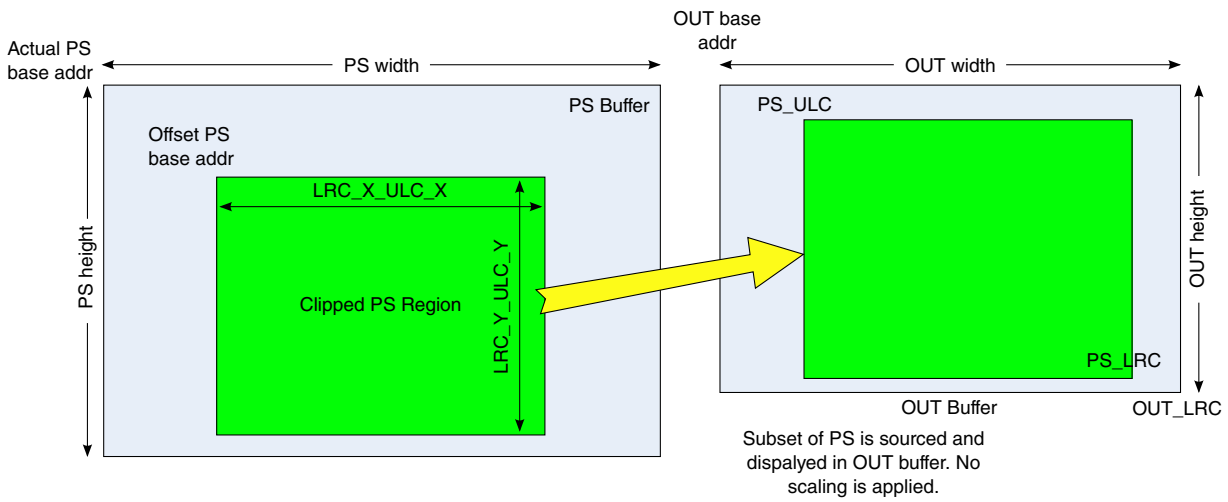

Figure 39-21. PS Buffer Scaling

When sourcing a subset of the PS image, it should fall completely within the PS buffer to avoid displaying incorrect data. The following conditions should be met:

x_base_addr_offset + x_scale * (LRC_X-ULC_X) <= PS_pitch

y_base_addr_offset + y_scale * (LRC_Y-ULC_Y) <= PS_size

The PXP hardware does not check for these conditions and will render the image as programmed. The following case could indicate invalid programming parameters for the PXP:

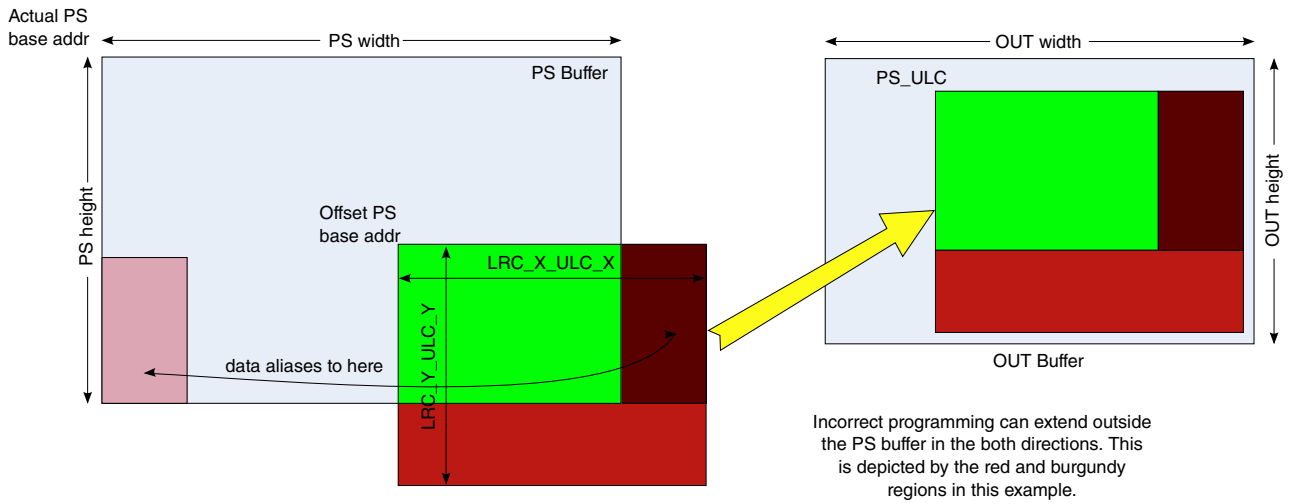

Figure 39-22. Example with Invalid Parameters

39.3.38 Color Key Processing

Pixels may be made transparent to the corresponding AS by using the PS color key registers.

If a PS pixel matches the range specified by the REG_PS_COLORKEYLOW and REG_PS_COLORKEYHIGH registers, the pixel from the associated AS will be displayed. If no AS is present for the pixel, a black pixel will be generated since the default AS pixel is 0x00000000 (transparent black pixel).

The most common use for this is when a bitmap does not support an alpha-field or for applications such as "green screen" where an image is substituted for a solid background color .

Figure 39-23. The PS image (player) and AS image (stadium)

The green portion of the background image can be color keyed to display the contents of the AS buffer for locations that match the color range. For this example, the color range is:

PS Colorkey: 00<R<80 70<G<ff 00<B<80

The resulting image becomes:

Figure 39-24. Resulting Image

39.3.39 In Place Processing (PS buffer is destination buffer)

The PXP also has the ability to process an image and write the resulting buffer back to the original PS buffer. This is referred to as "in place" rendering.

This could be useful for basic blit operations into the PS buffer. IN_PLACE operations are achieved by programming the OUT base address to the pixel location in the PS buffer that marks the upper left pixel of the update region. The actual region that is updated should be indicated by programming the ULC = (0,0) and the LRC = (X,Y). The region bounded by the coordinates will be updated, and the rest of the PS buffer will not be modified.

39.3.40 Alpha Surface (AS) Processing

The AS surface has a complete set of registers that determines how the AS effects the final OUT surface.

Most of the registers that exist for the PS surface also are defined for the AS surface where applicable. This is provided to replicate the SW interface for each PS and AS processes.

39.3.41 Alpha Handling

Alpha values in the AS are embedded in the source image pixels. For AS pixel formats that do not support an alpha value, the pixel is assigned an alpha value of 0xFF (opaque).

This can be modified by the AS control by setting either the ALPHA_MULTIPLY or ALPHA_OVERRIDE bit in the associated AS_CTRL register. If ALPHA_MULTIPLY is enabled, the 8-bit ALPHA value from the AS_CTRL register is multiplied by the source alpha before blending with the PS image. If the ALPHA_OVERRIDE bit is set, the 8-bit ALPHA value is simply substituted for the pixel.

39.3.42 Color Key Processing (AS_CTRL)

The AS_CTRL register also contains an ENABLE_COLORKEY bit that can be used to enable or disable color key substitution for the AS.

When enabled, the pixel values are compared to the ASCOLORKEYLOW and ASCOLORKEYHIGH registers to determine if a match has occurred. When an AS pixel matches the color key range, the pixel from the AS image is considered transparent and the corresponding PS pixel is rendered. If both the PS and AS pixels match their corresponding color key ranges, the AS pixel is displayed unmodified.

AS color keys are handled in a manner similar to PS color keys. The same images used in the PS color key example could be used with the images swapped. In this case, matches on the AS image to the ASCOLORKEY register would display the PS pixels.

39.4 Output Image Processing

Several PXP options affect the resulting output image.

39.4.1 Output Image Size

The PXP generates an output image in the resolution programmed by the REG_OUT_LRC. As the PXP processes pixels, it iterates over the NxN blocks (in output scan-block order) based on the final image resolution.

39.4.2 Output Format

The result of PXP operations are written to the buffer pointed to by the REG_OUT_BUF/ REG_OUT_BUF2 registers. The pixel format is controlled by the REG_OUT_CTRL[FORMAT] bit-field.

32-bit pixels are formed directly from the internal 24-bit representations and 16-bit pixel formats are generated by truncating the internal 24-bit values to the appropriate number of bits. For formats supporting an alpha value, the PXP assigns the alpha using the 8-bit value in the REG_OUT_CTRL[ALPHA] field. For ARGB1555, the most significant alpha bit is appended to the output pixel. Also, for ARGB4444, the most significant nibble is appended to the output pixel. Single and dual buffer YUV output formats are also available. Since each pixel in the data path is represented by a full YUV444 24bpp value, decimation reduces the output in cases of YUV422/420 output formats.

39.4.3 Rotation/Flip operations

The PXP supports four rotation angles in conjunction with vertical and horizontal flip options. The flip operations effectively take place before the rotation.

Rotations of 0, 90, 180, and 270 degrees are supported and any combination of rotation and flip are supported. There is no performance difference between any of these modes of operation.

39.5 Queuing PXP transactions

The PXP supports a primitive ability to queue up one operation while the current operation is running. This is enabled through the use of the REG_NEXT register.

When this register is written, it enables the PXP to reload its current register contents with the data found at the location pointed to by this address when it completes processing of the current frame. This feature may be useful in helping to reduce the interrupt latency in servicing the PXP, especially in cases where the PXP and LCDIF are using the on-chip SRAM buffer handshake (since the PXP must begin generating next frame data immediately).

If the PXP is idle when the REG_NEXT register is written, the PXP treats this as an indication that it should immediately load the values at the pointer and begin processing the frame. This ability should allow software to use the same routines when programming the PXP (so that the first frame doesn't differ from subsequent frames).

When loading values from the NEXT register, all registers in the PXP are reloaded. Some register loads have no effect

After writing the REG_NEXT register, the PXP will set the REG_NEXT[ENABLED] bit of the REG_NEXT register to indicate that the next command has been queued. Software should first check the status of this bit to ensure that a previous command has not been enabled. Likewise, after programming the first frame in a sequence of frames, software should poll this bit until it is sampled logic 1'b0 before queuing the next operation.

The PXP will issue interrupts from frames as they complete, regardless of whether they were started by writing the control registers directly or using the REG_NEXT register. When software receives an interrupt, it should check/clear the PXP's status register as normal, poll the REG_PXP[ENABLED] bit, and then issue the next operation. A queued operation may be cancelled by issuing a CLEAR operation to the REG_PXP[ENABLED] register bit. The SET and TOGGLE operations should never be used with this register.

39.6 Error Handling

The PXP does minimal checking on the control registers, so it is important that these are correctly specified. The PXP does monitor the bus transactions for errors and will report errors in the status register.

Upon receipt of a bus error, the PXP will set the ERROR interrupt and abort any further operations. Bus errors can be generated from any system access that results in an error response returned from the internal SIM Bus errors in the PXP are signaled as either a read or a write error, but do not indicate the failing address. Software may deduce the failing address from the current block status indicators.

39.6.1 Known PXP Limitations/Issues

The PXP has the following known limitations:

1. When using the NEXT register, the interrupt enable setting should remain the same for all frames. If not, the PXP will change the interrupt enable register value and possible cause the loss of an interrupt.
2. Rotations of 180/270 are not supported when performing LCD handshakes

39.7 PXP Memory Map/Register Definition

PXP Hardware Register Format Summary

PXP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21C_C000	Control Register 0 (PXP_CTRL)	32	R/W	C000_0000h	39.7.1/2352

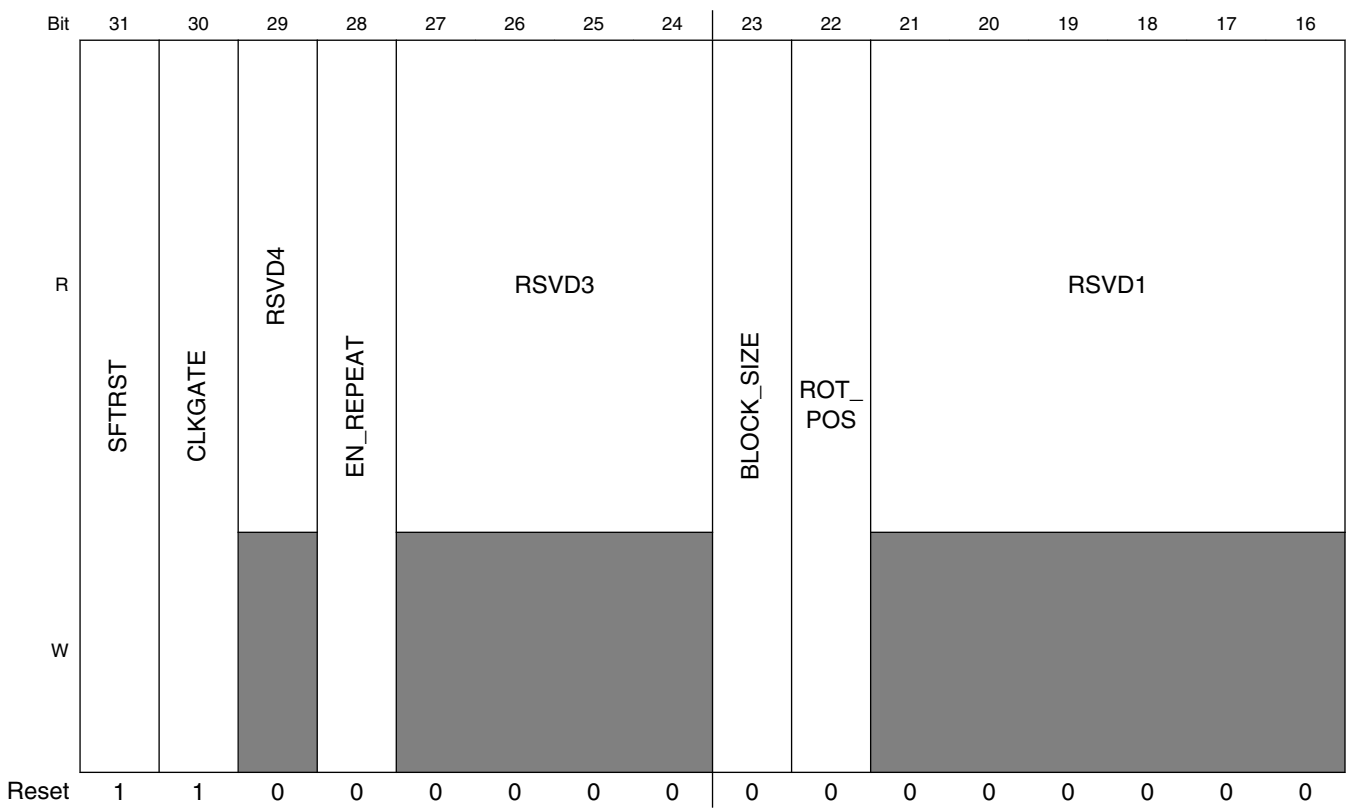
39.7.1 Control Register 0 (PXP_CTRL)

The CTRL register contains controls for the PXP module.

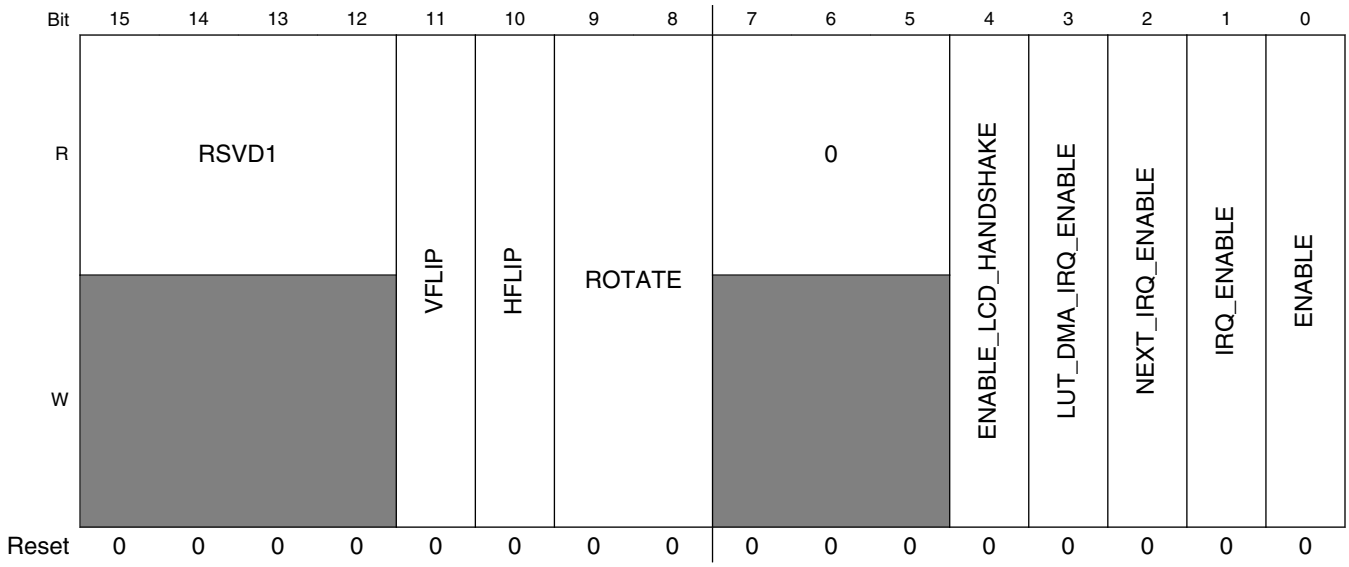
PXP_CTRL: 0x000

PXP_CTRL_SET: 0x004

PXP_CTRL_CLR: 0x008



PXP_CTRL_TOG: 0x00C



The Control register contains the primary controls for the PXP block. The present bits indicate which of the sub-features of the block are present in the hardware.

EXAMPLE

```
PXP_CTRL_SET(BM_PXP_CTRL_SFTRST);
PXP_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 21C_C000h base + 0h offset = 21C_C000h

PXP_CTRL field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal PXP operation. Set this bit to one (default) to disable clocking with the PXP and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the PXP block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 RSVD4	Reserved, always set to zero.
28 EN_REPEAT	Enable the PXP to run continuously. When this bit is set, the PXP will repeat based on the current configuration register settings. If this bit is not set, the PXP will complete the process and enter the idle state ready to accept the next frame to be processed. This bit should be set when the LCDIF handshake mode is enabled so that the next frame is automatically generated for the next screen refresh cycle. If it not set and the handshake mode is enabled, the CPU will have to initiate the PXP for the next refresh cycle. When the PXP NEXT feature is used, it has priority over the REPEAT mode, in that the new register settings are fetched first, and then the next PXP operation will continue.
27–24 RSVD3	Reserved, always set to zero.
23 BLOCK_SIZE	Select the block size to process. 0x0 **8X8** — Process 8x8 pixel blocks. 0x1 **16X16** — Process 16x16 pixel blocks.
22 ROT_POS	This bit controls where rotation will occur in the PXP datapath. Setting this bit to 1'b0 will place the rotation resources at the output stage of the PXP data path. Image compositing will occur before pixels are processed for rotation. Setting this bit to a 1'b1 will place the rotation resources before image composition. Only the PS can be rotated in this configuration and AS will not be rotated.
21–12 RSVD1	Reserved, always set to zero.
11 VFLIP	Indicates that the output buffer should be flipped vertically (effect applied before rotation).
10 HFLIP	Indicates that the output buffer should be flipped horizontally (effect applied before rotation).

Table continues on the next page...

PXP_CTRL field descriptions (continued)

Field	Description
9–8 ROTATE	Indicates the clockwise rotation to be applied at the output buffer. The rotation effect is defined as occurring after the FLIP_X and FLIP_Y permutation. 0x0 **ROT_0** — 0x1 **ROT_90** — 0x2 **ROT_180** — 0x3 **ROT_270** —
7–5 Reserved	This read-only field is reserved and always has the value 0.
4 ENABLE_LCD_ HANDSHAKE	Enable handshake with LCD controller. When this is set, the PXP will not process an entire framebuffer, but will instead process rows of NxN blocks in a double-buffer handshake with the LCDIF. This enables the use of the onboard SRAM for a partial frame buffer.
3 LUT_DMA_IRQ_ ENABLE	LUT DMA interrupt enable. When set, the PXP will issue an interrupt when the LUT DMA has finished transferring data.
2 NEXT_IRQ_ ENABLE	Next command interrupt enable. When set, the PXP will issue an interrupt when a queued command initiated by a write to the PXP_NEXT register has been loaded into the PXP's registers. This interrupt also indicates that a new command may now be queued.
1 IRQ_ENABLE	Interrupt enable. NOTE: When using the PXP_NEXT functionality to reprogram the PXP, the new value of this bit will be used and may therefore enable or disable an interrupt unintentionally.
0 ENABLE	Enables PXP operation with specified parameters. The ENABLE bit will remain set while the PXP is active and will be cleared once the current operation completes. Software should use the IRQ bit in the PXP_STAT when polling for PXP completion.

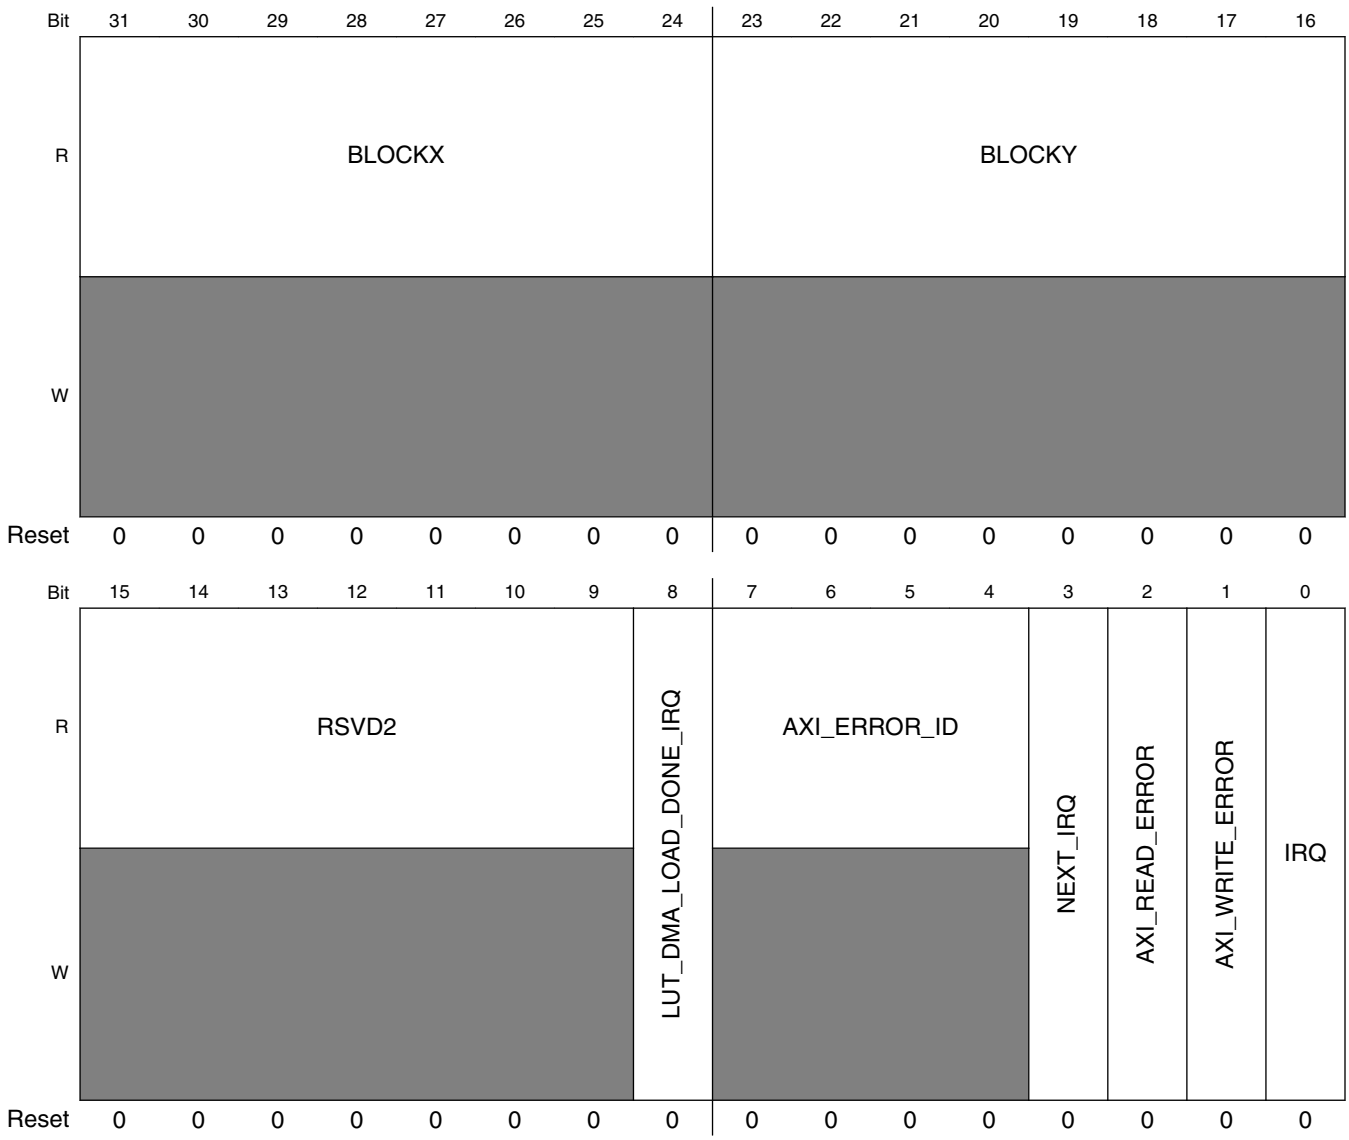
39.7.2 Status Register (PXP_STAT)

The PXP Interrupt Status register provides interrupt status information.

PXP_STAT: 0x010

PXP_STAT_SET: 0x014

PXP_STAT_CLR: 0x018



PXP_STAT_TOG: 0x01C

This register provides PXP interrupt status and the current X/Y block coordinate that is being processed.

EXAMPLE

```
PXP_STAT_CLR(BM_PXP_STAT_IRQ);  // clear CSC interrupt
```

Address: 21C_C000h base + 10h offset = 21C_C010h

PXP_STAT field descriptions

Field	Description
31–24 BLOCKX	Indicates the X coordinate of the block currently being rendered.
23–16 BLOCKY	Indicates the X coordinate of the block currently being rendered.
15–9 RSVD2	Reserved, always set to zero.
8 LUT_DMA_ LOAD_DONE_ IRQ	Indicates that the LUT DMA transfer has completed.
7–4 AXI_ERROR_ID	Indicates the AXI ID of the failing bus operation.

Table continues on the next page...

PXP_STAT field descriptions (continued)

Field	Description
3 NEXT_IRQ	Indicates that a command issued with the "Next Command" functionality has been issued and that a new command may be initiated with a write to the PXP_NEXT register.
2 AXI_READ_ ERROR	Indicates PXP encountered an AXI read error and processing has been terminated.
1 AXI_WRITE_ ERROR	Indicates PXP encountered an AXI write error and processing has been terminated.
0 IRQ	Indicates current PXP interrupt status. The IRQ is routed through the pxp_irq when the IRQ_ENABLE bit in the control register is set.

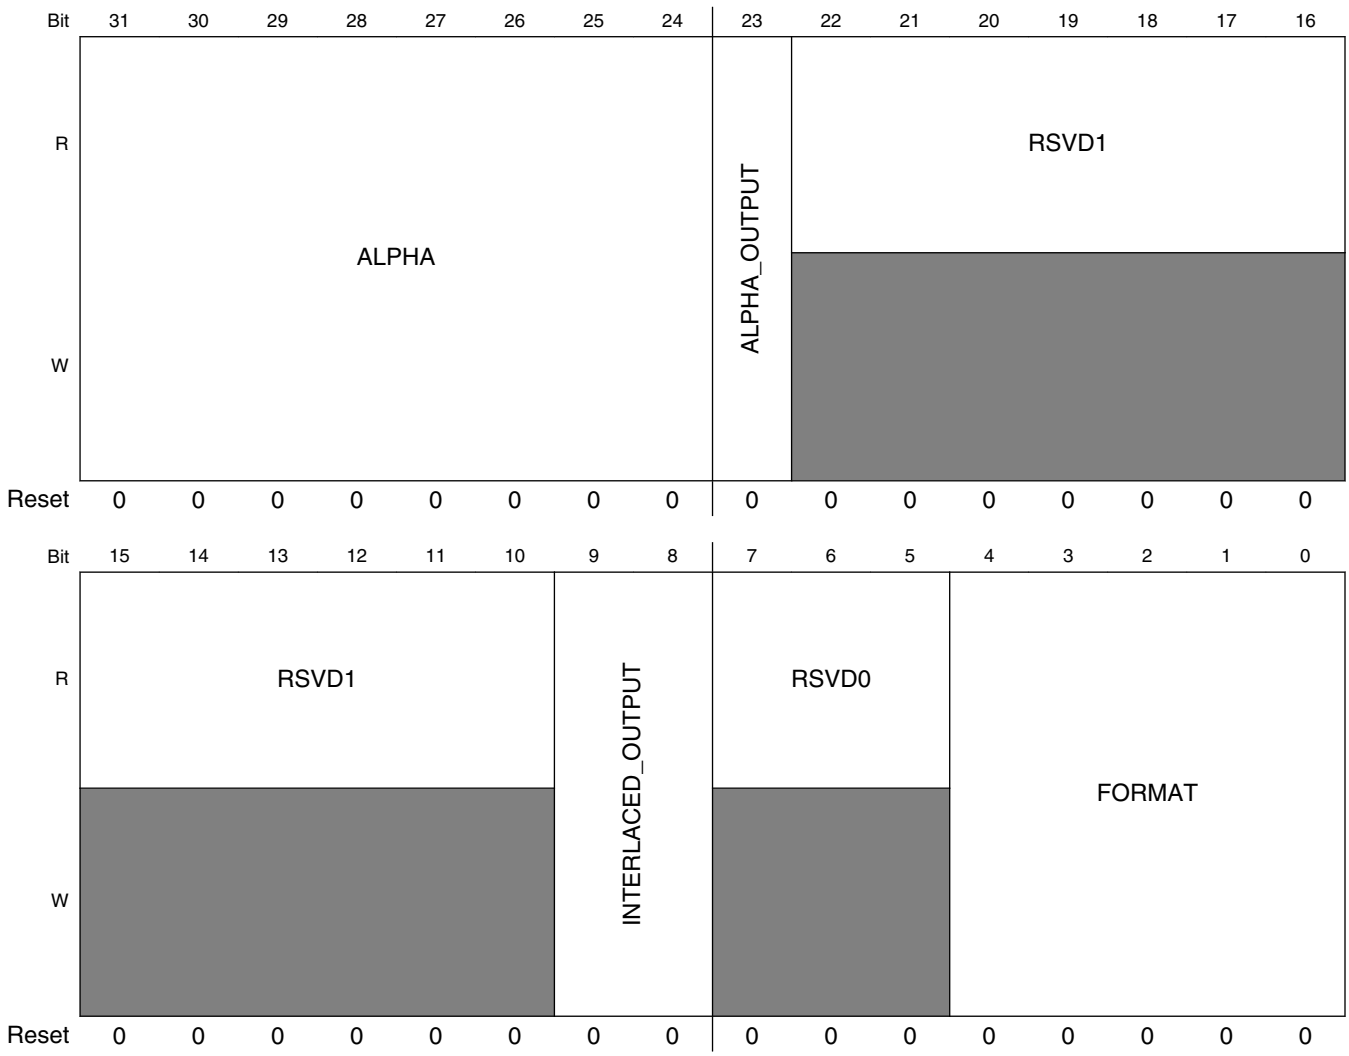
39.7.3 Output Buffer Control Register (PXP_OUT_CTRL)

The OUT_CTRL register contains controls for the Output Buffer.

PXP_OUT_CTRL: 0x020

PXP_OUT_CTRL_SET: 0x024

PXP_OUT_CTRL_CLR: 0x028



PXP_OUT_CTRL_TOG: 0x02C

The Control register contains the primary controls for the PXP block. The present bits indicate which of the sub-features of the block are present in the hardware.

EXAMPLE

```
PXP_CTRL_SET(BM_PXP_CTRL_SFTRST);
PXP_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 21C_C000h base + 20h offset = 21C_C020h

PXP_OUT_CTRL field descriptions

Field	Description
31–24 ALPHA	When generating an output buffer with an alpha component, the value in this field will be used when enabled to override the alpha passed through the pixel data pipeline.
23 ALPHA_ OUTPUT	Indicates that alpha component in output buffer pixels should be overwritten by PXP_OUT_CTRL[ALPHA]. If 0, retain their alpha value from the computed alpha for that pixel.
22–10 RSVD1	Reserved, always set to zero.
9–8 INTERLACED_ OUTPUT	Determines how the PXP writes it's output data. Output interlacing should not be used in conjunction with input interlacing. Splitting frames into fields is most efficient using output interlacing. 2-plane output formats AND interlaced output is NOT supported. 0x0 **PROGRESSIVE** — All data written in progressive format to the OUTBUF Pointer. 0x1 **FIELD0** — Interlaced output: only data for field 0 is written to the OUTBUF Pointer.

Table continues on the next page...

PXP_OUT_CTRL field descriptions (continued)

Field	Description
	0x2 **FIELD1** — Interlaced output: only data for field 1 is written to the OUTBUF2 Pointer. 0x3 **INTERLACED** — Interlaced output: data for field 0 is written to OUTBUF and data for field 1 is written to OUTBUF2.
7–5 RSVD0	Reserved, always set to zero.
FORMAT	Output framebuffer format. The UV byte lanes are synonymous with CbCr byte lanes for YUV output pixel formats. For example, the YUV2P420 format should be selected when the output is YCbCr 2-plane 420 output format. 0x0 **ARGB8888** — 32-bit pixels 0x4 **RGB888** — 32-bit pixels (unpacked 24-bit pixel in 32 bit DWORD.) 0x5 **RGB888P** — 24-bit pixels (packed 24-bit format) 0x8 **ARGB1555** — 16-bit pixels 0x9 **ARGB4444** — 16-bit pixels 0xC **RGB555** — 16-bit pixels 0xD **RGB444** — 16-bit pixels 0xE **RGB565** — 16-bit pixels 0x10 **YUV1P444** — 32-bit pixels (1-plane XYUV unpacked) 0x12 **UYVY1P422** — 16-bit pixels (1-plane U0,Y0,V0,Y1 interleaved bytes) 0x13 **VYUY1P422** — 16-bit pixels (1-plane V0,Y0,U0,Y1 interleaved bytes) 0x14 **Y8** — 8-bit monochrome pixels (1-plane Y luma output) 0x15 **Y4** — 4-bit monochrome pixels (1-plane Y luma, 4 bit truncation) 0x18 **YUV2P422** — 16-bit pixels (2-plane UV interleaved bytes) 0x19 **YUV2P420** — 16-bit pixels (2-plane UV) 0x1A **YVU2P422** — 16-bit pixels (2-plane VU interleaved bytes) 0x1B **YVU2P420** — 16-bit pixels (2-plane VU)

39.7.4 Output Frame Buffer Pointer (PXP_OUT_BUF)

Output Framebuffer Pointer. This register points to the beginning of the output frame buffer. This pointer is used for progressive format and field 0 when generating interlaced output.

This register is used by the logic to point to the current output location for the output frame buffer.

EXAMPLE

```
PXP_OUT_BUF_WR( buffer );
```

Address: 21C_C000h base + 30h offset = 21C_C030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_OUT_BUF field descriptions

Field	Description
ADDR	Current address pointer for the output frame buffer. The address can have any byte alignment. 64B alignment is recommended for optimal performance.

39.7.5 Output Frame Buffer Pointer #2 (PXP_OUT_BUF2)

Output Framebuffer Pointer #2. This register points to the beginning of the output frame buffer for either field 1 when generating interlaced output or for the UV buffer when in YUV 2-plane output modes. Both interlaced output AND 2-plane output modes are not supported in a single PXP operation. This register is not used as the pointer to the second buffer when in LCDIF_HANDSHAKE mode.

This register is used by the logic to point to the current output location for the field 1 or UV output frame buffer.

EXAMPLE

```
PXP_OUT_BUF_WR( field0 );  // buffer for interlaced field 0
PXP_OUT_BUF2_WR( field1 ); // buffer for interlaced field 1
```

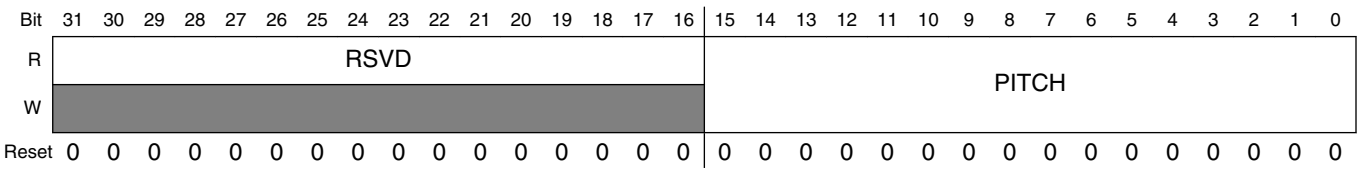
Address: 21C_C000h base + 40h offset = 21C_C040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_OUT_BUF2 field descriptions

Field	Description
ADDR	Current address pointer for the output frame buffer. The address can have any byte alignment. 64B alignment is recommended for optimal performance.

39.7.6 Output Buffer Pitch (PXP_OUT_PITCH)



This register contains the output buffer pitch in bytes.

Any byte value will indicate the vertical pitch. This value will be used in output pixel address calculations.

EXAMPLE

```
PXP_OUT_PITCH_WR( 68 * 4 );  // The output buffer pitch is 68 pixels times 32 bits per pixel
```

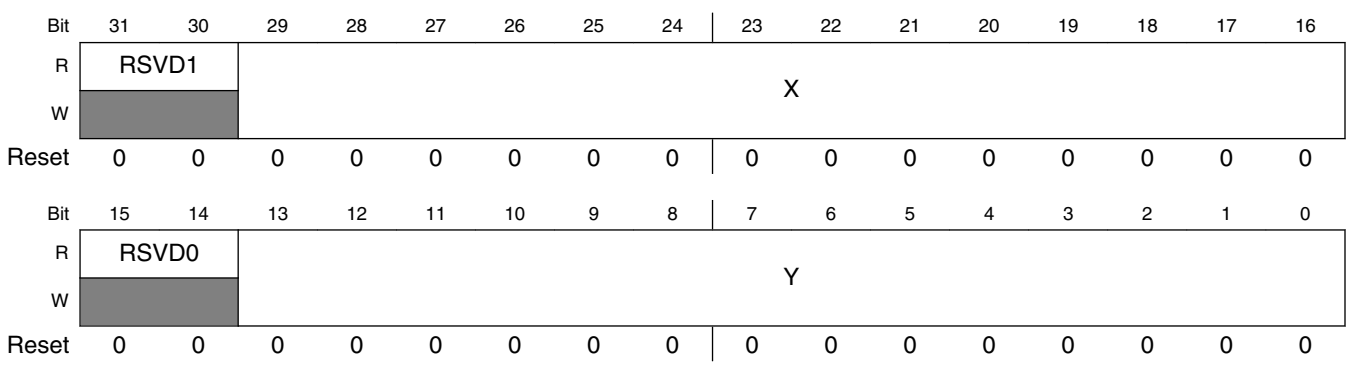
Address: 21C_C000h base + 50h offset = 21C_C050h

PXP_OUT_PITCH field descriptions

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

39.7.7 Output Surface Lower Right Coordinate (PXP_OUT_LRC)

This register contains the size, or lower right coordinate, of the output buffer NOT rotated. It is implied that the upper left coordinate of the output surface is always [0,0]. When rotating the framebuffer, the PXP will automatically swap the X/Y, or WIDTH/HEIGHT, to accomodate the rotated size.



This register sets the size of the output frame buffer in pixels, not blocks. The frame buffer need not be a multiple of NxN pixels. Partial blocks will be written for output frame buffer sizes that are not divisable by N pixels in either dimension.

EXAMPLE

```
PXP_OUT_LRC[X]=319;   // set width of output frame buffer to 320 pixels
PXP_OUT_LRC[Y]=243;  // set height of output frame buffer to 244 pixels which is not
divisible by block size N

PXP_OUT_LRC_WR( BF_PXP_OUT_LRC_X(319)  |  BF_PXP_OUT_LRC_Y(243) );
```

Address: 21C_C000h base + 60h offset = 21C_C060h

PXP_OUT_LRC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	Indicates number of horizontal PIXELS in the output surface (non-rotated). The output buffer pixel width minus 1 should be programmed. The image size is not required to be a multiple of 8 pixels. The PXP will clip the pixel output at this boundary.
15–14 RSVD0	Reserved, always set to zero.
Y	Indicates the number of vertical PIXELS in the output surface (non-rotated). The output buffer pixel height minus 1 should be programmed. The image size is not required to be a multiple of 8 pixels. The PXP will clip the pixel output at this boundary.

39.7.8 Processed Surface Upper Left Coordinate (PXP_OUT_PS_ULC)

This register contains the upper left pixel coordinate for the Processed Surface in the OUTPUT buffer.

This register contains the upper left coordinate of the Processed Surface in the output frame buffer (in pixels). Values that are within the PXP_OUT_LRC X,Y extents are valid. The lowest valid value for these fields is 0,0. If the value of the PXP_OUT_PS_ULC is greater than the PXP_OUT_LRC, then no PS pixels will be fetched from memory, but only PXP_PS_BACKGROUND pixels will be processed by the PS engine. Pixel locations that are greater than or equal to the PS upper left coordinates, less than or equal to the PS lower right coordinates, and within the PXP_OUT_LRC extents will use the PS to render pixels into the output buffer.

EXAMPLE

```
PXP_OUT_PS_ULC_WR(0,0x0002_0002); // Processed Surface upper left coordinate at (X,Y) =
2,2.  The PS surface will not effect pixels in the first and second row and column of the
output buffer.
```

Address: 21C_C000h base + 70h offset = 21C_C070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_OUT_PS_ULC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the upper left X-coordinate (in pixels) of the processed surface (PS) in the output buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the upper left Y-coordinate (in pixels) of the processed surface in the output buffer.

39.7.9 Processed Surface Lower Right Coordinate (PXP_OUT_PS_LRC)

This register contains the lower right extent for the Processed Surface in the OUTPUT buffer.

This register contains the lower right coordinate of the Processed Surface in the output frame buffer (in pixels). Values that are within the PXP_OUT_LRC X,Y extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are greater than or equal to the PS upper left coordinates, less than or equal to the PS lower right coordinates, and within the PXP_OUT_LRC extents will use the PS to render pixels into the output buffer.

EXAMPLE

```
PXP_OUT_PS_ULC_WR(0,0x03FF_03FF); // With this UL/LR pair of pixel coordinates, only one
pixel at OUT[X,Y]=1023,1023 will use the PS to contribute to its value.
PXP_OUT_PS_LRC_WR(0,0x03FF_03FF);
```

Address: 21C_C000h base + 80h offset = 21C_C080h

PXP_OUT_PS_LRC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the lower right X-coordinate (in pixels) of the processed surface (PS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the lower right Y-coordinate (in pixels) of the processed surface in the output frame buffer.

39.7.10 Alpha Surface Upper Left Coordinate (PXP_OUT_AS_ULC)

This register contains the upper left location for the Alpha Surface in the output buffer.

This register contains the upper left coordinate of AS in the output frame buffer (in pixels). Values that are within the PXP_OUT_LRC X,Y extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are greater than or equal to the upper left coordinates will use the AS to render pixels in the output buffer.

EXAMPLE

```
PXP_OUT_AS_ULC_WR(0,0x0001_0001); // Alpha Surface upper left coordinate at (X,Y) = 1,1.
The AS surface will not effect pixels in the first row or first column of the output buffer.
```

Address: 21C_C000h base + 90h offset = 21C_C090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

PXP_OUT_AS_ULC field descriptions

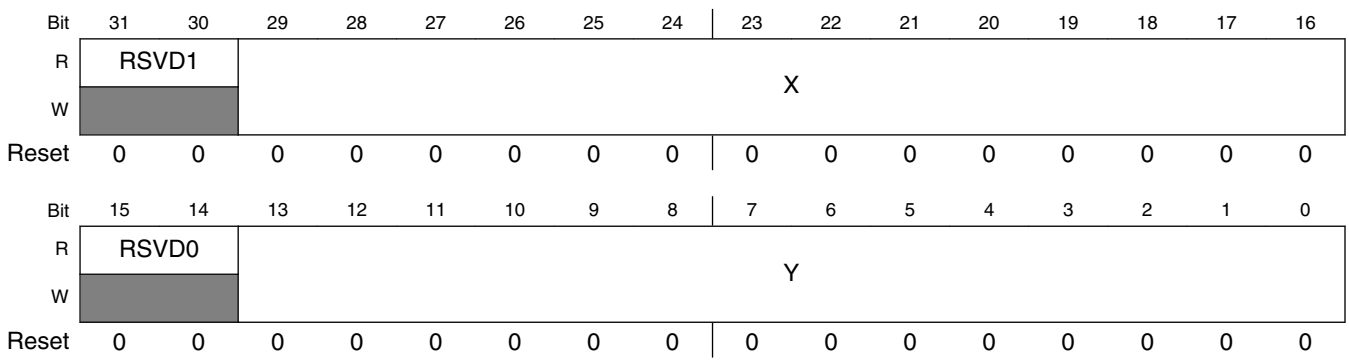
Field	Description
31–30 RSVD1	Reserved, always set to zero.

Table continues on the next page...

PXP_OUT_AS_ULC field descriptions (continued)

Field	Description
29–16 X	This field indicates the upper left X-coordinate (in pixels) of the alpha surface (AS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the upper left Y-coordinate (in pixels) of the alpha surface in the output frame buffer.

39.7.11 Alpha Surface Lower Right Coordinate (PXP_OUT_AS_LRC)



This register contains the lower right extent for Alpha Surface in the output buffer.

This register contains the lower right coordinate of AS in the output frame buffer (in pixels). Values that are within the PXP_OUT_LRC X,Y extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are less than or equal to the lower right coordinates will use the AS to render pixels in the output buffer.

EXAMPLE

```
PXP_AS_LRC_WR(0,0x03FF_03FF); // Alpha Surface lower right coordinate at (X,Y) = 1023,1023.
```

Address: 21C_C000h base + A0h offset = 21C_C0A0h

PXP_OUT_AS_LRC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the lower right X-coordinate (in pixels) of the alpha surface (AS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the lower right Y-coordinate (in pixels) of the alpha surface in the output frame buffer.

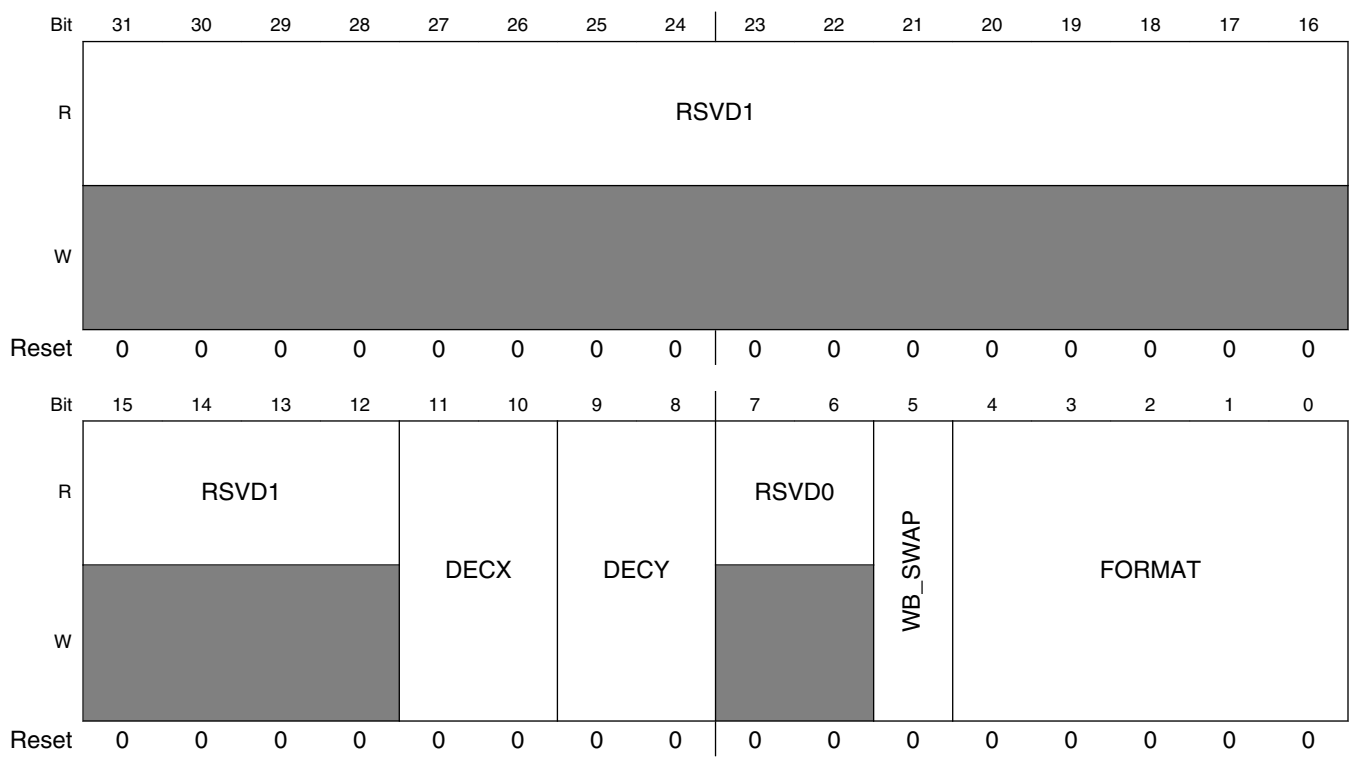
39.7.12 Processed Surface (PS) Control Register (PXP_PS_CTRL)

The PS_CTRL register contains controls for the Processed Surface Buffer.

PXP_PS_CTRL: 0x0B0

PXP_PS_CTRL_SET: 0x0b4

PXP_PS_CTRL_CLR: 0x0B8



PXP_PS_CTRL_TOG: 0x0BC

The Control register contains the primary controls for the PXP block. The present bits indicate which of the sub-features of the block are present in the hardware.

EXAMPLE

```
PXP_CTRL_SET(BM_PXP_CTRL_SFTRST);
PXP_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 21C_C000h base + B0h offset = 21C_C0B0h

PXP_PS_CTRL field descriptions

Field	Description
31–12 RSVD1	Reserved, always set to zero.
11–10 DECX	Horizontal pre decimation filter control. 0x0 **DISABLE** — Disable pre-decimation filter. 0x1 **DECX2** — Decimate PS by 2. 0x2 **DECX4** — Decimate PS by 4. 0x3 **DECX8** — Decimate PS by 8.
9–8 DECY	Verticle pre decimation filter control. 0x0 **DISABLE** — Disable pre-decimation filter. 0x1 **DECY2** — Decimate PS by 2. 0x2 **DECY4** — Decimate PS by 4. 0x3 **DECY8** — Decimate PS by 8.
7–6 RSVD0	Reserved, always set to zero.
5 WB_SWAP	Swap bytes in words. For each 16 bit word, the two bytes will be swapped.
FORMAT	PS buffer format. To select between YUV and YCbCr formats, see bit 31 of the CSC1_COEF0 register. 0x4 **RGB888** — 32-bit pixels (unpacked 24-bit format) 0xC **RGB555** — 16-bit pixels 0xD **RGB444** — 16-bit pixels 0xE **RGB565** — 16-bit pixels 0x10 **YUV1P444** — 32-bit pixels (1-plane XYUV unpacked) 0x12 **UYVY1P422** — 16-bit pixels (1-plane U0,Y0,V0,Y1 interleaved bytes) 0x13 **VYUY1P422** — 16-bit pixels (1-plane V0,Y0,U0,Y1 interleaved bytes) 0x14 **Y8** — 8-bit monochrome pixels (1-plane Y luma output) 0x15 **Y4** — 4-bit monochrome pixels (1-plane Y luma, 4 bit truncation) 0x18 **YUV2P422** — 16-bit pixels (2-plane UV interleaved bytes) 0x19 **YUV2P420** — 16-bit pixels (2-plane UV) 0x1A **YVU2P422** — 16-bit pixels (2-plane VU interleaved bytes) 0x1B **YVU2P420** — 16-bit pixels (2-plane VU) 0x1E **YUV422** — 16-bit pixels (3-plane format) 0x1F **YUV420** — 16-bit pixels (3-plane format)

39.7.13 PS Input Buffer Address (PXP_PS_BUF)

PS Input Buffer Address. This should be programmed to the starting address of the RGB data or Y (luma) data for the PS plane.

This register contains the pointer to the Luma/RGB buffer. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

EXAMPLE

```
PXP_PS_BUF_WR(image_rgb); // RGB image
PXP_PS_BUF_WR(image_y);   // Y (luma) image data
PXP_PS_UBUF_WR(image_u);  // U (Cb) image data
PXP_PS_VBUF_WR(image_v);  // V (Cr) image data
```

Address: 21C_C000h base + C0h offset = 21C_C0C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_PS_BUF field descriptions

Field	Description
ADDR	Address pointer for the PS RGB or Y (luma) input buffer.

39.7.14 PS U/Cb or 2 Plane UV Input Buffer Address (PXP_PS_UBUF)

PS Chroma (U/Cb/UV) Input Buffer Address. This register points to the beginning of the PS U/Cb input buffer. In two plane operation, this register points to the beginning of the PS UV chroma input buffer.

This register contains the pointer to the Chroma U/Cb or 2 plane UV buffer. This register is unused when processing 1-plane buffer formats. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

EXAMPLE

```
PXP_PS_BUF_WR(image_y);   // Y (luma) image data
PXP_PS_UBUF_WR(image_u);  // U (Cb) image data
PXP_PS_VBUF_WR(image_v);  // V (Cr) image data
```

Address: 21C_C000h base + D0h offset = 21C_C0D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_PS_UBUF field descriptions

Field	Description
ADDR	Address pointer for the PS U/Cb or 2 plane UV Chroma input buffer.

39.7.15 PS V/Cr Input Buffer Address (PXP_PS_VBUF)

PS Chroma (V/Cr) Input Buffer Address. This register points to the beginning of the PS V/Cr input buffer. In one or two plane operation, this register is not used. In monochrome modes Y8 and Y4, the low 16 bits are used as the U/V data in the datapath instead of sourcing U/V data from external buffers. In this case, it represents a fixed value for U/V data.

This register contains the pointer to the Chroma V/Cr buffer. For Y8/Y4 modes, the low 16 bits are used as the monochrome U and V values in the data path. Bits [15:8] represent the U data byte, and bits]7:0] represent the V data byte. Other than with Y8/Y4 input buffer formats, this register is unused when processing 1 or 2-plane buffer formats. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

EXAMPLE

```
PXP_PS_BUF_WR(image_y);   // Y (luma) image data
PXP_PS_UBUF_WR(image_u);  // U (Cb) image data
PXP_PS_VBUF_WR(image_v);  // V (Cr) image data
```

Address: 21C_C000h base + E0h offset = 21C_C0E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

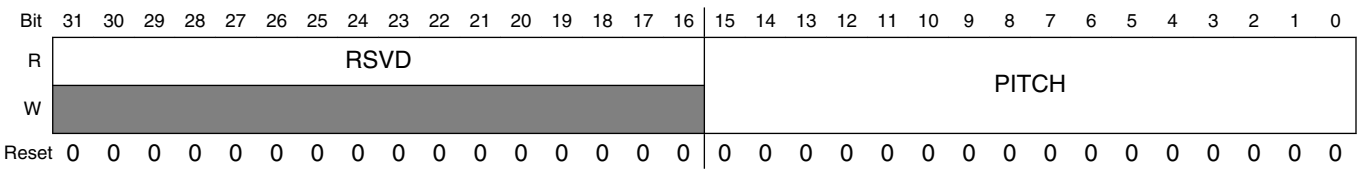
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_PS_VBUF field descriptions

Field	Description
ADDR	Address pointer for the PS V/Cr Chroma input buffer.

39.7.16 Processed Surface Pitch (PXP_PS_PITCH)

This register contains the processed surface pitch in bytes.



Any byte value will indicate the vertical pitch of the PS source frame buffer. This value will be used in PS pixel address calculations. This value has no relation to the UL and LR registers. It specifies how many bytes are between two vertically adjacent pixels in the input PS surface. For multi-plane formats, the Y buffer pitch should be programmed. For 2-plane YUV422, the UV pitch is the same as the Y pitch. For 3-plane YUV422, the U

and V pitch is 1/2 the Y pitch. For 2-plane YUV420, the UV pitch is 1/2 the Y pitch. For 3-plane YUV420, the U and V pitch is 1/4 the Y pitch. All source buffers should comply with these U and V resolution reductions with respect to their Y source buffers.

EXAMPLE

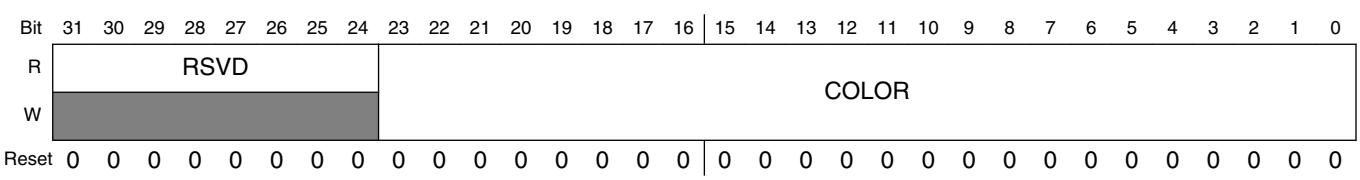
```
PXP_PS_PITCH_WR( 64 * 4 );  // The output buffer pitch is 64 pixels times 32 bits per pixel
```

Address: 21C_C000h base + F0h offset = 21C_C0F0h

PXP_PS_PITCH field descriptions

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

39.7.17 PS Background Color (PXP_PS_BACKGROUND)



PS Background Pixel Color. This register provides a pixel value used when processing pixels outside of the region specified by the PS Coordinate registers. This value can effectively be used to set the color of the letterboxing region around the PS image.

This register contains a pixel value to be used for any PS pixels that fall outside the PS extents. This is effectively a background or letterbox color. The CSC1 control and datapath pixel format should be considered when selecting the background color.

EXAMPLE

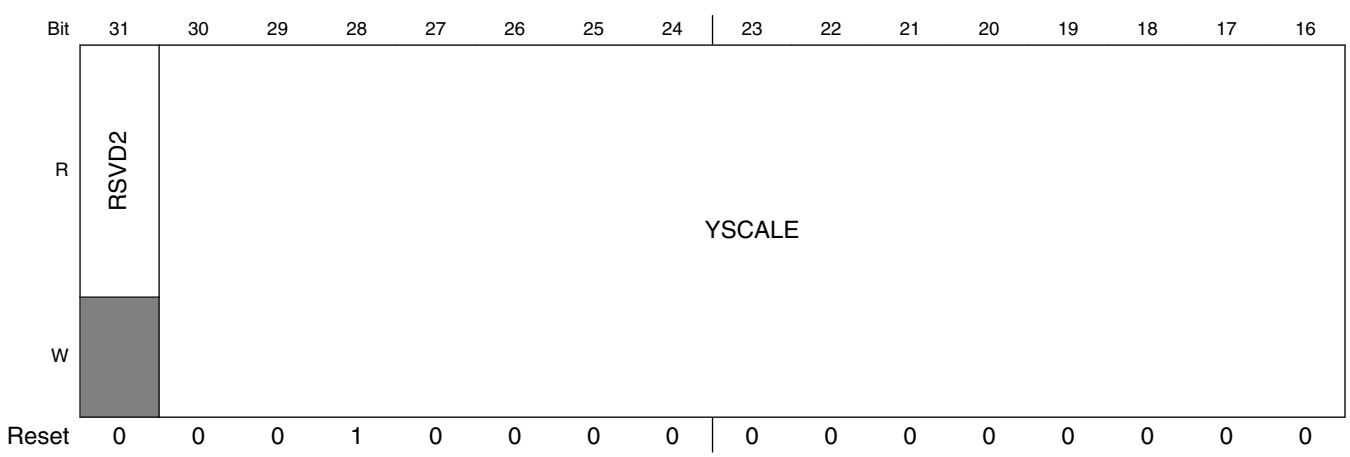
```
PXP_PS_BACKGROUND_WR(0x00000000);  // letterbox is black
PXP_PS_BACKGROUND_WR(0x00800000);  // letterbox is dark red
PXP_PS_BACKGROUND_WR(0x00008000);  // letterbox is dark green
PXP_PS_BACKGROUND_WR(0x00000080);  // letterbox is dark blue
```

Address: 21C_C000h base + 100h offset = 21C_C100h

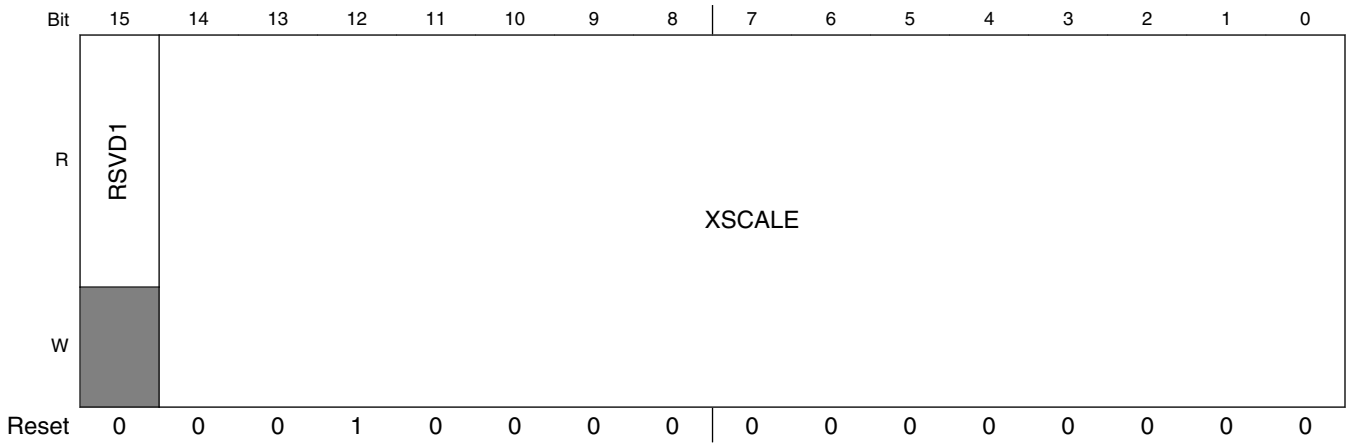
PXP_PS_BACKGROUND field descriptions

Field	Description
31–24 RSVD	Reserved, always set to zero.
COLOR	Background color (in 24bpp format) for any pixels not within the buffer range specified by the PS ULC/LRC.

39.7.18 PS Scale Factor Register (PXP_PS_SCALE)



PS Scale Factor. This register provides the scale factor for the PS buffer.



The maximum down scaling factor is 1/2 such that the output image in either axis is 1/2 the size of the source. The maximum up scaling factor is 2^12 for either axis. The reciprocal of the scale factor should be loaded into this register. To reduce the PS buffer by a factor of two in the output frame buffer, a value of 10.0000_0000_0000 should be loaded into this register. To scale up by a factor of 4, the value of 1/4, or 00.0100_0000_0000, should be loaded into this register. To scale up by 8/5, the value of 00.1010_0000_0000 should be loaded.

EXAMPLE

```
PXP_PS_SCALE_WR(0x10001000);  // 1:1  scaling (0x1.000)
PXP_PS_SCALE_WR(0x08000800);  // 2x   scaling (0x0.800)
PXP_PS_SCALE_WR(0x20002000);  // 1/2x scaling (0x2.000)
```

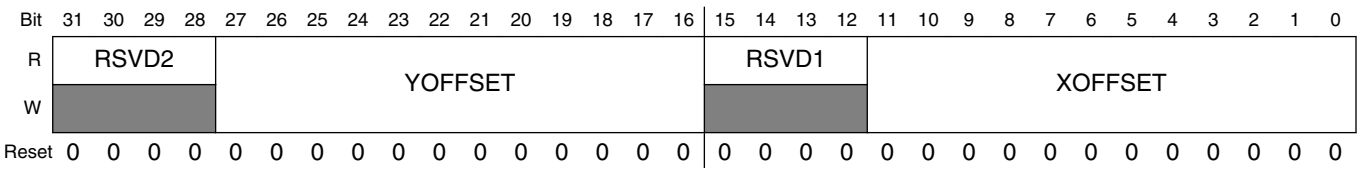
Address: 21C_C000h base + 110h offset = 21C_C110h

PXP_PS_SCALE field descriptions

Field	Description
31 RSVD2	Reserved, always set to zero.
30–16 YSCALE	This is a two bit integer and 12 bit fractional representation (##.####_####_####) of the Y scaling factor for the PS source buffer. The maximum value programmed should be 2 since scaling down by a factor greater than 2 is not supported with the bilinear filter. Decimation and the bilinear filter should be used together to achieve scaling by more than a factor of 2.
15 RSVD1	Reserved, always set to zero.
XSCALE	This is a two bit integer and 12 bit fractional representation (##.####_####_####) of the X scaling factor for the PS source buffer. The maximum value programmed should be 2 since scaling down by a factor greater than 2 is not supported with the bilinear filter. Decimation and the bilinear filter should be used together to achieve scaling by more than a factor of 2.

39.7.19 PS Scale Offset Register (PXP_PS_OFFSET)

PS Scale Offset. This register provides the initial scale offset for the PS buffer.



The X and Y offset provides the ability to access the source image with a per sub-pixel granularity. This provides the capability to use all source pixels to effect the output PS image. The fixed offset values can be used for sub-pixel adjustments in the bilinear scaling filter. For example, when scaling an image down by a factor of 2, an initial offset of 0x0 would result in sub-sampling every other pixel. If a fixed offset of 0x800 (1/2), all pixels are used in scaling the final output pixel value. In this case, the first output pixel would be the sum of (1/2*P0) + (1/2*P1). This fixed offset is applied after the decimation filter stage, and before the bilinear filter stage.

EXAMPLE

```
PXP_PS_SCALE_WR(0x2000_2000);   // 1/2x scaling (0x2.000)
PXP_PS_OFFSET_WR(0x0800_0800);  // half-pixel offset in both X and Y to ensure averaging
```

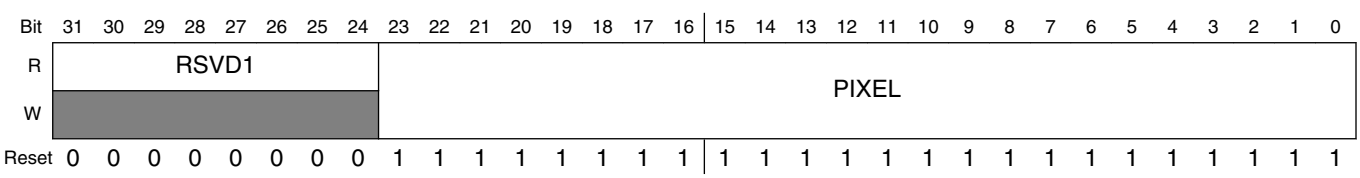
```
versus pixel decimation
```

Address: 21C_C000h base + 120h offset = 21C_C120h

PXP_PS_OFFSET field descriptions

Field	Description
31–28 RSVD2	Reserved, always set to zero.
27–16 YOFFSET	This is a 12 bit fractional representation (0.####_####_####) of the Y scaling offset. This represents a fixed pixel offset which gets added to the scaled address to determine source data for the scaling engine.
15–12 RSVD1	Reserved, always set to zero.
XOFFSET	This is a 12 bit fractional representation (0.####_####_####) of the X scaling offset. This represents a fixed pixel offset which gets added to the scaled address to determine source data for the scaling engine.

39.7.20 PS Color Key Low (PXP_PS_CLRKEYLOW)



This register contains the color key low value for the PS buffer.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between PXP_PS_CLRKEYLOW and PXP_PS_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the PXP_PS_BACKGROUND color is passed down the pixel pipeline.

EXAMPLE

```
                                    // colorkey values between
PXP_PS_CLRKEYLOW_WR (0x008000); // medium green and
PXP_PS_CLRKEYHIGH_WR(0x00FF00); // light green
```

Address: 21C_C000h base + 130h offset = 21C_C130h

PXP_PS_CLRKEYLOW field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFF and the high colorkey to 0x000000.

39.7.21 PS Color Key High (PXP_PS_CLRKEYHIGH)

This register contains the color key high value for the PS buffer.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between PXP_PS_CLRKEYLOW and PXP_PS_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the PXP_PS_BACKGROUND color is passed down the pixel pipeline.

EXAMPLE

```
                                    // colorkey values between
PXP_PS_CLRKEYLOW_WR (0x008000); // medium green and
PXP_PS_CLRKEYHIGH_WR(0x00FF00); // light green
```

Address: 21C_C000h base + 140h offset = 21C_C140h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

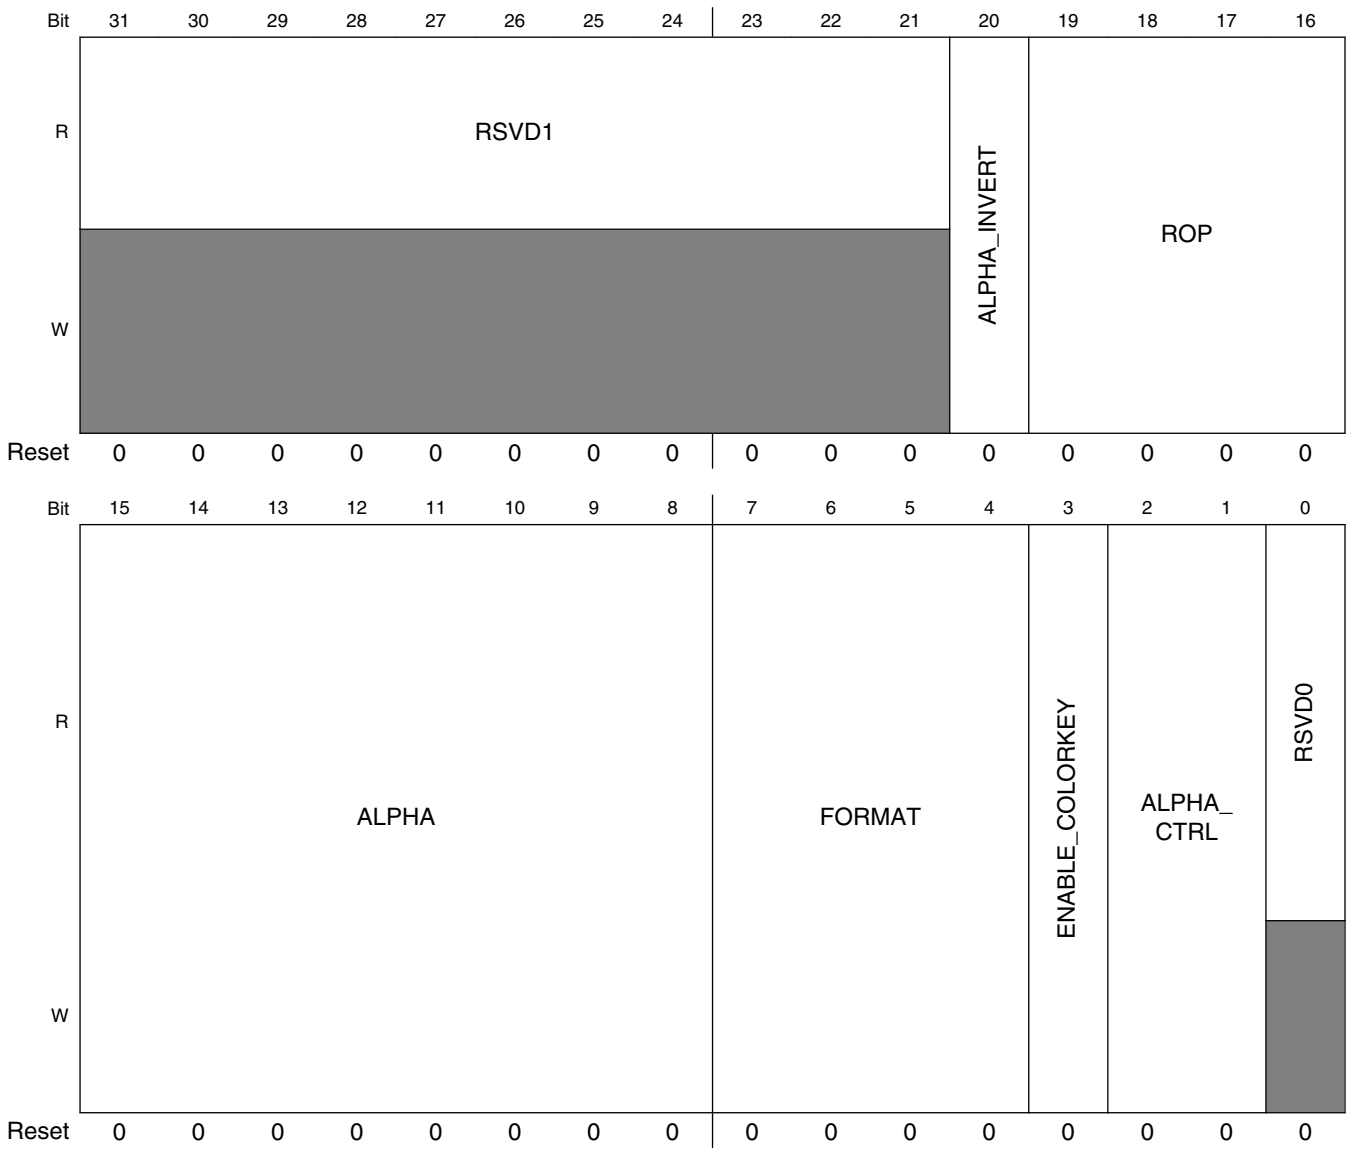
PXP_PS_CLRKEYHIGH field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFF and the high colorkey to 0x000000.

39.7.22 Alpha Surface Control (PXP_AS_CTRL)



This register contains buffer control for the Alpha Surface 0 input buffer.

The Alpha Surface Parameter register provides additional controls for AS.

EXAMPLE

```
u32 asparam;
      asparam  = BF_PXP_ASPARAM_ENABLE    (1);
      asparam |= BF_PXP_ASPARAM_ALPHA_CTRL(BV_PXP_ASPARAM_ALPHA_CTRL__ROPs);
      asparam |= BF_PXP_ASPARAM_FORMAT    (BV_PXP_ASPARAM_FORMAT__ARGB8888);
      asparam |= BF_PXP_ASPARAM_ROP       (BV_PXP_ASPARAM_ROP__XORAS);
PXP_ASPARAM_WR(0,asparam);  // enable alpha surface to perform XOR ROP using RGB8888 AS
pixel format
```

Address: 21C_C000h base + 150h offset = 21C_C150h

PXP_AS_CTRL field descriptions

Field	Description
31–21 RSVD1	Reserved, always set to zero.

Table continues on the next page...

PXP_AS_CTRL field descriptions (continued)

Field	Description
20 ALPHA_INVERT	Setting this bit to logic 0 will not alter the alpha value. A logic 1 will invert the alpha value and apply (1-alpha) for image composition.
19–16 ROP	Indicates a raster operation to perform when enabled. Raster operations are enabled through the ALPHA_CTRL field. 0x0 **MASKAS** — AS AND PS 0x1 **MASKNOTAS** — nAS AND PS 0x2 **MASKASNOT** — AS AND nPS 0x3 **MERGEAS** — AS OR PS 0x4 **MERGENOTAS** — nAS OR PS 0x5 **MERGEASNOT** — AS OR nPS 0x6 **NOTCOPYAS** — nAS 0x7 **NOT** — nPS 0x8 **NOTMASKAS** — AS NAND PS 0x9 **NOTMERGEAS** — AS NOR PS 0xA **XORAS** — AS XOR PS 0xB **NOTXORAS** — AS XNOR PS
15–8 ALPHA	Alpha modifier used when the ALPHA_MULTIPLY or ALPHA_OVERRIDE values are programmed in PXP_AS_CTRL[ALPHA_CTRL]. The output alpha value will either be replaced (ALPHA_OVERRIDE) or scaled (ALPHA_MULTIPLY) when selected.
7–4 FORMAT	Indicates the input buffer format for AS. 0x0 **ARGB8888** — 32-bit pixels with alpha 0x4 **RGB888** — 32-bit pixels without alpha (unpacked 24-bit format) 0x8 **ARGB1555** — 16-bit pixels with alpha 0x9 **ARGB4444** — 16-bit pixels with alpha 0xC **RGB555** — 16-bit pixels without alpha 0xD **RGB444** — 16-bit pixels without alpha 0xE **RGB565** — 16-bit pixels without alpha
3 ENABLE_ COLORKEY	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
2–1 ALPHA_CTRL	Determines how the alpha value is constructed for this alpha surface. Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. 0x0 **Embedded** — Indicates that the AS pixel alpha value will be used to blend the AS with PS. The ALPHA field is ignored. 0x1 **Override** — Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. 0x2 **Multiply** — Indicates that the value in the ALPHA field should be used to scale all pixel alpha values. Each pixel alpha is multiplied by the value in the ALPHA field. 0x3 **ROPs** — Enable ROPs. The ROP field indicates an operation to be performed on the alpha surface and PS pixels.
0 RSVD0	Reserved, always set to zero.

39.7.23 Alpha Surface Buffer Pointer (PXP_AS_BUF)

Alpha Surface 0 Buffer Address Pointer. This register points to the beginning of the Alpha Surface 0 input buffer.

This register is used to indicate the base address of the AS buffer.

EXAMPLE

```
u32* alpha_ptr;
PXP_ASn_WR(0,alpha_ptr);
```

Address: 21C_C000h base + 160h offset = 21C_C160h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_AS_BUF field descriptions

Field	Description
ADDR	Address pointer for the alpha surface 0 buffer.

39.7.24 Alpha Surface Pitch (PXP_AS_PITCH)

This register contains the alpha surface pitch in bytes.

Any byte value will indicate the vertical pitch. This value will be used in AS pixel address calculations. This value has no relation to the UL and LR registers. It specifies how many bytes are between two vertically adjacent pixels in the input AS surface.

EXAMPLE

```
PXP_AS_PITCH_WR( 1920 * 4 );  // The output buffer pitch is HD resolution at 32 bits per
pixel
```

Address: 21C_C000h base + 170h offset = 21C_C170h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

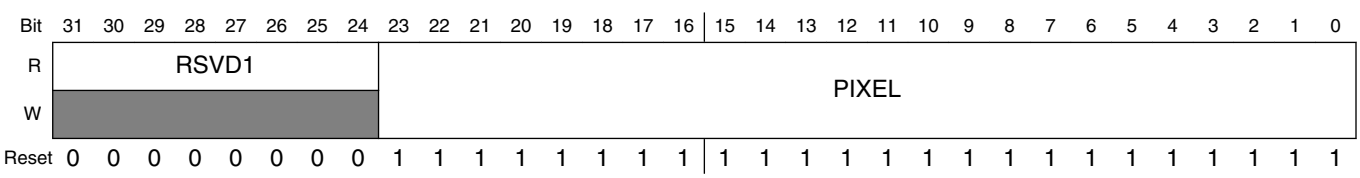
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_AS_PITCH field descriptions

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

39.7.25 Overlay Color Key Low (PXP_AS_CLRKEYLOW)



This register contains the color key low value for the AS buffer.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

EXAMPLE

```
                                    // colorkey values between
PXP_AS_CLRKEYLOW_WR (0x000000); // black and
PXP_AS_CLRKEYHIGH_WR(0x800000); // medium red
```

Address: 21C_C000h base + 180h offset = 21C_C180h

PXP_AS_CLRKEYLOW field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

39.7.26 Overlay Color Key High (PXP_AS_CLRKEYHIGH)

This register contains the color key high value for the AS buffer.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

EXAMPLE

```
                                    // colorkey values between
PXP_AS_CLRKEYLOW_WR (0x000000); // black and
PXP_AS_CLRKEYHIGH_WR(0x800000); // medium red
```

Address: 21C_C000h base + 190h offset = 21C_C190h

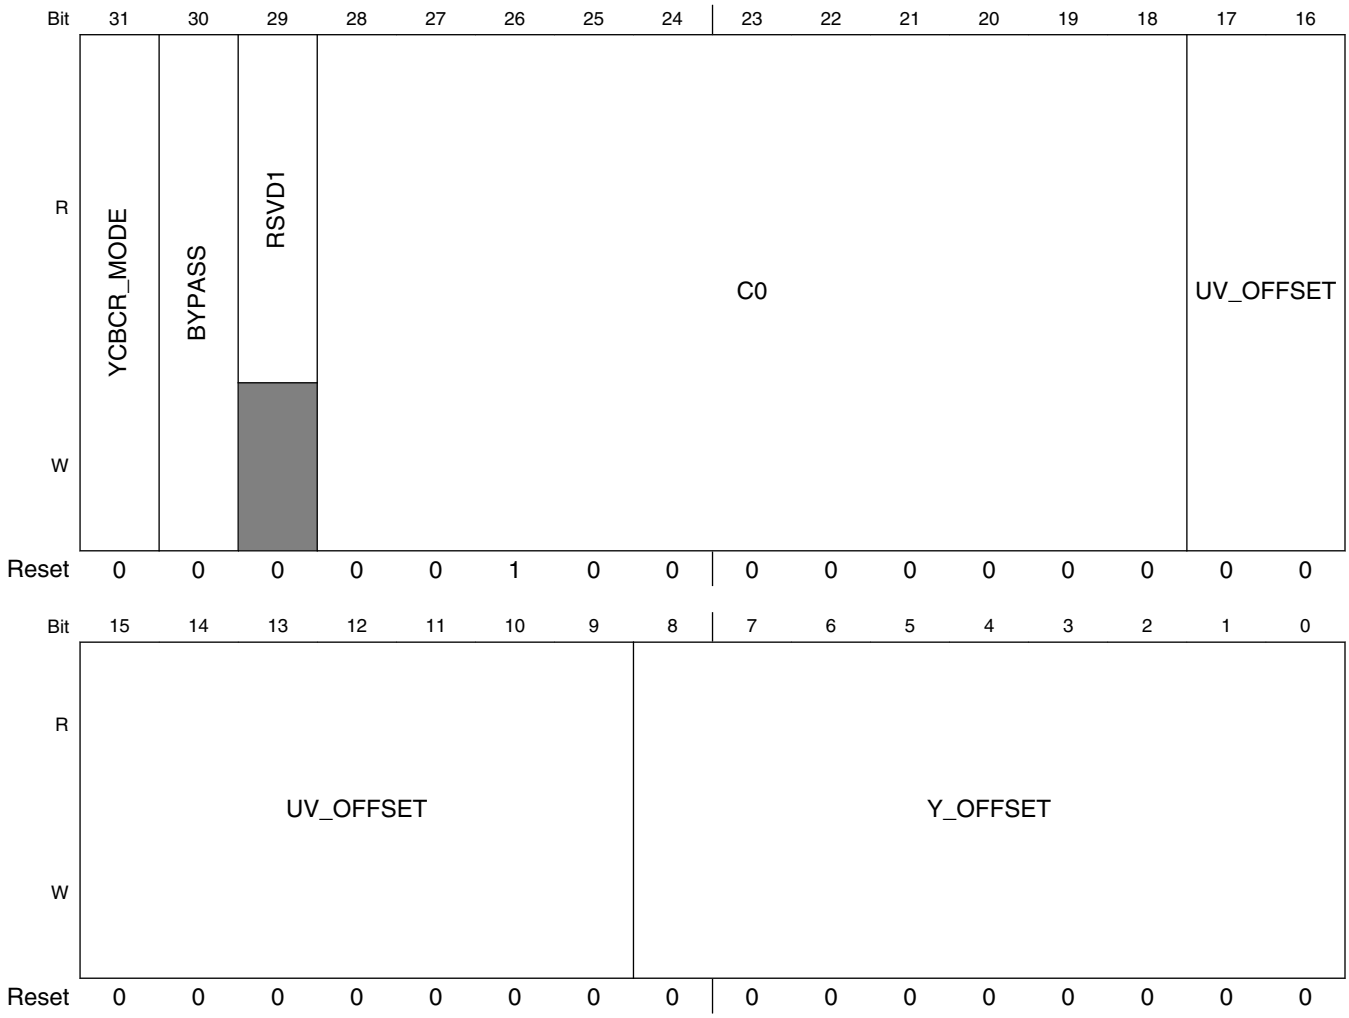
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1								PIXEL																							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_AS_CLRKEYHIGH field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

39.7.27 Color Space Conversion Coefficient Register 0 (PXP_CSC1_COEF0)

This register contains color space conversion coefficients in two's compliment notation.



The coefficient 0 register contains coefficients used in the color space conversion algorithm. The Y and UV offsets are added to the source buffer to normalize them before the conversion. C0 is the coefficient that is used to multiply the luma component of the data for all three RGB components.

EXAMPLE

```
//  The equations used for Colorspace conversion are:
//     R = C0*(Y+YOFFSET)                    + C1(V+UV_OFFSET)
//     G = C0*(Y+YOFFSET) + C3(U+UV_OFFSET) + C2(V+UV_OFFSET)
//     R = C0*(Y+YOFFSET) + C4(U+UV_OFFSET)

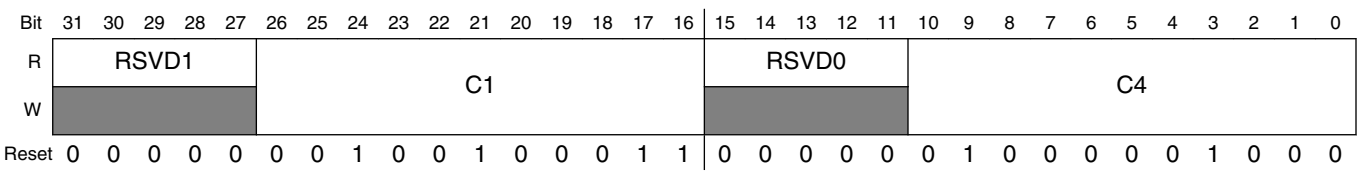
   PXP_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UVoffset
   PXP_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
   PXP_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3
```

Address: 21C_C000h base + 1A0h offset = 21C_C1A0h

PXP_CSC1_COEF0 field descriptions

Field	Description
31 YCBCR_MODE	Set to 1 when performing YCbCr conversion to RGB. Set to 0 when converting RGB to YUV data. This bit changes the behavior of the scaler when performing U/V scaling.
30 BYPASS	Bypass the CSC unit in the scaling engine. When set to logic 1, bypass is enabled and the output pixels will be in the YUV/YCbCr color space. When set to logic 0, the CSC unit is enabled and the pixels will be converted based on the programmed coefficients.
29 RSVD1	Reserved, always set to zero.
28–18 C0	Two's compliment Y multiplier coefficient. YUV=0x100 (1.000) YCbCr=0x12A (1.164)
17–9 UV_OFFSET	Two's compliment phase offset implicit for CbCr data. Generally used for YCbCr to RGB conversion. YCbCr=0x180, YUV=0x000 (typically -128 or 0x180 to indicate normalized -0.5 to 0.5 range)
Y_OFFSET	Two's compliment amplitude offset implicit in the Y data. For YUV, this is typically 0 and for YCbCr, this is typically -16 (0x1F0)

39.7.28 Color Space Conversion Coefficient Register 1 (PXP_CSC1_COEF1)



This register contains color space conversion coefficients in two's compliment notation.

The Coeffient 1 register contains coefficients used in the color space conversion algorithm. C1 is the coefficient that is used to multiply the chroma (Cr/V) component of the data for the red component. C4 is the coefficient that is used to multiply the chroma (Cb/U) component of the data for the blue component. Both values should be coded as a two's compliment fixed point number with 8 bits right of the decimal.

EXAMPLE

```
PXP_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UVoffset
PXP_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
PXP_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3
```

Address: 21C_C000h base + 1B0h offset = 21C_C1B0h

PXP_CSC1_COEF1 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C1	Two's compliment Red V/Cr multiplier coefficient. YUV=0x123 (1.140) YCbCr=0x198 (1.596)
15–11 RSVD0	Reserved, always set to zero.
C4	Two's compliment Blue U/Cb multiplier coefficient. YUV=0x208 (2.032) YCbCr=0x204 (2.017)

39.7.29 Color Space Conversion Coefficient Register 2 (PXP_CSC1_COEF2)

This register contains color space conversion coefficients in two's compliment notation.

The Coefficient 2 register contains coefficients used in the color space conversion algorithm. C2 is the coefficient that is used to multiply the chroma (Cr/V) component of the data for the green component. C3 is the coefficient that is used to multiply the chroma (Cb/U) component of the data for the green component. Both values should be coded as a two's compliment fixed point number with 8 bits right of the decimal.

EXAMPLE

```
// NOTE: The default values for the CSCCOEF2 register are incorrect.  C2 should be 0x76B and
C3 should be 0x79C for proper operation.

   PXP_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UVoffset
   PXP_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
   PXP_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3
```

Address: 21C_C000h base + 1C0h offset = 21C_C1C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

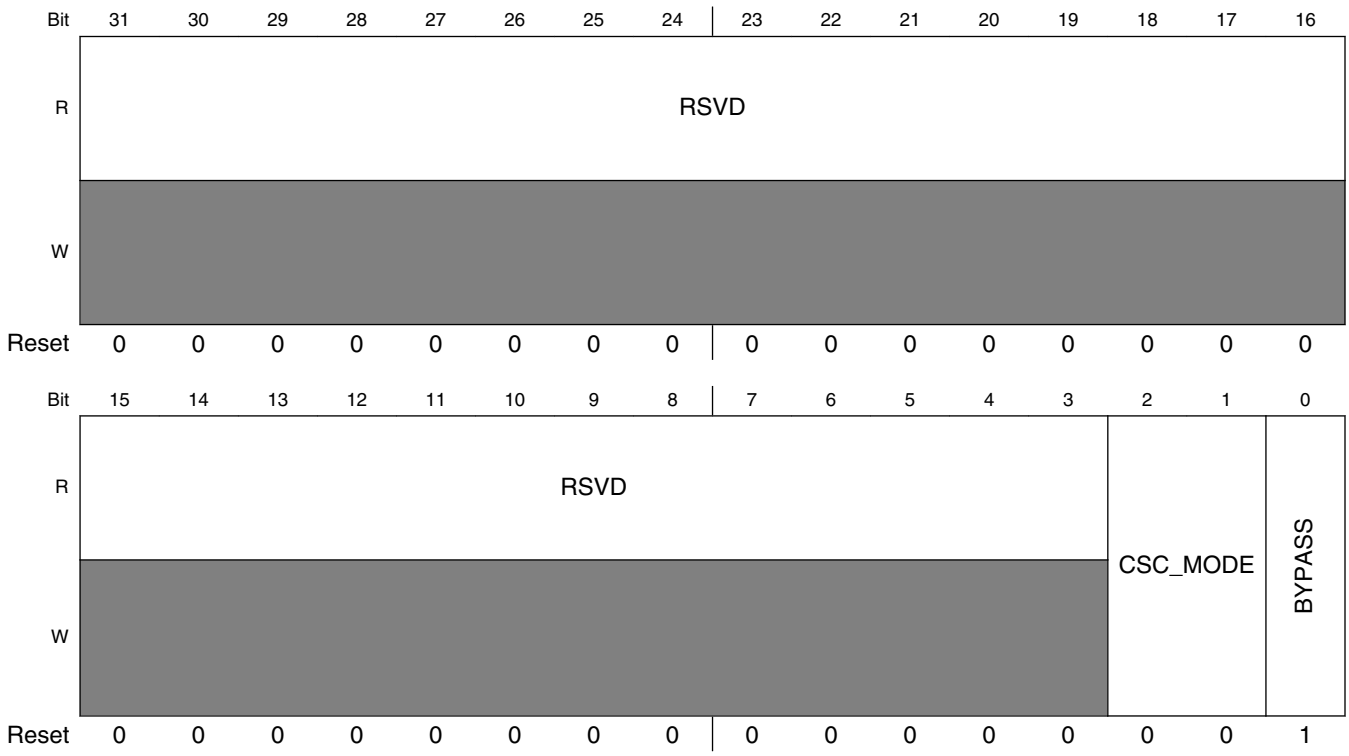
PXP_CSC1_COEF2 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C2	Two's complement Green V/Cr multiplier coefficient. YUV=0x76B (-0.581) YCbCr=0x730 (-0.813)
15–11 RSVD0	Reserved, always set to zero.
C3	Two's complement Green U/Cb multiplier coefficient. YUV=0x79C (-0.394) YCbCr=0x79C (-0.392)

39.7.30 Color Space Conversion Control Register. (PXP_CSC2_CTRL)

This register contains the control registers to configure the CSC module.



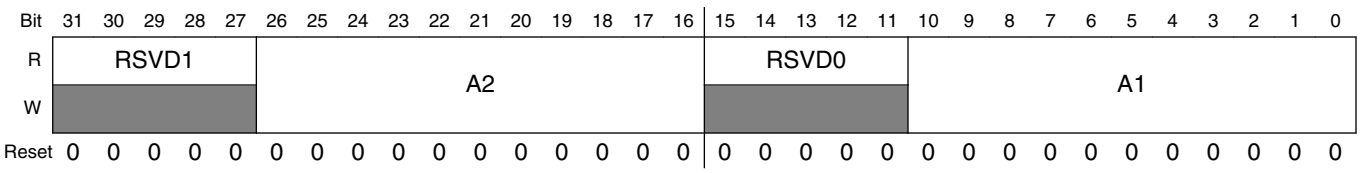
The CSC control register will configure the CSC module to perform color space conversion between the RGB/YUV/YCbCr color spaces.

EXAMPLE

```
//Converting from YUV/YCbCr color spaces to the RGB color space uses the
//following equation structure:
//
// R = A1(Y-D1) + A2(U-D2) + A3(V-D3)
```

```
// G = B1(Y-D1) + B2(U-D2) + B3(V-D3)
// B = C1(Y-D1) + C2(U-D2) + C3(V-D3)
//
//Converting from the RGB color space to YUV/YCbCr color spaces uses the
//following equation structure:
//
// Y = A1*R + A2*G + A3*B + D1
// U = B1*R + B2*G + B3*B + D2
// V = C1*R + C2*G + C3*B + D3
//
//All math is signed, so all coefficients come in as two's comp numbers
//
```

Address: 21C_C000h base + 1D0h offset = 21C_C1D0h



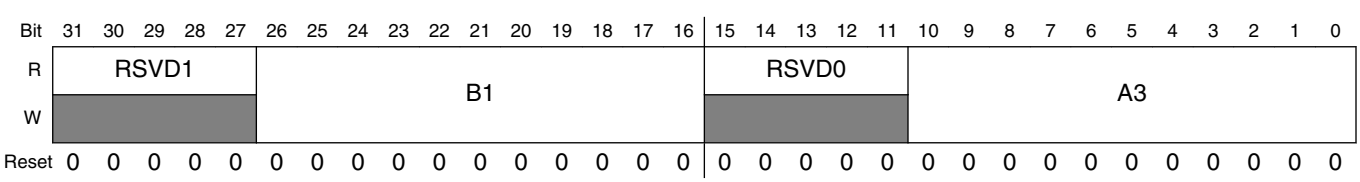
PXP_CSC2_CTRL field descriptions

Field	Description
31–3 RSVD	Reserved, always set to zero.
2–1 CSC_MODE	This field controls how the CSC unit operates on pixels when the CSC is not bypassed. 0x0 **YUV2RGB** — Convert from YUV to RGB. 0x1 **YCbCr2RGB** — Convert from YCbCr to RGB. 0x2 **RGB2YUV** — Convert from RGB to YUV. 0x3 **RGB2YCbCr** — Convert from RGB to YCbCr.
0 BYPASS	This bit controls whether the pixels entering the CSC2 unit get converted or not. When BYPASS is set, no operations occur on the pixels. When BYPASS is cleared, the selected CSC operation takes place.

39.7.31 Color Space Conversion Coefficient Register 0 (PXP_CSC2_COEF0)

This register contains color space conversion coefficients in two's complement notation.

Address: 21C_C000h base + 1E0h offset = 21C_C1E0h



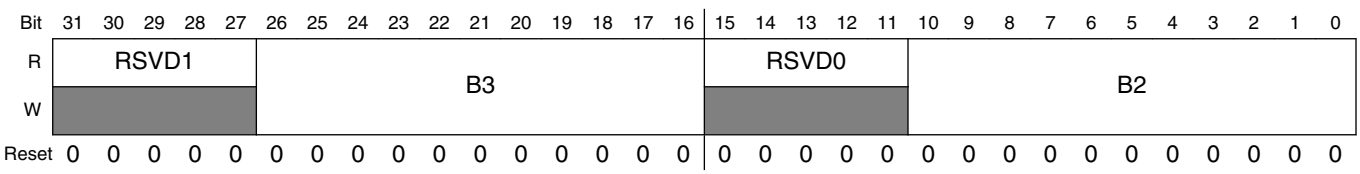
PXP_CSC2_COEF0 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 A2	Two's complement coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.
15–11 RSVD0	Reserved, always set to zero.
A1	Two's complement coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

39.7.32 Color Space Conversion Coefficient Register 1 (PXP_CSC2_COEF1)

This register contains color space conversion coefficients in two's complement notation.

Address: 21C_C000h base + 1F0h offset = 21C_C1F0h



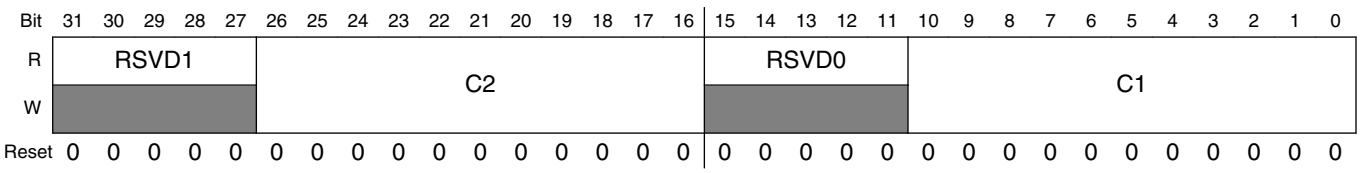
PXP_CSC2_COEF1 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 B1	Two's complement coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.
15–11 RSVD0	Reserved, always set to zero.
A3	Two's complement coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

39.7.33 Color Space Conversion Coefficient Register 2 (PXP_CSC2_COEF2)

This register contains color space conversion coefficients in two's complement notation.

Address: 21C_C000h base + 200h offset = 21C_C200h



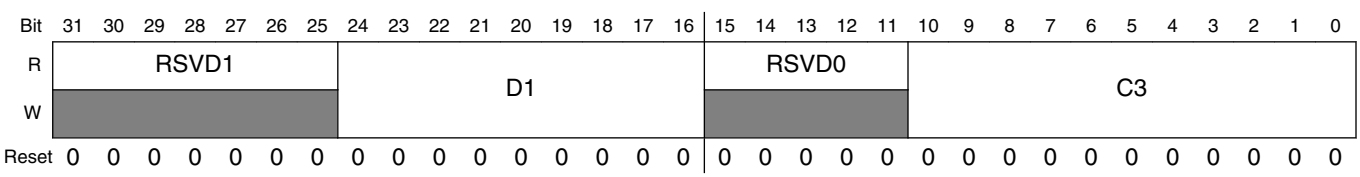
PXP_CSC2_COEF2 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 B3	Two's complement coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.
15–11 RSVD0	Reserved, always set to zero.
B2	Two's complement coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

39.7.34 Color Space Conversion Coefficient Register 3 (PXP_CSC2_COEF3)

This register contains color space conversion coefficients in two's complement notation.

Address: 21C_C000h base + 210h offset = 21C_C210h



PXP_CSC2_COEF3 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C2	Two's complement coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.
15–11 RSVD0	Reserved, always set to zero.
C1	Two's complement coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

39.7.35 Color Space Conversion Coefficient Register 4 (PXP_CSC2_COEF4)

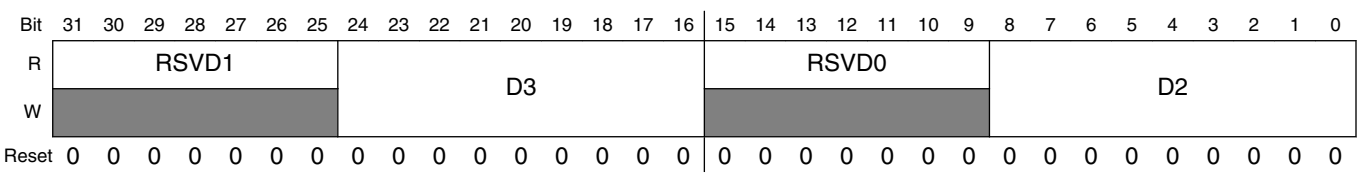
This register contains color space conversion coefficients in two's complement notation.

Address: 21C_C000h base + 220h offset = 21C_C220h

PXP_CSC2_COEF4 field descriptions

Field	Description
31–25 RSVD1	Reserved, always set to zero.
24–16 D1	Two's complement coefficient integer offset to be added.

Table continues on the next page...



PXP_CSC2_COEF4 field descriptions (continued)

Field	Description
15–11 RSVD0	Reserved, always set to zero.
C3	Two's complement coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

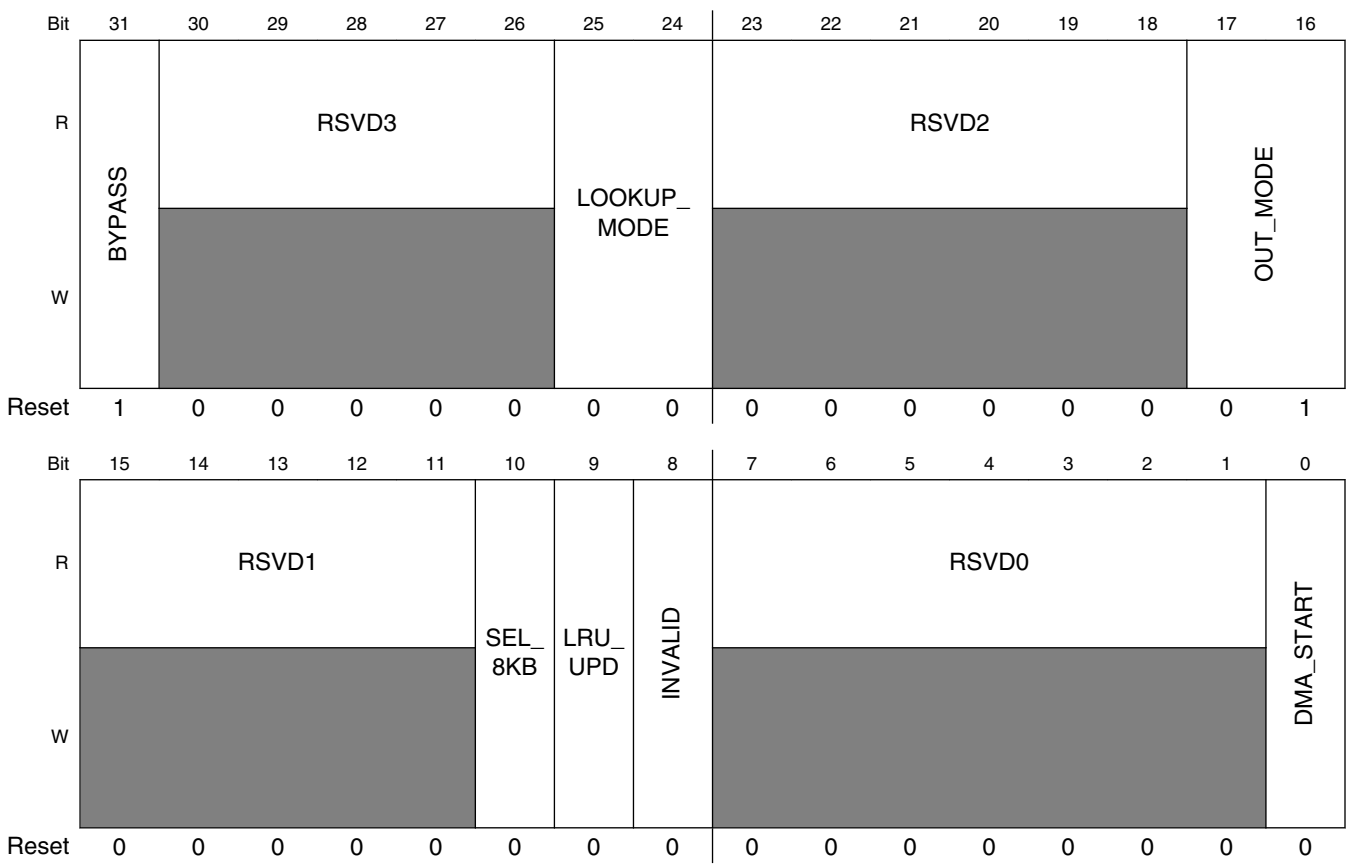
39.7.36 Color Space Conversion Coefficient Register 5 (PXP_CSC2_COEF5)

This register contains color space conversion coefficients in two's complement notation.

Address: 21C_C000h base + 230h offset = 21C_C230h

PXP_CSC2_COEF5 field descriptions

Field	Description
31–25 RSVD1	Reserved, always set to zero.
24–16 D3	Two's complement coefficient integer offset to be added.
15–9 RSVD0	Reserved, always set to zero.
D2	Two's complement D1 coefficient integer offset to be added.



39.7.37 Lookup Table Control Register. (PXP_LUT_CTRL)

This register is used to access/control the Monochrome Lookup table.

The Y8 LUT input mode will take the high order data path byte and transform it using the LUT memory. This is an 8-bit to 8-bit transformation. The two low order bytes bypass the LUT and are not transformed, but bypassed without modification. This option can be used for monochrome gamma correction. The Direct Lookup mode will use the high nibble of each data byte and truncate the low nibble to generate the lookup address, i.e.

R[7:0]G[7:0]B[7:0] -> R[7:4]G[7:4]B[7:4]. 4K pixels (12-bit address) with 2 bytes per pixel is supported in this mode. Cached Lookup mode will use the high order bits, R[7:3],G[7:2],B[7:3] or RGB565, to address the cached LUT memory. 64KB LUT tables, using 16KB of internal LUT memory, can be indirectly transformed to 16-bit output pixels (as in RGBW4444/RGB565). This is used for 16bpp gamma correction or EPD color panel support. Cache misses are internally managed by the PXP LUT Cache controller.

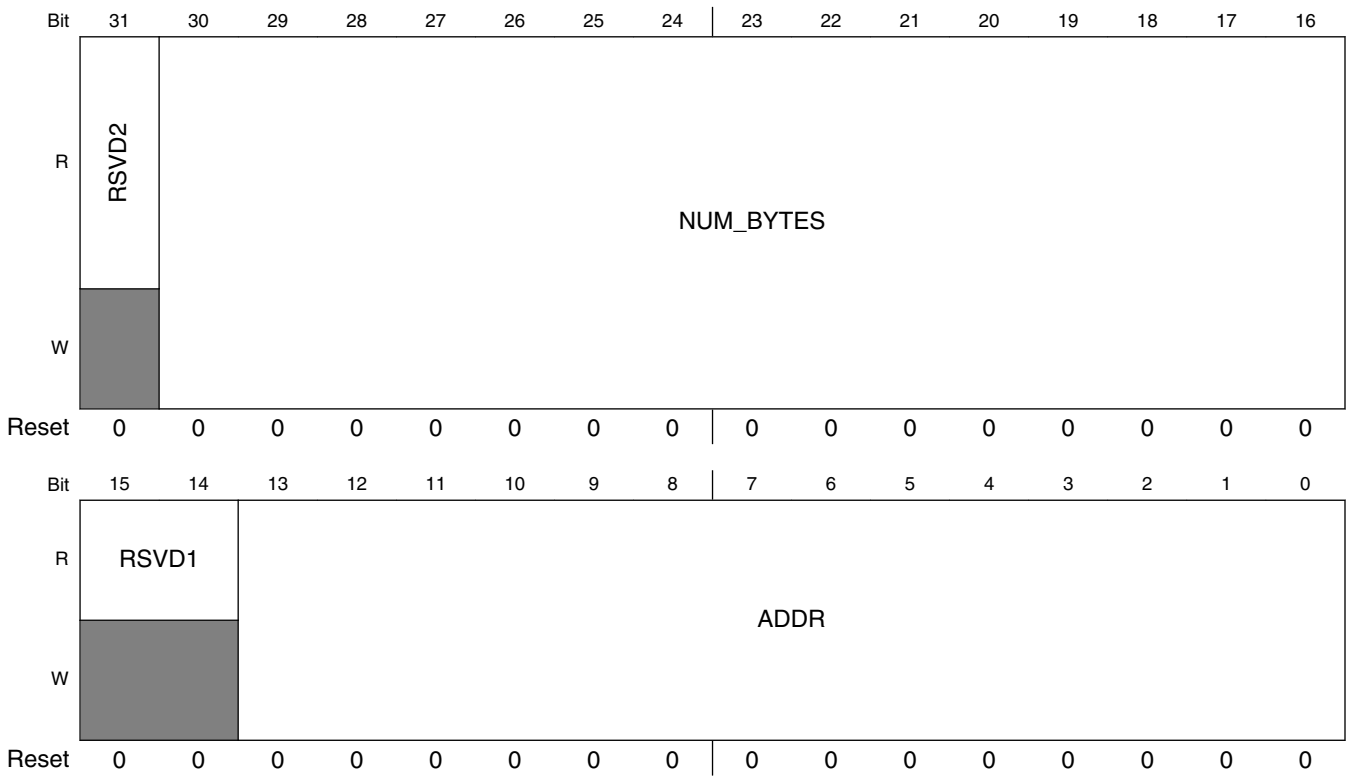
Address: 21C_C000h base + 240h offset = 21C_C240h

PXP_LUT_CTRL field descriptions

Field	Description
31 BYPASS	Setting this bit will bypass the LUT memory resource completely. No pixel transfermations will occur at this stage of the PXP pixel rpocessing pipeline.
30–26 RSVD3	Reserved, always set to zero.
25–24 LOOKUP_MODE	Configure the input address for the 16KB LUT memory. The address into the LUT uses different parts of the pixel data path bytes. The data path is

Table continues on the next page...

PXP_LUT_CTRL field descriptions (continued)



Field	Description
	defined as three bytes, conceptually as RGB/YUV/YCbCr[23:0]. Also referred to as R/Y[7:0],G/U[7:0],B/V[7:0] 0x0 **CACHE_RGB565** — LUT ADDR = R[7:3],G[7:2],B[7:3]. Use all 16KB of LUT for indirect cached 128KB lookup. 0x1 **DIRECT_Y8** — LUT ADDR = 16'b0,Y[7:0]. Use only the first 256 bytes of LUT. Only the Y, or third data path byte, is tranformed. 0x2 **DIRECT_RGB444** — LUT ADDR = R[7:4],G[7:4],B[7:4]. Use one 8KB bank of LUT selected by SEL_8KB. 0x3 **DIRECT_RGB454** — LUT ADDR = R[7:4],G[7:3],B[7:4]. Use all 16KB of LUT.
23–18 RSVD2	Reserved, always set to zero.
17–16 OUT_MODE	Select the output mode of operation for the LUT resource. There are four bytes [3-0] in the data path at the output of the LUT resource. Byte lane 3 is always bypassed and usually contains an alpha value. The LUT can be programmed to transform bytes 2,1,0 according to the options available in this field. 0x0 **RESERVED** — Reserved, not valid when using the LUT to transform pixels. 0x1 **Y8** — R/Y byte lane 2 lookup, bytes 1,0 bypassed. 0x2 **RGBW4444CFA** — Byte lane 2 = CFA_Y8, byte lane 1,0 = RGBW4444. 0x3 **RGB888** — RGB565->RGB888 conversion for Gamma correction.
15–11 RSVD1	Reserved, always set to zero.
10 SEL_8KB	Selects which 8KB bank of memory to use for direct 12bpp lookup modes. Logic 0 indicates first 8KB, logic 1 indicates second 8KB. Two direct LUT arrays can be stored and one can be selected for a given PXP operation.
9 LRU_UPD	Least Recently Used Policy Update Control: 1=> block LRU update for hit after miss. 0=> update LRU for all hits including hit after miss.
8 INVALID	Invalidate the cache LRU and valid bits. This bit will automatically reset when set to a logic 1.
7–1 RSVD0	Reserved, always set to zero.
0 DMA_START	Setting this bit will result in the DMA operation to load the PXP LUT memory based on PXP_LUT_ADDR_NUM_BYTES, PXP_LUT_ADDR_ADDR, and PXP_LUT_MEM_ADDR. This bit will automatically reset when set to a logic 1. Note: The LOOKUP_MODE must not be set to CACHE_RGB565 when starting and performing DMA transfers.

39.7.38 Lookup Table Control Register. (PXP_LUT_ADDR)

This register is used to access/control the Monochrome Lookup table.

The Y8 LUT input mode will take the high order data path byte and transform it using the LUT memory. This is an 8-bit to 8-bit transformation. The two low order bytes bypass the LUT and are not transformed, but bypassed without modification. This option can be used for monochrome gamma correction. The Direct Lookup mode will use the high nibble of each data byte and truncate the low nibble to generate the lookup address, i.e. R[7:0]G[7:0]B[7:0] -> R[7:4]G[7:4]B[7:4]. 4K pixels (12-bit address) with 2 bytes per pixel is supported in this mode. Cached Lookup mode will use the high order bits, R[7:3],G[7:2],B[7:3] or RGB565, to address the cached LUT memory. 64KB LUT tables, using 16KB of internal LUT memory, can be indirectly transformed to 16-bit output pixels (as in RGBW4444/RGB565). This is used for 16bpp gamma correction or EPD color panel support. Cache misses are internally managed by the PXP LUT Cache controller.

Address: 21C_C000h base + 250h offset = 21C_C250h

PXP_LUT_ADDR field descriptions

Field	Description
31 RSVD2	Reserved, always set to zero.
30–16 NUM_BYTES	Indicates the number of bytes to load via a DMA operation. This field must be divisable by 8 and the least significant 3 bits must be 0. The value 8 indicates load 8 bytes from the external address indicated by PXP_LUT_MEM_ADDR to the LUT memory location indicated by PXP_LUT_CTRL_ADDR.
15–14 RSVD1	Reserved, always set to zero.

Table continues on the next page...

PXP_LUT_ADDR field descriptions (continued)

Field	Description
ADDR	LUT indexed address pointer. This address into the LUT memory is always four byte aligned for PIO access, and eight byte aligned for DMA access. The least two significant bits are not used to drive the LUT memory array. For PIO LUT access, when the LUT data register is written, the contents of the LUT at the address specified by this address field will be loaded with a 32-bit DWORD. This address pointer will be incremented after the LUT data is written. This will provide recursive writes to the LUT data register to initialize the entire LUT array with recursive writes to the LUT data register. For DMA access, this register indicates the LUT memory address of the 8 byte QWORD to be loaded. When using the NUM_BYTES field to load more than 8 bytes, the register should be programmed with the first LUT memory location to be filled and each load of the LUT memory will increment this address field until NUM_BYTES has been loaded.

39.7.39 Lookup Table Data Register. (PXP_LUT_DATA)

This register is used to load data into the lookup table.

Address: 21C_C000h base + 260h offset = 21C_C260h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_LUT_DATA field descriptions

Field	Description
DATA	Writing this field will load 4 bytes, aligned to four byte boundaries, of data indexed by the ADDR field of the PXP_LUT_CTRL register.

39.7.40 Lookup Table External Memory Address Register. (PXP_LUT_EXTMEM)

For DMA LUT memory loads, this is the base address from which data will be sourced to store into the LUT memory array. For Cached LUT memory pixel transformations, this register will store the base address of the full 64K pixel LUT translation table.

Address: 21C_C000h base + 270h offset = 21C_C270h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PXP_LUT_EXTMEM field descriptions

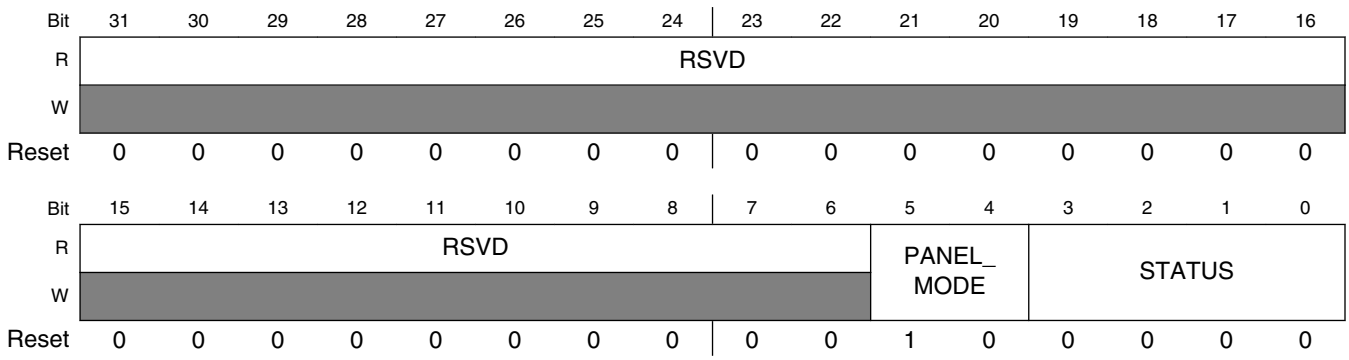
Field	Description
ADDR	This register contains the external memory address used for LUT memory operation. For DMA LUT memory loads, this is the base address from which data will be sourced to store into the LUT memory array. For Cached LUT memory pixel transformations, this register will store the base address of the full 64K pixel LUT translation table.

39.7.41 Color Filter Array Register. (PXP_CFA)

There are sixteen 2 bit values in this register each mapping a selected component to the output pixel. The two bit values are defined as 0=>R, 1=>G, 2=>B, and 3=>W. The first byte represents the repetitive pattern of RGBW pixels in the CFA for the first line segment of each processed PXP block. The second byte represents the pattern in the second line segment of the block, and so on. The first byte repeats two times for 8x8 macro block mode, and repeats four times for 16x16 block mode.

Address: 21C_C000h base + 280h offset = 21C_C280h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DATA																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



PXP_CFA field descriptions

Field	Description
DATA	This register contains the Color Filter Array pattern for decimation of RGBW4444 16 bit pixels to individual R, G, B, W values. The pattern represents a replicated 4x4 color filter array for the entire output frame buffer.

39.7.42 Histogram Control Register. (PXP_HIST_CTRL)

Provides control and status registers for the PXP's histogram classification algorithm.

Address: 21C_C000h base + 290h offset = 21C_C290h

PXP_HIST_CTRL field descriptions

Field	Description
31–6 RSVD	Reserved, always set to zero.
5–4 PANEL_MODE	This value is used to specify the number of bits used in comparisons when matching pixels to histogram bins. All comparator values MUST be programmed such that their bit width is consistent with the value of this register field. For instance, if GRAY16 is selected, comparator values must be in the range of 0x0-0xF. 0x0 **GRAY4** — 4-bit grayscale 0x1 **GRAY8** — 8-bit grayscale 0x2 **GRAY16** — 16-bit grayscale 0x3 **GRAY32** — 32-bit grayscale
STATUS	Indicates which histogram matched the processed bitmap. Bit[0] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.

39.7.43 2-level Histogram Parameter Register. (PXP_HIST2_PARAM)

This register specifies the valid values for a 2-level histogram. If all pixels in a bitmap match the 2-level histogram values, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL_MODE control field.

Address: 21C_C000h base + 2A0h offset = 21C_C2A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

39.7.51 PXP Power Control Register. (PXP_POWER)

Address: 21C_C000h base + 320h offset = 21C_C320h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	CTRL																				ROT_MEM_LP_STATE			LUT_LP_STATE_WAY1_BANKN			LUT_LP_STATE_WAY0_BANKN			LUT_LP_STATE_WAY0_BANK0		
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_POWER field descriptions

Field	Description
31–12 CTRL	This register contains power control for the PXP.
11–9 ROT_MEM_LP_STATE	Select the low power state of the ROT memory. 0x0 **NONE** — Memory is not in low power state. 0x1 **LS** — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 **DS** — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 **SD** — Shut Down Mode. Shut Down periphery and core, no memory retention.
8–6 LUT_LP_STATE_WAY1_BANKN	Select the low power state of the LUT's WAY0-BANK0,1,2,3 memory. 0x0 **NONE** — Memory is not in low power state. 0x1 **LS** — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 **DS** — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 **SD** — Shut Down Mode. Shut Down periphery and core, no memory retention.
5–3 LUT_LP_STATE_WAY0_BANKN	Select the low power state of the LUT's WAY0-BANK1,2,3 memory. 0x0 **NONE** — Memory is not in low power state. 0x1 **LS** — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 **DS** — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 **SD** — Shut Down Mode. Shut Down periphery and core, no memory retention.
LUT_LP_STATE_WAY0_BANK0	Select the low power state of the LUT's WAY0-BANK0 memory. 0x0 **NONE** — Memory is not in low power state. 0x1 **LS** — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 **DS** — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 **SD** — Shut Down Mode. Shut Down periphery and core, no memory retention.

39.7.52 Next Frame Pointer (PXP_NEXT)

This register contains a pointer to a data structure used to reload the PXP registers at the end of the current frame.

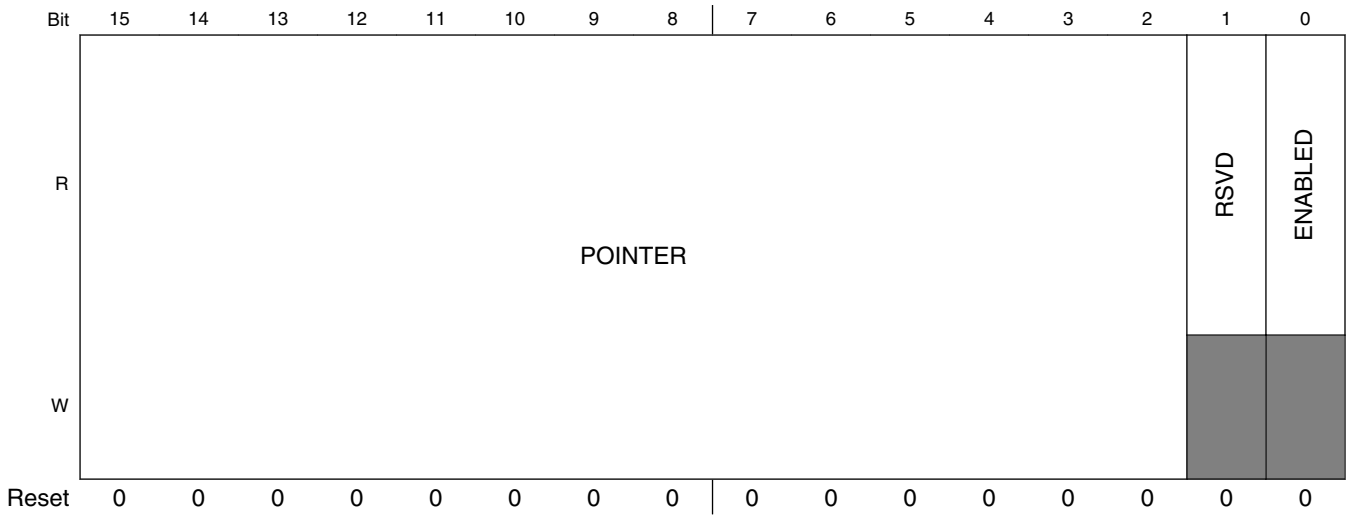
To enable this functionality, software must write this register while the PXP is processing the current data frame (if the PXP is currently idle, this will also initiate an immediate load of registers from the pointer). The process of writing this register (WRITE operation) will set a semaphore in hardware to notify the control logic that a register reload operation must be performed when the current frame processing is complete. At

the end of a frame, the PXP will fetch the register settings from this location, signal an interrupt to software, then proceed with rendering the next frame of data. Software may cancel the reload operation by issuing a CLEAR operation to this register. SET and TOGGLE operations should not be used when addressing this register. All registers will be reloaded with the exception of the following: STAT, CSCCOEFn, NEXT. All other registers will be loaded in the order they appear in the register map. Once the pointer's contents have been loaded into the PXP's registers, the NEXT_IRQ interrupt will be issued (see the PXP_STATUS register).

EXAMPLE

```
// create register command structure in memory
  u32* pxp_commands0[48], pxp_commands1;
  u32  rc;

// initialize control structure for frame 0
  pxp_commands0[0] = ...; // CTRL
  pxp_commands0[1] = ...; // OUT Buffer
  ...
  pxp_commands0[47] = ..; // Overlay7 param2



// initialize control structure for frame 1
  pxp_commands1[0] = ...; // CTRL
  pxp_commands1[1] = ...; // OUT Buffer
  ...
  pxp_commands1[47] = ..; // Overlay7 param2

// poll until a command isn't queued
  while (rc=PXP_NEXT_RD() & BM_PXP_NEXT_ENABLED );
  PXP_NEXT_WR(pxp_commands0);  // enable PXP operation 0 via command pointer

// poll until first command clears
  while (rc=PXP_NEXT_RD() & BM_PXP_NEXT_ENABLED );
  PXP_NEXT_WR(pxp_commands1);  // enable PXP operation 1 via command pointer
```

Address: 21C_C000h base + 400h offset = 21C_C400h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	POINTER															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PXP_NEXT field descriptions

Field	Description
31–2 POINTER	A pointer to a data structure containing register values to be used when processing the next frame. The pointer must be 32-bit aligned and should reside in on-chip or off-chip memory.
1 RSVD	Reserved, always set to zero.
0 ENABLED	Indicates that the "next frame" functionality has been enabled. This bit reflects the status of the hardware semaphore indicating that a reload operation is pending at the end of the current frame.

Chapter 40
Quad Serial Peripheral Interface (QuadSPI)

40.1 Overview

The Quad Serial Peripheral Interface (QuadSPI) block acts as an interface to one or two external serial flash devices, each with up to four bidirectional data lines. The following figure is a block diagram of the QuadSPI module.

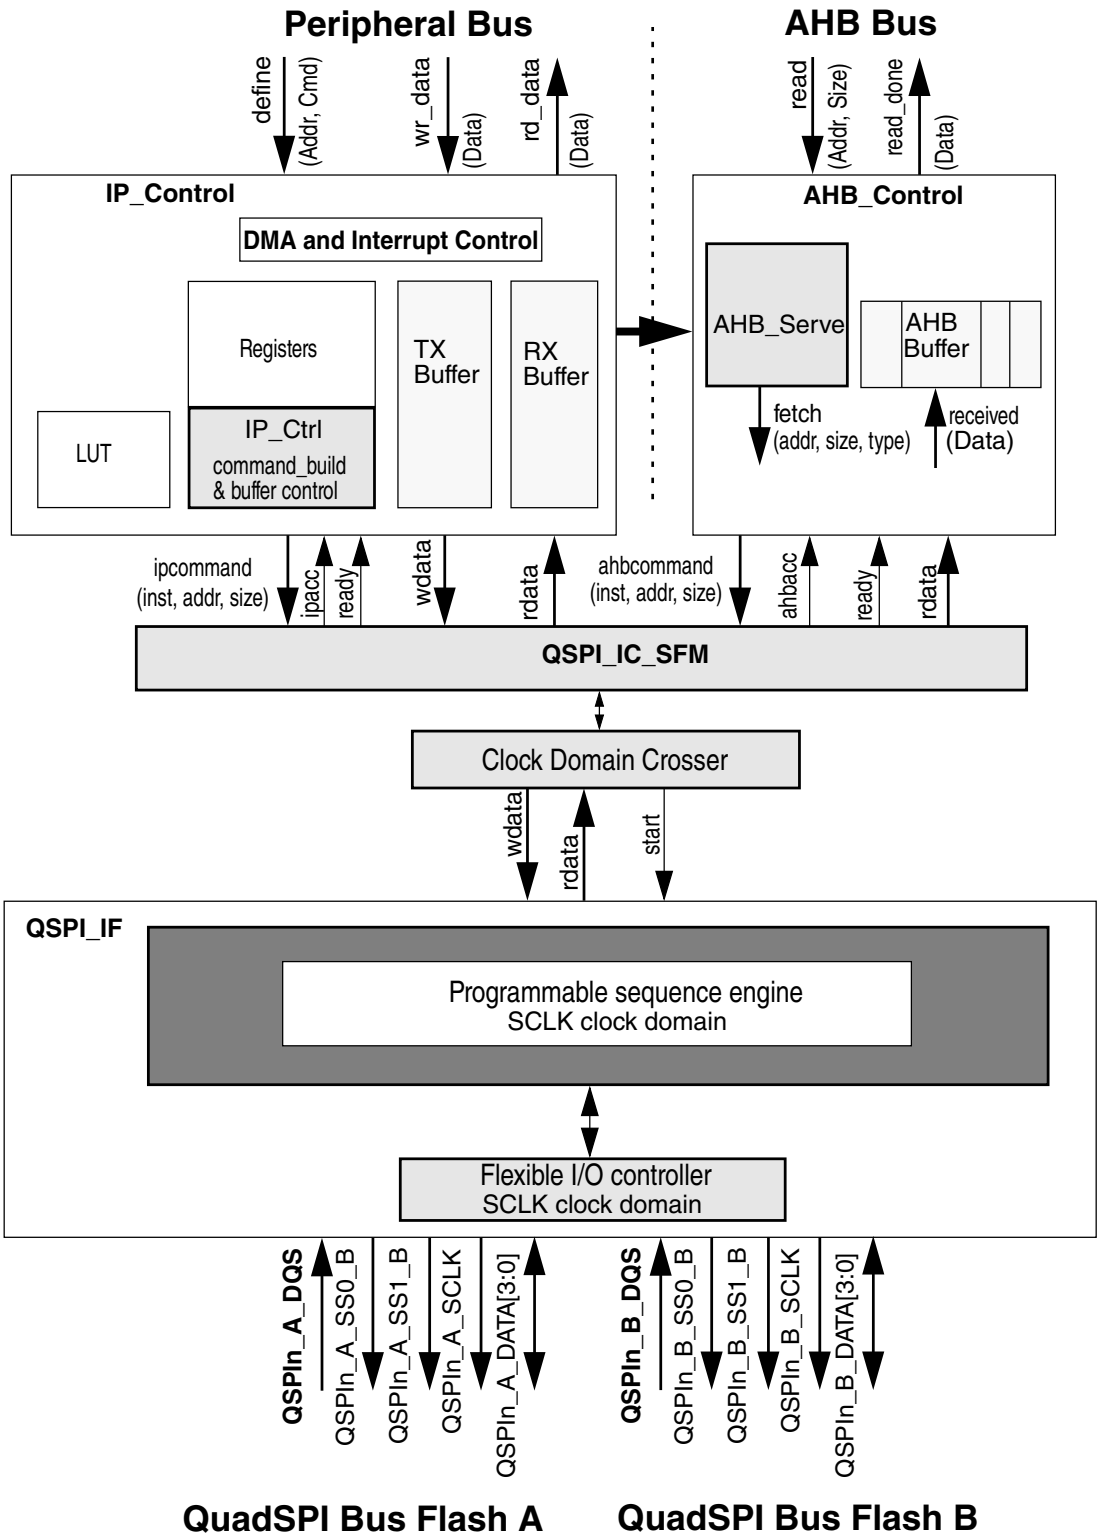


Figure 40-1. QuadSPI Block Diagram

The following figure describes the serial flash clock diagram in QuadSPI:

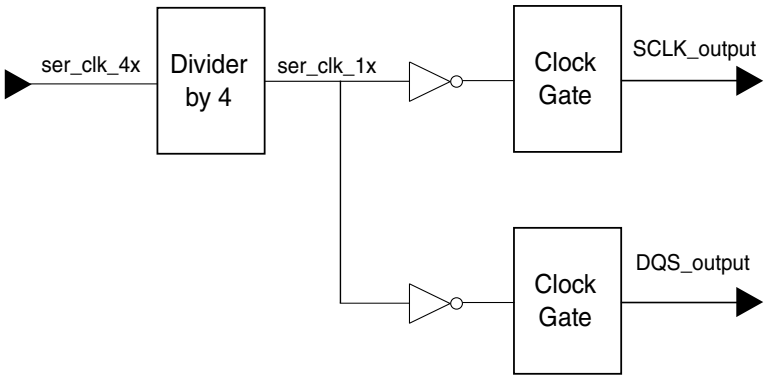

Figure 40-2. Flash Clock Diagram

ser_clk_4x is the serial clock root from CCM

ser_clk_1x' is generated clock from 'ser_clk_4x' divided by 4

SCLK_output is serial output clock generated from 'ser_clk_1x' with inverter and clock gate, it's used as Clock by external serial flash device.

DQS_output is serial flash data strobe signal generated from 'ser_clk_1x' with inverter and clock gate. This signal could be loopback from pad and used as sampling clock for serial flash data.

40.1.1 Features

The QuadSPI supports the following features:

- Flexible sequence engine to support various flash vendor devices.
- Single, dual, quad mode of operation.
- DDR/DTR mode wherein the data is generated on every edge of the serial flash clock.
- Support for flash data strobe signal for data sampling in DDR and SDR mode.
- Two identical serial flash devices can be connected and accessed in parallel for data read operations, forming one (virtual) flash memory with doubled readout bandwidth.
- DMA support to read RX Buffer data via AMBA AHB bus (64-bit width interface) or IP registers space (32-bit access).
    - Inner loop size of DMA access can be configured.
- Multi master accesses with priority

- Flexible and configurable buffer for each master

- Thirteen interrupt conditions (see Table 40-10)
- Memory mapped read access to connected flash devices.
- Programmable sequence engine to cater to future command/protocol changes and able to support all existing vendor commands and operations.
  - Supports 3-byte and 4-byte addressing.
  - TXFIFO size is 512Byte
  - RXFIFO size is 128Byte
  - AHB BUF size is 1KByte

40.1.2 QuadSPI Modes of Operation

This section provides information about the modes in which the QuadSPI module can be used.

40.1.2.1 Normal Mode

In this mode, one or two external serial flash memory devices can be accessed. Further details about this mode of operation can be found in Modes of Operation (Normal Mode).

40.1.2.2 Module Disable Mode

This mode is used for power management of the device containing the QuadSPI module. It is controlled by signals external to the QuadSPI. The clock to the non-memory mapped logic in the QuadSPI can be stopped while in Module Disable Mode.

40.1.3 Acronyms and Abbreviations

The following table contains acronyms and abbreviations used in this document.

Table 40-1. Acronyms and Abbreviations

Terms	Description
AHB	Advanced High-performance Bus, version of AMBA
AMBA	Advanced Microcontroller Bus Architecture

Table continues on the next page...

Table 40-1. Acronyms and Abbreviations (continued)

Terms	Description
BE	Big Endian Byte Ordering
CS	Chip Select
DMA	Direct Memory Access
MB	Megabyte. Each MB is 1024 * 1024 bytes
IFM	Individual Flash Mode
PFM	Parallel Flash Mode
LSB	Least Significant Bit
MSB	Most Significant Bit
PCS	Peripheral Chip Select
QSPI, QuadSPI	Quad Serial Peripheral Interface
SCK	Serial Communications Clock
w1c	Write 1 to clear, writing a 1 to this field resets the flag

40.1.4 Glossary for QuadSPI module

Table 40-2. Glossary

Term	Definition
AHB Command	An AHB Command is a SFM Command triggered by a read access to the address range belonging to the memory mapped access defined in Table 40-7. Refer to AHB Commands for details.
Asserted	A signal that is asserted is in its active state. An active low signal changes from logic level one to logic level zero when asserted, and an active high signal changes from logic level zero to logic level one.
Clear	To clear a bit or bits means to establish logic level zero on the bit or bits.
Clock Phase	Determines when the data should be sampled relative to the active edge of SCK
Clock Polarity	Determines the idle state of the SCK signal.
Drain	To remove entries from a FIFO by software or hardware.
Endianness	Byte Ordering scheme.
Field	Two or more register bits grouped together.
Fill	To add entries to a FIFO by software or hardware.
Host	Refers to another functional block in the device containing the QuadSPI module
Instruction Code	8 bits defining the type of command to be executed.
IP Command	An IP Command is a SFM Command triggered by writing into the QSPI_IPCR[SEQID] field.
Logic level one	The voltage that corresponds to Boolean true (1) state.
Logic level zero	The voltage that corresponds to Boolean false (0) state.
Negated	A signal that is negated is in its inactive state. An active low signal changes from logic level 0 to logic level 1 when negated, and an active high signal changes from logic level 1 to logic level 0.
QSPI_AMBA_BASE	First address of QuadSPI address space on system memory map.
QSPI_ARDB_BASE	First address of QuadSPI Rx Buffer on system memory map.

Table continues on the next page...

Table 40-2. Glossary (continued)

Term	Definition
Set	To set a bit or bits means to establish logic level one on the bit or bits.
RX Buffer PUSH Event	Addition of valid entries into the RX Buffer. In the default case each Buffer PUSH Event adds 2 entries to the RX Buffer since the interface to the serial clock domain is 64 bits in width. Depending on the number of bytes read from the serial flash device it is possible for the very last Buffer PUSH Event that only one entry is added. The QSPI_RBSR[RDBFL] field is incremented by the number of entries added to the RX Buffer.
RX Buffer POP Event	Removal of valid entries from the RX Buffer. Each Buffer POP Event removes (QSPI_RBCT[WMRK] + 1) valid entries from the buffer. The QSPI_RBSR[RDBFL] field is decremented by the same number and the QSPI_RBSR[RDCTR] field is incremented accordingly.
Individual Flash Mode	Access to a single, individual serial flash device. Refer to Serial Flash Access Schemes for details.
Parallel Flash Mode	Read access to two serial flash devices attached to the QuadSPI module in parallel. Refer to Serial Flash Access Schemes for details.
SFM Command	Serial Flash Memory Command. A SFM command consists of an instruction code and all other parameters (for example, size or mode bytes) needed for that specific instruction code. Triggering a command either initiates a transaction on the external serial flash or results in an error. Refer to Table 40-20 for details on errors.
Single/Dual/Quad Instructions	Depending on the serial flash device connected to the QuadSPI module there will be instructions using a different number of data lines. • Single: Single line I/O with one data out and one data in line to/from the serial flash device. • Dual: Dual line I/O with two bidirectional I/O lines, driven alternatively by the serial flash device or the QuadSPI module • Quad: Quad line I/O with 4 bidirectional I/O lines, driven alternatively by the serial flash device or the QuadSPI
Transaction	A transaction consists of all flags, data and signals in either direction to execute a command for an attached serial flash device. It is a combination of chip select, sclk, instruction code, address, mode- and/or dummy bytes, transmit and/or receive data.
LUT	Look-up table.

40.2 External Signals

The following table describes the external signals of QSPI:

Table 40-3. QSPI External Signals

Signal	Description	Pad	Mode	Direction
QSPI_A_DATA0	I/O data signal 1 port 0 for serial flash device A	NAND_READY_B	ALT0	I/O
QSPI_A_DATA1	I/O data signal 1 port 1 for serial flash device A	NAND_CE0_B	ALT0	I/O
QSPI_A_DATA2	I/O data signal 1 port 2 for serial flash device A	NAND_CE1_B	ALT0	I/O
QSPI_A_DATA3	I/O data signal 1 port 3 for serial flash device A	NAND_CLE	ALT0	I/O

Table continues on the next page...

Table 40-3. QSPI External Signals (continued)

Signal	Description	Pad	Mode	Direction
QSPI_A_SS0_B	Chip select 1 port 0 for serial flash device A	NAND_DQS	ALT0	O
QSPI_A_SS1_B	Chip select 1 port 1 for serial flash device A	NAND_DATA07	ALT0	O
QSPI_A_DQS	Data strobe signal 1 to serial flash device A	NAND_ALE	ALT0	I
QSPI_A_SCLK	Serial clock output 1 to serial flash device A	NAND_WP_B	ALT0	O
QSPI_B_DATA0	I/O data signal 1 port 0 for serial flash device B	NAND_DATA02	ALT0	I/O
QSPI_B_DATA1	I/O data signal 1 port 1 for serial flash device B	NAND_DATA03	ALT0	I/O
QSPI_B_DATA2	I/O data signal 1 port 2 for serial flash device B	NAND_DATA04	ALT0	I/O
QSPI_B_DATA3	I/O data signal 1 port 3 for serial flash device B	NAND_DATA05	ALT0	I/O
QSPI_B_SS0_B	Chip select 1 port 0 for serial flash device B	NAND_WE_B	ALT0	O
QSPI_B_SS1_B	Chip select 1 port 1 for serial flash device B	NAND_DATA00	ALT0	O
QSPI_B_DQS	Data strobe signal 1 to serial flash device B	NAND_DATA01	ALT0	I
QSPI_B_SCLK	Serial clock output 1 to serial flash device B	NAND_RE_B	ALT0	O

40.2.1 Driving External Signals

The different phases of serial flash access scheme are shown in the following figure.

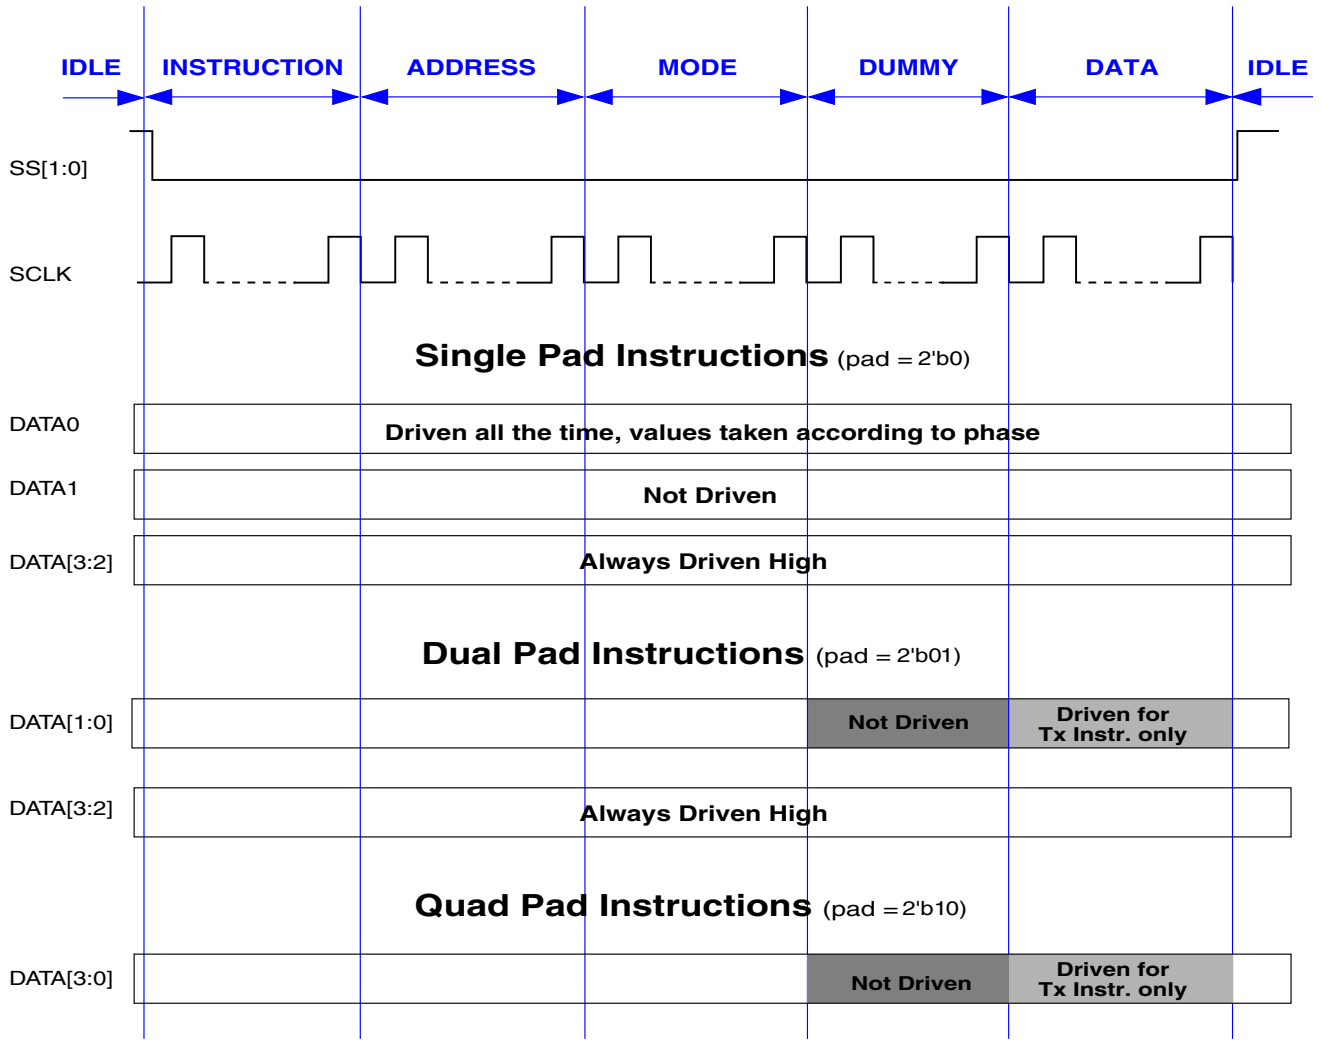

Figure 40-3. Serial Flash Access Scheme

The different phases and the I/O driving characteristics of the QuadSPI module are characterized in the following way:

- IDLE: Serial flash device not selected. No interaction with the serial flash device. All DATA signals driven.
- INSTRUCTION: Serial flash device selected. The instruction is sent to the serial flash device. All DATA signals are driven.
- ADDRESS: Serial Flash Address is sent to the device. All DATA signals are driven. Note that this phase is not applicable for all SFM Commands.
- MODE: Mode bytes are sent to the serial flash device. All DATA signals are driven. Note that this phase is not applicable for all SFM Commands.

- DUMMY: Dummy clocks are provided to the serial flash device. Refer to the Figure 40-3 for the DATA signals driven. The actual data lines required for the SFM Command executed are not driven for data read commands. Note that this phase is not applicable for all SFM Commands.
- DATA: Serial flash data are sent to or received from the serial flash device. Refer to the preceding figure for the DATA signals driven. The actual data lines required for the SFM Command executed are not driven for data read commands. Note that this phase is not applicable for all SFM Commands.

The SS[1:0] and SCLK signals are driven permanently throughout all the phases.

In Individual Flash Mode this applies to the selected flash device. In Parallel Flash Mode this applies to both serial flash devices simultaneously.

40.3 Memory Map and Register Definition

This section provides the memory map and register definitions of the QuadSPI module.

40.3.1 Register Write Access

This section describes the write access restriction terms that apply to all registers, which can be one of the following:

- **Register Write Access Restriction**

  For each register bit and register field, the write access conditions are specified in the detailed register description. A description of the write access conditions is given in the following table. If, for a specific register bit or field, none of the given write access conditions is fulfilled, any write attempt to this register bit or field is ignored without any notification. The values of the bits or fields are not changed.

  The condition term [A or B] indicates that the register or field can be written to if at least one of the conditions is fulfilled.

Table 40-4. Register Write Access Restrictions

Condition	Description
Anytime	No write access restriction.
Disabled Mode	Write access only if *QSPI_MCR[MDIS] = 1*.

Table continues on the next page...

Table 40-4. Register Write Access Restrictions (continued)

Condition	Description
Normal Mode	Write access only if the module is in *Normal Mode*.

- **Register Write Access Requirements**

  All registers can be accessed with 8-bit, 16-bit, and 32-bit wide operations. For some of the registers, at least a 16/32-bit wide write access is required to ensure correct operation. This write access requirement is stated in the detailed register description for each register affected.

40.3.2 Serial Flash Address Assignment

The serial flash address assignment may be modified by writing into Serial Flash A1 Top Address (QuadSPI_SFA1AD) and Serial Flash A2 Top Address (QuadSPI_SFA2AD) for device A and into Serial Flash B1Top Address (QuadSPI_SFB1AD) and Serial Flash B2Top Address (QuadSPI_SFB2AD) for device B. The following table shows how different access modes are related to the address specified for the next SFM Command. Note that this address assignment is valid for both IP and AHB commands.

Table 40-5. Serial Flash Address Assignment

Parameter	Function	Access Mode
QSPI_AMBA_BASE ((31:10) - 22 bits)	QuadSPI AHB base address	
TOP_ADDR_MEMA1(TPADA1)	Top address for the external flash A1 (first device of the dual die flash A, or the first of the two independent flashes sharing the IOFA)	Any access to the address space between TOP_ADDR_MEMA1 and QSPI_AMBA_BASE will be routed to **Serial Flash A1**
TOP_ADDR_MEMA2(TPADA2)	Top address for the external flash A2 (second device of the dual die flash A, or the second of the two independent flashes sharing the IOFA).	Any access to the address space between TOP_ADDR_MEMA2 and TOP_ADDR_MEMA1 will be routed to **Serial Flash A2**
TOP_ADDR_MEMB1(TPADB1)	Top address for the external flash B1 (first device of the dual die flash B, or the first of the two independent flashes sharing the IOFB)	Any access to the address space between TOP_ADDR_MEMB1 and TOP_ADDR_MEMA2 will be routed to **Serial Flash B1**
TOP_ADDR_MEMB2(TPADB2)	Top address for the external flash B2 (second device of the dual die flash B or the second of the two independent flashes sharing the IOFB)	Any access to the address space between TOP_ADDR_MEMB2 and TOP_ADDR_MEMB1 will be routed to **Serial Flash A2**

40.3.3 AMBA Bus Register Memory Map

QSPI_AMBA_BASE defines the address to be used as start address of the serial flash device as defined by the system memory map..

Table 40-6. QuadSPI AMBA Bus Memory Map

Address	Register Name
Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A	
QSPI_AMBA_BASE to (TOP_ADDR_MEMA2 - 0x01)	Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A Refer to Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A for details and to Table 40-14 and Table 40-18 for information about the byte ordering.
Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B	
TOP_ADDR_MEMA2 to (TOP_ADDR_MEMB2 - 0x01)	Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B Refer to Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B for details and to Table 40-14 and Table 40-18 for information about the byte ordering.
Parallel Flash Mode	
QSPI_AMBA_BASE to (TOP_ADDR_MEMB2 - 0x01)	Parallel Flash Mode Refer to Parallel Flash Mode for details and to Table 40-17 and Table 40-18 for information about the byte ordering.
AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31)	
QSPI_ARDB_BASE to… (32 * 4 Byte) QSPI_ARDB_BASE + 0x0000_01FF	AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31) Refer to Table 40-14 and Table 40-16 for information about the byte ordering.

Note

Any read access to non-implemented addresses will provide undefined results.

In case single die flash devices, TOP_ADDR_MEMA2 and TOP_ADDR_MEMB2 should be initialized/programmed to TOP_ADDR_MEMA1 and TOP_ADDR_MEMB1 respectively- in effect, setting the size of these devices to 0. This would ensure that the complete memory map is assigned to only one flash device.

Parallel Flash Mode is valid only for commands related to data read from the serial flash. The first device of flash A has to be paired with the first device of flash B and the second device of flash A has to be paired with the second device of flash B in parallel mode. Parallel mode is selected via the QSPI_BFGENCR[PAR_EN] bit for all masters in AHB driven mode and via the QSPI_IPCR[PAR_EN] in IP driven mode. In

parallel mode, the incoming address (SFAR address in case of IP initiated transactions and the incoming AHB address in case of AHB initiated transactions) is divided by 2 and sent to the two flashes connected in parallel.

Any IP Command other than data read in Parallel Flash Mode will result in the assertion of the QSPI_FR[IUEF] flag and any AHB Command other than data read in Parallel Flash Mode will result in the assertion of the QSPI_FR[ABSEF] flag.

In the Individual Flash Modes, the 3/4 address bytes (as programmed in the instruction/operand in the sequence) available for the flash address is determined by SFADR [23:0] or SFADR [31:0]as given in the table above.

In Parallel Flash Mode, both flashes are read with the same starting address of 3/4 (as programmed in the instruction/operand in the sequence) bytes in size. This address is derived from SFADR [24:1] or SFADR [31:1] as given in the table above. The LSB of the SFADR field is used to select the appropriate bits of both flash devices to combine the byte corresponding to the selected address.

40.3.4 AHB Bus Register Memory Map Descriptions

This chapter contains definitions of registers in the AMBA address space.

40.3.4.1 AHB Bus Access Considerations

It has to be noted that all logic in the QuadSPI module implementing the AHB Bus access is designed to read the content of an external serial flash device. Therefore the following restrictions apply to the QuadSPI module with respect to accesses to the AHB bus:

- Any write access is answered with the ERROR condition according to the AMBA AHB Specification. No write occurs.
- Any AHB Command resulting in the assertion of the QSPI_FR[ABSEF] flag is answered with the ERROR condition according to the AMBA_AHB specification. The resulting AHB Command is ignored.

- AHB Bus access types fully supported are NONSEQ and BUSY.
- AHB access type SEQ is treated in the same way like NONSEQ. Refer to the AMBA AHB Specification for further details.

40.3.4.2 Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A

Starting with address QSPI_AMBA_BASE the content of the first external serial flash devices is mapped into the address space of the device containing the QuadSPI module. Serial flash address byte address 0x0 corresponds to bus address QSPI_AMBA_BASE with increasing order. Assuming that a dual-die flash is connected on the first set of external pads, the address space is divided into two parts, one for each device of the dual die package. Refer to the following table for the address mapping. The byte ordering for 32 bit access is given in Table 40-14 and for 64 bit read access the byte ordering is given in Table 40-18.

Table 40-7. Memory Mapped Individual Flash Mode - Flash A Address Scheme

Memory Mapped Address 32 Bit Access	Memory Mapped Address 64 Bit Access	Serial Flash Byte Address	Flash Device
QSPI_AMBA_BASE + 0x00	QSPI_AMBA_BASE + 0x00	0x00_0000 to 0x00_0003	A1
QSPI_AMBA_BASE + 0x04		0x00_0004 to 0x00_0007	
…	…	…	
TOP_ADDR_MEMA1 - 0x08	TOP_ADDR_MEMA1 - 0x08	(TOP_ADDR_MEMA1- 0x08) to (TOP_ADDR_MEMA1 - 0x04 -0x01)	
TOP_ADDR_MEMA1 - 0x04		(TOP_ADDR_MEMA1 - 0x04) to (TOP_ADDR_MEMA1 - 0x01)	
TOP_ADDR_MEMA1 + 0x00	TOP_ADDR_MEMA1 + 0x00_0000	0x00_0000 to 0x00_0003	A2
TOP_ADDR_MEMA1 + 0x04		0x00_0004 to 0x00_0007	
…..	…	…	
TOP_ADDR_MEMA2 - 0x08	TOP_ADDR_MEMA2 - 0x08	(TOP_ADDR_MEMA2 - 0x08) to (TOP_ADDR_MEMA2 - 0x04 - 0x01)	
TOP_ADDR_MEMA2 - 0x04		(TOP_ADDR_MEMA2 - 0x04) to (TOP_ADDR_MEMA2 - 0x01)	

The available address range depends from the size of the external serial flash device. Any access beyond the size of the external serial flash provides undefined results.

For details concerning the read process refer to Flash Read.

40.3.4.3 Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B

Starting with address TOP_ADDR_MEMA2 the content of the first external serial flash devices is mapped into the address space of the device containing the QuadSPI module. Serial flash address byte address 0x0 corresponds to bus address TOP_ADDR_MEMA2 with increasing order. Assuming that a dual-die flash is connected on the first set of external pads, the address space is divided into two parts, one for each device of the dual die package. Refer the following table for the address mapping. The byte ordering for 32 bit access is given in Table 40-14 and for 64 bit read access the byte ordering is given in Table 40-18.

Table 40-8. Memory Mapped Individual Flash Mode - Flash B Address Scheme

Memory Mapped Address 32 Bit Access	Memory Mapped Address 64 Bit Access	Serial Flash Byte Address	Flash Device
TOP_ADDR_MEMA2 + 0x00	TOP_ADDR_MEMA2 + 0x00	0x00_0000 to 0x00_0003	B1
TOP_ADDR_MEMA2 + 0x04		0x00_0004 to 0x00_0007	
…	…	…	
TOP_ADDR_MEMB1 - 0x08	TOP_ADDR_MEMB1 - 0x08	(TOP_ADDR_MEMB1- TOP_ADDR_MEMA2 - 0x08) to (TOP_ADDR_MEMB1 - TOP_ADDR_MEMA2 - 0x04 -0x01)	
TOP_ADDR_MEMB1 - 0x04		(TOP_ADDR_MEMB1- TOP_ADDR_MEMA2 - 0x04) to (TOP_ADDR_MEMB1- TOP_ADDR_MEMA2- 0x01)	
TOP_ADDR_MEMB1 + 0x00	TOP_ADDR_MEMB1 + 0x00_0000	0x00_0000 to 0x00_0003	B2
TOP_ADDR_MEMB1 + 0x04		0x00_0004 to 0x00_0007	
…..	…	…	
TOP_ADDR_MEMB2 - 0x08	TOP_ADDR_MEMA2 - 0x08	(TOP_ADDR_MEMB2 - TOP_ADDR_MEMB1- 0x08) to (TOP_ADDR_MEMB2 - TOP_ADDR_MEMB1 - 0x04 - 0x01)	
TOP_ADDR_MEMB2 - 0x04		(TOP_ADDR_MEMB2- TOP_ADDR_MEMB1 - 0x04) to (TOP_ADDR_MEMB2 - TOP_ADDR_MEMB1 - 0x01)	

The available address range depends from the size of the external serial flash device. Any access beyond the size of the external serial flash provides undefined results.

For details concerning the read process refer to Flash Read.

40.3.4.4 Parallel Flash Mode

Any of the AHB flexible-buffers can be configured to work in parallel flash mode by programming the QSPI_BFGENCR[PAR_EN] bit to '1'. When parallel mode is set, Flash A1 is paired with Flash B1 and Flash A2 is paired with Flash B2. In parallel mode, software should ensure that the size of Flash A1(A2) is equal to the size of Flash B1(B2).

Reads from any even AHB bus address provides bits [7:4] of both serial flash devices and reads from any odd AHB bus address provides bits [3:0] of both flash devices. Refer to the following table for the address mapping. The byte ordering for 32 bit access is given in Table 40-16 and for 64 bit read access the byte ordering is given in Table 40-18.

Table 40-9. Memory Mapped Parallel Flash Mode Address Scheme

Memory Mapped Address 32 Bit Access	Memory Mapped Address 64 Bit Access	Serial Flash A Byte Address	Serial Flash B Byte Address
QSPI_AMBA_BASE + 0x0000_0000	QSPI_AMBA_BASE + 0x00 For details, please refer to Parallel mode and Dual Die Flashes.	0x00_0000 - 0x00_0001	0x00_0000 - 0x00_0001
QSPI_AMBA_BASE + 0x0000_0004		0x00_002 - 0x00_0003	0x00_0002 - 0x00_0003
QSPI_AMBA_BASE + 0x0000_0008	QSPI_AMBA_BASE + 0x08	0x00_0004 - 0x00_0005	0x00_0004 - 0x00_0005
QSPI_AMBA_BASE + 0x0000_000C		0x00_0006 - 0x00_0007	0x00_0006 - 0x00_0007
…	…	…	…
TOP_ADDR_MEMB2 - 0x08	TOP_ADDR_MEMB2 - 0x08	(TOP_ADDR_MEMB2 - QSPI_AMBA_BASE - 0x08)/2	(TOP_ADDR_MEMB2 - QSPI_AMBA_BASE - 0x08)/2
TOP_ADDR_MEMB2 - 0x04		(TOP_ADDR_MEMB2 - QSPI_AMBA_BASE - 0x04)/2 +0x01	(TOP_ADDR_MEMB2 - QSPI_AMBA_BASE- 0x04)/2 + 0x01

The available address range covers 27 address bits, corresponding to 128 MB per flash device. The usable space depends from the size of the external serial flash devices. Any access beyond the size of the external serial flash provides undefined results.

For details concerning the read process refer to Flash Read.

40.4 Interrupt Signals

The interrupt request lines of the QuadSPI module are mapped to the internal flags according to the following table.

Table 40-10. Assignment of Interrupt Request Lines

IRQ/DMA line	QSPI_FR Flag	Interrupt Description
ipi_int_tfff	TBFF	TX Buffer Fill
ipi_int_tcf	TFF	Peripheral Command Transaction Finished
ipi_int_rfdf	RBDF	RX Buffer Drain
ipi_int_overrun		Buffer Overflow/Underrun Error Logical OR from:
	RBOF	RX Buffer Overrun
	TBUF	TX Buffer Underrun
	ABOF	AHB Buffer Overflow
ipi_int_cerr		Serial Flash Command Error Logical OR from:
	IPAEF	Peripheral access while AHB busy Error
	IPIEF	Peripheral Command could not be triggered Error
	IPGEF	Peripheral access while AHB Grant Error
	IUEF	Peripheral Command Usage Error
ipi_int_ored	DLPFF, TBFF, TFF, ILLINE, RBDF, RBOF, TBUF, ABSEF, ABOF, IPAEF, IPIEF, IPGEF, IUEF	Logical OR from all the QSPI_FR flags mentioned

40.5 Functional Description

This section provides the functional information of the QuadSPI module.

40.5.1 Serial Flash Access Schemes

The Quad Serial Peripheral Interface (QuadSPI) block acts as an interface to one single or two external serial flash devices, each with up to 4 bidirectional data lines. Depending from the serial flash devices attached to the QuadSPI module the following access schemes are possible:

Table 40-11. Access Schemes for Serial Flash Data Access

Access Scheme	One Flash Device on Port A	One Flash Device on Port B	Two identical Flash Devices connected on Port A and Port B
Individual Flash Mode: Access to Flash A	Yes	N/a	Yes
Individual Flash Mode: Access to Flash B	N/a	Yes	Yes
Parallel Flash Mode: Read from Flash A and Flash B	N/a	N/a	Yes

Note

If two flash devices are accessed in Parallel Flash Mode, they are accessed with identical control signals. Special alignment on per-flash basis is **not** possible. It is within the responsibility of the application to ensure that the identical signals are applicable to both flash devices.

In Parallel Flash Mode, both external serial flash devices appear logically as one single memory doubled in size with respect to one individual flash device.

If two different flash devices are attached, they can be operated only in Individual Flash Mode.

In the Parallel Flash Mode, only data read commands are supported. Any other IP Command will result in an error condition signaled by the assertion of the QSPI_FR[IUEF] flag and any other AHB Command will result in the assertion of the QSPI_FR[ABSEF] flag.

In the Individual Flash Mode, all supported commands are available.

Unless explicitly noted, all the following descriptions relate to the Individual Flash Mode.

40.5.2 Modes of Operation

Refer to QuadSPI Modes of Operation for an overview over the possible operational modes of the QuadSPI block.

- Normal Mode can be used for write or read accesses to an external serial flash device.

- Serial Flash Write: Data can be programmed into the flash via the IP interface only. Refer to Flash Programming for further details.
- Serial Flash Read: Read the contents of the serial flash device. Two separate read channels are available via RX Buffer and AHB Buffer, see Flash Read.

- Stop Mode: The mode is used for power management. When a request is made to enter Stop Mode, the QuadSPI block acknowledges the request and completes the SFM Command in progress, then the system clocks to the QuadSPI block may be shut off
- Module Disable Mode: The mode is used for power management. The clock to the non-memory mapped logic in the QuadSPI can be stopped while in Module Disable Mode. The module enters the mode by setting QSPI_MCR[MDIS].

40.5.3 Normal Mode

This mode is used to allow communication with an external serial flash device. Compared to the standard SPI protocol, this communication method uses up to 4 bidirectional data lines operating at high data rates. The communication to the external serial flash device consists of an instruction code and optional address, mode, dummy and data transfers. The flexible programmable core engine described below is immune to a wide variety of command/protocol differences in the serial flash devices provided by various flash vendors.

40.5.3.1 Programmable Sequence Engine

The core of the QuadSPI module is a programmable sequence engine that works on "instruction-operand" pairs. The core controller executes each programmed instruction sequentially. The complete list of instructions and the corresponding operands is given in the following table.

Table 40-12. Instruction set

Instruction	Instruction encoding	Pins	Operand	Action on Serial Flash(es)
CMD	6'd1	N=2'd{0,1,2} 2'd0 - One pad 2'd1 - Two pads	8 bit command value	Provide the serial flash with operand on the number of pads specified

Table continues on the next page...

Table 40-12. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on Serial Flash(es)
ADDR	6'd2	2'd2 - Four pads	Number of address bits to be sent (for example, 8'd24 => 24 address bits required)	Provide the serial flash with address cycles according to the operand on the number of pads specified. The actual address to be provided will be derived from the incoming address in case of AHB initiated transactions and the value of SFAR in case of IPS initiated transactions .
DUMMY	6'd3		Number of dummy clock cycles (should be <= 64 cycles)	Provide the serial flash with dummy cycles as per the operand. The PAD information defines the number of pads in input mode. (for example, one pad implies that pad 1 is not driven, rest all are driven)
MODE	6'd4		8 bit mode value	Provide the serial flash with 8 bit operand on the number of pads specified
MODE2	6'd5	N=2'd{0,1}	2 bit mode value	Provide the serial flash with 2 bit operand on the number of pads[1] specified
MODE4	6'd6	N=2'd{0,1,2}	4 bit mode value	Provide the serial flash with 4 bit operand on the number of pads[2] specified
READ	6'd7	N=2'd{0,1,2} 2'd0 - One pad 2'd1 - Two pads 2'd2 - Four pads	Read data size in bytes (for AHB transactions, the user's application should ensure that data size is a multiple of 8 bytes)	Read data from flash on the number of pads specified. The data size may be overwritten by writing to the ADATSZ field of the QSPI_BUFxCR registers for AHB initiated transactions and IDATSZ field of IP Configuration Register (QuadSPI_IPCR) for IP initiated transactions.
WRITE	6'd8		Write data size in bytes	Write data on number of pads sepcified. The data size may be overwritten by writing to the IDATSZ field of IP Configuration Register (QuadSPI_IPCR) register
JMP_ON_CS	6'd9	NA	Instruction number	Every time the CS is deasserted, jump to the instruction pointed to by the operand. This instruction allows the programmer to specify the behavior of the controller when a new read transaction is initiated following a CS deassertion.
ADDR_DDR	6'd10	N=2'd{0,1,2} 2'd0 - One pad 2'd1 - Two pads 2'd2 - Four pads	Number of address bits to be sent (for example, 8'd24 => 24 address bits required)	Provide the serial flash with address cycles according to the operand on the number of pads specified at each clock edge of serial flash clock. The actual address to be provided will be derived from the incoming address in case of AHB initiated transactions and the value of QSPI_SFAR in case of IPS initiated transactions .
MODE_DDR	6'd11		8 bit mode value	Provide the serial flash with 8 bit operand on the number of pads specified at each clock edge of serial flash.
MODE2_DDR	6'd12	N=2'd{0}	2 bit mode value	Provide the serial flash with 2 bit operand on the number of pads specified at each clock edge of serial flash[3]
MODE4_DDR	6'd13	N=2'd{0,1}	4 bit mode value	Provide the serial flash with 4 bit operand on the number of pads specified at each clock edge of serial flash[4].

Table continues on the next page...

Table 40-12. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on Serial Flash(es)
READ_DDR	6'd14	N=2'd{0,1,2} 2'd0 - One pad 2'd1 - Two pads 2'd2 - Four pads	Read data size in bytes (for AHB transactions, the user's application should ensure that data size is in multiple of 8 bytes)	Read data from flash on the number of pads specified at each clock edge of serial flash. The data size may be overwritten by writing to the ADATSZ field of the QSPI_BUFxCR registers for AHB initiated transactions and IDATSZ field of IP Configuration Register (QuadSPI_IPCR) for IP initiated transactions
WRITE_DDR	6'd15		Write data size in bytes	Write data on the number of pads specified at each clock edge of serial flash. The data size may be overwritten by writing to the IDATSZ field of IP Configuration Register (QuadSPI_IPCR) register
DATA_LEARN[5]	6'd16		8 bit Data learning pattern	Find the correct sampling point with the data learning pattern. When this instruction is encountered, the QSPI_SMPR[DDRSMP] values are ignored and the controller finds the correct sampling point on its own by sampling the data learning pattern.[6]
STOP	8'd0	NA	NA	Stop execution; deassert CS

1. For a one pad instruction, MODE2 will take 2 serial flash clock cycles on the flash interface.
2. For a one pad instruction, MODE4 will take 4 serial flash clock cycles on the flash interface. For a 4 pad instruction, MODE4 will take 1 serial flash clock cycle on the flash interface.
3. For a one pad instruction, MODE2_DDR will take 1 serial flash clock cycle on the flash interface.
4. For a one pad instruction, MODE4_DDR will take 2 serial flash clock cycles on the flash interface. For a 4 pad instruction MODE4_DDR will take half a cycle on the serial flash interface.
5. Data learning is not implemented on this chip.
6. t is not recommended to have 0x00 or 0xFF as the data learning pattern.

A sequence of such instruction-operand pairs may be pre-populated in the LUT according to the device connected on board. Each instruction-operand pair is of 16 bits (2 bytes) each. Every sequence pre-programmed in the LUT is referred to by its index.

The programmable sequence engine allows the user to configure the QuadSPI module according to the serial flash connected on board. The flexible structure is easily adaptable to new command/protocol changes from different vendors.

40.5.3.2 Flexible AHB buffers

In order to reduce the latency of the reads for AHB masters, the data read from the serial flash is buffered in flexible AHB buffers. There are four such flexible buffers. The size of each of these buffers is configurable with the minimum size being 0 Bytes and maximum size being the size of the complete buffer instantiated.The size of buffer 0 is defined as being from 0 to QSPI_BUF0IND. The Size of buffer 1 is from QSPI_BUF0IND to

QSPI_BUF1IND, buffer2 is from QSPI_BUF1IND to QSPI_BUF2IND and buffer 3 is from QSPI_BUF2IND to the size of the complete buffer, which is given in the chip-specific QuadSPI information.

Each flexible AHB buffer is associated with the following

1. An AHB master. Optionally, buffer3 may be configured as an "all master" buffer by setting the QSPI_BUF3CR[ALLMST] bit. When buffer3 is configured in such a way, any access from a master not associated with any other buffer is routed to buffer3.
2. A datasize field representing the amount of data to be fetched from the flash on every "missed" access.

The master port number of every incoming request is checked and the data is returned/ fetched into the corresponding associated buffer. Every "missed" access to the buffer causes the controller to clear the buffer and fetch QSPI_BUFxCR[ADATSZ] amount of data from the serial flash.As such, there is no benefit in configuring a buffer size of greater than ADATSZ, as the locations greater than ADATSZ will never be used. For any AHB access, the sequence pointed to by the QSPI_BFGENCR[SEQID] field is used for the flash transaction initiated. The data is returned to the master as soon as the requested amount is read from the serial flash. The controller however, continues to prefetch the rest of the data in anticipation of a next consecutive request. Figure 40-4 shows the flexible AHB buffers.

The QSPI_BFGENCR[SEQID] field points to an index of the LUT. Refer to Look-up Table for details.

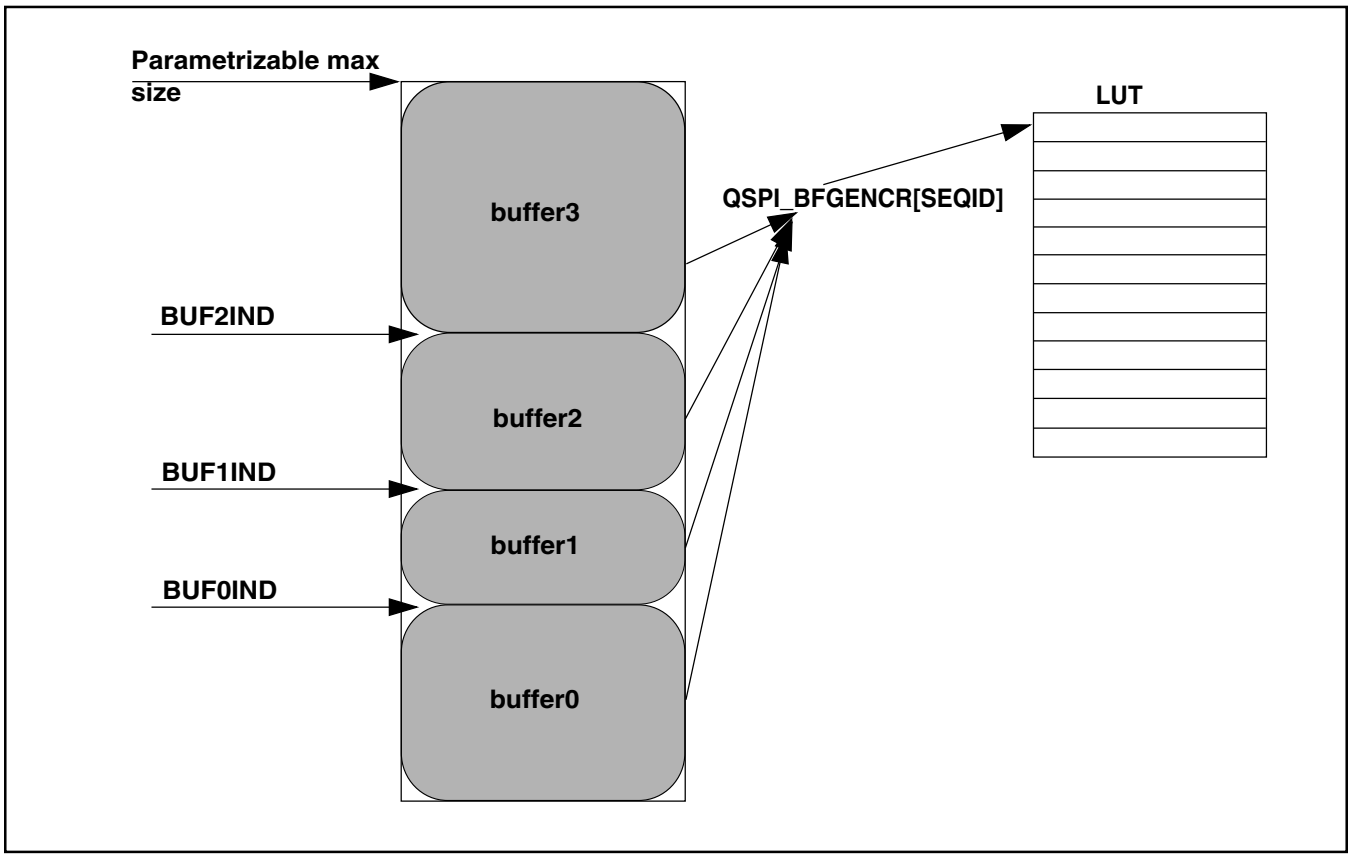

Figure 40-4. Flexible AHB Buffers

Buffer0 may optionally be configured to be associated with a high priority master by setting the QSPU_BUF0CR[HP_EN] bit. An access by a high priority master suspends any ongoing prefetch to any of the other buffers. The ongoing prefetch is suspended and the high priority master is serviced first. Once the high priority masters access completes, the suspended transaction is resumed (before any other AHB access is entertained). The status of the suspended buffer can be read from Sequence Suspend Status Register (QuadSPI_SPNDST).

40.5.3.3 Suspend-Abort Mechanism

Any low priority AHB access can be suspended by a high priority AHB master request. The ongoing transaction is suspended at 64 bit boundary. The suspended transaction is restarted after the high priority master is served and the high priority transaction including data prefetch is completed. While a transaction is in suspended state, it may be aborted if a transaction by the same suspended master is made to a location which is different from the location of the suspended transaction.

Any ongoing transaction is aborted if a request from the same master arrives for a location other than the location at which the transaction is going on. The abort can happen at any point of time.

40.5.3.4 Look-up Table

The Look-up-table or LUT consists of a number of pre-programmed sequences. Each sequence is basically a sequence of instruction-operand pairs which when executed sequentially generates a valid serial flash transaction. Each sequence can have a maximum of 8 instruction-operand pairs. The LUT can hold a maximum of sequences. The figure below shows the basic structure of the sequence in the LUT.

At reset, the index 0 of the look-up-table (LUT[0..3]) is programmed with a basic read sequence as given in Table 40-13. After reset the complete LUT may be reprogrammed according to the device connected on board.In order to protect its contents during a code runover the LUT may be locked, after which a write to the LUT will not be successful until it has been unlocked again.The key for locking or unlocking the LUT is **0x5AF05AF0**. The process for locking and un-locking the LUT is as follows:

Locking the LUT

1. Write the key **(0x5AF05AF0)** in to the LUT Key Register (QuadSPI_LUTKEY).
2. Write 0b01 to the LUT Lock Configuration Register (QuadSPI_LCKCR). Note that this IPS transaction should immediately follow the above IPS transaction (no other IPS transaction can be issued in between). A successful write into this register locks the LUT.

Unlocking the LUT

1. Write the key **(0x5AF05AF0)** into the LUT Key Register (QuadSPI_LUTKEY)
2. Write 0b10 to the LUT Lock Configuration Register (QuadSPI_LCKCR). Note that this IPS transaction should immediately follow the above IPS transaction (no other IPS transaction can be issued in between). A successful write into this register unlocks the LUT.

The lock status of the LUT can be read from QSPI_LCKCR[UNLOCK] and QSPI_LCKCR[LOCK] bit.

Some example sequences are defined in Example Sequences. The reset sequence at LUT index 0 is given in the following table.

Table 40-13. Reset sequence

Instruction	Pad	Operand	Comment
CMD	0x00	0x03	Read Data byte command on one pad
ADDR	0x00	0x18	24 Addr bits to be sent on one pad
READ	0x00	0x08	Read 64 bits
JMP_ON_CS	0x00	0x00	Jump to instruction 0 (CMD)

40.5.3.5 Issuing SFM Commands

Each access to the external device follows the same sequence:

1. The user must pre-populate the LUT with the serial flash command sequences that are required for the flash device being used.
2. The QuadSPI module starts executing the instructions in the sequence one by one. The transaction starts and the status bit QSPI_SR[BUSY] is set.
3. Communication with the external serial flash device is started and the transaction is executed.
4. When the transaction is finished (all transmit- and receive operations with the external serial flash device are finished) the status bit QSPI_SR[BUSY] is reset. In case of an IP Command the QSPI_FR[TFF] flag is asserted.

Further details are given in below in Flash Programming and Flash Read.

You can trigger the processing of SFM commands in the QuadSPI module in one of the following ways:

- **Using IP commands**

  For IP Commands the required components need to be written into the following registers:

  - Write the serial flash address to be used by the instruction into QSPI_SFAR, refer to Serial Flash Address Register (QSPI_SFAR). For IP Commands not related to specific addresses, the base address of the related flash need to be programmed.For example, for an instruction which does not require an address (i.e. write enable instruction) the SFAR should be programmed with the base address of the memory the command is to be sent to.

- Write the sequence ID and data size details in the IP Configuration Register (QSPI_IPCR).
- Note that the write into the QSPI_IPCR[SEQID] field must be the last step of the sequence. It is possible to combine all fields of the QSPI_IPCR into one single write. Refer to IP Configuration Register (QSPI_IPCR) for details.

Note that there are some conditions where no IP Command is executed after writing the QSPI_IPCR[SEQID] field and the write operation itself is ignored. They are described in Command Arbitration.

- **Using AHB commands**

  Any AHB memory mapped access is routed to one of the buffers depending on the master port number of the request. If the access is a "miss", a new serial flash transaction is started. The transaction is based on the sequence pointed to by the BFGENCR[SEQID] field as described in Flexible AHB buffers.

  An AHB access is termed memory mapped when the access is to the memory mapped serial flashes, as described in Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A and Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B.

  Again the possible error conditions are described in Command Arbitration .

40.5.3.6 Flash Programming

In all cases the memory sector to be written needs to be erased first. The programming sequence itself is then initiated in the following way:

1. Check that the TX Buffer is empty. If the QSPI_SR[TXEDA] bit is set then the TX Buffer must be cleared by writing 1 into the QSPI_MCR[CLR_TXF] bit.
2. Program the address related to the command in the QSPI_SFAR register.
3. Provide initial data for the program command into the circular buffer via register TX Buffer Data Register (QSPI_TBDR) . At least four word of data must be written into the TX Buffer up to a maximum of 32.
4. Program the QSPI_IPCR register to trigger the command. The QSPI_IPCR[SEQID] should point to an index of the LUT which has the flash program sequence pre-programmed.The IDATSZ field should be set to denote the size of the write.

5. Depending on the amount of data required, step 3 must be repeated until all the required data have been written into the QSPI_TBDR register.The QSPI_SR[TXFULL] can be used to check if the buffer is ready to receive more data. At any time, the QSPI_TBSR[TRCTR] field can be read to check how many words have been written actually into the TX Buffer.

Upon writing the QSPI_IPCR[SEQID] field (refer to step 4) the QuadSPI module will start to execute the programmed sequence. It is the responsibility of the software to ensure that a correct sequence is programmed into the LUT in accordance with the flash memory connected to the module. The data is fetched from the TX Buffer. It consists of **32** entries of 32-bits and is organized as a circular FIFO, whose read pointer is incremented by four after each fetch. When all data are transmitted, the QuadSPI module will return from 'busy' to 'idle'. However, this is not true for the external device since the internal programming is still ongoing. It is up to the user to monitor the relevant status information available from the serial flash device and to ensure that the programming is finished properly.

40.5.3.7 Flash Read

Host access to the data stored in the external serial flash device is done in two steps. First, the data must be read into the internal buffers and in the second step these internal buffers can be read by the host.

1. **Reading Serial Flash Data into the QuadSPI Module Internal Buffers**

   A read access to the external serial flash device can be triggered in two different ways:

   - **IP Command Read**: For **reading flash data into the RX Buffer** the user must provide the correct sequence ID in the QuadSPI_IPCR[SEQID] register. The sequence ID points to a sequence in the LUT. It is the responsibility of the software to ensure that a correct read sequence is programmed in the LUT in accordance with the serial flash device connected on board. The user should program the Serial Flash Address Register (QSPI_SFAR) and the IP Configuration Register (QSPI_IPCR) registers. All available read commands supported by the external serial flash are possible.

     Optionally it is possible to clear the RX Buffer pointer prior to triggering the IP Command by writing a 1 into the QuadSPI_MCR[CLR_RXF] field.

     From these inputs, the complete transaction is built when the QSPI_IPCR[SEQID] field is written. The transaction related to the read access starts and the requested number of bytes is fetched from the external serial flash

device into the RX Buffer. Since the read access is triggered by an IP command, the IP_ACC status bit and the BUSY bit are both set (both are located in the Status Register (QSPI_SR)). A count of the number of entries currently in the Rx Buffer can be obtained from QSPI_RBCT[RXBRD].

The communication with the external serial flash is stopped when the specified number of bytes has been read (successful completion of the transaction).

- **AHB Command Read**: For **reading flash data into the AHB Buffer** the user must set up a read access by a master to the address range in the system memory map which the external serial flash devices are mapped to. The user should also program the buffer registers corresponding to the AHB master initiating the request, this is depends on the configuration of the QSPI_RBCT[RXBRD]. The user should provide the correct sequence ID into the buffer generic configuration register (QSPI_BFGENCR). It is the responsibility of the software to ensure that a correct read sequence in programmed in the LUT in accordance with the serial flash device connected on board. Flash device selection and access mode are determined by the address accessed in the AHB address space associated to the QuadSPI module (refer to Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A, Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B and Parallel Flash Mode.)

  On each AHB read access to the memory mapped area the valid data in the AHB Buffer is checked against the address requested in the actual read. When the AHB read request can't be served from the content of the AHB Buffer, the buffer is flushed and the sequence pointed to by the sequence ID is executed by the controller. The requested number of buffer entries defined in the QSPI_BUFxCR[ADATSZ] field is then fetched from the external serial flash device into the internal AHB Buffer. Since the read access is triggered via the AHB bus, the QSPI_SR[AHB_ACC] status bit is set driving in turn the QSPI_SR[BUSY] bit until the transaction is finished. The communication with the external serial flash is stopped when the specified number of entries has been filled.

2. **Data Transfer from the QuadSPI Module Internal Buffers**

   The data read out from the external serial flash device by the QuadSPI module is stored in the internal buffers.The means of accessing the data from the buffer differs depending on which buffer the data has been loaded to. Refer to Block Diagram for details about the two available buffers, the RX Buffer and the AHB Buffer, in the QuadSPI module:

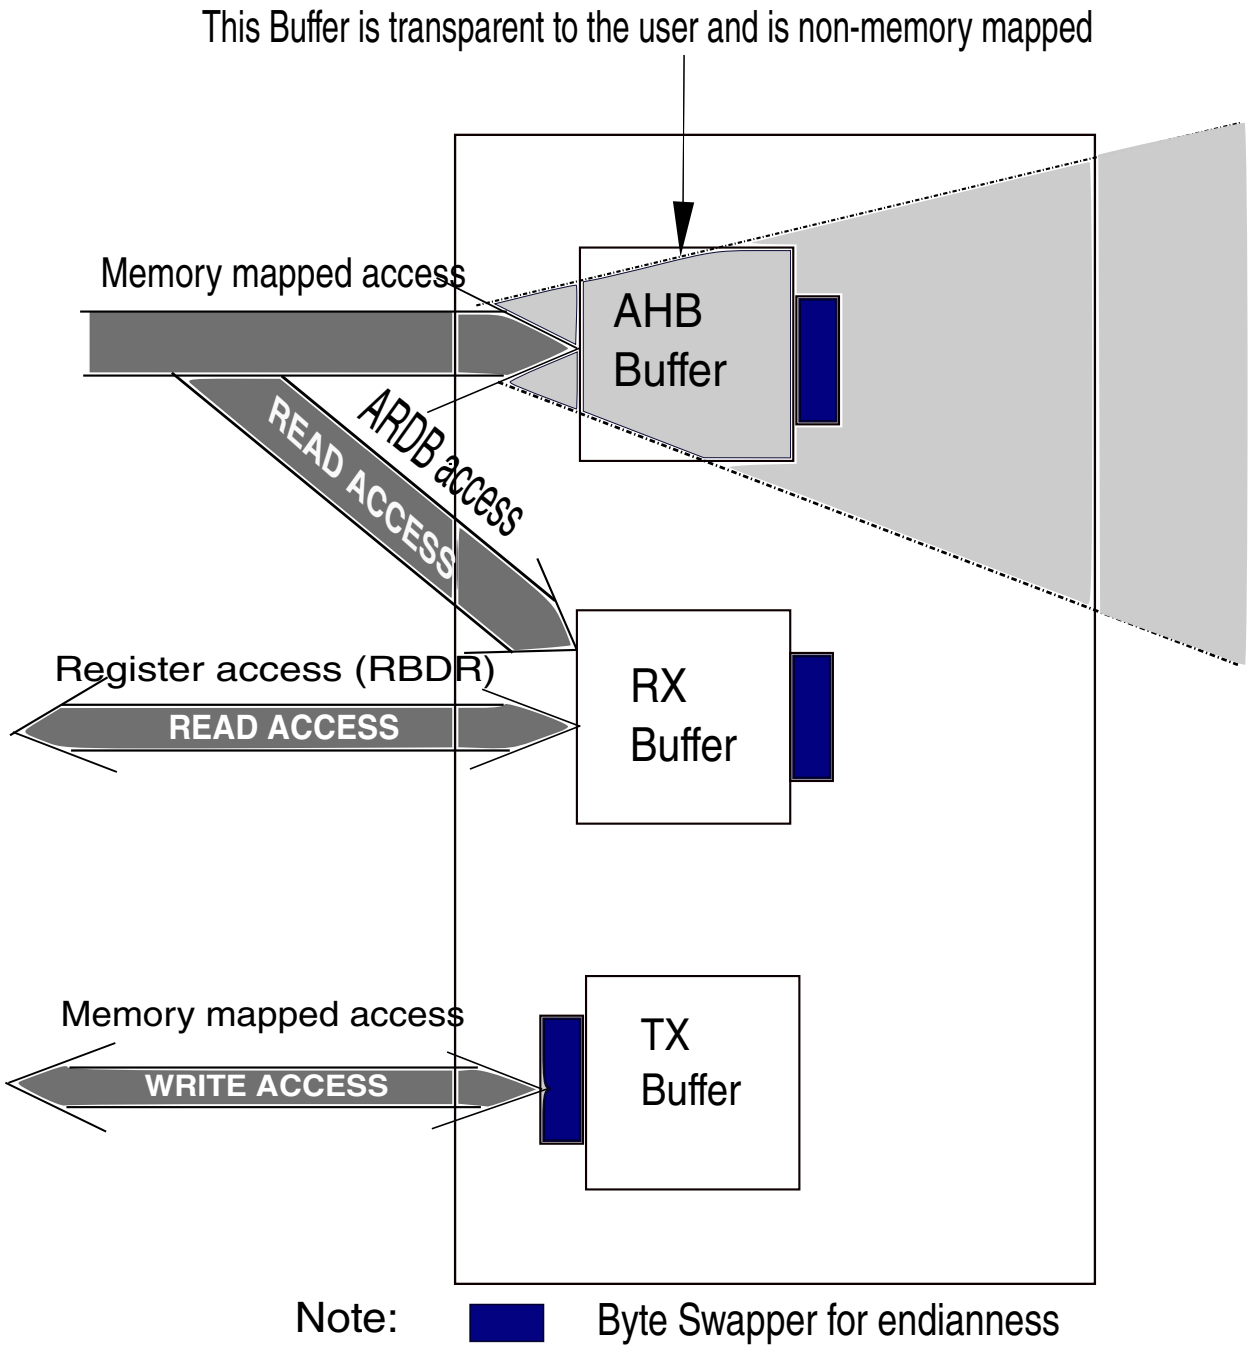

Figure 40-5. QuadSPI memory map

- The RX Buffer is implemented as FIFO of depth 32 entries of 4 bytes. Its content is accessible in two different address areas both referring to the identical data and the same physical memory.

  In the IPS address space in the area associated to QSPI_RBDR0 to QSPI_RBDR31

  In the AHB address space in the area associated to QSPI_ARDB0 to QSPI_ARDB31. Two successive entries are accessed with one single 64 bit AHB read operation.

RX Buffer operation can be summarized as follows: The QSPI_RBCT[WMRK] field determines at which fill level the RXWE bit is asserted and how many entries are removed from the RX Buffer on each Buffer POP operation. So the QSPI_SR[RXWE] bit indicates that the configured number of data entries is available in the RX Buffer and the QSPI_RBSR[RDBFL] field indicates how many valid entries are available in total. Note that the first entry (QSPI_RBDR0 or QSPI_ARDB0) always corresponds to the first valid entry in the RX Buffer. The software needs to manage the number of valid data bytes itself.

Further details can be found in RX Buffer Data Register (QuadSPI_RBDR*n*) and in AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31).

- **Flag-based Data Read of the RX Buffer** is done by polling the QSPI_SR[RXWE] bit. When it is asserted the valid entries can be read either via the IPS address space (QSPI_RBDRn) or the AHB address space (QSPI_ARDBn). A Buffer POP operation must be triggered by the application by writing a 1 into the QSPI_FR[RBDF] bit - this automatically updates the FIFO to point to the next entry as defined by RBCT[WMRK]. For example, if WMRK is set to 3, then the buffer will discard 16 bytes of data.
- **DMA controlled Data Read of the RX Buffer** is done by using the DMA module.The application must ensure that the DMA controller of the related device is programmed appropriately like it is described in DMA Usage.

  DMA controlled read out is triggered fully automatically by the assertion of the QSPI_SR[RXWE] bit. The related Buffer POP operation is also handled completely inside the QuadSPI module. Like in the case above, accessing the RX Buffer content either on QSPI_RBDRn or QSPI_ARDBn related addresses is equivalent.

- **AHB Buffer data read via memory mapped access:** This kind of access is done by reading one of the addresses assigned to the external serial flash device(s) within the range given in Table 40-6 table *under the condition that the data requested are already present in the AHB Buffer or it is currently being read from the serial flash device by the instruction in progress.* If this is not the case a memory mapped AHB command read is triggered as described above. If the requested data is already available in the AHB Buffer they are provided directly to the host.

  When AHB access are made to the flash memory mapped address, the data will be fetched and returned to the AHB interface. Till the data is being fetched the AHB interface would be stalled. As soon as the data from the requested address has been read by the QuadSPI module the AHB read access is served. So it is possible to run sequential reads from the AHB buffer at arbitrary speed without

the need to monitor any information about the availability of the data. Nevertheless this access scheme stalls the AHB bus for the time required to read the data from the serial flash device. A better way is (when it is known the access is sequential) to have a prefetch enabled (by programming the ADATSZ field) such that before the next sequential AHB access come, the data is already fetched into the buffer.

As long as the host restricts its accesses to the data already in the buffer and the data currently fetched from the serial flash, it is possible to run the host read from the AHB Buffer in parallel to the serial flash read into the AHB Buffer.

40.5.3.8 Byte Ordering of Serial Flash Read Data

In this paragraph the byte ordering of the serial flash data is given. The basic scheme is that the **first** byte read out of the serial flash device - which is addressed by the QSPI_SFAR[SFADR] field - corresponds to bit position QSPI_RBDR0[31:24] register for IP Command read. In contrast to that for AHB Command read the bytes are always positioned according to the byte ordering of the AHB bus.

- **Byte Ordering in Individual Flash Mode**

  The following table gives the byte ordering scheme of how the byte oriented data space of the serial flash device is mapped into one single 32 bit entry of the RX Buffer or the AHB Buffer. The table is valid within the following context:

  - Flash A or Flash B in Individual Flash Mode
  - All AHB data read commands with access size of 32 bit

Table 40-14. Byte Ordering in Individual Flash Mode

Serial Flash Byte Numbering	3	2	1	0
Buffer Entry Bit Position [31:0] (32 Bit data width)	[31:24]	[23:16]	[15:8]	[7:0]

Note

For IP Commands the read size can be given in number of bytes. If this number is not a multiple of 4, then the last buffer entry is not completely filled with the missing higher numbered bytes at undefined values.

For AHB Commands, reads, starting from an address not aligned to 32 bit boundaries, the requested bytes are given at the appropriate positions according to the AMBA AHB specification.

- **Byte Ordering in Parallel Flash Mode**

  In Parallel Flash Mode each byte is combined out of 2 half bytes which are read in parallel from the two serial flash devices. The following tables shows how the flash content is separated into the half bytes and how the half bytes are assembled to the content of the QSPI_RBDR0 register.

Table 40-15. Serial Flash Device Half Byte Ordering

Serial Flash Device Byte #	Flash A Bit Position		Flash B Bit Position	
	[7:4]	[3:0]	[7:4]	[3:0]
0	fah0	fal0	fbh0	fbl0
1	fah1	fal1	fbh1	fbl1
2	fah2	fal2	fbh2	fbl2
3	fah3	fal3	fbh3	fbl3
4	fah4	fal4	fbh4	fbl4
5	fah5	fal5	fbh5	fbl5
6	fah6	fal6	fbh6	fbl6
7	fah7	fal7	fbh7	fbl7
8	fah8	fal8	fbh8	fbl8

The table entry naming reflects the half byte positioning in the serial flash devices:

- **<fa>**h0 means **Flash A**, <fb>h0 means Flash B.
- fa**<h>**0 means half byte in **high position**, fa<l>o means half byte in low position.
- fah**<0>** means **physical byte address 0** in the serial flash device, fal<1> means physical byte address 1 in the serial flash device.

Table 40-16. Byte Ordering in Parallel Flash Mode - RX Buffer

QSPI_SFAR[SFADR] set to 0x000_0000

Table continues on the next page...

Table 40-16. Byte Ordering in Parallel Flash Mode - RX Buffer (continued)

QSPI_RBDR0 **QSPI_ARDB0**	fal1	fbl1	fah1	fbh1	fal0	fbl0	fah0	fbh0
QSPI_RBDR1 **QSPI_ARDB1**	fal3	fbl3	fah3	fbh3	fal2	fbl2	fah2	fbh2
QSPI_SFAR[SFADR] set to 0x000_0001								
QSPI_RBDR0 **QSPI_ARDB0**	fal2	fbl2	fah2	fbh2	fal1	fbl1	fah1	fbh1
QSPI_RBDR1 **QSPI_ARDB1**	fal4	fbl4	fah4	fbh4	fal3	fbl3	fah3	fbh3

Note

For IP Commands the read size can be given in number of bytes. If this number is not a multiple of 4 the last buffer entry is not completely filled with the missing higher numbered bytes at undefined values.

* Appicable only for single io mode.

Table 40-17. Byte Ordering in Parallel Flash Mode - AHB Buffer

AHB Address **(32 Bit Access)**	fal1	fbl1	fah1	fbh1	fal0	fbl0	fah0	fbh0
AHB Address 0x800_0004 **(32 Bit Access)**	fal3	fbl3	fah3	fbh3	fal2	fbl2	fah2	fbh2

Note

For AHB Command read starting from an address not aligned to 32 bit boundaries or AHB access size smaller than 32 bit the requested bytes are given at the appropriate positions according to the AMBA AHB specification.

- **Buffer Entry Ordering for 64 Bit Read Access**

For read access via the AHB interface 64 bit access is possible. Each 64 bit access reads 2 32 bit entries simultaneously. The ordering of these 32 bit entries within the 64 bit word is given in the following table.

Table 40-18. 64 Bit Read Access Buffer Entry Ordering

AHB Read Data Bit Position [63:0]	[63:32]	[31:0]
Buffer Entry #	Odd (1, 3, 5, ...)	Even (0, 2, 4, ...)

40.5.3.9 Normal Mode Interrupt and DMA Requests

The QuadSPI module has different flags that can only generate interrupt requests and one flag that can generate interrupt as well as DMA requests. The following table lists the eight conditions. Note that the flags mentioned in the table are related to the Flag Register (QSPI_FR).

Table 40-19. Interrupt and DMA Request Conditions

Condition	Flag(QSPI_FR)	DMA
Data Learn patttern Failure	DLPFF	-
TX Buffer Fill	TBFF	-
TX Buffer Underrun	TBUF	-
Illegal Instruction Error	ILLINE	-
RX Buffer Drain	RBDF	X
RX Buffer Overflow	RBOF	-
AHB Buffer Overflow	ABOF	-
AHB Sequence Error	ABSEF	-
IP Command Usage Error	IUEF	-
IP Command Trigger during AHB Access Error	IPAEF	-
IP Command Trigger could not be executed Error	IPIEF	-
IP Access during AHB Grant Error	IPGEF	-
IP Command related Transaction Finished	TFF	-

Each condition has a flag bit in the Flag Register (QSPI_FR) and a Request Enable bit in the DMA Request Select and Enable Register (QSPI_RSER) . The RX Buffer Drain Flag (RBDF) has separate enable bits for generating IRQ and DMA requests. Note that not all flags have an individual IRQ line. Check the devices Interrupt Vector Table for more details.

- Transmit Buffer Fill Interrupt Request:

  The Transmit Buffer Fill IRQ indicates that the TX Buffer can accept new data. It is asserted if the QSPI_FR[TBFF] flag is asserted and if the corresponding enable bit (QSIP_RSER[TBFIE]) is set. Refer to TX Buffer Operation, for details about the assertion of the QSPI_FR[TBFF] flag.

- Receive Buffer Drain Interrupt or DMA Request:

  The Receive Buffer Drain IRQ derived from the QSPI_FR[RBDF] flag indicates that the RX Buffer of the QuadSPI module has data available from the serial flash device to be read by the host. It remains set as long as the QSPI_RBSR[RXWE] bit is set. The QSPI_RSER[RBDIE] bit enables the related IRQ.

  Aside from the IRQ it is possible to handle RX Buffer drain by DMA. If the QSPI_RSER[RBDDE] bit is set, a DMA request will be triggered when the RX Buffer contains more than QSPI_RBCT[WMRK] valid entries.The application must set the environment appropriately (for example, the DMA controller) for the DMA transfers.

- Buffer Overflow/Underrun Interrupt Request:

  The Buffer Overflow/Underrun IRQ is a combination of the following flags (all located in the QSPI_FR register with the related enable bits in the QSPI_RSER register):

  - TBUF - TX Buffer Underrun, enabled by TBUIE
  - RBOF - RX Buffer Overflow, enabled by RBOIE
  - ABOF - AHB Buffer Overflow, enabled by ABOIE

    The Transmit Buffer Underrun indicates that an underrun condition in the TX Buffer has occurred. It is generated when a write instruction is triggered whilst the Tx Buffer is empty and the QSPI_RSER[TFUFIE] bit is set.

    The Receive Buffer Overflow indicates that an overflow condition in the RX Buffer has occurred. It is generated when the RX Buffer is full, an additional read transfer attempts to write into the RX Buffer and the QSPI_RSER[RBOIE] bit is set.

    The AHB Buffer Overflow indicates that an overflow condition in the AHB Buffer has occurred. It is generated when the AHB Buffer is full, an additional read transfer attempts to write into the AHB Buffer and the QSPI_RSER[ABOIE] bit is set.

    The data from the transfers that generated the individual overflow conditions is ignored.

- Serial Flash Command Error Interrupt Request

  If the IPAEF, IPIEF, IPGEF or IUEF flags in the QSPI_FR are set, and the related interrupt enable bits in the QSPI_RSER are also set, then an interrupt is requested.

- Transaction Finished Interrupt Request

  The IP Command Transaction Finished IRQ indicates the completion of the current IP Command.It is triggered by the QSPI_FR[TFF] flag and is masked by the QSPI_RSER[TFIE] bit.

40.5.3.10 TX Buffer Operation

The TX Buffer provides the data used for page programming. For proper operation it is required to provide at least four entry in the TX Buffer prior to starting the execution of the page programming command. The application must ensure that the required number of data bytes is written into the TX Buffer fast enough as long as the command is executed without a TX Buffer overflow or underrun.

The QuadSPI module sets the QSPI_FR[TBFF] flag so long as the TX Buffer is not full and can accept more data.

When the QuadSPI module tries to pull data out of an empty TX Buffer the TX Buffer underrun is signaled by the QSPI_FR[TBUF] flag.The TX buffer underrun flag is also asserted when TX buffer contains less than 128 bits of data and QuadSPI module tries to pull out data from it. The current IP Command leading to the underrun condition is continued until the specified number of bytes has been sent to the serial flash device, in the underrun condition when QuadSPI module tries to pull out data of empty TX buffer, the data transferred is all F's i.e. once the underrun flag is set under this condition, it will return F's until the required number of bytes are not sent. This has been done to ensure that the software need not to erase whole sector after underrun, just reprogramming from failure point will serve the purpose. When this Sequence Command is finished, the QSPI_FR[TBFF] flag is asserted indicating that the Tx Buffer is ready to be written again.

The TX Buffer overflow isn't signaled explicitly, but the TX Buffer fill level can be monitored by the QSPI_TBSR[TRBFL] field.

Refer to TX Buffer Status Register (QuadSPI_TBSR) and Flag Register (QuadSPI_FR) for details about the TX Buffer related registers.

40.5.3.11 Address scheme

Earlier serial flash memories supported only 24-bit address space hence restricting the maximum memory size of the serial flash as 16 MB. The new memory specification supports two types of 32-bit addressing mode in addition to legacy 24-bit address mode.

- **Extended Address Mode**

  In this mode, the legacy 24-bit commands are converted to accept 32-bit address commands. The flash memory needs to be configured for 32-bit address mode. Also, while programming the LUT sequence in QuadSPI for 32-bit mode, the ADDR and ADDR_DDR command should be programmed with 8'd32 as the operand value. By default, the QuadSPI is in 24-bit legacy address mode. Each of the memory vendors have a different way of enabling this mode (Refer to the memory specification from memory vendors). For example, the command B7h sent to Macronix flash will enable it for 32-bit address mode.

- **Extended Address register**

  In this mode, the upper 8-bit of the 32-bit address is provided by the Extended address register in the memory itself. The memory provides a specific register which is updated according to the address to be accessed. This effectively converts the legacy 24-bit address command into 32-bit address commands. The memories greater in size than 16 MB, consists of banks of 16 MB. The 8-bit written in the extended address register effectively enables a bank. For example in Spansion memory, when the extended address register is updated with a value of 0x01 with the help of the command 17h, it will open Bank1 of the memory. The consequent 24-bit address commands will lead to Bank1. The extended address register needs to be update with the respective value for access to other banks. This effectively converts the legacy 24-bit address command into 32-bit address commands.

40.6 Initialization/Application Information

This section provides the initialization and application information of the QuadSPI module.

40.6.1 Power Up and Reset

Note that the serial flash devices connected to the QuadSPI module may require special voltage characteristics of their inputs during power up or reset. It is the responsibility of the application to ensure this.

40.6.2 Available Status/Flag Information

This paragraph gives an overview of the different status and flag information available and their interdependencies for different use cases. Related registers are QSPI_SR and QSPI_FR. Refer to the related descriptions how to set up the QuadSPI module appropriately.

40.6.2.1 IP Commands

Refer to IP Configuration Register (QuadSPI_IPCR) for additional details not explicitly covered in this paragraph.

- **IP Commands - Normal Operation**

  Writing the QSPI_IPCR[SEQID] field triggers the execution of a new IP Command. Given that this is a legal command the QSPI_SR[IPACC] and the QSPI_SR[BUSY] bits are asserted simultaneously, immediately after the execution is started.

  When the instruction on the serial flash device has been finished these bits are de-asserted and the QSPI_FR[TFF] flag is set.

- **IP Commands - Error Situations**

  Refer to Table 40-20 below.

40.6.2.2 AHB Commands

Refer to Section 1, Reading Serial Flash Data into the QuadSPI Module, in Flash Read for additional details not explicitly covered in this paragraph.

- **AHB Commands - Normal Operation**

  Memory mapped read access to a serial flash address not contained in the AHB Buffer, triggers the execution of an AHB Command. Given that this is a legal command the QSPI_SR[AHBACC] and the QSPI_SR[BUSY] bits are asserted simultaneously immediately after the execution is started. When the instruction on the serial flash device has been finished these bits are de-asserted.

- **IP Commands - Error Situations**

  Refer to Table 40-20 below.

40.6.2.3 Overview of Error Flags

The following table gives an overview of the different error flags in the QSPI_FR register and additional error-related details.

Table 40-20. Overview of QSPI_FR Error Flags

Error Category	Error Flag in QSPI_FR	Command Execution on Serial Flash Device TFF Behavior (in case of IP commands only)	Description
AHB Error Flag	ABSEF	Flash transaction is aborted	AHB sequence contains • WRITE instruction • WRITE_DDR instruction
AHB Error Flag	ABOF	Flash transaction continues until it finishes	Set when the module tried to push data into the AHB buffer that exceeded the size of the AHB buffer. Only occurs due to wrong programming of the QSPI_BUFxCR[ADATSZ].
Miscellaneous Error Flag	DLPFF[1]	Flash transaction continues until it finishes	Set when DATA_LEARN instruction was encountered in a sequence but no sampling point was found for the data learning pattern.
Miscellaneous Error Flag	ILLINE	Flash transaction aborted	Illegal instruction Error Flag – Set when an illegal instruction is encountered by the controller in any of the sequences.
Command Arbitration Error	IPIEF	TFF not asserted in conjunction with that command	IP Command Error - caused when IP access is currently in progress (IP_ACC set) and • write attempt to QSPI_IPCR register. • write attempt to QSPI_SFAR register. • write attempt to QSPI_RBCT register.
Command Arbitration Error	IPAEF		• AHB Command already running, another IP Command could not be executed. • AHB Command already running, write attempt to QSPI_IPCR[SEQID] field.
Command Arbitration Error	IPGEF		• Exclusive access to the serial flash granted for AHB Commands, write attempt to QSPI_IPCR[SEQID] field.
IP Command Error	IUEF	—	• IP Command Usage Error

Table continues on the next page...

Table 40-20. Overview of QSPI_FR Error Flags (continued)

Error Category	Error Flag in QSPI_FR	Command Execution on Serial Flash Device TFF Behavior (in case of IP commands only)	Description
Buffer Related Error	RBOF	TFF is asserted on completion	• RX Buffer Overrun
Buffer Related Error	TBUF		• TX Buffer Underrun

1. Data learning is not implemented on this chip.

Note that only the buffer related errors are related to a transaction on the external serial flash. All the other errors do not trigger an actual transaction.

40.6.2.4 IP Bus and AHB Access Command Collisions

There are two flags related to this topic, the QSPI_FR[IPAEF] and QSPI_FR[IPIEF]. Refer to sub-section "Reading Serial Flash Data into the QuadSPI Module" of Flash Read section, for a description of the flags and Command Arbitration , for details about possible command collisions.

40.6.3 Exclusive Access to Serial Flash for AHB Commands

It is possible that several masters need to access the serial flash device connected to the QuadSPI module separately, one master by triggering IP Commands and reading the RX Buffer (via RBDR*n* register) and the other masters by triggering AHB Commands (via ARDB*n* Registers). These two set of buffer (RBDR and ARDB Buffer) points to the same physical buffer.Refer to Figure 40-5 To avoid command collisions resulting in excessive latencies the QuadSPI module implements a request-handshake mechanism between the master triggering AHB Commands and the QuadSPI module allowing this specific master to request exclusive access to the serial flash device for AHB Commands. If this exclusive access is granted the execution of IP Commands is blocked. This resolves command collisions and excessive times where the AHB interface may be blocked.

If this capability is used in the device there is additional status and flag information available related to this mechanism. The QSPI_SR[AHBGNT] bit reflects the module-internal state that the exclusive access mentioned above is granted, any attempt to trigger an IP Command is rejected and results in the assertion of the QSPI_FR[IPGEF] flag. Refer to the descriptions of the related bit and flag for details.

It is within the responsibility of the application to set up the master using this mechanism appropriately, if used incorrectly no IP Commands at all can be triggered.

Two different cases can be distinguished:

40.6.3.1 RX Buffer Read via QSPI_ARDB Registers

In this case all masters share the AHB bus for RX Buffer as well as for AHB Buffer read. In this case the access to the AHB interface by the master triggering AHB Commands must be deferred until any pending IP Command has been finished **and** the RX Buffer readout has been finished as well. The QSPI ARDB Buffers access the Rx buffer i.e the data from the Rx Buffer is returned and no data from AHB Buffer is touched. This is the conservative use case, corresponding to the reset value 0 of the QSPI_RBCT[RXBRD] bit.

In this case the QSPI_SR[AHBGNT] bit is asserted not earlier than any running IP Command has been finished (QSPI_SR[IP_ACC] is 0), the RX Buffer has been read out completely (QSPI_RBSR[RDBFL] equal to 0) or no DMA read is pending (QSPI_SR[RXDMA] equal to 0 and Rx Buffer readout is via AHB(QSPI_RBCT[RXBRD]) equal to 1.

40.6.3.2 RX Buffer Read via QSPI_RBDR Registers

This is the preferred use case as an access to the AHB buffer (memory mapped flash) does not interfere with any IPS access to read the RBDR buffer. It is not possible that a pending AHB bus access triggered by an AHB Command stalls the AHB bus and blocks the RX Buffer readout since the RX Buffer is read via the IP bus based registers QSPI_RBDR0 to QSPI_RBDR31.

For this case it is recommended to program the QSPI_RBCT[RXBRD] bit to 1. The QSPI_SR[AHBGNT] bit is asserted immediately after any running IP Command has been finished (QSPI_SR[IP_ACC] is 0), the RX Buffer has been read out completely (QSPI_RBSR[RDBFL] equal to 0) or no DMA read is pending (QSPI_SR[RXDMA] equal to 0, allowing the master triggering AHB Commands to trigger AHB Commands as soon as possible without the need to wait for the RX Buffer readout to be finished.

40.6.4 Command Arbitration

In case of overlapping commands, the arbitration scheme is described in the following paragraphs under the assumption that the priority mechanism described in Exclusive Access to Serial Flash for AHB Commands is **not** used:

- During the execution of an IP Command, the running IP Command can't be terminated by issuing another IP Command or AHB Command. The QSPI_FR[IPIEF] flag is asserted when the host tries to write into the QSPI_IPCR register. When the host triggers an AHB Command (refer to sub-section "Reading Serial Flash Data into the QuadSPI Module" of Flash Read section, for details), this command is stalled until the currently running IP Command is finished.
- During the execution of an AHB Command, the running AHB Command can't be terminated by issuing an IP Command. The command is ignored and the QSPI_FR[IPAEF] flag is asserted. Refer to Flag Register (QuadSPI_FR) for the description of these flags.

  When another AHB Command is triggered the address of the memory mapped access is considered. If the requested address is currently read from the serial flash device, the running command is continued. If this is not the case the currently running command is terminated and another AHB Command related to the requested address is executed. Refer to sub-section "Reading Serial Flash Data into the QuadSPI Module" of Flash Read section, for further details.

In case of coinciding commands the IP Command is triggered and the AHB Command is stalled until the IP Command has been finished (QSPI_SR[IP_ACC] has been deasserted).

The IP Commands ignored in case of command collision will not result in the assertion of the QSPI_FR[TFF] flag.

40.6.5 Flash Device Selection

Regardless of the SFM Command (IP or AHB) the access mode is selected by specifying the 32 bit address value for the following SFM Command.

For IP Commands the access mode is selected with the address programmed into the QSPI_SFAR register. Refer to Serial Flash Address Register (QuadSPI_SFAR) for details.

For AHB Commands the access mode is determined by the memory mapped address which is accessed Refer to AMBA Bus Register Memory Map for details.

40.6.6 DMA Usage

For the complete description of the DMA module refer to the related DMA Controller chapter. In this paragraph only the details specific to the DMA usage related to the QuadSPI module are given.

40.6.6.1 DMA Usage in Normal Mode

40.6.6.1.1 Bandwidth considerations

Careful consideration of the throughput rate of the entire chain (serial flash -> AHB bus / IP Bus -> DMA controller) involved in the read data process is essential for proper operation. Such analysis must take into account not only the data rate provided by the serial flash but also the data rate of the AHB bus and the performance of the DMA controller in reading data from the RX buffer.

Two figures must match for proper operation, that means that the data rate provided by the serial flash device must not exceed the average RX Buffer readout data rate. Otherwise, the longer this state persists, a RX Buffer overflow will result.

AHB Bus Side (data read):

The total number of bus cycles for each DMA Minor Loop completion is added from the following components:

- Overhead for each minor loop, given by DMA controller: Assume 10 cycles
- Overhead due to clock domain crossing: Assume 2 cycles
- Number of bus clock cycles required for 8 bytes (64 bit read size): Assume 2 cycles (read/write sequence of DMA controller)

Note that the size of the minor loop is determined by the size of the QSPI_RBCT[WMRK] field, therefore the overhead given above distributes among (QSPI_RBCT[WMRK]+1)/2 read accesses of 64 bit each.

The following table gives some examples for typical use cases:

Table 40-21. Access Duration Examples - Bus Clock Side

QSPI_RBCT[WMRK]	Number of Bytes per DMA Loop [1]	Number of Bus Clock cycles for DMA Minor Loop	Time Duration of DMA Minor Loop for 120Mhz Bus clock Frequency
0	4	12+2 = 14	~117ns

Table continues on the next page...

Table 40-21. Access Duration Examples - Bus Clock Side (continued)

QSPI_RBCT[WMRK]	Number of Bytes per DMA Loop [1]	Number of Bus Clock cycles for DMA Minor Loop	Time Duration of DMA Minor Loop for 120Mhz Bus clock Frequency
1	8	12+2 = 14	~117ns
3	16	12+4 = 16	~133ns
7	32	12+8 = 20	~167ns
11	48	12+12 = 24	~200ns

1. DMA Loop means one Minor Loop Completion which is equivalent to one.

NOTE

The table figure represents ideal scenario, actual performance will depend on how the system is integrated.

Serial Flash Device Side (data read):

The number of serial flash cycles can be determined in the following way:

- Number of serial flash clock cycles required to read 4 bytes, corresponding to one RX Buffer entry (setup of command and address not considered): 2 cycles for Quad DDR mode instructions in Parallel Flash Mode, 4 cycles for Quad (SDR) mode instruction in parallel flash mode or Dual IO DDR mode instruction in parallel flash mode, 8 cycles for Quad Mode (SDR) instructions in Individual Flash Mode etc.
- Overhead due to clock domain crossing : 1 cycle.

The following table lists the number of clock cycles required to read the data from the serial flash corresponding to the different settings of the QSPI_RBCT[WMRK] field:

Table 40-22. Access Duration Examples - Serial Flash side

QSPI_RBCT[WMRK] setting	Num Bytes per DMA Loop [1]	Num SCKFx for 60MHz SCKFx			Time duration of Flash data readout for 60MHz SCKFx (~16.6ns period)		
		IFM [2] Quad	IFM Quad DDR	PFM [3] Quad DDR	IFM Quad	IFM Quad DDR	PFM Quad DDR
0	4	9	5	3	~150ns	~83ns	~50ns
1	8	17	9	5	~282ns	~150ns	~83ns
3	16	33	17	9	~548ns	~282ns	~150ns
7	32	65	33	17	~1079ns	~548ns	~282ns
11	48	97	49	25	~1610ns	~813ns	~415ns

1. DMA Loop means one Minor loop completion which is equivalent to one Major Loop iteration.
2. Individual flash mode.
3. Parallel flash mode.

From the examples given in the two tables above, it can be seen that depending on the relationship between the Bus clock and Serial flash clock frequencies, there are settings possible where the serial flash provides the read data faster than the AHB bus can read out the RX buffer. In the above tables, it is the case of PFM Quad DDR mode with Watermark up to 3 and other cases. In these cases, the RX buffer data keeps accumulating over time and will eventually overflow. To avoid RX Buffer overflow, the data transaction size should be small enough.

A complementary example would be when the watermark is set to be too high. In such a case, the time taken by the DMA to read out the RX buffer entries should be smaller than the time taken by the controller to push in the remaining entries in the buffer.

NOTE

The tables mentioned above are only examples which must be correlated with the DMA in the system.

40.6.7 Parallel mode

QuadSPI can access two flashes in parallel. This increases the throughput of the QuadSPI by two times. Only read operations are allowed in parallel mode. In case a write transaction is initiated in parallel mode, QSPI_FR[IUEF] is set. When dual die flashes are accessed in parallel mode, it is mandatory for flash A1 to be of the same size as B1 and A2 to be of the same size as B2. The following figure shows how QuadSPI maps the incoming addresses to the different flashes connected on board.

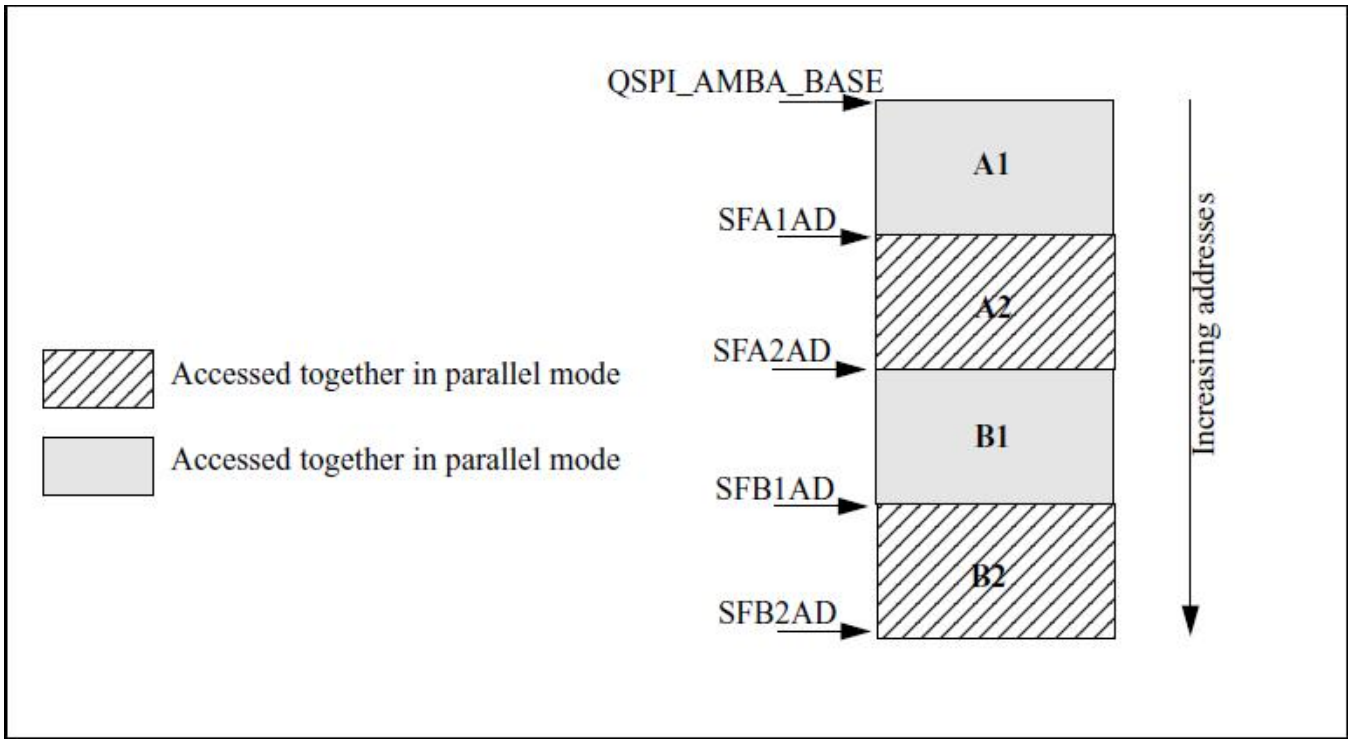

Figure 40-6. Flash addressing

An example programming for parallel mode access is given below (flash sizes are assumed to be 256MB):

- QSPI_AMBA_BASE - 0x10000000
- QSPI_SFA1AD[TPADA1] - 0x20000000
- QSPI_SFA2AD[TPADA2] - 0x30000000
- QSPI_SFB1AD[TPADB1] - 0x40000000
- QSPI_SFB2AD[TPADB2] - 0x50000000

In order to access the first location of A1/B1 pair, the incoming address should be 0x10000000. QSPI_AMBA_BASE is subtracted from this address and the result is divided by two. Therefore, address provided to flash A1 and B1

Flash Address = (Memory mapped address - QSPI_AMBA_BASE)/2

For Memory Mapped address:

- 0x10000000, flash address: 0x0 (Or, the first address of flash A1 and B1)
- 0x10000004, flash address: 0x2
- 0x10000008, flash address: 0x4 etc.

Similarly, in order to access the first location of A2/B2 pair, the incoming address should be 0x30000000.

Flash Address = (Memory mapped address - SFA2AD)/2

For Memory Mapped address:

- 0x30000000, flash address: 0x0 (Or, the first address of flash A2 and B2)
- 0x30000004, flash address: 0x2
- 0x30000008, flash address: 0x4 etc.

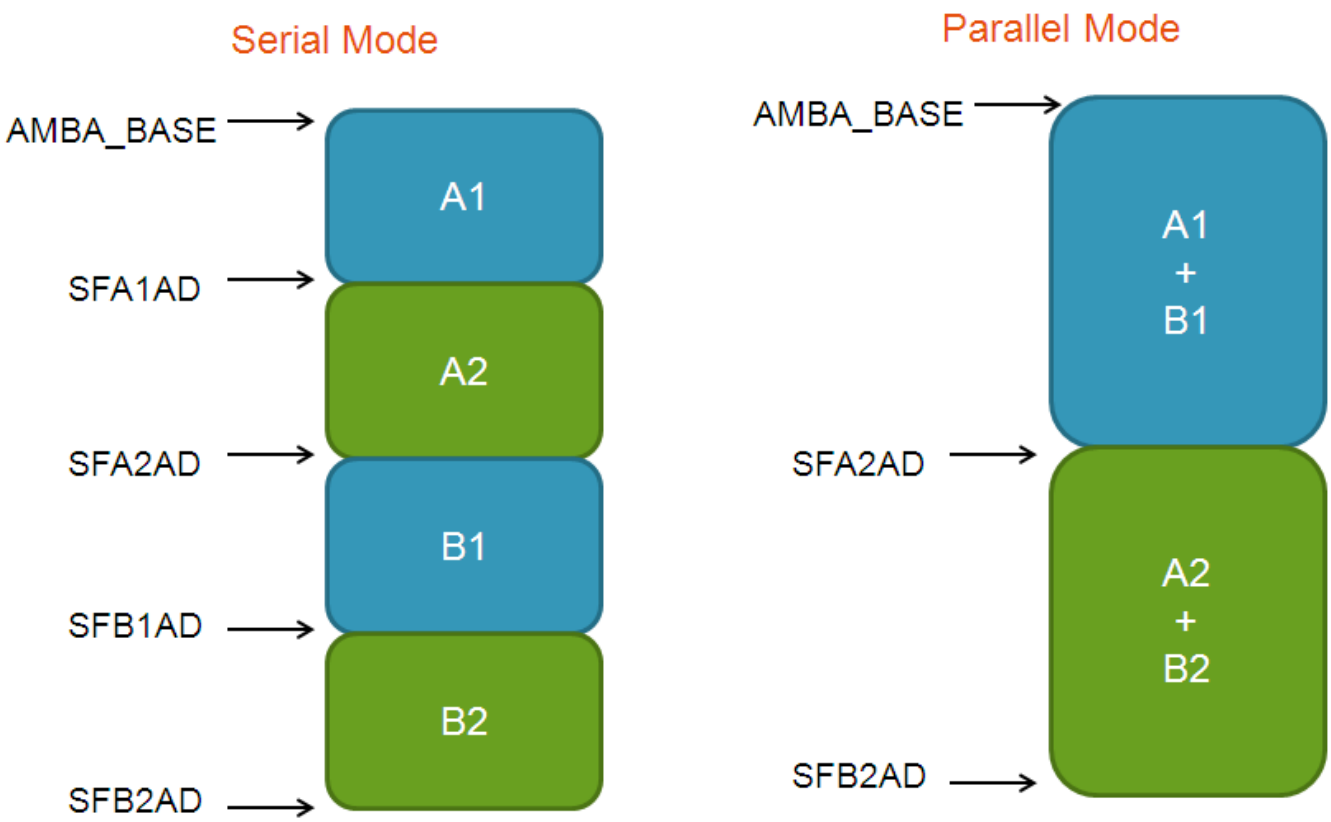

Figure 40-7. Memory map - Serial and Parallel

40.7 Byte Ordering - Endianness

QuadSPI provides support for swapping the flash read/write data based on the configuration of the QSPI_MCR[END_CFG]. By default the data is always returned in 64 bit LE format on the AHB bus and 32 bit LE format on the IPS interface when read via the RX buffer and written in 32 bit LE format when written via the TX buffer.

The table(QSPI_MCR[END_CFG]) below shows the complete bit ordering. BE signifies Big Endian which means the high order bits of the associated data vectors are associated with low order address positions. LE signifies Little Endian which means the lower order bits of the associated data vectors are associated with low order address positions.Refer to figure Figure 40-5

Table 40-23. QSPI_MCR[END_CFG]

00	64 bit BE
01	32 bit LE
10	32 bit BE
11	64 bit LE

The tables below (Byte ordering configuration in AHB) and (Byte ordering configuration in IPS) show how this configuration is implemented in QSPI AHB and IPS interfaces respectively. B in the table signifies Byte and the index 1-8 refers to the byte position i.e. 1 refer to bits[7:0], 8 refer to bits[63:56] and so on.

Table 40-24. Byte ordering configuration in AHB

64 bit BE	B1	B2	B3	B4	B5	B6	B7	B8
64 bit LE	B8	B7	B6	B5	B4	B3	B2	B1
32 bit BE	B5	B6	B7	B8	B1	B2	B3	B4
32 bit LE	B4	B3	B2	B1	B8	B7	B6	B5

Table 40-25. Byte ordering configuration in IPS

32BE	B1	B2	B3	B4
32LE	B4	B3	B2	B1

The examples below show the byte ordering in 64 bit BE configuration for AHB Buffer and 32 bit BE for TX/RX Buffer:

40.7.1 Programming Flash Data

CPU write instructions to the QSPI_TBDR register like

- Write QSPI_TBDR -> 0x01_02_03_04
- Write QSPI_TBDR -> 0x05_06_07_08

result in the following content of the TX Buffer:

Table 40-26. Example of QuadSPI TX Buffer

TX Buffer Entry	Content
0	32'h01_02_03_04
1	32'h05_06_07_08

Programming the TX Buffer into the external serial flash device results in the following byte order to be sent to the serial flash:

- 01…02…03…04…05…06…07…08

40.7.2 Reading Flash Data into the RX Buffer

Reading the content from the same address provides the following sequence of bytes, identical to the write case:

- 01…02…03…04…05…06…07…08

This results in the RX Buffer filled with:

Table 40-27. Resulting RX Buffer Content

RX Buffer Entry	Content
0	32'h01_02_03_04
1	32'h05_06_07_08

40.7.2.1 Readout of the RX Buffer via QSPI_RBDRn

The RX Buffer content appears at CPU read access via the Peripheral bus interface in the following order:

- Read QSPI_RBDR0 <- 0x01_02_03_04
- Read QSPI_RBDR1 <- 0x05_06_07_08

40.7.2.2 Readout of the RX Buffer via ARDBn

The RX Buffer content appears at read access on the AMBA AHB interface at the QuadSPI module boundary:

- (1a): 32 Bit Access: Read QSPI_ARDB0 <- 0x01_02_03_04
- (2a): 32 Bit Access: Read QSPI_ARDB1 <- 0x05_06_07_08
- (1b/2b): 64 Bit Access: Read QSPI_ARDB0 <- 0x01_02_03_04_05_06_07_08

40.7.3 Reading Flash Data into the AHB Buffer

Reading the content from the same address as it was written to provides the following sequence of bytes, identical to the write case:

- 01…02…03…04…05…06…07…08

This results in the AHB Buffer filled with:

Table 40-28. Resulting AHB Buffer Content

AHB Buffer Entry	Content
0	64'h01_02_03_04_05_06_07_08

40.7.3.1 Readout of the AHB Buffer via Memory Mapped Read

The AHB Buffer content appears at read access on the AMBA AHB interface at the QuadSPI module boundary:

- (1a): 32 Bit Read Access: <- 0x01_02_03_04
- (2a): 32 Bit Read Access: <- 0x05_06_07_08
- (1/2): 64 Bit Read Access: <- 0x01_02_03_04_05_06_07_08

40.8 Serial Flash Devices

Several different vendors make flash devices with a QuadSPI interface. At present there is no set standard for the QuadSPI instruction set. Most common commands currently have the same instruction code for all vendors, however some commands are unique to specific vendors. Some example sequences are provided below.

40.8.1 Example Sequences

This section provides the example sequences of the QuadSPI module.

Table 40-29. Exit 4 x I/O Read Enhance Performance Mode (XIP) (Macronix) and Read Status

INSTR	PAD	OPERAND	COMMENT
CMD	0x0	0xEB	4xIO Read Command
ADDR	0x2	0x18	24 Bit address to be send on 4 pads
MODE	0x2	0x00	2 mode cycles (exit XIP)
DUMMY	0x0	0x04	4 dummy cycles
READ	0x2	0x08	Read 64 bits
CMD	0x0	0x05	Read Status register
READ	0x0	0x01	Status register data
STOP	0x0	0x00	STOP, Instruction over

40.8.1.1 Fast Read Sequence (Macronix/Numonyx/Spansion/ Winbond)

The following table shows the fast read sequence for Macronix/Numonyx/Spansion/ Winbond flashes.

Table 40-30. Fast Read sequence

Instruction	Pad	Operand	Comment
CMD	0x0	0x0B	Fast Read command = 0x0B
ADDR	0x0	0x18	24 Addr bits to be sent on one pad
DUMMY	0x0	0x08	8 Dummy cycles
READ	0x0	0x04	Read 32 Bits on one pad
JMP_ON_CS	0x0	0x00	Jump to instruction 0 (CMD)

40.8.1.2 Fast Dual I/O DT Read Sequence (Macronix)

The following table shows the Fast Dual I/O DT read sequence for Macronix flashes.

Table 40-31. Fast Dual I/O DT Read sequence

Instruction	Pad	Operand	Comment
CMD	0x0	0xBD	Fast Dual I/O DT read command = 0xBD

Table continues on the next page...

Table 40-31. Fast Dual I/O DT Read sequence (continued)

Instruction	Pad	Operand	Comment
ADDR_DDR	0x1	0x18	24 Addr bits to be sent on 2 pads in DDR mode
MODE4_DDR	0x1	0x00	P2=P0 or P3=P1 is necessary. Refer to Macronix datasheet for details. One clock cycle for mode.
DUMMY	0x0	0x06	6 Dummy cycles
READ_DDR	0x1	0x04	Read 32 Bits on 2 pads in DDR mode
JMP_ON_CS	0x0	0x00	Jump to instruction 0 (CMD)

40.8.1.3 Fast Read Quad Output (Winbond)

The following table shows the Fast read quad output sequence for Winbond memories

Table 40-32. Fast Read Quad output sequence

Instruction	Pad	Operand	Comment
CMD	0x0	0x6B	Fast read quad output command = 0x6B
ADDR	0x0	0x18	24 Addr bits to be sent on 1 pad
DUMMY	0x0	0x08	8 Dummy cycles
READ	0x2	0x04	Read 32 Bits on 4 pads
JMP_ON_CS	0x0	0x00	Jump to instruction 0 (CMD)

40.8.1.4 4 x I/O Read Enhance Performance Mode (XIP) (Macronix)

The following table shows the 4 x I/O Read Enhance Performance Mode for Macronix flashes. The enhanced performance mode is also known as XIP mode.

Table 40-33. Fast Read Quad output sequence

Instruction	Pad	Operand	Comment
CMD	0x0	0xEB	4xI/O Read command = 0xEB
ADDR	0x2	0x18	24 Addr bits to be sent on 4 pads
MODE	0x2	0xA5	2 mode cycles
DUMMY	0x0	0x04	4 Dummy cycles
READ	0x2	0x04	Read 32 Bits on 4 pads
JMP_ON_CS	0x0	0x01	Jump to instruction 1 (ADDR)

When in XIP mode the software should ensure that all the flashes connected to the controller are in XIP mode. As a part of initializing the controller, all the flashes may be enabled with XIP by carrying out dummy reads.

40.8.1.5 Dual Command Page Program (Numonyx)

The following table shows the Dual command page program sequence for Numonyx flashes.

Table 40-34. Dual Command Page Program sequence

Instruction	Pad	Operand	Comment
CMD	0x1	0x02	Dual command page program = 0x02 on 2 pads
ADDR	0x1	0x18	24 Addr bits to be sent on 2 pads
WRITE	0x1	0x20	Write 32 Bytes on 2 pads
STOP	0x0	0x00	STOP, Instruction over

40.8.1.6 Sector Erase (Macronix/Spansion/Numonyx)

The following table shows the Sector erase sequence for Macronix/Spansion/Numonyx flashes

Table 40-35. Sector Erase sequence

Instruction	Pad	Operand	Comment
CMD	0x0	0xD8	Sector erase command = 0xD8
ADDR	0x0	0x18	24 Addr bits to be sent on 1 pad
STOP	0x0	0x00	STOP, Instruction over

40.8.1.7 Read Status Register (Macronix/Spansion/Numonyx/ Winbond)

The following table shows the Read status register sequence for Macronix/Spansion/ Numonyx/Winbond flashes.

Table 40-36. Read Status Register Sequence

Instruction	Pad	Operand	Comment
CMD	0x0	0x05	Read status register command = 0x05
READ	0x0	0x01	Read status register data
STOP	0x0	0x00	STOP, Instruction over

40.8.2 Dual Die Flashes

Certain serial flash vendors provide dual-die packages which are essentially two devices (dies) stacked within the same package to increase the memory capacity of a single package. These two devices within a package share the same data and clock pins, but have individual Chip Selects. QuadSPI controller provides support for two dual-die packages to be connected simultaneously. The figure below shows the two dual-die packages and the naming conventions used in this document. For simplicity, the data pins are shown to be unidirectional.

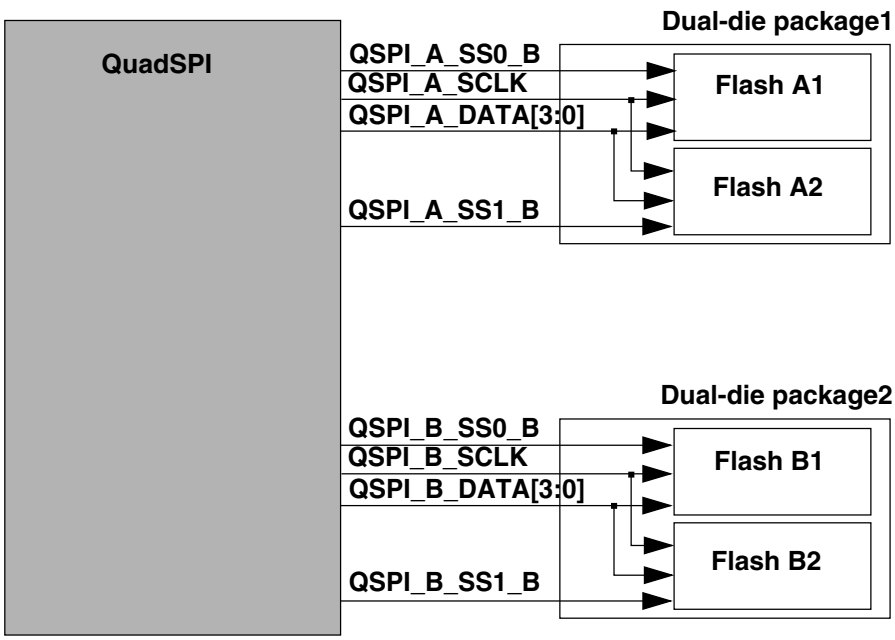

Figure 40-8. Dual-die support

Since the two devices within one package share the same i/o pads, they cannot function in parallel mode. Software should ensure that when QuadSPI is configured in parallel mode the two selected flash devices are from different dual-die packages.

40.8.3 Boot initialization sequence

The following are the recommended sequence of steps for booting from QuadSPI:

- System out of reset and flash available (300us)

- Clocks still at very low frequency. Clock tree configured, I/O pins configured. First request sent to QuadSPI for address 0x0 of flash.
- The reset command sequence in QuadSPI has 0x03 (basic read command) which is applicable to all flashes at < 50MHz serial flash clock
- The first few bytes of data is read from the flash which contains the following information:
  - The total sizes of all the flashes connected on board
  - Whether DDR mode supported
  - Frequency of DDR operation
  - Continuous mode entry sequence
  - 24bit or 32bit addressing (assuming 24bit for first accesses)
- All the serial flashes are configured
  - Quad Mode enabled
  - Dummy reads to enter into XIP
- QuadSPI is configured
  - Parallel enable set
  - LUT configured for highest performance reads
  - DDR mode enabled (if applicable)
  - Buffers configured
- Serial flash clock frequency increased.
- Boot reads happen in parallel, DDR enabled, quad output mode @66MHz.

40.9 Sampling of Serial Flash Input Data

40.9.1 Internal Sampling of Serial Flash Input Data

Depending from the actual implementation there is a delay between the internal clocking in the QuadSPI module and the external serial flash device.Refer to the following figure for an overview of this scheme.

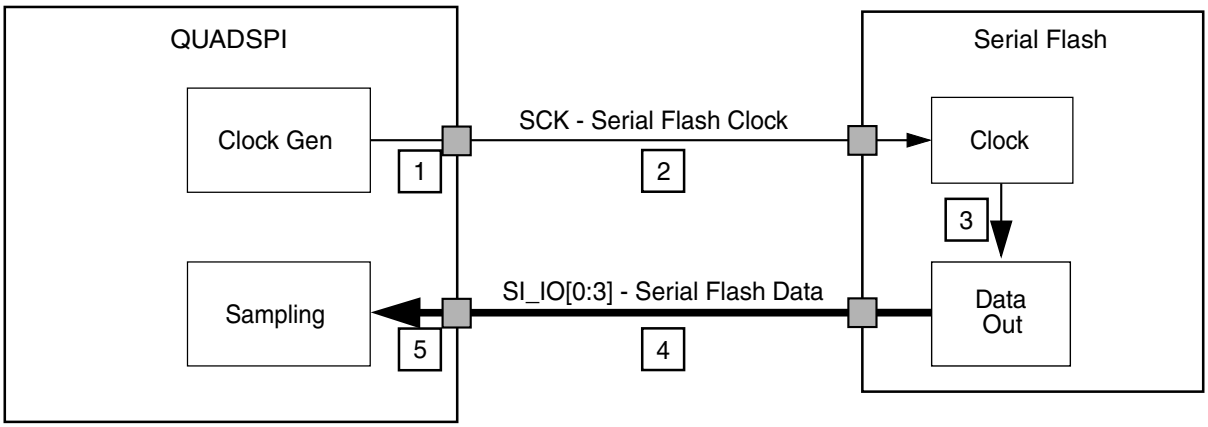

Figure 40-9. Serial Flash Sampling Clock Overview

Note

The arrival of the serial flash data in the sampling stage of the QuadSPI module are given in the following figure. Note that the amount of the total delay $t_{Del,total}$ is very specific to the characteristics of the actual implementation.

Note also that the serial flash device clock SCK is inverted with respect to the QuadSPI internal reference clock.

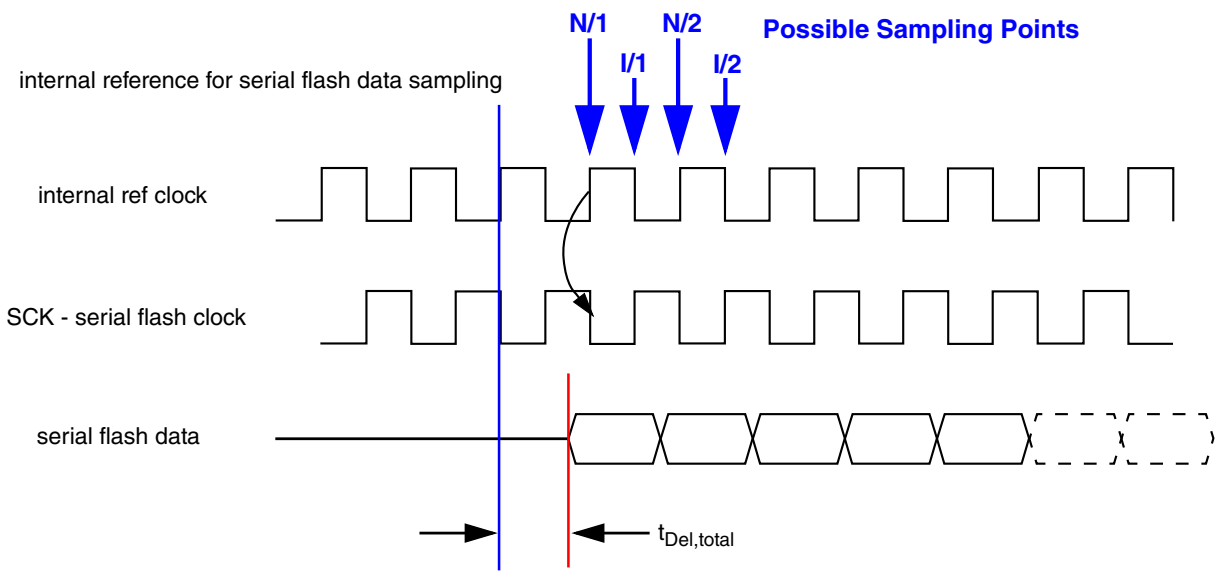

Figure 40-10. Serial Flash Sampling Clock Timing

The rising edge of the internal reference clock is taken as timing reference for the data output of the serial flash. After a time of $t_{Del,total}$ the data arrive at the internal sampling stage of the QuadSPI module.

According to the Serial Flash Sampling Clock Overview figure, the following parts of the delay chain contribute to $t_{Del,total}$:

1. Output delay of the serial flash clock output of the device containing the QuadSPI module
2. Wire delay of application/PCB from the device containing the QuadSPI module to the external serial flash device
3. Clock to data out delay of the external serial flash device, including input and output delays
4. Wire delay of application/PCB from the external serial flash device to the device containing the QuadSPI module
5. Input delay belonging to the data in input

The possible points in time for the sampling of the incoming data are denoted as N/1, I/1, N/2 and I/2 above. The sampling point relevant for the internal sampling is configured in the QSPI_SMPR register, refer to Sampling Register (QuadSPI_SMPR) for details. Note that the falling edges of the reference clock are not actually used, instead the inverted clock is used for sampling at these positions. The following table gives an overview of the available configurations for the commands running at regular (full) speed:

Table 40-37. Sampling Configuration

Sampling Point	Description	Delay [FSDLY] [HSDLY]	Phase [FSPHS] [HSPHS]	QSPI_SMPR for Full Speed Setting[1]
N/1	sampling with non-inverted clock, 1 sample delay	0	0	0x0000000x
I/1	sampling with inverted clock, 1 sample delay	0	1	0x0000002x
N/2	sampling with non-inverted clock, 2 samples delay	1	0	0x0000004x
I/2	sampling with inverted clock, 2 samples delay	1	1	0x0000006x

1. 'x' is not considered here

Depending from the actual delay and the serial flash clock frequency the appropriate sampling point can be chosen. The following remarks should be considered when selecting the appropriate setting:

- Theoretically there should be 2 settings possible to capture the correct data since the serial flash output is valid for 1 clock cycle, disregarding rise and fall times and timing uncertainties.
- Depending from the timing uncertainties it may turn out in actual applications that only one possible sample positions remains. This is subject to careful consideration depending from the actual implementation.

- The delay $t_{Del,total}$ is an absolute size to shift the point in time when the serial flash date get valid at the QuadSPI input.
- For decreasing frequency of the serial flash clock the distance between the edges increases. So for large differences in the frequency the required setting may change.
- For commands running at half of the regular serial flash clock (QSPI_SMPR[HSENA] bit set) the sampling point must be figured separately to allow for the compensation of the absolute shift in time with respect to the sample-relative setting in the QSPI_SPMPR register.

40.9.2 DDR Mode

The increasing requirement of improved throughput has introduced the double data rate (DDR) mode. In DDR mode, the data is transferred on both the rising and falling edges of the serial flash clock. The DDR serial flashes sample as well as drive the data on both rising and falling edges of serial flash clock.

40.10 Serial Flash Data Input Timing

There are sampling modes for input flash data:

- Internal sampling - Input serial flash data is captured by internal serial clock. In SDR mode, serial data is sampled by serial clock 1x (ser_clk_1x) rise edge. In DDR mode, serial data is sampled by serial clock 4x (ser_clk_4x) rise edge.
- Loopback DQS sampling - Soc will output serial data strobe with internal serial clock. This serial data strobe would be loopback from pad and used to sample input serial data. In SDR mode, serial data is sampled by loopback DQS rise edge. In DDR mode, serial data is sampled by loopback DQS both edge

NOTE

DQS pad need to be set to force input for loopback.

- Flash DQS sampling - Some serial Flash device provide the data strobe output together with serial data. This strobe signal is used to sample input serial data directly. In SDR mode, serial data is sampled by Flash DQS rise edge. In DDR mode, serial data is sampled by Flash DQS both edge

Following table shows selection for sampling mode:

Sampling mode	DQS_EN	DQS_LOOPBACK_EN
Internal sampling	0	doesn't matter

Table continues on the next page...

Sampling mode	DQS_EN	DQS_LOOPBACK_EN
Loopback DQS sampling	1	1
Flash DQS sampling	1	0

Serial flash data and clock path for input timing is shown in the following figure.

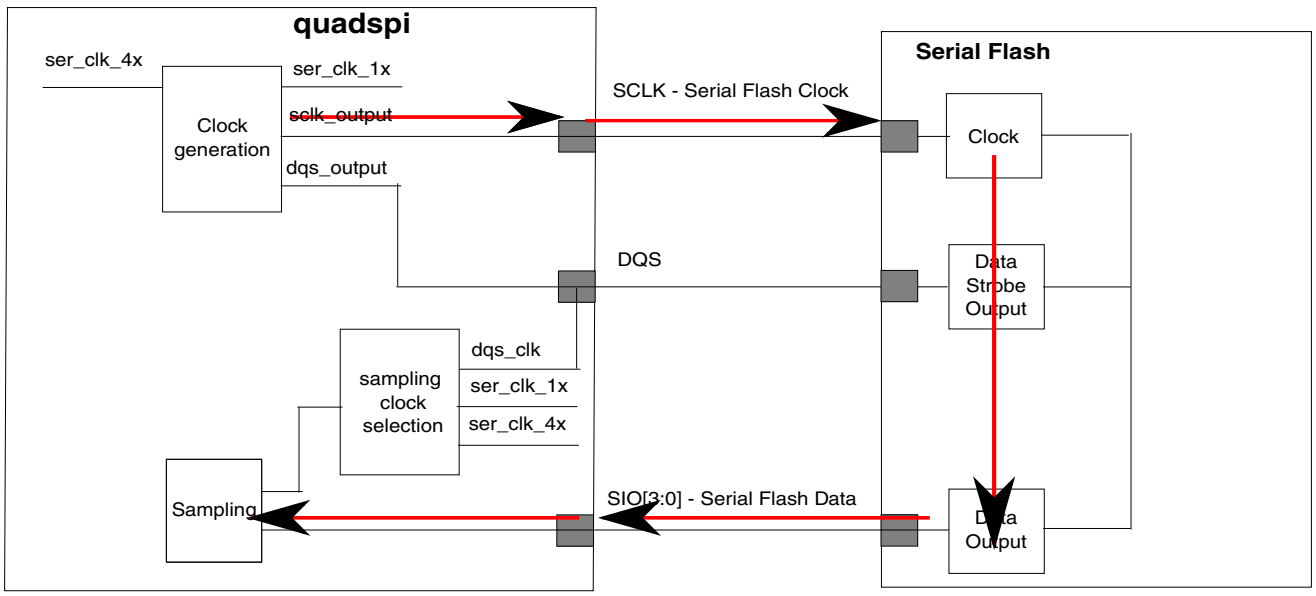

Figure 40-11. Serial flash data and clock path

NOTE

The red line is for data input path, the blue line is for DQS loopback path, and the purple line is for DQS input path from Serial Flash.

Total delay (Ttotal_delay_data) for serial flash data input is the sum of following delay:

1. Output delay of serial flash clock from internal serial clock to SCLK pad inside SOC
2. Wire delay of serial flash clock (SCLK) from SOC to external Serial Flash Device
3. Clock to Output Valid time of external Serial Flash Device
4. Wire delay of serial flash data (SIO) from external serial Flash Device to SOC
5. Input delay of serial flash data from SIO pad to internal sample register

Total delay (Ttotal_delay_loopback_dqs) for loopback DQS clock is the sum of following delay:

1. Output delay of DQS clock from internal serial clock to DQS pad inside SOC
2. Input delay of DQS clock from DQS pad to internal sample register

Total delay (Ttotal_delay_flash_dqs) for Flash DQS clock is the sum of following delay:

1. Output delay of serial flash clock from internal serial clock to SCLK pad inside SOC
2. Wire delay of serial flash clock (SCLK) from SOC to external Serial Flash Device

3. Clock to DQS Output time of external Serial Flash Device
4. Wire delay of serial flash data strobe (DQS) from external serial Flash Device to SOC
5. Input delay of DQS clock from DQS pad to internal sample register

40.10.1 Input timing in SDR mode with internal sampling

Input Timing diagram in SDR mode with internal sampling is show in the figure below.

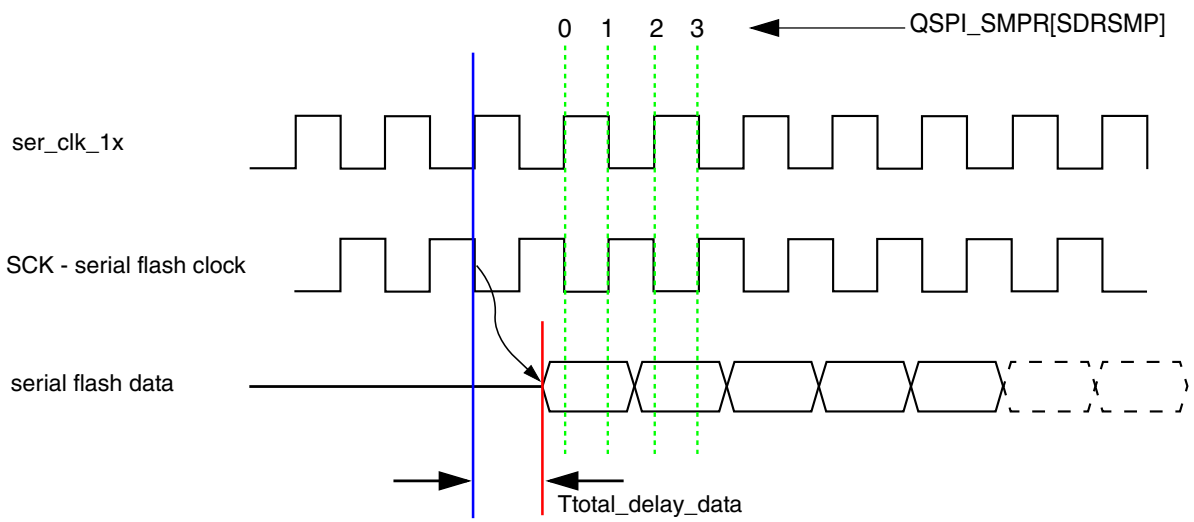

Figure 40-12. Internal sample SDR

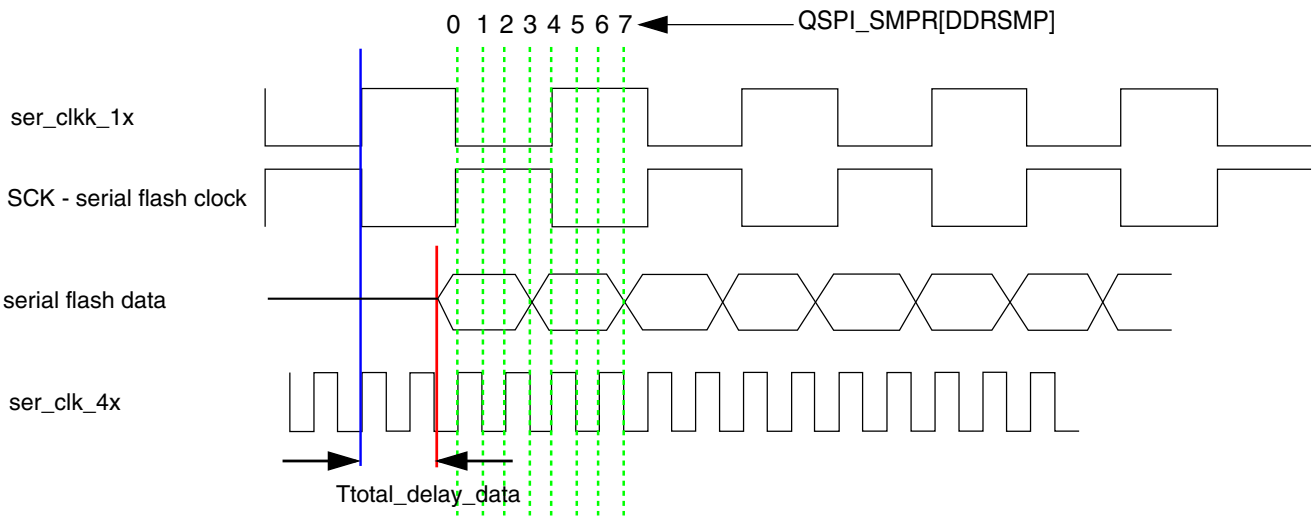
There are four sample points for this sampling mode, which is determined by register field QSPI_SMPR.SDRSMP.

Sampling point need to be select correctly to meet both Setup and Hold timing for internal sample registers:



- For sample point N, Setup requirement is: Tcycle*(N+2)/2>Ttotal_delay_data,max
- For sample point N, Hold requirement is: Ttotal_delay_data,min>Tcycle*N/2

NOTE

Tcycle is the cycle of ser_clk_1x. Ttotal_delay_data,max is maximum delay of serial data input path. Ttotal_delay_data,min is the minimum delay of serial data input path. N=0,1,2,3

40.10.2 Input timing in DDR mode with internal sampling

Input Timing diagram in SDR mode with internal sampling is show in the following figure.

There are 8 sample points for this sampling mode, which is determined by register field DDRSMP.

Sampling point need to be select correctly to meet both Setup and Hold timing for internal sample registers:

- For sample point N, Setup requirement is: Tcycle * (N+2)/8 >Ttotal_delay_data,max
- For sample point N, Hold requirement is: Ttotal_delay_data,min> Tcycle * N/8

40.10.3 Input timing in SDR mode with loopback DQS sampling

Input Timing diagram in SDR mode with internal sampling is show in the following figure.

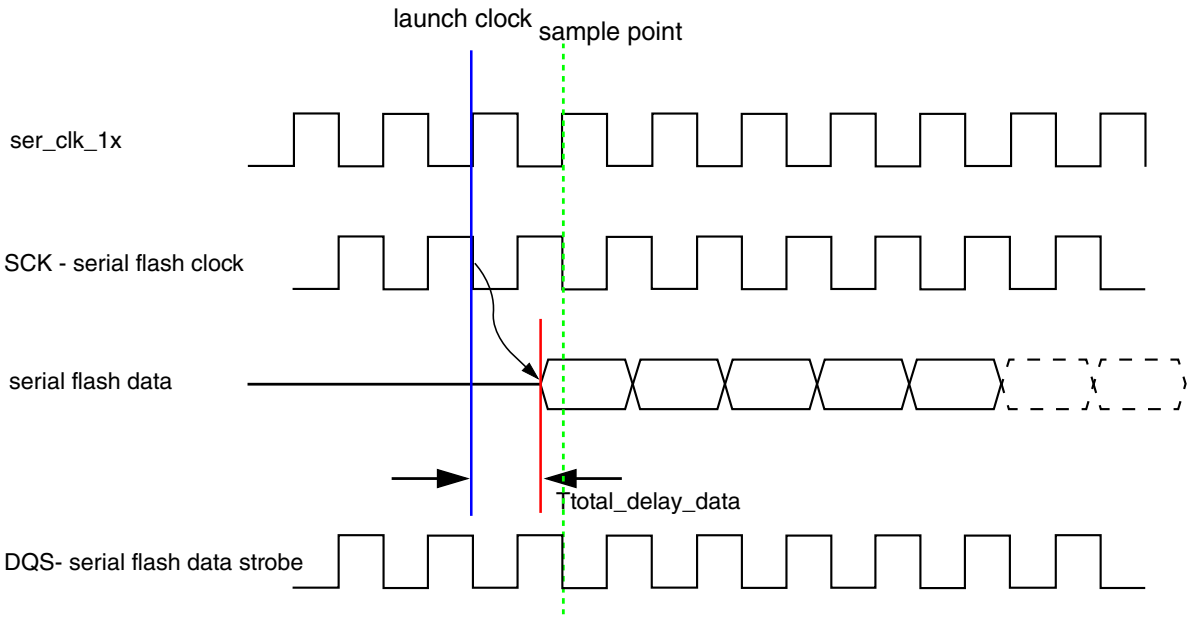


Figure 40-13. Input timing in SDR mode with loopback DQS sampling

In SDR mode and loopback sampling mode, DQS_PHASE_EN should be set 1.

For this sample point, the Setup requirement is: Tcycle >max(Ttotal_delay_data-Ttotal_delay_loopback_dqs). The Hold requirement is: min(Ttotal_delay_data-Ttotal_delay_loopback_dqs)> 0.

40.10.4 Input timing in DDR mode with loopback DQS sampling

Input Timing diagram in DDR mode with internal sampling is show in the following figure.

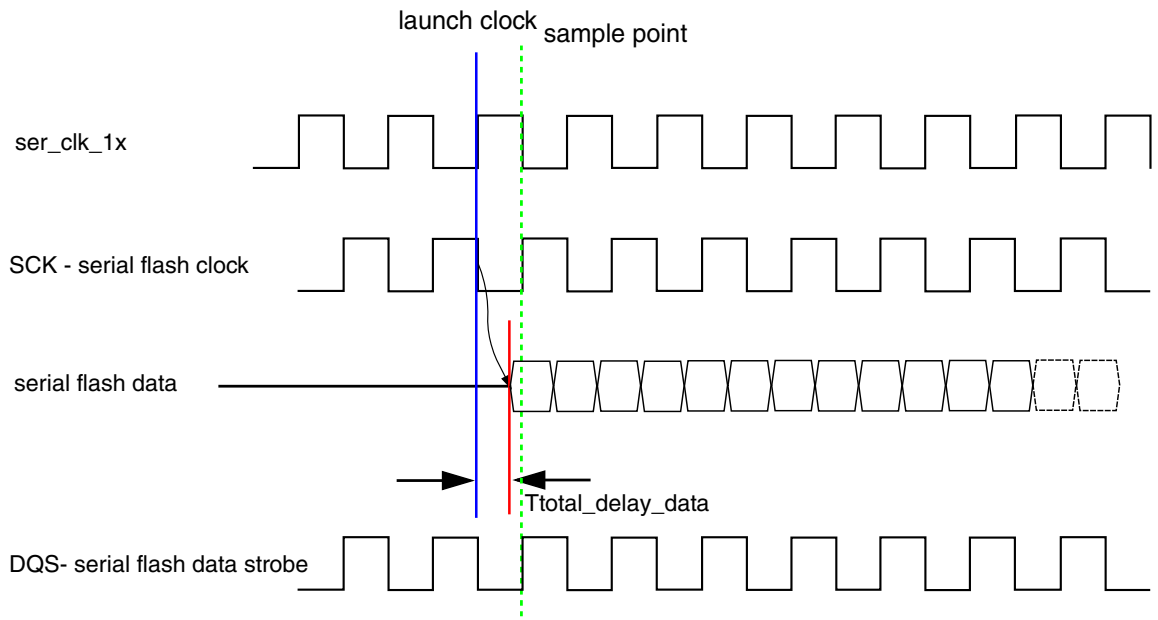

Figure 40-14. Input timing in DDR mode with loopback DQS sampling

In DDR mode and loopback sampling mode, DQS_PHASE_EN should be set 0.

For this sample point, the Setup requirement is: Tcycle >max(Ttotal_delay_data-Ttotal_delay_loopback_dqs). The Hold requirement is: min(Ttotal_delay_data-Ttotal_delay_loopback_dqs)> 0.

40.10.5 Input timing in SDR mode with flash DQS sampling

Input Timing diagram in SDR mode with internal sampling is show in the following figure.

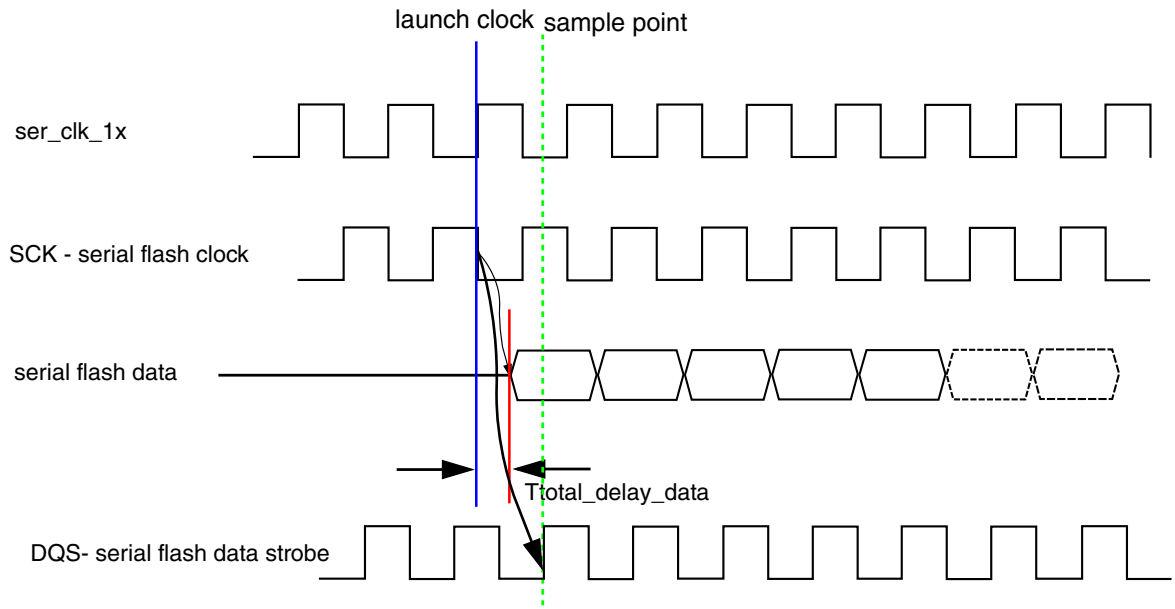

Figure 40-15. Input timing in SDR mode with flash DQS sampling

In this sampling mode, there will be a setup/hold requirement on Flash serial Data and Flash serial Data Strobe. This value will be specified in the data sheet.

40.10.6 Input timing in DDR mode with flash DQS sampling

Input Timing diagram in DDR mode with internal sampling is show in the following figure.

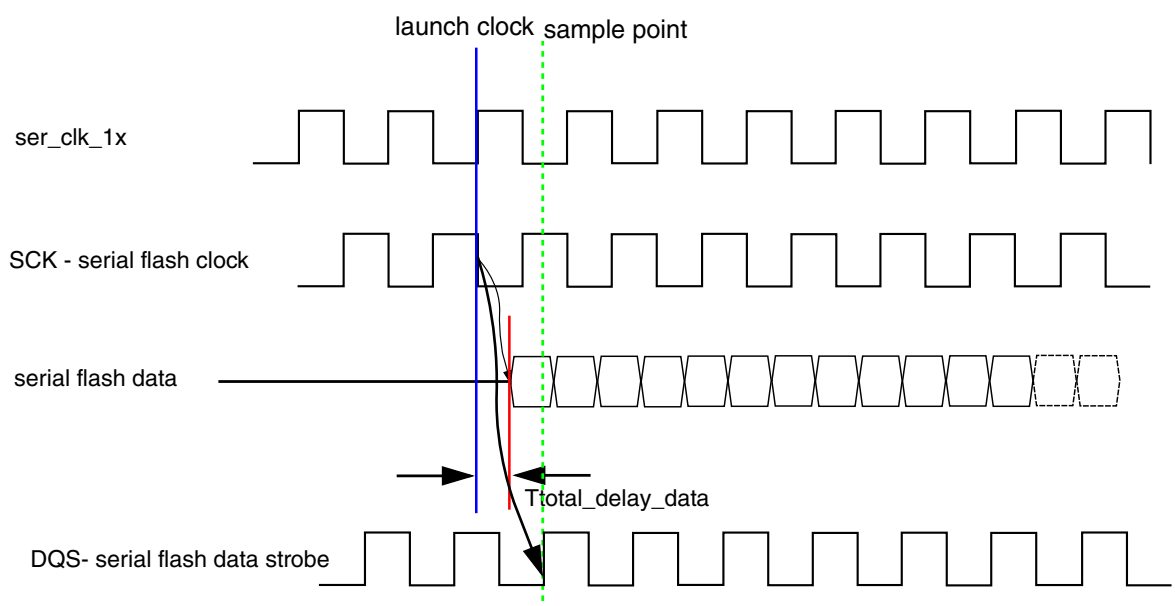

Figure 40-16. Input timing in DDR mode with flash DQS sampling

In this sampling mode, there will be a setup/hold requirement on Flash serial Data and Flash serial Data Strobe. This value will be specified in the data sheet.

40.10.7 Data Strobe Signal functionality

Some external serial flashes provide the data strobe (DQS/RDS) output which is fed directly to the QuadSPI module. The strobe (DQS/RDS) signal needs to be delayed to have the edges aligned to the data valid period. QuadSPI internally samples the incoming data at posedge of the strobe signal for SDR and on both the edges of the strobe signal for DDR. Refer to the figure for more detail.

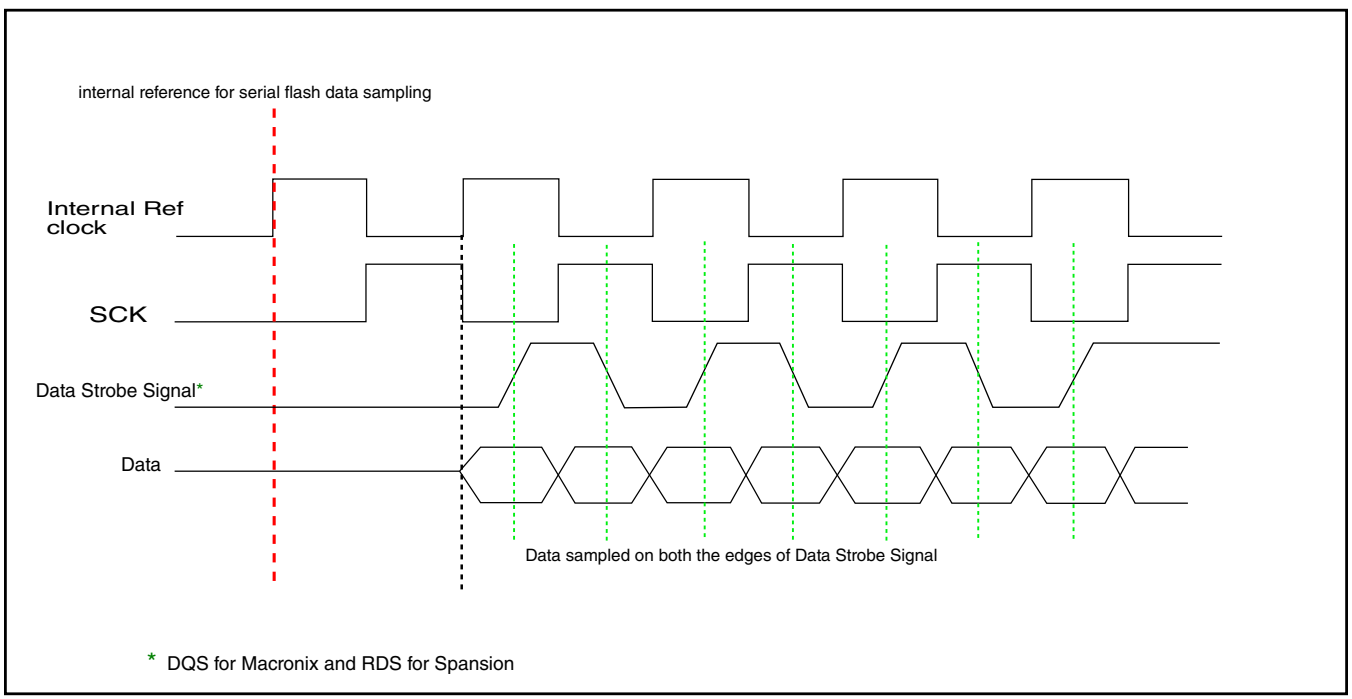

Figure 40-17. Data strobe signal functionality

40.11 Output timing in SDR mode

Output timing diagram in SDR mode is show in the following figure.

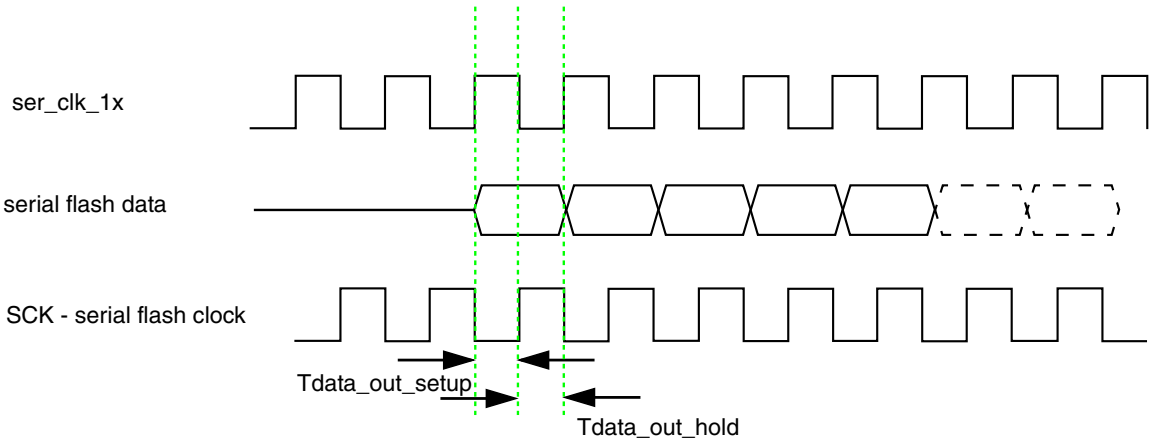

Figure 40-18. Output timing in SDR mode

In SDR mode, quadspi output serial data with internal serial clock rise edge 1x (ser_clk_1x). Flash Device has requirement on Data and Clock setup and hold timing.

40.12 Output timing in DDR mode

Output Timing diagram in DDR mode is show in the following figure.

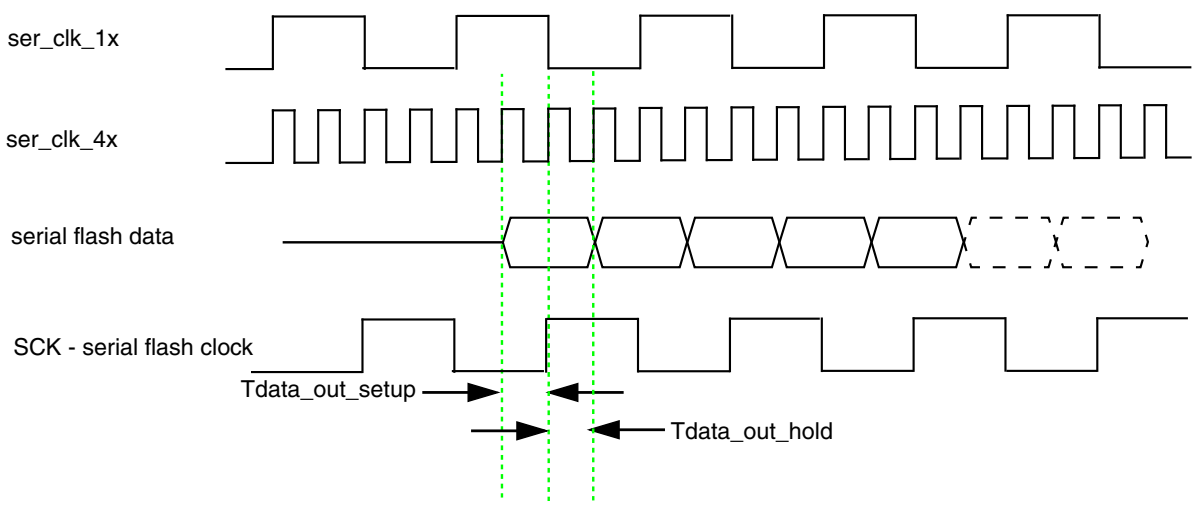

Figure 40-19. Output timing in DDR mode

In DDR mode, quadspi output serial data with internal serial clock both edge 1x (ser_clk_1x) and then delay one ser_clk_4x cycle for hold timing.

NOTE

TX_DDR_DELAY_EN should be set to 1 for DDR mode.

40.13 AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31)

40.13.1 AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31)

NOTE

See the System Memory map in this document for the base address of the QSPI AHB RX Data Buffer.

memory map

7C	AHB RX Data Buffer register (ARDB31)	32	R/W	0000_0000h	40.13.1.1/ 2468

40.13.1.1 AHB RX Data Buffer register (ARDB*n*)

The AHB RX Data Buffer register 0 to 31 can be used to read the buffer content of the RX Buffer from successive addresses. QSPI_ARDB0 corresponds to the RX Buffer register entry corresponding to the current value of the read pointer with increasing order.

The increment of the read pointer depends from the access scheme (DMA or flag-driven). Refer to "Data Transfer from the QuadSPI Module Internal Buffers" section in Flash Read section, RX Buffer, data read via register interface and AHB read, for the description of successive accesses to the RX Buffer content. Refer also to Byte Ordering of Serial Flash Read Data for the byte ordering scheme.

Valid address range accessible in the QSPI_ARDBn range depends from the number of RX Buffer entries implemented and from the number of valid buffer entries available in the RX Buffer.

- Example 1, RX Buffer filled completely with 32 words: In this case the address range for valid read access extends from QSPI_ARDB0 to QSPI_ARDB31.
- Example 2, RX Buffer filled with 5 valid words, RX Buffer fill level QSPI_RBSR[RDBFL] is 5. In this case an access to QSPI_ARDB4 provides the last valid entry.

Address: 0h base + 0h offset + (4d × i), where i=0d to 31d

40.14.1 Module Configuration Register (QuadSPI_MCR)

The QuadSPI_MCR holds configuration data associated with QuadSPI operation.

Write:

- *All other fields: Anytime*

Address: 21E_0000h base + 0h offset = 21E_0000h

QuadSPI_MCR field descriptions

Field	Description
31 Reserved	This field is reserved. This field should always be set to 0.
30 DQS_PHASE_EN	This bit controls internal DQS output phase. If DQS_EN and DQS_LOOPBACK_EN are both set to 1, this bit should be set in SDR mode, and cleared in DDR mode. If either DQS_EN or DQS_LOOPBACK_EN is set to 0, this bit is ignored.
29 Reserved	This field is reserved. This field should always be set to 0.
28–25 Reserved	This field is reserved. This field should always be set to 0.
24 DQS_LOOPBACK_EN	Quadspi will output serial data strobe signal which will be loopback from pad to sample input flash serial data. Please note pad should be force input for loopback.Quadspi will output serial data strobe signal which will be loopback from pad to sample input flash serial data. Please note pad should be force input for loopback. This bit is a don't care when DQS_EN is set to 0. 1'b1 DQS loopback sampling enabled 1'b0 DQS loopback sampling disabled
23–20 Reserved	This field is reserved.
19–16 Reserved	This field is reserved. This field is reserved and should always be set to 0xF.
15 Reserved	This field is reserved. This field is reserved.
14 MDIS	Module Disable. The MDIS bit allows the clock to the non-memory mapped logic in the QuadSPI to be stopped, putting the QuadSPI in a software controlled power-saving state. Please refer to , for more information.

Table continues on the next page...

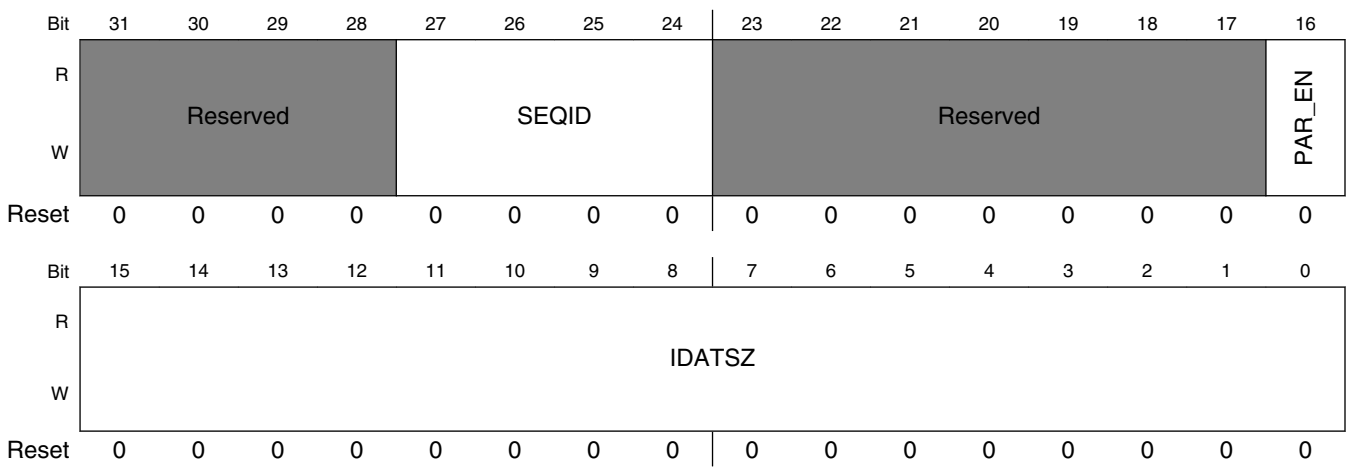
QuadSPI_MCR field descriptions (continued)

Field	Description
	0 Enable QuadSPI clocks. 1 Allow external logic to disable QuadSPI clocks.
13–12 Reserved	This field is reserved.
11 CLR_TXF	Clear TX FIFO/Buffer. Invalidate the TX Buffer content. 0 No action. 1 Read and write pointers of the TX Buffer are reset to 0. QSPI_TBSR[TRCTR] is reset to 0.
10 CLR_RXF	Clear RX FIFO. Invalidate the RX Buffer. 0 No action. 1 Read and write pointers of the RX Buffer are reset to 0. QSPI_RBSR[RDBFL] is reset to 0.
9–8 Reserved	This field is reserved.
7 DDR_EN	DDR mode enable: 0 2x and 4x clocks are disabled for SDR instructions only 1 2x and 4x clocks are enabled supports both SDR and DDR instruction.
6 DQS_EN	DQS enable: This field is valid for both SDR and DDR mode.For more details Refer Data Strobe Signal Functionality 0 DQS disabled. 1 DQS enabled- When enabled, the incoming data is sampled on both the edges of DQS input when QSPI_MCR[DDR_EN] is set, else, on only one edge when QSPI_MCR[DDR_EN] is 0. The QSPI_SMPR[DDR_SMP] values are ignored.
5–4 Reserved	This field is reserved.
3–2 END_CFG	Defines the endianness of the QSPI module.For more details refer to Byte Ordering Endianess
1 SWRSTHD	Software reset for AHB domain **NOTE:** Please keep other fields value when write to SWRSTHD and SWRSTSD **NOTE:** These software reset don't reset register setting but only reset internal flip-flops in quadspi controller **NOTE:** To remove the reset, need to write 0 to SWRSTHD and SWRSTSD 0 No action 1 AHB domain flops are reset. Does not reset configuration registers. It is advisable to reset both the serial flash domain and AHB domain at the same time. Resetting only one domain might lead to side effects.
0 SWRSTSD	Software reset for Serial Flash domain **NOTE:** Please keep other fields value when write to SWRSTHD and SWRSTSD **NOTE:** These software reset don't reset register setting but only reset internal flip-flops in quadspi controller **NOTE:** To remove the reset, need to write 0 to SWRSTHD and SWRSTSD

Table continues on the next page...

QuadSPI_MCR field descriptions (continued)

Field	Description
	0 No action 1 Serial Flash domain flops are reset. Does not reset configuration registers. It is advisable to reset both the serial flash domain and AHB domain at the same time. Resetting only one domain might lead to side effects.



40.14.2 IP Configuration Register (QuadSPI_IPCR)

The IP configuration register provides all the configuration required for an IP initiated command. An IP command can be triggered by writing in the SEQID field of this register. If the SEQID field is written successfully, a new command to the external serial flash is started as per the sequence pointed to by the SEQID field. Refer to Normal Mode , for details about the command triggering and command execution.

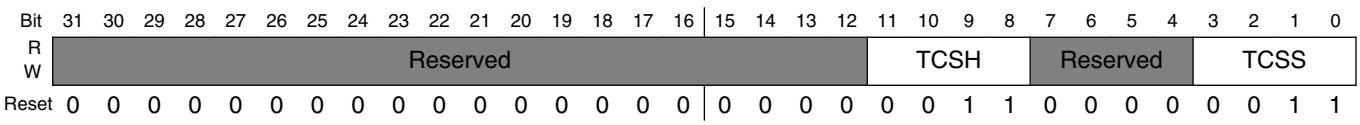
Write:

- *QSPI_SR[IP_ACC]=0*

Address: 21E_0000h base + 8h offset = 21E_0008h

QuadSPI_IPCR field descriptions

Field	Description
31–28 Reserved	This field is reserved.
27–24 SEQID	Points to a sequence in the Look-up-table. The SEQID defines the bits [6:2] of the LUT index. The bits [1:0] are always assumed to be 0. Refer to Look-up Table for more details. A write to this bit -field triggers a transaction on the serial flash interface.
23–17 Reserved	This field is reserved.
16 PAR_EN	When set, a transaction to two serial flash devices is triggered in parallel mode. Refer to Parallel Flash Mode for more details.
IDATSZ	IP data transfer size: Defines the data transfer size in bytes of the IP command.



40.14.3 Flash Configuration Register (QuadSPI_FLSHCR)

The Flash configuration register contains the flash device specific timings that must be met by the QuadSPI controller for the device to function correctly.

Write:

- *QSPI_SR[AHB_ACC] = 0*
- *QSPI_SR[IP_ACC] = 0*

Address: 21E_0000h base + Ch offset = 21E_000Ch

QuadSPI_FLSHCR field descriptions

Field	Description
31–12 Reserved	This field is reserved. Reserved.
11–8 TCSH	Serial flash CS hold time in terms of serial flash clock cycles. **NOTE:** The actual delay between chip select assertion and clock fall edge is defined as: • 1 SCK cycle if TCSH is set 0 or 1 • N SCK cycle if TCSH is set N (N>1)
7–4 Reserved	This field is reserved. Reserved.
TCSS	Serial flash CS setup time in terms of serial flash clock cycles. **NOTE:** 1. The actual delay between chip select assertion and clock fall edge is defined as: • 0.5 SCK cycle if TCSS is set 0 or 1 • N+0.5 SCK cycle if TCSS is set N (N>1) 2. Any update to TCSS register bits is visible on the flash interface only from the second transaction following the update.

40.14.4 Buffer0 Configuration Register (QuadSPI_BUF0CR)

This register provides the configuration for any access to buffer0. An access is routed to buffer0 when the master port number of the incoming AHB request matches the MSTRID field of the BUF0CR. Any buffer "miss" leads to a serial flash transaction being triggered as per the sequence pointed to the SEQID field. Buffer0 may also be configured as a high priority buffer by setting the HP_EN field of this register.

Write:

- *QSPI_SR[AHB_ACC] = 0*

Address: 21E_0000h base + 10h offset = 21E_0010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	HP_EN	Reserved														
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADATSZ								Reserved				MSTRID			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

QuadSPI_BUF0CR field descriptions

Field	Description
31 HP_EN	High Priority Enable: When set, the master associated with this buffer is assigned a priority higher than the rest of the masters. An access by a high priority master will suspend any ongoing prefetch by another AHB master and will be serviced on high priority. Refer to Flexible AHB Buffers for details.
30–16 Reserved	This field is reserved.
15–8 ADATSZ	AHB data transfer size: Defines the data transfer size in 8 bytes of an AHB triggered access to serial flash. For example,a value of 0x2 will set transfer size to 16bytes.When ADATSZ = 0, the data size mentioned the sequence pointed to by the SEQID field overrides this value. SW should ensure that this transfer size is not greater than the size of this buffer.
7–4 Reserved	This field is reserved. Reserved.
MSTRID	Master ID: The ID of the AHB master associated with BUFFER0. Any AHB access with this master port number is routed to this buffer.

40.14.5 Buffer1 Configuration Register (QuadSPI_BUF1CR)

This register provides the configuration for any access to buffer1. An access is routed to buffer1 when the master port number of the incoming AHB request matches the MSTRID field of the BUF1CR. Any buffer "miss" leads to the buffer being flushed and a serial flash transaction being triggered as per the sequence pointed to by the SEQID field.

Write:

- *QSPI_SR[AHB_ACC] = 0*

Address: 21E_0000h base + 14h offset = 21E_0014h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved																ADATSZ								Reserved				MSTRID			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

QuadSPI_BUF1CR field descriptions

Field	Description
31–16 Reserved	This field is reserved.
15–8 ADATSZ	AHB data transfer size: Defines the data transfer size in 8 bytes of an AHB triggered access to serial flash.For example, a value of 0x2 will set transfer size to 16bytes. When ADATSZ = 0, the data size mentioned the sequence pointed to by the SEQID field overrides this value. SW should ensure that this transfer size is not greater than the size of this buffer.
7–4 Reserved	This field is reserved.
MSTRID	Master ID: The ID of the AHB master associated with BUFFER1. Any AHB access with this master port number is routed to this buffer.

40.14.6 Buffer2 Configuration Register (QuadSPI_BUF2CR)

This register provides the configuration for any access to buffer2. An access is routed to buffer2 when the master port number of the incoming AHB request matches the MSTRID field of the BUF2CR. Any buffer "miss" leads to the buffer being flushed and a serial flash transaction being triggered as per the sequence pointed to by the SEQID field.

Write:

- *QSPI_SR[AHB_ACC] = 0*

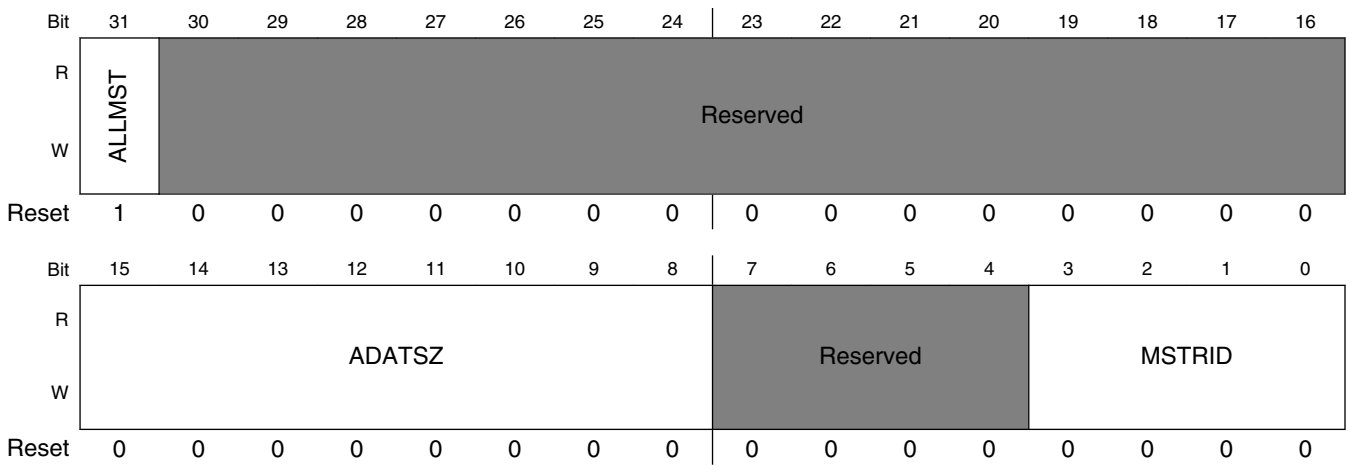
Address: 21E_0000h base + 18h offset = 21E_0018h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved																ADATSZ								Reserved				MSTRID			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

QuadSPI_BUF2CR field descriptions

Field	Description
31–16 Reserved	This field is reserved. Reserved.
15–8 ADATSZ	AHB data transfer size: Defines the data transfer size in 8 Bytes of an AHB triggered access to serial flash. For example, a value of 0x2 will set transfer size to 16bytes.When ADATSZ = 0, the data size mentioned the sequence pointed to by the SEQID field overrides this value. SW should ensure that this transfer size is not greater than the size of this buffer.
7–4 Reserved	This field is reserved. Reserved.
MSTRID	Master ID: The ID of the AHB master associated with BUFFER2. Any AHB access with this master port number is routed to this buffer.

40.14.7 Buffer3 Configuration Register (QuadSPI_BUF3CR)



This register provides the configuration for any access to buffer3. An access is routed to buffer3 when the master port number of the incoming AHB request matches the MSTRID field of the BUF3CR. Any buffer "miss" leads to the buffer being flushed a serial flash transaction being triggered as per the sequence pointed to by the SEQID field. If the ALLMST field is set, any transaction where the master port number does not match any of the buffer MSTRID fields will be routed to this buffer. In the case that the ALLMST field is not set, any such transaction (where master port number does not match any of the MSTRID fields) will be returned an ERROR response.

Write:

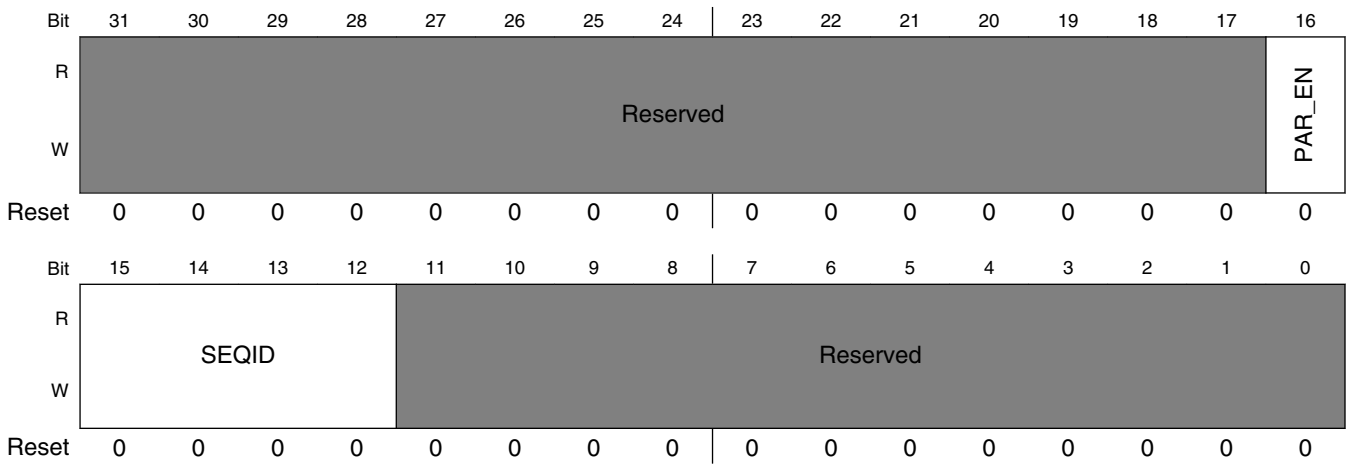
- *QSPI_SR[AHB_ACC] = 0*

.

Address: 21E_0000h base + 1Ch offset = 21E_001Ch

QuadSPI_BUF3CR field descriptions

Field	Description
31 ALLMST	All master enable: When set, buffer3 acts as an all-master buffer. Any AHB access with a master port number not matching with the master ID of buffer0 or buffer1 or buffer2 is routed to buffer3. When set, the MSTRID field of this register is ignored.
30–16 Reserved	This field is reserved. Reserved.
15–8 ADATSZ	AHB data transfer size: Defines the data transfer size in 8 Bytes of an AHB triggered access to serial flash. When ADATSZ = 0, the data size mentioned the sequence pointed to by the SEQID field overrides this value. SW should ensure that this transfer size is not greater than the size of this buffer.
7–4 Reserved	This field is reserved.
MSTRID	Master ID: The ID of the AHB master associated with BUFFER3. Any AHB access with this master port number is routed to this buffer.



40.14.8 Buffer Generic Configuration Register (QuadSPI_BFGENCR)

This register provides the generic configuration to any of the buffer accesses. Any buffer "miss" leads to the buffer being flushed and a serial flash transaction being triggered as per the sequence pointed to by the SEQID field. If the PAR_EN field is set, all the buffer accesses result in parallel accesses to the flashes.

Write:

- *QSPI_SR[AHB_ACC] = 0*

Address: 21E_0000h base + 20h offset = 21E_0020h

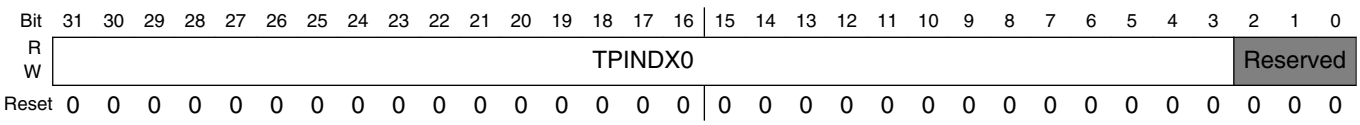
QuadSPI_BFGENCR field descriptions

Field	Description
31–17 Reserved	This field is reserved.
16 PAR_EN	When set, a transaction to two serial flash devices is triggered in parallel mode. Refer to Parallel Flash Mode for more details.
15–12 SEQID	Points to a sequence in the Look-up-table. The SEQID defines the bits [6:2] of the LUT index. The bits [1:0] are always assumed to be 0. Refer to Look-up Table. **NOTE:** If the sequence pointer differs between the new and previous sequence then the user should reset this. See QSPI_SPTRCLR for more information.
Reserved	This field is reserved.

40.14.9 Buffer0 Top Index Register (QuadSPI_BUF0IND)

This register specifies the top index of buffer0, which defines its size. Note that that the 3 LSBs of this register are set to zero - this ensures that the buffer is 64bit aligned, as each buffer entry is 64bits long.

The register value should be set to the desired number of bytes less 8. For example, setting BUF0IND to 0 gives 8 bytes, 1 give 16bytes etc.



The size of buffer0 is the difference between the BUF0IND+8 and 0.

It is the responsibility of the software to ensure that BUF0IND value is not greater than the overall size of the buffer. The hardware does not provide any protection against illegal programming.

Write:

- *QSPI_SR[AHB_ACC] = 0*

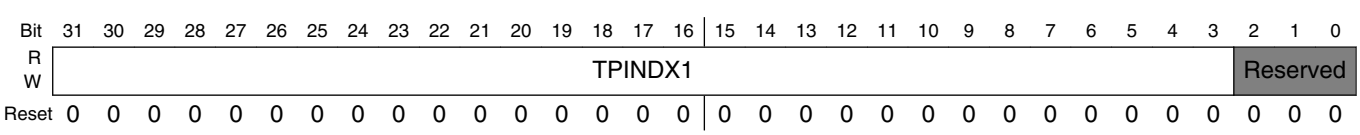
Address: 21E_0000h base + 30h offset = 21E_0030h

QuadSPI_BUF0IND field descriptions

Field	Description
31–3 TPINDX0	Top index of buffer 0.
Reserved	This field is reserved. Reserved.

40.14.10 Buffer1 Top Index Register (QuadSPI_BUF1IND)

This register specifies the top index of buffer1, which defines its size. Note that the 3 LSBs of this register are set to zero - this ensures that the buffer is 64bit aligned as each buffer entry is 64bits long.



The register value should be set to the desired number of bytes less. The size of buffer1 is the difference between the BUF1IND and BUF0IND.

It is the responsibility of the software to ensure that BUF1IND value is not greater than the overall size of the buffer. The hardware does not provide any protection against illegal programming.

Write:

- *QSPI_SR[AHB_ACC] = 0*

Address: 21E_0000h base + 34h offset = 21E_0034h

QuadSPI_BUF1IND field descriptions

Field	Description
31–3 TPINDX1	Top index of buffer 1.
Reserved	This field is reserved.

40.14.11 Buffer2 Top Index Register (QuadSPI_BUF2IND)

This register specifies the top index of buffer2, which defines its size. Note that that the 3 LSBs of this register are set to zero - this ensures that the buffer is 64bit aligned as each buffer entry is 64bits long.

The register value should be set to the desired number of bytes less 8. The size of buffer2 is the difference between the BUF2IND and BUF1IND.

It is the responsibility of the software to ensure that BUF2IND value is not greater than the overall size of the buffer. The hardware does not provide any protection against illegal programming.

Write:

- *QSPI_SR[AHB_ACC] = 0*

Address: 21E_0000h base + 38h offset = 21E_0038h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	TPINDX2																													Reserved		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

QuadSPI_BUF2IND field descriptions

Field	Description
31–3 TPINDX2	Top index of buffer 2.
Reserved	This field is reserved.

40.14.12 Serial Flash Address Register (QuadSPI_SFAR)

The module automatically translates this address on the memory map to the address on the flash itself. When operating in 24bit mode, only bits 23-0 are sent to the flash, in 32bit mode, bits 27-0 are used with bits 31-28 driven to 0 Refer to Table 40-5 for the mapping between the access mode and the QSPI_SFAR content and to Normal Mode for details about the command triggering and command execution. The software should ensure that the serial flash address provided in the QSPI_SFAR register lies in the valid flash address range as defined in Table 40-5.

Write:

- *QSPI_SR[IP_ACC] = 0*

Address: 21E_0000h base + 100h offset = 21E_0100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	SFADR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

QuadSPI_SFAR field descriptions

Field	Description
SFADR	Serial Flash Address. The register content is used as byte address for all following IP Commands.

40.14.13 Sampling Register (QuadSPI_SMPR)

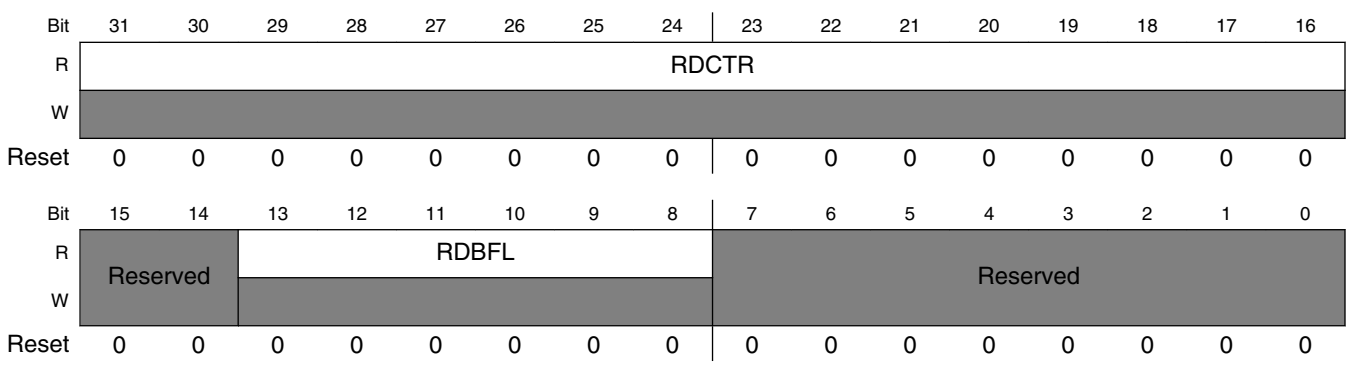
The Sampling Register allows configuration of how the incoming data from the external serial flash devices are sampled in the QuadSPI module.

Write:Disabled Mode

Address: 21E_0000h base + 108h offset = 21E_0108h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0													DDRSMP		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								SDRSMP			0		0		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



QuadSPI_SMPR field descriptions

Field	Description
31–19 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
18–16 DDRSMP	DDR Sampling point. Select the sampling point for incoming data when serial flash is executing a DDR instruction. Refer to Input timing in DDR mode with internal sampling , for details on the sampling points.
15–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6–5 SDRSMP	SDR sampling point.
4–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

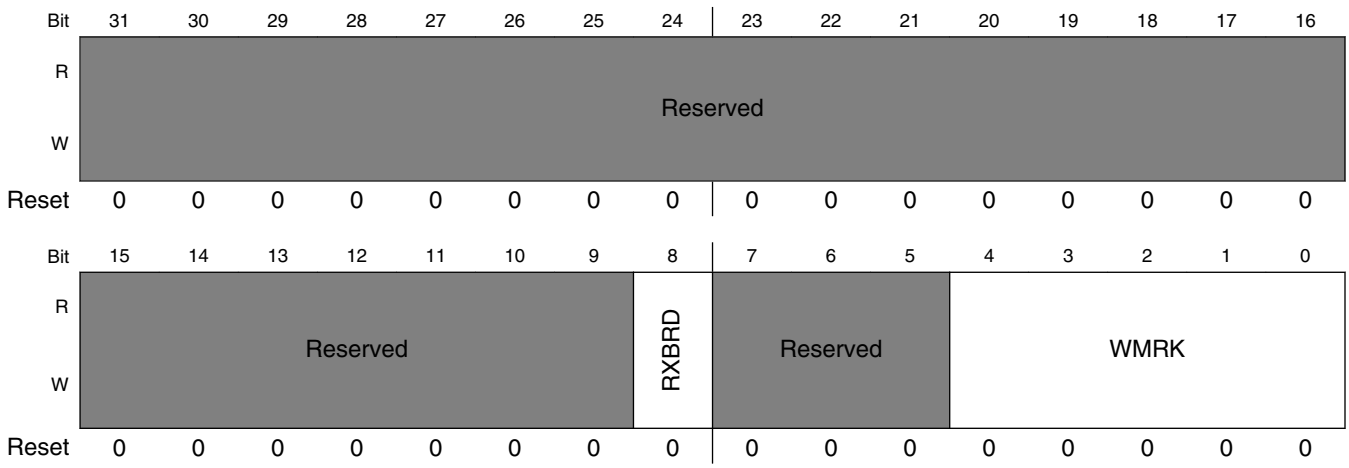
40.14.14 RX Buffer Status Register (QuadSPI_RBSR)

This register contains information related to the receive data buffer.

Address: 21E_0000h base + 10Ch offset = 21E_010Ch

QuadSPI_RBSR field descriptions

Field	Description
31–16 RDCTR	Read Counter, indicates how many entries of 4 bytes have been removed from the RX Buffer.For example a value of 0x2 would indicate 8bytes have been removed It is incremented by the number (QSPI_RBCT[WMRK] + 1) on RX Buffer POP event. The RX Buffer can be popped using DMA or pop flag QSPI_FR[RBDF]. The QSPI_RSER[RBDDE] defines which pop has to be done. For further details please refer to AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31) and "Data Transfer from the QuadSPI Module Internal Buffers section in Flash Read section.
15–14 Reserved	This field is reserved.
13–8 RDBFL	RX Buffer Fill Level, indicates how many entries of 4 bytes are still available in the RX Buffer.For example a value of 0x2 would indicate 8bytes are available.
Reserved	This field is reserved.



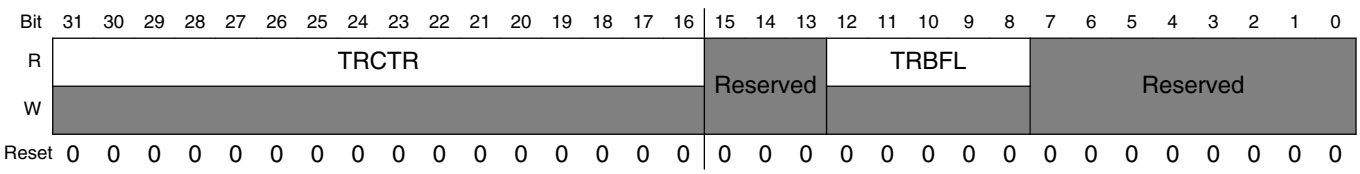
40.14.15 RX Buffer Control Register (QuadSPI_RBCT)

This register contains control data related to the receive data buffer.

Write:

- *QSPI_SR[IP_ACC] = 0*

Address: 21E_0000h base + 110h offset = 21E_0110h



QuadSPI_RBCT field descriptions

Field	Description
31–9 Reserved	This field is reserved.
8 RXBRD	RX Buffer Readout: This bit specifies the access scheme for the RX Buffer readout. 0 RX Buffer content is read using the AHB Bus registers QSPI_ARDB0 to QSPI_ARDB31. For details, refer to Exclusive Access to Serial Flash for AHB Commands. 1 RX Buffer content is read using the IP Bus registers QSPI_RBDR0 to QSPI_RBDR31.
7–5 Reserved	This field is reserved.
WMRK	RX Buffer Watermark: This field determines when the readout action of the RX Buffer is triggered. When the number of valid entries in the RX Buffer is equal to or greater than the number given by (WMRK+1) the QSPI_SR[RXWE] flag is asserted.The value should be entered as the number of 4byte entries minus 1. For example a value of 0x0 would set the watermark to 4bytes, 1 to 8bytes, 2 to 12bytes etc. For details, refer to DMA Usage.

40.14.16 TX Buffer Status Register (QuadSPI_TBSR)

This register contains information related to the transmit data buffer.

Address: 21E_0000h base + 150h offset = 21E_0150h

QuadSPI_TBSR field descriptions

Field	Description
31–16 TRCTR	Transmit Counter. This field indicates how many entries of 4 bytes have been written into the TX Buffer by host accesses. It is reset to 0 when a 1 is written into the QSPI_MCR[CLR_TXF] bit. It is incremented on each write access to the QSPI_TBDR register when another word has been pushed onto the TX Buffer. When it is not cleared the TRCTR field wraps around to 0. Refer to TX Buffer Data Register (QuadSPI_TBDR) for details.
15–13 Reserved	This field is reserved.
12–8 TRBFL	TX Buffer Fill Level. The TRBFL field contains the number of entries of 4 bytes each available in the TX Buffer for the QuadSPI module to transmit to the serial flash device.
Reserved	This field is reserved.

40.14.17 TX Buffer Data Register (QuadSPI_TBDR)

The QSPI_TBDR register provides access to the circular TX Buffer of depth 128 bytes. This buffer provides the data written into it as write data for the page programming commands to the serial flash device. Refer to Table 40-14 for the byte ordering scheme. A write transaction on the flash with data size of less than 32 bits will lead to the removal of four data entry from the TX buffer. The valid bits will be used and the rest of the bits will be discarded.

Write:

- *QSPI_SR[TXFULL] = 0*

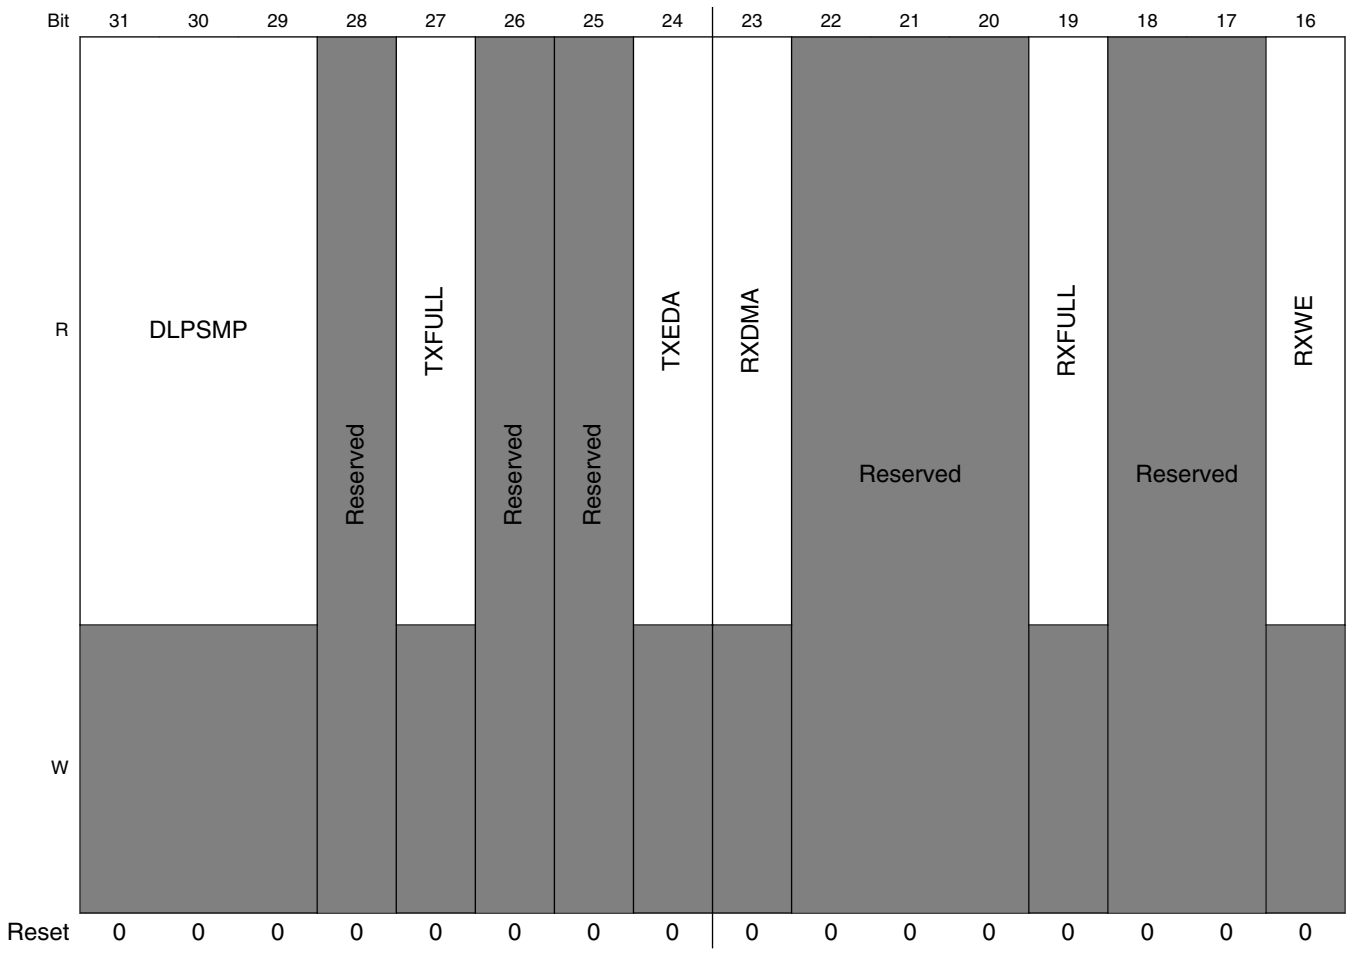
32-bit write access required

NOTE

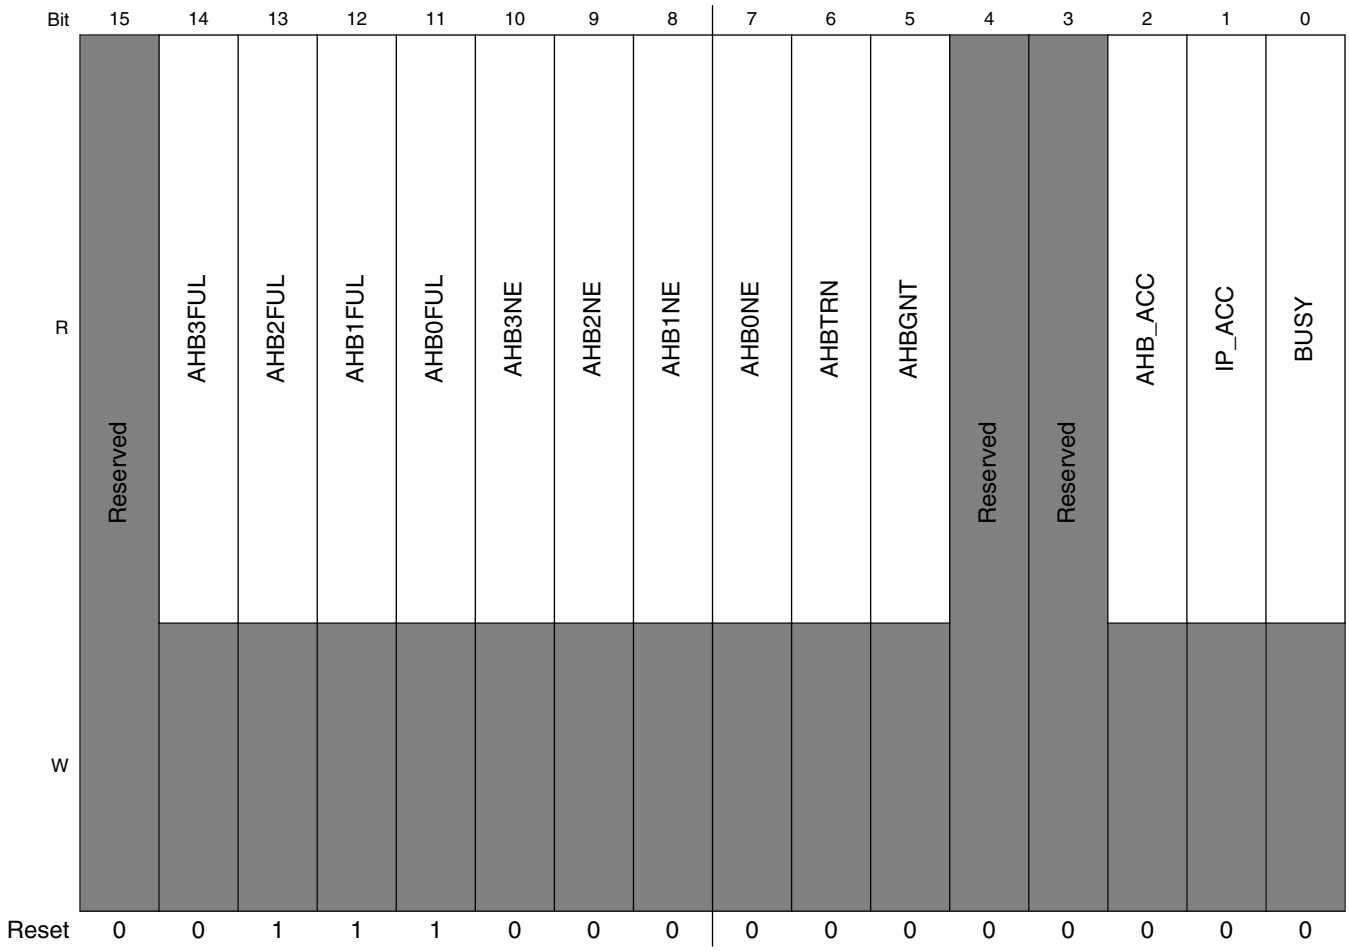
There is no limitation on Flash programming size. But the data size written to TX Buffer should be 64 Byte aligned. If flash programming size is not 64 bytes aligned, please write redundant data to TX Buffers. The redundant data will be ignored by QuadSPI controller.

Address: 21E_0000h base + 154h offset = 21E_0154h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	TXDATA																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



QuadSPI_TBDR field descriptions



Field	Description
TXDATA	TX Data On write access the data is written into the next available entry of the TX Buffer and the QPSI_TBSR[TRBFL] field is updated accordingly. On a read access, the last data written to the register is returned.

40.14.18 Status Register (QuadSPI_SR)

The QSPI_SR register provides all available status information about SFM command execution and arbitration, the RX Buffer and TX Buffer and the AHB Buffer.

Address: 21E_0000h base + 15Ch offset = 21E_015Ch

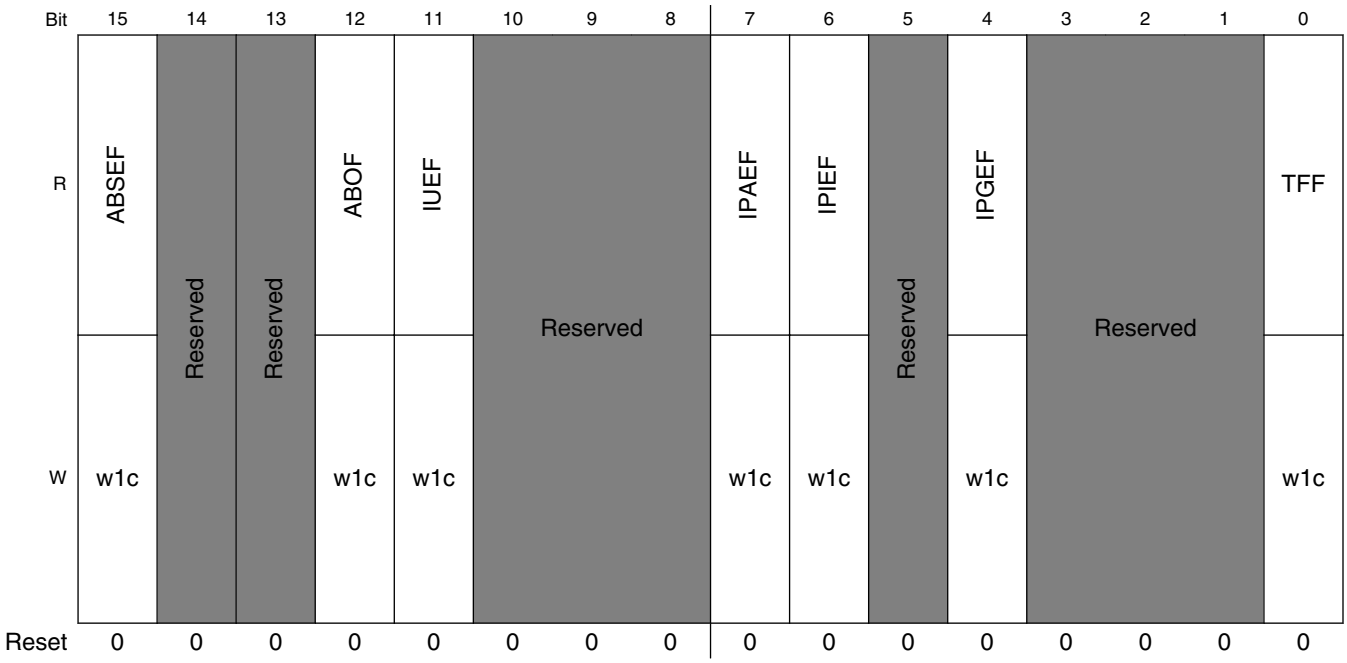
QuadSPI_SR field descriptions

Field	Description
31–29 DLPSMP	**NOTE:** Data learning is not implemented on this chip. Data learning pattern sampling point: The sampling point found by the controller with the data learning pattern. • This is used for DDR only. • If the learning fails, this field will return garbage and DLPFF bit will be set. •
28 Reserved	This field is reserved.
27 TXFULL	TX Buffer Full: Asserted when no more data can be stored.
26 Reserved	This field is reserved.
25 Reserved	This field is reserved.
24 TXEDA	Tx Buffer Enough Data Available Asserted when TX Buffer contains enough data for any pop operation to take place. There must be atleast 128bit data available in TX FIFO for any pop operation otherwise QSPI_FR[TBUF] will be set.

Table continues on the next page...

QuadSPI_SR field descriptions (continued)

Field	Description
23 RXDMA	RX Buffer DMA: Asserted when RX Buffer read out via DMA is active i.e DMA is requested or running.
22–20 Reserved	This field is reserved.
19 RXFULL	RX Buffer Full: Asserted when the RX Buffer is full, i.e. that QSPI_RBSR[RDBFL] field is equal to 32.
18–17 Reserved	This field is reserved.
16 RXWE	RX Buffer Watermark Exceeded: Asserted when the number of valid entries in the RX Buffer exceeds the number given in the QSPI_RBCT[WMRK] field.
15 Reserved	This field is reserved.
14 AHB3FUL	AHB 3 Buffer Full: Asserted when AHB 3 buffer is full.
13 AHB2FUL	AHB 2 Buffer Full: Asserted when AHB 2 buffer is full.
12 AHB1FUL	AHB 1 Buffer Full: Asserted when AHB 1 buffer is full.
11 AHB0FUL	AHB 0 Buffer Full: Asserted when AHB 0 buffer is full.
10 AHB3NE	AHB 3 Buffer Not Empty: Asserted when AHB 3 buffer contains data.
9 AHB2NE	AHB 2 Buffer Not Empty: Asserted when AHB 2 buffer contains data.
8 AHB1NE	AHB 1 Buffer Not Empty: Asserted when AHB 1 buffer contains data.
7 AHB0NE	AHB 0 Buffer Not Empty: Asserted when AHB 0 buffer contains data.
6 AHBTRN	AHB Access Transaction pending: Asserted when there is a pending request on the AHB interface. Refer to the AMBA specification for details.
5 AHBGNT	AHB Command priority Granted: Asserted when another module has been granted priority of AHB Commands against IP Commands. For details refer to Command Arbitration.
4 Reserved	This field is reserved.
3 RESERVED	This field is reserved.
2 AHB_ACC	AHB Access: Asserted when the transaction currently executed was initiated by AHB bus.
1 IP_ACC	IP Access: Asserted when transaction currently executed was initiated by IP bus.
0 BUSY	Module Busy: Asserted when module is currently busy handling a transaction to an external flash device.



40.14.19 Flag Register (QuadSPI_FR)

The QSPI_FR register provides all available flags about SFM command execution and arbitration which may serve as source for the generation of interrupt service requests. Note that the error flags in this register do not relate directly to the execution of the transaction in the serial flash device itself but only to the behavior and conditions visible in the QuadSPI module.

Write:Enabled Mode

Address: 21E_0000h base + 160h offset = 21E_0160h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

QuadSPI_FR field descriptions

Field	Description
31 DLPFF	**NOTE:** Data learning is not implemented on this chip. Data Learning Pattern Failure Flag: Set when DATA_LEARN instruction was encountered in a sequence but no sampling point was found for the data learning pattern The controller automatically starts sampling using the value in QSPI_SMPR[DDRSMP].
30 Reserved	This field is reserved.
29–28 Reserved	This field is reserved.
27 TBFF	TX Buffer Fill Flag: Before writing to the TX buffer, this bit should be cleared. Then this bit has to be read back. If the bit is set, the TX Buffer can take more data. If the bit remains cleared, the TX buffer is full. Refer to Tx Buffer Operation for details.
26 TBUF	TX Buffer Underrun Flag: Set when the module tried to pull data although TX Buffer was emptyor the buffer contains less than 128bits of data. The application must ensure that the buffer never goes empty during a transaction expect for the last data fetch. The IP Command leading to the TX Buffer underrun is continued (data sent to the serial flash device is all F in case of valid tx underrun. The application must clear the TX Buffer in response to this event by writing a 1 into the QSPI_MCR[CLR_TXF] bit.
25–24 Reserved	This field is reserved.
23 ILLINE	Illegal Instruction Error Flag: Set when an illegal instruction is encountered by the controller in any of the sequences. Refer to Table 40-12 for a list of legal instructions.
22–18 Reserved	This field is reserved.
17 RBOF	RX Buffer Overflow Flag: Set when not all the data read from the serial flash device could be pushed into the RX Buffer. The IP Command leading to this condition is continued until the number of bytes according to the QSPI_IPCR[IDATSZ] field has been read from the serial flash device.

Table continues on the next page...

QuadSPI_FR field descriptions (continued)

Field	Description
	The content of the RX Buffer is not changed.
16 RBDF	RX Buffer Drain Flag: Will be set if the QuadSPI_SR[RXWE] status bit is asserted. Writing 1 into this bit triggers one of the following actions: • If the RX Buffer has up to QuadSPI_RBCT[WMRK] valid entries then the flag is cleared. • If the RX Buffer has more than QuadSPI_RBCT[WMRK] valid entries and the QuadSPI_RSER[RBDDE] bit is not set (flag driven mode) a RX Buffer POP event is triggered. The flag remains set if the RX Buffer contains more than QuadSPI_RBCT[WMRK] valid entries after the RX Buffer POP event is finished. The flag is cleared if the RX Buffer contains less than or equal to QuadSPI_RBCT[WMRK] valid entries after the RX Buffer POP event is finished. Refer to "Receive Buffer Drain Interrupt or DMA Request" section in Normal Mode Interrupt and DMA Requests, for details.
15 ABSEF	AHB Sequence Error Flag: Set when the execution of an AHB Command is started with an WRITE or WRITE_DDR Command in the sequence pointed to by the QSPI_BUFxCR register Communication with the serial flash device is terminated before the execution of WRITE/WRITE_DDR command by the QuadSPI module. The AHB bus request which triggered this command is answered with an ERROR response.
14 Reserved	Reserved This field is reserved.
13 Reserved	Reserved This field is reserved.
12 ABOF	AHB Buffer Overflow Flag: Set when the size of the AHB access exceeds the size of the AHB buffer. This condition can occur only if the QSPI_BUFxCR[ADATSZ] field is programmed incorrectly. The AHB Command leading to this condition is continued until the number of entries according to the QSPI_BUFxCR[ADATSZ] field has been read from the serial flash device. The content of the AHB Buffer is not changed.
11 IUEF	IP Command Usage Error Flag: Set when in parallel flash mode the execution of an IP Command is started and the sequence pointed to by the sequence ID contains a WRITE or a WRITE_DDR command. Refer to Table 40-12 table for the related commands. Communication with the serial flash device is terminated before the execution of WRITE/WRITE_DDR command by the QuadSPI module.
10–8 Reserved	This field is reserved.
7 IPAEF	IP Command Trigger during AHB Access Error Flag. Set when the following condition occurs: • A write access occurs to the QSPI_IPCR[SEQID] field and the QSPI_SR[AHB_ACC] bit is set. Any command leading to the assertion of the IPAEF flag is ignored.
6 IPIEF	IP Command Trigger could not be executed Error Flag. Set when the QSPI_SR[IP_ACC] bit is set (i.e. an IP triggered command is currently executing) and any of the following conditions occurs: • Write access to the QSPI_IPCR register. Any command leading to the assertion of the IPIEF flag is ignored • Write access to the QSPI_SFAR register. • Write access to the QSPI_RBCT register.
5 Reserved	This field is reserved.

Table continues on the next page...

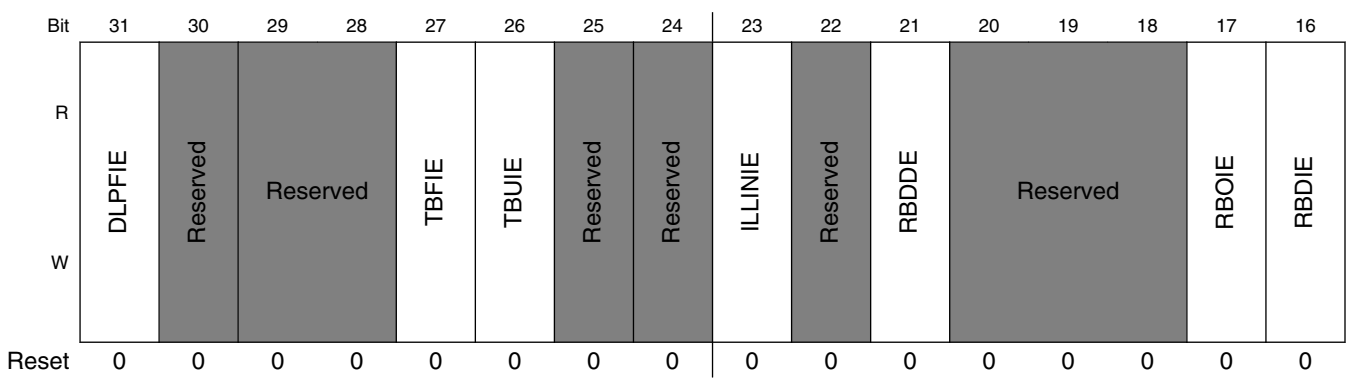
QuadSPI_FR field descriptions (continued)

Field	Description
4 IPGEF	IP Command Trigger during AHB Grant Error Flag: Set when the following condition occurs: • A write access occurs to the QSPI_IPCR[SEQID] field and the QSPI_SR[AHBGNT] bit is set. Any command leading to the assertion of the IPGEF flag is ignored.
3–1 Reserved	This field is reserved.
0 TFF	IP Command Transaction Finished Flag: Set when the QuadSPI module has finished a running IP Command. If an error occurred the related error flags are valid, at the latest, in the same clock cycle when the TFF flag is asserted.

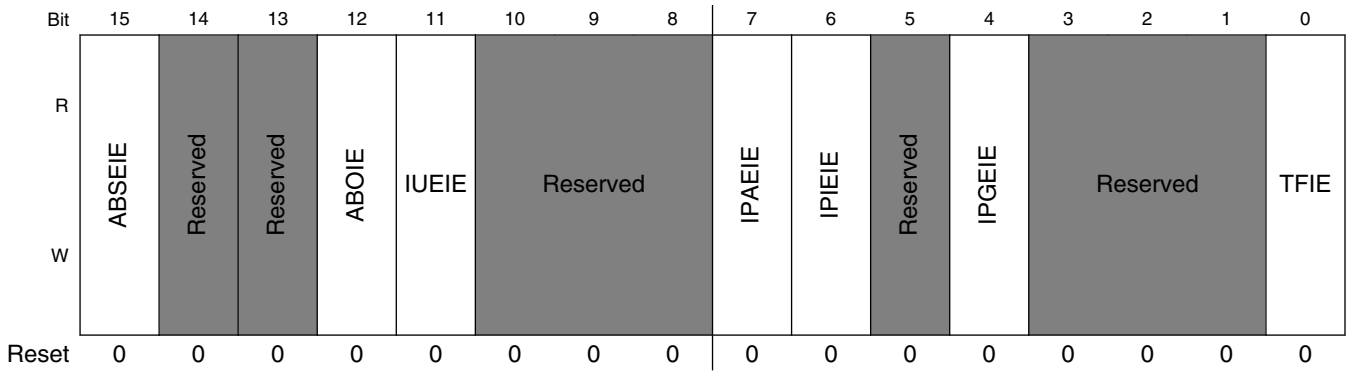
1. QSPI_BUFxCR implies anyone of QSPI_BUF0CR/QSPI_BUF1CR/QSPI_BUF2CR/QSPI_BUF3CR

40.14.20 Interrupt and DMA Request Select and Enable Register (QuadSPI_RSER)

The QuadSPI_RSER register provides enables and selectors for the interrupts in the QuadSPI module.



NOTE



Each flag of the QuadSPI_FR register enabled as source for an interrupt prevents the QuadSPI module from entering Stop Mode or Module Disable Mode when this flag is set.

>

Write:Anytime

Address: 21E_0000h base + 164h offset = 21E_0164h

QuadSPI_RSER field descriptions

Field	Description

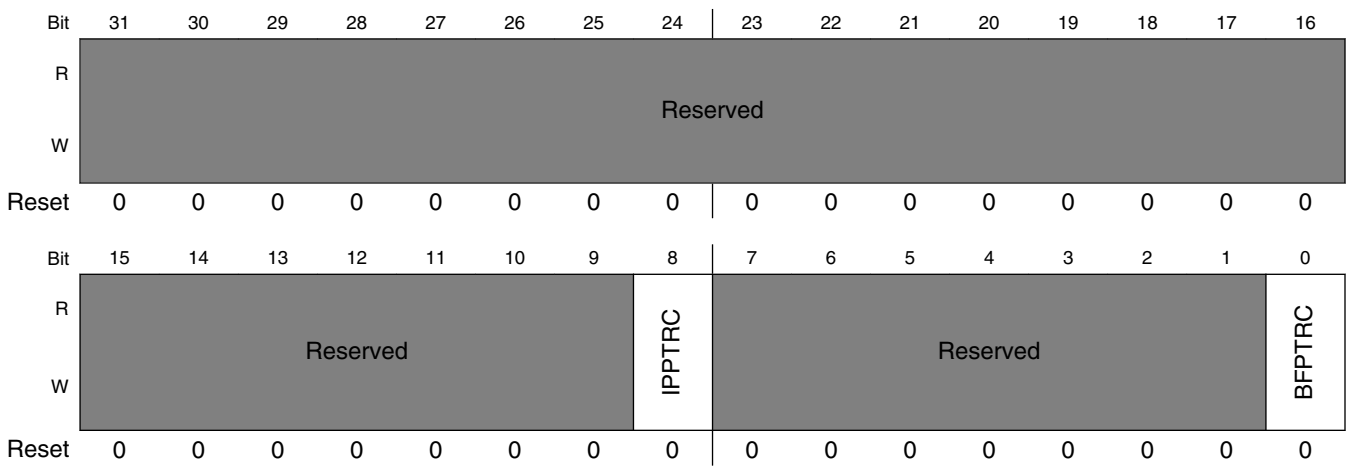
40.14.21 Sequence Suspend Status Register (QuadSPI_SPNDST)

The sequence suspend status register provides information specific to any suspended sequence. An AHB sequence may be suspended when a high priority AHB master makes an access before the AHB sequence completes the data transfer requested.

Address: 21E_0000h base + 168h offset = 21E_0168h

QuadSPI_SPNDST field descriptions



Field	Description
31–16 Reserved	This field is reserved.
15–9 DATLFT	Data left: Provides information about the amount of data left to be read in the suspended sequence. Valid only when SUSPND is set to 1'b1. Value in terms of 64 bits or 8 bytes
8 Reserved	This field is reserved.
7–6 SPDBUF	Suspended Buffer: Provides the suspended buffer number. Valid only when SUSPND is set to 1'b1
5–1 Reserved	This field is reserved.
0 SUSPND	When set, it signifies that a sequence is in suspended state

40.14.22 Sequence Pointer Clear Register (QuadSPI_SPTRCLR)

The sequence pointer clear register provides bits to reset the IP and Buffer sequence pointers. The sequence pointer contains the index of which instruction within the LUT entry is to be executed next. For example, if the LUT entry ends on a JMP_ON_CS value of 2, the index will be stored as 2.

The software should reset the sequence pointers whenever the sequence ID is changed by updating the SEQID field in QSPI_IPCR or QSPI_BFGENCR.

Address: 21E_0000h base + 16Ch offset = 21E_016Ch

QuadSPI_SPTRCLR field descriptions

Field	Description
31–9 Reserved	This field is reserved.
8 IPPTRC	IP Pointer Clear: 1: Clears the sequence pointer for IP accesses as defined in QuadSPI_IPCR
7–1 Reserved	This field is reserved. Reserved.
0 BFPTRC	Buffer Pointer Clear: 1: Clears the sequence pointer for AHB accesses as defined in QuadSPI_BFGENCR.

40.14.23 Serial Flash A1 Top Address (QuadSPI_SFA1AD)

The QSPI_SFA1AD register provides the address mapping for the serial flash A1.The difference between QSPI_SFA1AD[TPADA1] and QSPI_AMBA_BASE defines the size of the memory map for serial flash A1.

Write:

- *QSPI_SR[IP_ACC] = 0*
- *QSPI_SR[AHB_ACC] = 0*

Address: 21E_0000h base + 180h offset = 21E_0180h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

40.14.27 RX Buffer Data Register (QuadSPI_RBDR*n*)

The QuadSPI_RBDR registers provide access to the individual entries in the RX Buffer. Refer to Table 40-14 for the byte ordering scheme.

QuadSPI_RBDR0 corresponds to the actual position of the read pointer within the RX Buffer. The number of valid entries available depends from the number of RX Buffer entries implemented and from the number of valid buffer entries available in the RX Buffer.

Example 1, RX Buffer filled completely with 32 words: In this case the address range for valid read access extends from QuadSPI_RBDR0 to QuadSPI_RBDR31.

Example 2, RX Buffer filled with 5 valid words: RX Buffer fill level QuadSPI_RBSR[RDBFL] is 5. In this case an access to QuadSPI_RBDR4 provides the last valid entry.

Any access beyond the range of valid RX Buffer entries provides undefined results.

Address: 21E_0000h base + 200h offset + (4d × i), where i=0d to 31d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	RXDATA

QuadSPI_RBDR*n* field descriptions

Field	Description
RXDATA	RX Data. The RXDATA field contains the data associated with the related RX Buffer entry. Data format and byte ordering is given in Byte Ordering of Serial Flash Read Data .

40.14.28 LUT Key Register (QuadSPI_LUTKEY)

The LUT Key register contains the key to lock and unlock the Look-up-table. Refer to Look-up Table for details.

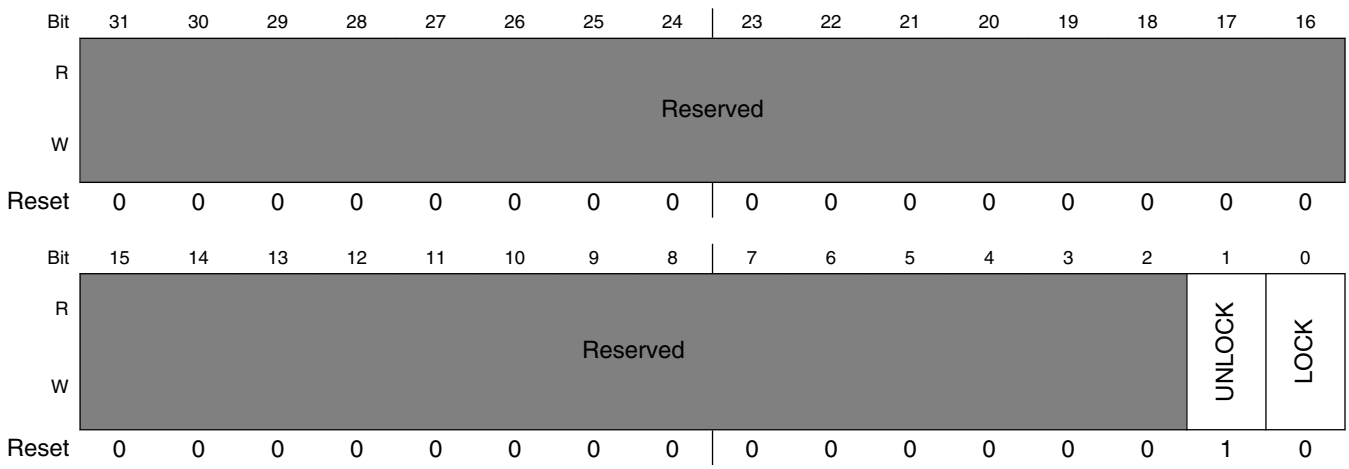
Write:Anytime

Address: 21E_0000h base + 300h offset = 21E_0300h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	KEY																															
Reset	0	1	0	1	1	0	1	0	1	1	1	1	0	0	0	0	0	1	0	1	1	0	1	0	1	1	1	1	0	0	0	0

QuadSPI_LUTKEY field descriptions

Field	Description
KEY	The key to lock or unlock the LUT. The KEY is 0x5AF05AF0. The read value is always 0x5AF05AF0



40.14.29 LUT Lock Configuration Register (QuadSPI_LCKCR)

The LUT lock configuration register is used along with QSPI_LUTKEY register to lock or unlock the LUT. This register has to be written immediately after QSPI_LUTKEY register for the lock or unlock operation to be successful. Refer to Look-up Table for details. Setting both the LOCK and UNLOCK bits as "00" or "11" is not allowed.

Write:Just after writing the LUT Key Register

(QSPI_LUTKEY)

Address: 21E_0000h base + 304h offset = 21E_0304h

QuadSPI_LCKCR field descriptions

Field	Description
31–2 Reserved	This field is reserved.
1 UNLOCK	Unlocks the LUT when the following two conditions are met: 1. This register is written just after the LUT Key Register (QuadSPI_LUTKEY) 2. The LUT key register was written with 0x5AF05AF0 key
0 LOCK	Locks the LUT when the following condition is met: 1. This register is written just after the LUT Key Register (QuadSPI_LUTKEY) 2. The LUT key register was written with 0x5AF05AF0 key

40.14.30 Look-up Table register (QuadSPI_LUT0)

The LUT registers are a look-up-table for sequences of instructions. The programmable sequence engine executes the instructions in these sequences to generate a valid serial flash transaction. There are a total of 64 LUT registers. These 64 registers are divided into groups of 4 registers that make a valid sequence. Therefore, QSPI_LUT[0], QSPI_LUT[4], QSPI_LUT[8] ..... QSPI_LUT[60] are the starting registers of a valid sequence. Each of these sets of 4 registers can have a maximum of 8 instructions. A maximum of 16 sequences can be defined at one time. Look-up Table describes the LUT registers in detail.

Write:Once the LUT is unlocked

Address: 21E_0000h base + 310h offset = 21E_0310h

Chapter 41
ROM Controller with Patch (ROMC)

41.1 Overview

The Read Only Memory Controller with ROM Patch (ROMC) acts as an interface between the ARM advanced high-performance bus (AHB - Lite) and the Read Only Memory. The ROMC consists of a ROM Controller and a ROM Patch. The ROM Patch is used to either patch code routines or fix data tables in the ROM area. There is an IP Bus interface to access the ROM Patch Registers . The figure below depicts the main functional sub-blocks of the ROMC.

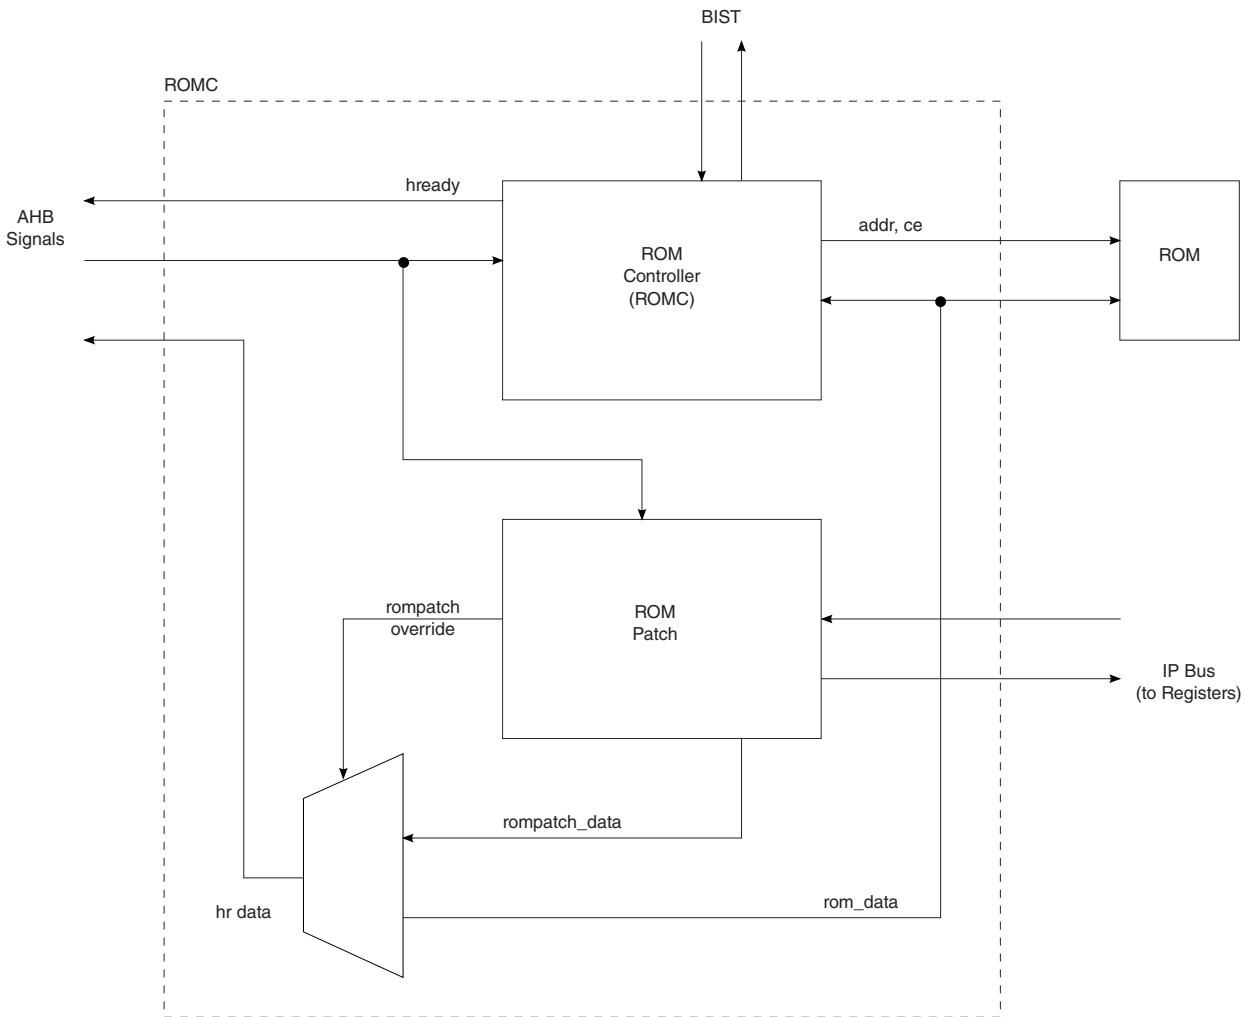

Figure 41-1. ROMC Block Diagram

41.1.1 Features

- Supports ROM size ranges from 16 Kbyte up to 4 Mbyte with increments of 1 Kbyte
- Supports opcode patching for a maximum of 16 different addresses in 4 Mbytes of ROM space
- Supports one-word data fixes for a max of 8 memory locations in 4 Mbytes of ROM space
- Supports patching of the Reset Vector (at 0x0000_0000) to allow external booting

41.1.2 Modes of Operation

There are two modes of operation: normal mode and BIST mode. In normal mode, the ROMC ensures correct reads from the ROM, assuming the memory complies with the characteristics and requirements for which the ROMC was designed.

41.1.2.1 Low Power Mode

There are two clock enables that are used to switch off parts of the ROMC logic when inactive. The first clock enable is used to disable the ROM Controller when the master connected to the AHB interface is not initiating a read to the ROM. The second clock enable is used to disable the registers used to program the ROM patch feature when the registers are not being accessed.

41.2 Clocks

The table found here describes the clock sources for ROMCP.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 41-1. ROMCP Clocks

Clock name	Clock Root	Description
hclk	ahb_clk_root	System / bus clock
hclk_reg	ipg_clk_root	System access clock
96krom_CLK	ahb_clk_root	ROM clock

41.3 Memory Map

41.3.1 ROM Memory Map in detail

The ROMC supports ROM sizes with a range of 16 Kbyte to 4 Mbyte with an increment of 1 Kbyte. The 16 Kbyte lower limit was chosen because the minimum size of security code on an ARM platform is approximately 16 Kbyte of code, which is only accessible in supervisor mode. Note that it is the MMU that controls whether any region of memory is secure.

The exception vectors must be secured as well, and must be put in the same area as the security code. Since they must reside at address 0x0000_0000, the entire 16 Kbyte of ROM which can only be accessible in supervisor mode is located at the very beginning of the platform memory map.

If the user chooses not to use the security code, a memory size smaller than 16 Kbyte can be connected to the platform (minimum of 1 Kbyte). The MMU can be programmed to allow any kind of access into this memory. However, if the ROM size is less than 16 Kbyte, memory aliasing will occur for all invalid addresses greater than the memory size but within the 16 Kbyte of space.

For ROM sizes bigger than 16 Kbyte, the rest of its physical size resides at the address starting at 0x0040_4000 (4 M+16 Kbyte) going up to [0x0040_4000 + (mem. size - 16Kbyte)]. .

41.4 Functional Description

This section is divided up into the ROM Controller Functional Description and the ROMC functional description.

41.4.1 ROM Controller (ROMC) Functional Description

41.4.1.1 Functionality overview

The ROMC serves two main functions. First, as an interface between the AHB-Lite bus on an ARM platform and the ROM. Second, it drives and receives several signals for the BIST engine. In normal mode of operation, the ROMC monitors the AHB-Lite for memory access requests and performs the memory operation to the ROM.

The ROMC includes the option to wait state all accesses from either the ARM or non-ARM masters to ROM in the event that timing requirements will not allow single HCLK clock cycle reads. If a wait state is required, the static inputs rom_wait_arm or rom_wait_alt_mstr can be set to 1 and accesses will take two HCLK clock cycles. If wait states are not required, rom_wait_arm or rom_wait_alt_mstr can be set to 0 and accesses will take one HCLK clock cycle to complete.

41.4.2 ROMC Functional Description

41.4.2.1 ROMC Disabling

All the bits in the ROMC_ROMPATCHENL register are cleared on Reset, disabling all the address comparators. Once the comparators have been enabled, the ROMC functions of data fixing and opcode patching can be quickly disabled by setting the DIS bit in the ROMC_ROMPATCHCNTL register. This bit is used to enable secure operations in which patching functions need to be disabled. This bit is cleared on Reset.

41.4.2.2 ROMC Event Priority

The ROMC has a total of 16 address comparators. The first 8 (0 through 7) comparators can be programmed for the data fixing function (through the 8 data fix enable bits in the ROMC_ROMPATCHCNTL register) while the rest are for opcode patching by default. This allows for potential multiple matching events involving both data fixing and opcode patch types. In these cases the ROMC assigns the highest priority to a data fixing event.

For example, if the ROMC is set up to data fix a certain address with comparator 4 and also opcode patch the same address with comparator 7, it will let comparator 4 have higher priority in indicating a match, and data from ROMC_ROMPATCHD4 will be put on the rompatch_romc_hrdata bus as the override value.

If multiple address matches of the same type level occur concurrently, then the ROMC will choose the source number based on the one with the highest source number. For example, the ROMC is setup to data fix the same location with address comparators 4 and 7, then address comparator 7 will have higher priority in indicating a match, and the value from ROMC_ROMPATCHD7 will be put on the rompatch_romc_hrdata bus as the orverride value. The same priority applies for an opcode patch event, except the override data is in the form of an SWI instruction with the comment field set to the source number with the highest priority.

41.4.2.3 Data Fixing

The data fixing feature allows ROM data to be updated by direct replacement when it is being read. This data usually originates from data tables, but can include ARM instructions. To enable data fixing on a certain address, this address value is written in to one of the first eight (0 through 7) of ROMC_ROMPATCHAxx registers and the same numbered bit set in the ROMC_ROMPATCHENL and ROMC_ROMPATCHCNTL registers. The data to be used for replacement is placed in the corresponding ROMC_ROMPATCHDxx.

The ROMC looks for a read access to ROM (either code fetch or data load) by snooping the AHB interface for read transactions. The address is compared with the values stored in the ROMC_ROMPATCHAxx[22:2] registers. If a match occurs from one of the comparators, the ROMC places the value in the corresponding ROMC_ROMPATCHDxx register on the read data bus by overriding the read data coming from the actual ROM (see the mux in Figure 41-1). The value on the read data bus is maintained until hready is asserted to terminate the access. In data fixing, the entire word is replaced so if a byte or half-word access occurs on a "data fix" location, the entire data word is replaced. The word being replaced is word aligned. (The two LSBs of the matching ROMC_ROMPATCHAxx are ignored in the data fix operation.)

41.4.2.4 Opcode Patching

The opcode patch feature provides the ARM core a mechanism to fetch updated versions of code routines that were originally programmed in ROM. This patching mechanism makes use of the SWI (software interrupt instruction) and a table of function pointers residing in writable memory. The opcode being patched is replaced with a SWI instruction by the ROMC. Subsequent processing of the SWI reads from a function pointers table to obtain the address of the replacement code. Execution resumes with this code patch.

To enable opcode patching of a certain address, this address value is written into one of the ROMPATCHAxx registers and the corresponding bit set in the ROMPATCHENL to enable the associated comparator. The register's LSB (ROMC_ROMPATCHxx[0]) should be set if THUMB mode patching is in effect for this address. The ROMC identifies a ROM read access by snooping the AHB interface. The address is compared with the values stored in the ROMC_ROMPATCHAxx[22:2] registers. If a match occurs from one of the comparators, the ROMC generates the opcode of a software interrupt (SWI) instruction with the comment field containing the number of the matching address comparator. This opcode and comment is placed on the read data bus until hready is asserted by the ROM controller to terminate the read access.

The type of SWI generated, (that is, either ARM or THUMB), is determined by the LSB of the ROMC_ROMPATCHAxx register associated with the opcode patch. This bit is cleared for ARM mode (32 bits). The ROMC generates a 32-bit SWI (opcode field is 0xEF, occupying bits [31:24] of the word), with the least significant 5 bits of the 24-bit comment field (bits [23:0]) containing the number of the matching address comparator. The rest of the comment field is filled with zeros. This means that the ROMC will use 16 of the 16777216 possible software interrupts. The ROMC overrides the read data from the ROM.

If the LSB of the matching ROMC_ROMPATCHAxx register is set, the opcode patch is in THUMB mode (16 bits or half word). The ROMC generates a 16-bit SWI instruction (opcode field is 0xDF, occupying bits [15:8] of the half word) with the least significant 5 bits of the 8-bit comment field containing with the source number of the address comparator. The rest of the comments field is filled with zeros. This means that the ROMC will use 16 of the 256 possible software interrupts. The ROMC puts this 16 bit SWI instruction value on the proper half of the rompatch_romc_hrdata bus. The other half is zeroed out. Which half of the bus contains the SWI opcode and comment depends on the mode (Big Endian or Little Endian) and the bit 1 of the matching ROMC_ROMPATCHAxx register. In Little Endian mode, the lower half is bits {15:0] and the upper half is bits {31:16]. The order is reversed in Big Endian mode.

In Little Endian mode (bigend signal negated), if bit 1 of the matching ROMC_ROMPATCHAxx is cleared (lower half word selected) then the SWI instruction is put on the lower 16 bits of the read data bus and the upper 16 bits are zeroed out. Only the lower 16 bits of the read data bus is overwritten by the ROMC data. If ROMC_ROMPATCHAxx[1] is set (upper half word selected), the SWI instruction is put on the upper 16 bits of the read data bus and the lower 16 bits are zeroed out. Only the upper 16 bits of the read data bus is overwritten.

In Big Endian mode (bigend asserted), if bit 1 of the matching ROMC_ROMPATCHAxx is cleared (lower half word selected) then the SWI instruction is put on the upper 16 bits of the read data bus while the lower 16 bits are zeroed out. Only the upper 16 bits of the read data bus is overwritten. If ROMC_ROMPATCHAxx[1] is set (upper word selected), the SWI instruction is put on the lower 16 bits and the upper 16 bits are zeroed out. Only the lower 16 bits of the read data bus is overwritten.

The eventual execution of the SWI causes the ARM to save the CPSR in SPSR_SVC, the address of the next instruction after the SWI in R14_SVC, enter Supervisor mode, and fetch the SWI vector at 0x8, which then takes it to a handler for further processing as described in the next section.

41.4.2.4.1 Typical Software Response to Opcode Patch

When the SWI handler executes it needs to determine whether the SWI was generated by the ROMC. This is done by loading the SWI instruction and extracting its comment field. The state of the ARM core (ARM or THUMB) when the SWI was executed dictates whether to load the instruction word (ARM) or half word (THUMB). This state information can be determined by testing the T bit (bit 5) of the SPSR. If it's set, the execution was in THUMB mode.

By convention, if the comment field of the SWI is greater than 16, the software interrupt was initiated by software (i.e. an operating system call), and a branch is taken to the appropriate handler routine for further processing. If the comment field is less than 16, the SWI was generated by the ROMC performing a code patch operation. In this case, the software then reads from a table of function pointers, using the value in the SWI comment field as the index into the table. The value that is read is the address of the code patch. This value is loaded into the PC to begin the execution of the code patch. The following code segment illustrates a typical handling of the SWI.

```
stmfd        sp!, {r0-r1,lr}       @ push register onto SWI stack
mrs         r0, spsr        @ get saved status register
tst          r0, #0x20     @ check if call was in THUMB mode
ldrneh      r0, [lr,#-2]       @ yes: load opcode half-word and
bicne       r0, r0, #0xff00   @ yes: extract THUMB comment
ldreq       r0, [lr,#-4]       @ no: load opcode word and
biceq       r0, r0, #0xff000000 @ no: extract ARM comment
                    @ now r0 has comment field
cmp         r0, #16      @ compare to 16 (maximum for ROMC)
ldrlt          lr, =rompatch_tbl_ptr @ < 16: get top of current ROMC
                    @ table; global variable which is
                    @ changeable per context
ldrlt         r1, [lr, r0, lsl #2]   @ < 16: read function pointer from
                    @ table assumed an array of pointers
                    @ patch functions

                    @ handler
ldmfd        sp!, {r0-r1,pc}^      @ >= 16: pop registers from stack
```

41.4.2.5 External Boot Feature

Following a Reset event, the ARM issues an instruction fetch of the Reset Vector from address 0x0. This instruction, normally residing in ROM is usually a branch to a Reset handler or boot code which also normally resides in ROM. The ROMC external boot feature allows the bypassing of this code, using a different boot code residing perhaps in external memory.

This feature uses the data fix mechanism and works as follows: if the boot_int signal is negated when a Reset event occurred, the ROMC will perform a data fix of the Reset Vector at 0x0 with the following instruction (opcode 0xE59FF00C):

```
ldr         pc,[pc,#12]      @ read 0x0000_0014 for reset_vector
```

The value of PC when this instruction is executed is 8 so that a PC relative offset of 12 makes the source address 20 or 0x14. When this instruction executes, the ARM core reads from address 0x0000_0014, triggering a ROMC data fix operation which places the

value taken from the external boot address on the read data bus, with the two LSBs zeroed out. This value is returned to the ARM to be placed in the PC causing code fetch and execution to start from that address.

41.4.2.6 Alternate Masters and ROMC

The ROMC sits on the AHB bus of the internal ROM (ROMC). This means that the ROMC can modify values on the read data bus going to the master. Therefore, any master which reads an opcode patched or data patched location will read patched data.

41.5 ROMCP Memory Map/Register Definition

All registers are accessible through an IP Bus and can only be accessed in privileged mode. These registers can only be written with 32-bits stores and are clocked by hclk_reg.

The ROMC register placement was originated from the AWPT design used in the ARM7 platform of Neptune

41.5.1 ROMC Data Registers (ROMC_ROMPATCH*n*D)

The ROMC data registers (ROMC_ROMPATCH7D through ROMC_ROMPATCH0D) store the data to use for the 8 1-word data fix events. Each register is associated with an address comparator (7 through 0). When a data fixing event occurs, the value in the data register corresponding to the comparator that has the address match is put on the romc_hrdata[31:0] bus until romc_hready is asserted by the ROM controller to terminate the access. A MUX external to the ROMC will select this data over that of romc_hrdata[31:0] in returning read data to the ARM core. The selection is done with the control bus rompatch_romc_hrdata_ovr[1:0] with both bits asserted by the ROMC.

If more than one address comparators match, the highest-numbered one takes precedence, and the value in corresponding data register is used for the patching event.

Address: 21A_C000h base + D4h offset + (4d × i), where i=0d to 7d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ROMC_ROMPATCH*n*D field descriptions

Field	Description
DATAX	Data Fix Registers - Stores the data used for 1-word data fix operations. The values stored within these registers do not affect the writes to the memory system. They are selected over the read data from ROM when a data fix event occurs.

ROMC_ROMPATCH*n*D field descriptions (continued)

Field	Description
	If any part of the 1-word data fix is read, then the entire word is replaced. Therefore, a byte or half-word read will cause the ROMC to replace the entire word. The word is word address aligned.

41.5.2 ROMC Control Register (ROMC_ROMPATCHCNTL)

The ROMC control register (ROMC_ROMPATCHCNTL) contains the block disable bit and the data fix enable bits. The block disable bit provides a means to disable the ROMC data fix and opcode patching functions, even when the address comparators are enabled. The External Boot feature is not affected by this bit. The eight data fix enable bits (0 through 7), when set, assign the associated address comparators to data fix operations

NOTE

Bits 27 and 22 always read as 1s.

Address: 21A_C000h base + F4h offset = 21A_C0F4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

41.5.3 ROMC Enable Register High (ROMC_ROMPATCHENH)

The ROMC enable register high (ROMC_ROMPATCHENH) and ROMC enable register low (ROMC_ROMPATCHENL) control whether or not the associated address comparator can trigger a opcode patch or data fix event. This implementation of the ROMC only has 16 comparators, therefore ROMC_ROMPATCHENH and the upper half of ROMC_OMPATCHENL are read-only. ROMC_ROMPATCHENL[15:0] are associated with comparators 15 through 0. ROMC_ROMPATCHENLH[31:0] would have been associated with comparators 63 through 32.

Address: 21A_C000h base + F8h offset = 21A_C0F8h

41.5.5 ROMC Address Registers (ROMC_ROMPATCH*n*A)

The ROMC address registers (ROMC_ROMPATCHA0 through ROMC_ROMPATCHA15) store the memory addresses where opcode patching begins and data fixing occurs. The address registers ROMC_ROMPATCHA0 through ROMC_ROMPATCHA15 are each 21 bits wide and dedicated to one 4 Mbyte memory space. Bits 21 through 2 are address bits, to be compared with romc_haddr[21:2] for a match; bit 1 is also an address bit used for half word selection. Bit 0 is the mode bit (set to 1 for THUMB mode). 1-word data fixing can only be used on the first 8 of the address comparators. ROMC_ROMPATCHA0 through ROMC_ROMPATCHA15 are associated each with address comparators 0 through 15.

Address: 21A_C000h base + 100h offset + (4d × i), where i=0d to 15d

Chapter 42
Synchronous Audio Interface (SAI)

42.1 Overview

The synchronous audio interface (SAI) supports full-duplex serial interfaces with frame synchronization such as I^2S, AC97, TDM, and codec/DSP interfaces.

42.1.1 Features

Note that some of the features are not supported across all SAI instances; see the chip-specific information in the first section of this chapter.

- Transmitter with independent bit clock and frame sync supporting 1 data line
- Receiver with independent bit clock and frame sync supporting 1 data line
- Maximum Frame Size of 32 words
- Word size of between 8-bits and 32-bits
- Word size configured separately for first word and remaining words in frame
- Asynchronous 32 × 32-bit FIFO for each transmit and receive channel
- Supports graceful restart after FIFO error

42.1.2 Block diagram

The following block diagram also shows the module clocks.

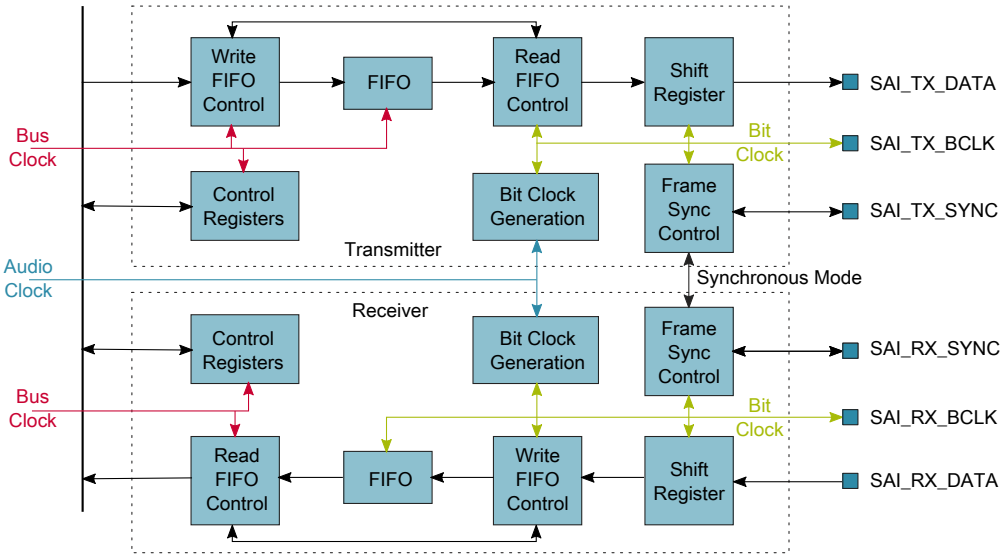

Figure 42-1. I²S/SAI block diagram

42.1.3 Modes of operation

The module operates in these power modes: Run mode, stop modes, and Debug mode.

42.1.3.1 Run mode

In Run mode, the SAI transmitter and receiver operate normally.

42.1.3.2 Stop modes

In Stop mode, the transmitter is disabled after completing the current transmit frame, and, the receiver is disabled after completing the current receive frame. Entry into Stop mode is prevented–not acknowledged–while waiting for the transmitter and receiver to be disabled at the end of the current frame.

42.1.3.3 Debug mode

In Debug mode, the SAI transmitter and/or receiver can continue operating provided the Debug Enable bit is set. When TCSR[DBGE] or RCSR[DBGE] bit is clear and Debug mode is entered, the SAI is disabled after completing the current transmit or receive frame. The transmitter and receiver bit clocks are not affected by Debug mode.

42.2 External Signals

The following table describes the external signals of SAI:

Table 42-1. SAI External Signals

Signal	Description	Pad	Mode	Direction
SAI1_MCLK	Audio Master Clock. The master clock is an input when externally generated and an output when internally generated.	CSI_DATA01	ALT6	IO
		LCD_DATA00	ALT8	
SAI1_RX_BCLK	Receive Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	CSI_DATA03	ALT6	IO
SAI1_RX_DATA	Receive Data. The receive data is sampled synchronously by the bit clock.	CSI_DATA06	ALT6	I
		LCD_DATA03	ALT8	
SAI1_RX_SYNC	Receive Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	CSI_DATA02	ALT6	IO
SAI1_TX_BCLK	Transmit Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	CSI_DATA05	ALT6	IO
		LCD_DATA02	ALT8	
SAI1_TX_DATA	Transmit Data. The transmit data is generated synchronously by the bit clock and is tristated whenever not transmitting a word.	CSI_DATA07	ALT6	O
		LCD_DATA04	ALT8	
SAI1_TX_SYNC	Transmit Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	CSI_DATA04	ALT6	IO
		LCD_DATA01	ALT8	
SAI2_MCLK	Audio Master Clock. The master clock is an input when externally generated and an output when internally generated.	JTAG_TMS	ALT2	IO
		SD1_CLK	ALT2	
SAI2_RX_BCLK	Receive Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	NAND_DATA06	ALT2	IO
SAI2_RX_DATA	Receive Data. The receive data is sampled synchronously by the bit clock.	JTAG_TCK	ALT2	I
		SD1_DATA2	ALT2	
SAI2_RX_SYNC	Receive Frame Sync. The frame sync is an input sampled	SD1_CMD	ALT2	IO

		LCD_RESET	ALT3	
SAI3_TX_SYNC	Transmit Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	LCD_DATA12	ALT1	IO
		LCD_ENABLE	ALT3	

42.3 Functional description

This section provides a complete functional description of the block.

42.3.1 SAI clocking

The SAI clocks include:

- The audio master clock
- The bit clock
- The bus clock

42.3.1.1 Audio master clock

The audio master clock is used to generate the bit clock when the receiver or transmitter is configured for an internally generated bit clock. The transmitter and receiver can independently select between the bus clock and up to three audio master clocks to generate the bit clock.

The audio master clock generation and selection is chip-specific. Refer to chip-specific clocking information about how the audio master clocks are generated.

42.3.1.2 Bit clock

The SAI transmitter and receiver support asynchronous free-running bit clocks that can be generated internally from an audio master clock or supplied externally. There is also the option for synchronous bit clock and frame sync operation between the receiver and transmitter.

Externally generated bit clocks must be:

- Enabled before the SAI transmitter or receiver is enabled
- Disabled after the SAI transmitter or receiver is disabled and completes its current frames

If the SAI transmitter or receiver is using an externally generated bit clock in asynchronous mode and that bit clock is generated by an SAI that is disabled in stop mode, then the transmitter or receiver should be disabled by software before entering stop mode. This issue does not apply when the transmitter or receiver is in a synchronous mode because all synchronous SAIs are enabled and disabled simultaneously.

42.3.1.3 Bus clock

The bus clock is used by the control and configuration registers and to generate synchronous interrupts and DMA requests.

NOTE

Although there is no specific minimum bus clock frequency specified, the bus clock frequency must be fast enough (relative to the bit clock frequency) to ensure that the FIFOs can be serviced, without generating either a transmitter FIFO underrun or receiver FIFO overflow condition.

42.3.2 SAI resets

The SAI is asynchronously reset on system reset. The SAI has a software reset and a FIFO reset.

42.3.2.1 Software reset

The SAI transmitter includes a software reset that resets all transmitter internal logic, including the bit clock generation, status flags, and FIFO pointers. It does not reset the configuration registers. The software reset remains asserted until cleared by software.

The SAI receiver includes a software reset that resets all receiver internal logic, including the bit clock generation, status flags and FIFO pointers. It does not reset the configuration registers. The software reset remains asserted until cleared by software.

42.3.2.2 FIFO reset

The SAI transmitter includes a FIFO reset that synchronizes the FIFO write pointer to the same value as the FIFO read pointer. This empties the FIFO contents and is to be used after TCSR[FEF] is set, and before the FIFO is re-initialized and TCSR[FEF] is cleared. The FIFO reset is asserted for one cycle only.

The SAI receiver includes a FIFO reset that synchronizes the FIFO read pointer to the same value as the FIFO write pointer. This empties the FIFO contents and is to be used after the RCSR[FEF] is set and any remaining data has been read from the FIFO, and before the RCSR[FEF] is cleared. The FIFO reset is asserted for one cycle only.

42.3.3 Synchronous modes

The SAI transmitter and receiver can operate synchronously to each other.

42.3.3.1 Synchronous mode

The SAI transmitter and receiver can be configured to operate with synchronous bit clock and frame sync.

If the transmitter bit clock and frame sync are to be used by both the transmitter and receiver:

- The transmitter must be configured for asynchronous operation and the receiver for synchronous operation.
- In synchronous mode, the receiver is enabled only when both the transmitter and receiver are enabled.
- It is recommended that the transmitter is the last enabled and the first disabled.

If the receiver bit clock and frame sync are to be used by both the transmitter and receiver:

- The receiver must be configured for asynchronous operation and the transmitter for synchronous operation.
- In synchronous mode, the transmitter is enabled only when both the receiver and transmitter are both enabled.
- It is recommended that the receiver is the last enabled and the first disabled.

When operating in synchronous mode, only the bit clock, frame sync, and transmitter/receiver enable are shared. The transmitter and receiver otherwise operate independently, although configuration registers must be configured consistently across both the transmitter and receiver.

42.3.4 Frame sync configuration

When enabled, the SAI continuously transmits and/or receives frames of data. Each frame consists of a fixed number of words and each word consists of a fixed number of bits. Within each frame, any given word can be masked causing the receiver to ignore that word and the transmitter to tri-state for the duration of that word.

The frame sync signal is used to indicate the start of each frame. A valid frame sync requires a rising edge (if active high) or falling edge (if active low) to be detected and the transmitter or receiver cannot be busy with a previous frame. A valid frame sync is also ignored (slave mode) or not generated (master mode) for the first four bit clock cycles after enabling the transmitter or receiver.

The transmitter and receiver frame sync can be configured independently with any of the following options:

- Externally generated or internally generated
- Active high or active low
- Assert with the first bit in frame or asserts one bit early
- Assert for a duration between 1 bit clock and the first word length
- Frame length from 1 to 32 words per frame
- Word length to support 8 to 32 bits per word
    - First word length and remaining word lengths can be configured separately
- Words can be configured to transmit/receive MSB first or LSB first

These configuration options cannot be changed after the SAI transmitter or receiver is enabled.

42.3.5 Data FIFO

Each transmit and receive channel includes a FIFO of size 32 × 32-bit. The FIFO data is accessed using the SAI Transmit/Receive Data Registers.

42.3.5.1 Data alignment

Data in the FIFO can be aligned anywhere within the 32-bit wide register through the use of the First Bit Shifted configuration field, which selects the bit index (between 31 and 0) of the first bit shifted.

Examples of supported data alignment and the required First Bit Shifted configuration are illustrated in Figure 42-2 for LSB First configurations and Figure 42-3 for MSB First configurations.

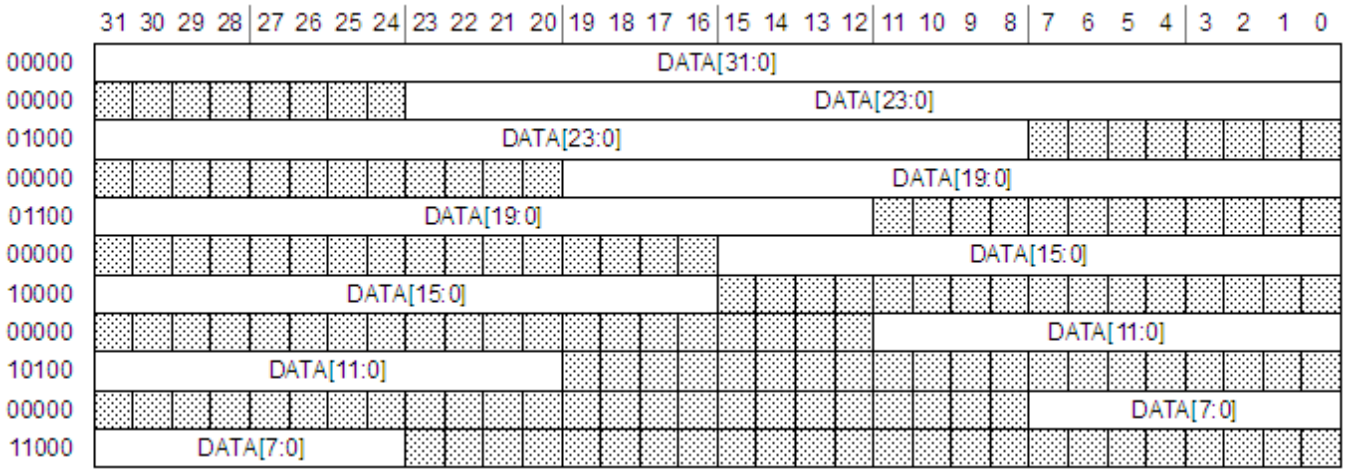

Figure 42-2. SAI first bit shifted, LSB first

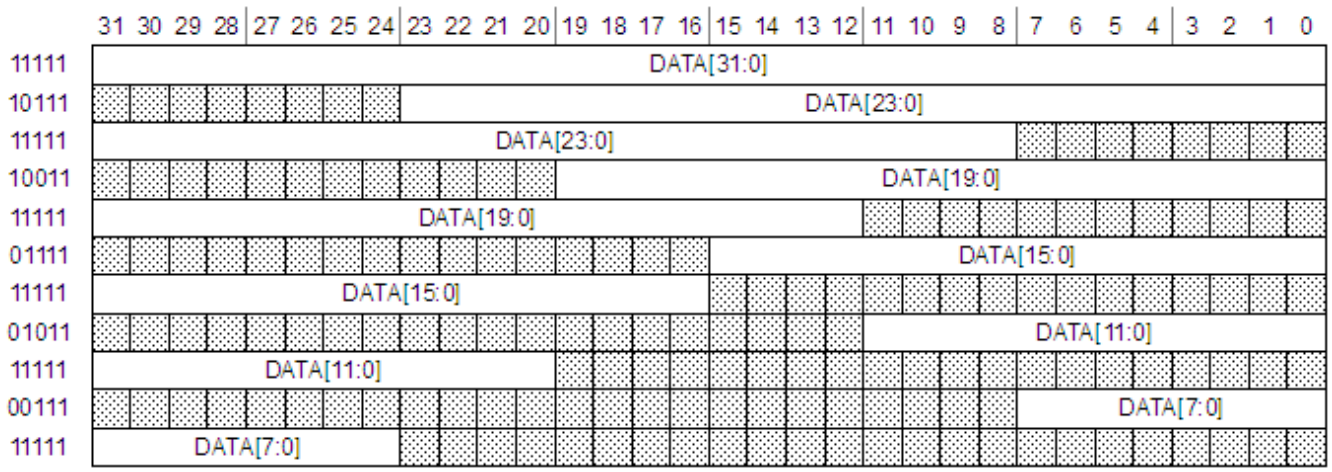

Figure 42-3. SAI first bit shifted, MSB first

42.3.5.2 FIFO pointers

When writing to a TDR, the WFP of the corresponding TFR increments after each valid write. The SAI supports 8-bit, 16-bit and 32-bit writes to the TDR and the FIFO pointer will increment after each individual write. Note that 8-bit writes should only be used when transmitting up to 8-bit data and 16-bit writes should only be used when transmitting up to 16-bit data.

Writes to a TDR are ignored if the corresponding bit of TCR3[TCE] is clear or if the FIFO is full. If the Transmit FIFO is empty, the TDR must be written at least three bit clocks before the start of the next unmasked word to avoid a FIFO underrun.

When reading an RDR, the RFP of the corresponding RFR increments after each valid read. The SAI supports 8-bit, 16-bit and 32-bit reads from the RDR and the FIFO pointer will increment after each individual read. Note that 8-bit reads should only be used when receiving up to 8-bit data and 16-bit reads should only be used when receiving up to 16-bit data.

Reads from an RDR are ignored if the corresponding bit of RCR3[RCE] is clear or if the FIFO is empty. If the Receive FIFO is full, the RDR must be read at least three bit clocks before the end of an unmasked word to avoid a FIFO overrun.

42.3.6 Word mask register

The SAI transmitter and receiver each contain a word mask register, namely TMR and RMR, that can be used to mask any word in the frame. Because the word mask register is double buffered, software can update it before the end of each frame to mask a particular word in the next frame.

The TMR causes the Transmit Data pin to be tri-stated for the length of each selected word and the transmit FIFO is not read for masked words.

The RMR causes the received data for each selected word to be discarded and not written to the receive FIFO.

42.3.7 Interrupts and DMA requests

The SAI transmitter and receiver generate separate interrupts and separate DMA requests, but support the same status flags.

42.3.7.1 FIFO request flag

The FIFO request flag is set based on the number of entries in the FIFO and the FIFO watermark configuration.

The transmit FIFO request flag is set when the number of entries in any of the enabled transmit FIFOs is less than or equal to the transmit FIFO watermark configuration and is cleared when the number of entries in each enabled transmit FIFO is greater than the transmit FIFO watermark configuration.

The receive FIFO request flag is set when the number of entries in any of the enabled receive FIFOs is greater than the receive FIFO watermark configuration and is cleared when the number of entries in each enabled receive FIFO is less than or equal to the receive FIFO watermark configuration.

The FIFO request flag can generate an interrupt or a DMA request.

42.3.7.2 FIFO warning flag

The FIFO warning flag is set based on the number of entries in the FIFO.

The transmit warning flag is set when the number of entries in any of the enabled transmit FIFOs is empty and is cleared when the number of entries in each enabled transmit FIFO is not empty.

The receive warning flag is set when the number of entries in any of the enabled receive FIFOs is full and is cleared when the number of entries in each enabled receive FIFO is not full.

The FIFO warning flag can generate an Interrupt or a DMA request.

42.3.7.3 FIFO error flag

The transmit FIFO error flag is set when the any of the enabled transmit FIFOs underflow. After it is set, all enabled transmit channels repeat the last valid word read from the transmit FIFO until TCSR[FEF] is cleared and the next transmit frame starts. All enabled transmit FIFOs must be reset and initialized with new data before TCSR[FEF] is cleared.

RCSR[FEF] is set when the any of the enabled receive FIFOs overflow. After it is set, all enabled receive channels discard received data until RCSR[FEF] is cleared and the next next receive frame starts. All enabled receive FIFOs should be emptied before RCSR[FEF] is cleared.

The FIFO error flag can generate only an interrupt.

42.3.7.4 Sync error flag

The sync error flag, TCSR[SEF] or RCSR[SEF], is set when configured for an externally generated frame sync and the external frame sync asserts when the transmitter or receiver is busy with the previous frame. The external frame sync assertion is ignored and the sync error flag is set. When the sync error flag is set, the transmitter or receiver continues checking for frame sync assertion when idle or at the end of each frame.

The sync error flag can generate an interrupt only.

42.3.7.5 Word start flag

The word start flag is set at the start of the second bit clock for the selected word, as configured by the Word Flag register field.

The word start flag can generate an interrupt only.

42.4 Memory map and register definition

A read or write access to an address from offset and above will result in a bus error.

I2S memory map

42.4.1 SAI Transmit Control Register (I2Sx_TCSR)

Address: Base address + 0h offset

I2Sx_TCSR field descriptions

Field	Description
31 TE	Transmitter Enable Enables/disables the transmitter. When software clears this field, the transmitter remains enabled, and this bit remains set, until the end of the current frame. 0 Transmitter is disabled. 1 Transmitter is enabled, or transmitter has been disabled and has not yet reached end of frame.
30 STOPE	Stop Enable Configures transmitter operation in Stop mode. This field is ignored and the transmitter is disabled in all stop modes. 0 Transmitter disabled in Stop mode. 1 Transmitter enabled in Stop mode.
29 DBGE	Debug Enable

Table continues on the next page...

I2Sx_TCSR field descriptions (continued)

Field	Description
	Enables/disables transmitter operation in Debug mode. The transmit bit clock is not affected by debug mode. 0 Transmitter is disabled in Debug mode, after completing the current frame. 1 Transmitter is enabled in Debug mode.
28 BCE	Bit Clock Enable Enables the transmit bit clock, separately from the TE. This field is automatically set whenever TE is set. When software clears this field, the transmit bit clock remains enabled, and this bit remains set, until the end of the current frame. 0 Transmit bit clock is disabled. 1 Transmit bit clock is enabled.
27–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
25 FR	FIFO Reset Resets the FIFO pointers. Reading this field will always return zero. FIFO pointers should only be reset when the transmitter is disabled or the FIFO error flag is set. 0 No effect. 1 FIFO reset.
24 SR	Software Reset When set, resets the internal transmitter logic including the FIFO pointers. Software-visible registers are not affected, except for the status registers. 0 No effect. 1 Software reset.
23–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20 WSF	Word Start Flag Indicates that the start of the configured word has been detected. Write a logic 1 to this field to clear this flag. 0 Start of word not detected. 1 Start of word detected.
19 SEF	Sync Error Flag Indicates that an error in the externally-generated frame sync has been detected. Write a logic 1 to this field to clear this flag. 0 Sync error not detected. 1 Frame sync error detected.
18 FEF	FIFO Error Flag Indicates that an enabled transmit FIFO has underrun. Write a logic 1 to this field to clear this flag. 0 Transmit underrun not detected. 1 Transmit underrun detected.

Table continues on the next page...

I2Sx_TCSR field descriptions (continued)

Field	Description
17 FWF	FIFO Warning Flag Indicates that an enabled transmit FIFO is empty. 0 No enabled transmit FIFO is empty. 1 Enabled transmit FIFO is empty.
16 FRF	FIFO Request Flag Indicates that the number of words in an enabled transmit channel FIFO is less than or equal to the transmit FIFO watermark. 0 Transmit FIFO watermark has not been reached. 1 Transmit FIFO watermark has been reached.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12 WSIE	Word Start Interrupt Enable Enables/disables word start interrupts. 0 Disables interrupt. 1 Enables interrupt.
11 SEIE	Sync Error Interrupt Enable Enables/disables sync error interrupts. 0 Disables interrupt. 1 Enables interrupt.
10 FEIE	FIFO Error Interrupt Enable Enables/disables FIFO error interrupts. 0 Disables the interrupt. 1 Enables the interrupt.
9 FWIE	FIFO Warning Interrupt Enable Enables/disables FIFO warning interrupts. 0 Disables the interrupt. 1 Enables the interrupt.
8 FRIE	FIFO Request Interrupt Enable Enables/disables FIFO request interrupts. 0 Disables the interrupt. 1 Enables the interrupt.
7–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 FWDE	FIFO Warning DMA Enable

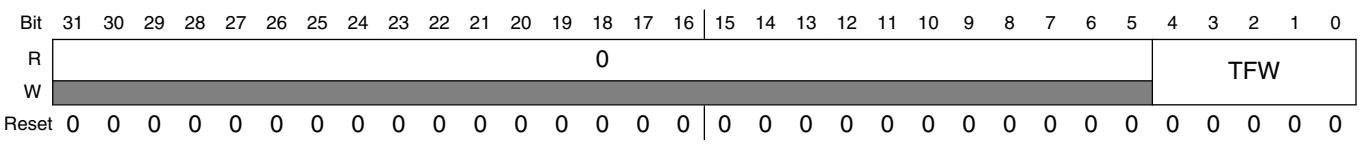

Table continues on the next page...

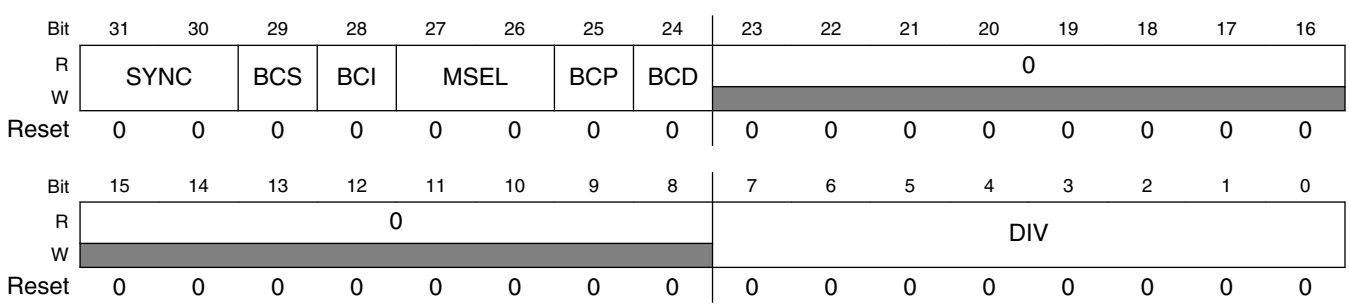
I2Sx_TCSR field descriptions (continued)

Field	Description
	Enables/disables DMA requests. 0 Disables the DMA request. 1 Enables the DMA request.
0 FRDE	FIFO Request DMA Enable Enables/disables DMA requests. 0 Disables the DMA request. 1 Enables the DMA request.

42.4.2 SAI Transmit Configuration 1 Register (I2Sx_TCR1)

Address: Base address + 4h offset



I2Sx_TCR1 field descriptions

Field	Description
31–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TFW	Transmit FIFO Watermark Configures the watermark level for all enabled transmit channels.

42.4.3 SAI Transmit Configuration 2 Register (I2Sx_TCR2)

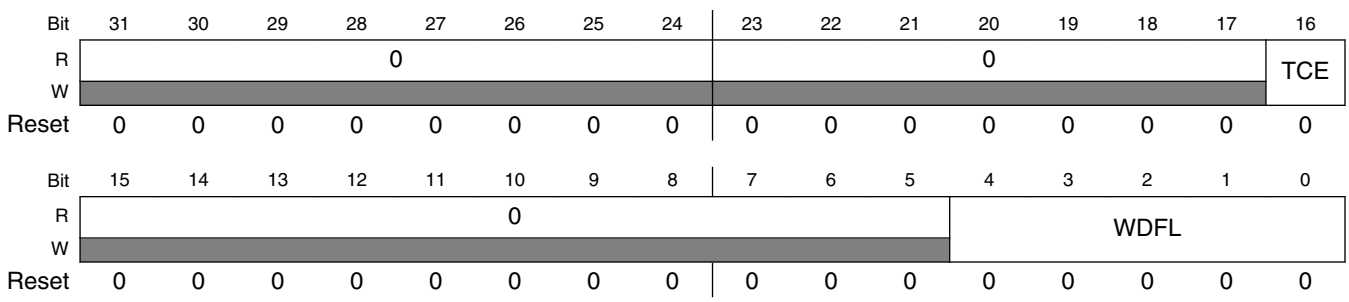
This register must not be altered when TCSR[TE] is set.

Address: Base address + 8h offset

I2Sx_TCR2 field descriptions

Field	Description
31–30 SYNC	Synchronous Mode Configures between asynchronous and synchronous modes of operation. When configured for a synchronous mode of operation, the receiver must be configured for asynchronous operation. 00 Asynchronous mode. 01 Synchronous with receiver.
29 BCS	Bit Clock Swap This field swaps the bit clock used by the transmitter. When the transmitter is configured in asynchronous mode and this bit is set, the transmitter is clocked by the receiver bit clock (SAI_RX_BCLK). This allows the transmitter and receiver to share the same bit clock, but the transmitter continues to use the transmit frame sync (SAI_TX_SYNC). When the transmitter is configured in synchronous mode, the transmitter BCS field and receiver BCS field must be set to the same value. When both are set, the transmitter and receiver are both clocked by the transmitter bit clock (SAI_TX_BCLK) but use the receiver frame sync (SAI_RX_SYNC). 0 Use the normal bit clock source. 1 Swap the bit clock source.
28 BCI	Bit Clock Input When this field is set and using an internally generated bit clock in either synchronous or asynchronous mode, the bit clock actually used by the transmitter is delayed by the pad output delay (the transmitter is clocked by the pad input as if the clock was externally generated). This has the effect of decreasing the data input setup time, but increasing the data output valid time. The slave mode timing from the datasheet should be used for the transmitter when this bit is set. In synchronous mode, this bit allows the transmitter to use the slave mode timing from the datasheet, while the receiver uses the master mode timing. This field has no effect when configured for an externally generated bit clock . 0 No effect. 1 Internal logic is clocked as if bit clock was externally generated.
27–26 MSEL	MCLK Select Selects the audio Master Clock option used to generate an internally generated bit clock. This field has no effect when configured for an externally generated bit clock. **NOTE:** Depending on the device, some Master Clock options might not be available. See the chip-specific information for the meaning of each option. 00 Master Clock (MCLK) 1 option selected. 01 Master Clock (MCLK) 1 option selected. 10 Master Clock (MCLK) 2 option selected. 11 Master Clock (MCLK) 3 option selected.
25 BCP	Bit Clock Polarity Configures the polarity of the bit clock. 0 Bit clock is active high with drive outputs on rising edge and sample inputs on falling edge. 1 Bit clock is active low with drive outputs on falling edge and sample inputs on rising edge.
24 BCD	Bit Clock Direction

Table continues on the next page...



I2Sx_TCR2 field descriptions (continued)

Field	Description
	Configures the direction of the bit clock. 0 Bit clock is generated externally in Slave mode. 1 Bit clock is generated internally in Master mode.
23–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
DIV	Bit Clock Divide Divides down the audio master clock to generate the bit clock when configured for an internal bit clock. The division value is (DIV + 1) * 2.

42.4.4 SAI Transmit Configuration 3 Register (I2Sx_TCR3)

This register must not be altered when TCSR[TE] is set.

Address: Base address + Ch offset

I2Sx_TCR3 field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 TCE	Transmit Channel Enable Enables the corresponding data channel for transmit operation. A channel must be enabled before its FIFO is accessed. 0 Transmit data channel N is disabled. 1 Transmit data channel N is enabled.
15–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
WDFL	Word Flag Configuration

Table continues on the next page...

I2Sx_TCR3 field descriptions (continued)

Field	Description
	Configures which word sets the start of word flag. The value written must be one less than the word number. For example, writing 0 configures the first word in the frame. When configured to a value greater than TCR4[FRSZ], then the start of word flag is never set.

42.4.5 SAI Transmit Configuration 4 Register (I2Sx_TCR4)

This register must not be altered when TCSR[TE] is set.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

I2Sx_TCR4 field descriptions

Field	Description
31–29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
25–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–16 FRSZ	Frame size Configures the number of words in each frame. The value written must be one less than the number of words in the frame. For example, write 0 for one word per frame. The maximum supported frame size is 32 words.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–8 SYWD	Sync Width Configures the length of the frame sync in number of bit clocks. The value written must be one less than the number of bit clocks. For example, write 0 for the frame sync to assert for one bit clock only. The sync width cannot be configured longer than the first word of the frame.
7–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

I2Sx_TCR4 field descriptions (continued)

Field	Description
4 MF	MSB First Configures whether the LSB or the MSB is transmitted first. 0 LSB is transmitted first. 1 MSB is transmitted first.
3 FSE	Frame Sync Early 0 Frame sync asserts with the first bit of the frame. 1 Frame sync asserts one bit before the first bit of the frame.
2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 FSP	Frame Sync Polarity Configures the polarity of the frame sync. 0 Frame sync is active high. 1 Frame sync is active low.
0 FSD	Frame Sync Direction Configures the direction of the frame sync. 0 Frame sync is generated externally in Slave mode. 1 Frame sync is generated internally in Master mode.

42.4.6 SAI Transmit Configuration 5 Register (I2Sx_TCR5)

This register must not be altered when TCSR[TE] is set.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

I2Sx_TCR5 field descriptions

Field	Description
31–29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28–24 WNW	Word N Width Configures the number of bits in each word, for each word except the first in the frame. The value written must be one less than the number of bits per word. Word width of less than 8 bits is not supported.
23–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

I2Sx_TCR5 field descriptions (continued)

Field	Description
20–16 W0W	Word 0 Width Configures the number of bits in the first word in each frame. The value written must be one less than the number of bits in the first word. Word width of less than 8 bits is not supported if there is only one word per frame.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–8 FBT	First Bit Shifted Configures the bit index for the first bit transmitted for each word in the frame. If configured for MSB First, the index of the next bit transmitted is one less than the current bit transmitted. If configured for LSB First, the index of the next bit transmitted is one more than the current bit transmitted. The value written must be greater than or equal to the word width when configured for MSB First. The value written must be less than or equal to 31-word width when configured for LSB First.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

42.4.7 SAI Transmit Data Register (I2S*x*_TDR*n*)

Address: Base address + 20h offset + (4d × i), where i=0d to 0d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																															
W	TDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2S*x*_TDR*n* field descriptions

Field	Description
TDR	Transmit Data Register The corresponding TCR3[TCE] bit must be set before accessing the channel's transmit data register. Writes to this register when the transmit FIFO is not full will push the data written into the transmit data FIFO. Writes to this register when the transmit FIFO is full are ignored.

42.4.8 SAI Transmit FIFO Register (I2Sx_TFR*n*)

The MSB of the read and write pointers is used to distinguish between FIFO full and empty conditions. If the read and write pointers are identical, then the FIFO is empty. If the read and write pointers are identical except for the MSB, then the FIFO is full.

Address: Base address + 40h offset + (4d × i), where i=0d to 0d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

I2Sx_TFR*n* field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21–16 WFP	Write FIFO Pointer FIFO write pointer for transmit data channel.
15–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RFP	Read FIFO Pointer FIFO read pointer for transmit data channel.

42.4.9 SAI Transmit Mask Register (I2Sx_TMR)

This register is double-buffered and updates:

1. When TCSR[TE] is first set
2. At the end of each frame.

This allows the masked words in each frame to change from frame to frame.

Address: Base address + 60h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Sx_RCSR field descriptions

Field	Description
31 RE	Receiver Enable Enables/disables the receiver. When software clears this field, the receiver remains enabled, and this bit remains set, until the end of the current frame. 0 Receiver is disabled. 1 Receiver is enabled, or receiver has been disabled and has not yet reached end of frame.
30 STOPE	Stop Enable Configures receiver operation in Stop mode. This bit is ignored and the receiver is disabled in all stop modes. 0 Receiver disabled in Stop mode. 1 Receiver enabled in Stop mode.
29 DBGE	Debug Enable Enables/disables receiver operation in Debug mode. The receive bit clock is not affected by Debug mode. 0 Receiver is disabled in Debug mode, after completing the current frame. 1 Receiver is enabled in Debug mode.
28 BCE	Bit Clock Enable Enables the receive bit clock, separately from RE. This field is automatically set whenever RE is set. When software clears this field, the receive bit clock remains enabled, and this field remains set, until the end of the current frame. 0 Receive bit clock is disabled. 1 Receive bit clock is enabled.
27–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
25 FR	FIFO Reset Resets the FIFO pointers. Reading this field will always return zero. FIFO pointers should only be reset when the receiver is disabled or the FIFO error flag is set. 0 No effect. 1 FIFO reset.
24 SR	Software Reset Resets the internal receiver logic including the FIFO pointers. Software-visible registers are not affected, except for the status registers. 0 No effect. 1 Software reset.
23–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20 WSF	Word Start Flag Indicates that the start of the configured word has been detected. Write a logic 1 to this field to clear this flag.

Table continues on the next page...

I2Sx_RCSR field descriptions (continued)

Field	Description
	0 Start of word not detected. 1 Start of word detected.
19 SEF	Sync Error Flag Indicates that an error in the externally-generated frame sync has been detected. Write a logic 1 to this field to clear this flag. 0 Sync error not detected. 1 Frame sync error detected.
18 FEF	FIFO Error Flag Indicates that an enabled receive FIFO has overflowed. Write a logic 1 to this field to clear this flag. 0 Receive overflow not detected. 1 Receive overflow detected.
17 FWF	FIFO Warning Flag Indicates that an enabled receive FIFO is full. 0 No enabled receive FIFO is full. 1 Enabled receive FIFO is full.
16 FRF	FIFO Request Flag Indicates that the number of words in an enabled receive channel FIFO is greater than the receive FIFO watermark. 0 Receive FIFO watermark not reached. 1 Receive FIFO watermark has been reached.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12 WSIE	Word Start Interrupt Enable Enables/disables word start interrupts. 0 Disables interrupt. 1 Enables interrupt.
11 SEIE	Sync Error Interrupt Enable Enables/disables sync error interrupts. 0 Disables interrupt. 1 Enables interrupt.
10 FEIE	FIFO Error Interrupt Enable Enables/disables FIFO error interrupts. 0 Disables the interrupt. 1 Enables the interrupt.
9 FWIE	FIFO Warning Interrupt Enable Enables/disables FIFO warning interrupts.

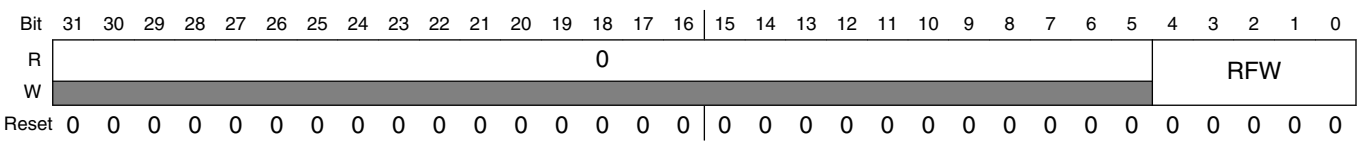

Table continues on the next page...

I2Sx_RCSR field descriptions (continued)

Field	Description
	0 Disables the interrupt. 1 Enables the interrupt.
8 FRIE	FIFO Request Interrupt Enable Enables/disables FIFO request interrupts. 0 Disables the interrupt. 1 Enables the interrupt.
7–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 FWDE	FIFO Warning DMA Enable Enables/disables DMA requests. 0 Disables the DMA request. 1 Enables the DMA request.
0 FRDE	FIFO Request DMA Enable Enables/disables DMA requests. 0 Disables the DMA request. 1 Enables the DMA request.

42.4.11 SAI Receive Configuration 1 Register (I2Sx_RCR1)

Address: Base address + 84h offset

I2Sx_RCR1 field descriptions

Field	Description
31–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RFW	Receive FIFO Watermark Configures the watermark level for all enabled receiver channels.

42.4.12 SAI Receive Configuration 2 Register (I2Sx_RCR2)

This register must not be altered when RCSR[RE] is set.

Address: Base address + 88h offset

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Sx_RCR2 field descriptions

Field	Description
31–30 SYNC	Synchronous Mode Configures between asynchronous and synchronous modes of operation. When configured for a synchronous mode of operation, the transmitter must be configured for asynchronous operation. 00 Asynchronous mode. 01 Synchronous with transmitter.
29 BCS	Bit Clock Swap This field swaps the bit clock used by the receiver. When the receiver is configured in asynchronous mode and this bit is set, the receiver is clocked by the transmitter bit clock (SAI_TX_BCLK). This allows the transmitter and receiver to share the same bit clock, but the receiver continues to use the receiver frame sync (SAI_RX_SYNC). When the receiver is configured in synchronous mode, the transmitter BCS field and receiver BCS field must be set to the same value. When both are set, the transmitter and receiver are both clocked by the receiver bit clock (SAI_RX_BCLK) but use the transmitter frame sync (SAI_TX_SYNC). 0 Use the normal bit clock source. 1 Swap the bit clock source.
28 BCI	Bit Clock Input When this field is set and using an internally generated bit clock in either synchronous or asynchronous mode, the bit clock actually used by the receiver is delayed by the pad output delay (the receiver is clocked by the pad input as if the clock was externally generated). This has the effect of decreasing the data input setup time, but increasing the data output valid time. The slave mode timing from the datasheet should be used for the receiver when this bit is set. In synchronous mode, this bit allows the receiver to use the slave mode timing from the datasheet, while the transmitter uses the master mode timing. This field has no effect when configured for an externally generated bit clock . 0 No effect. 1 Internal logic is clocked as if bit clock was externally generated.
27–26 MSEL	MCLK Select

Table continues on the next page...

I2Sx_RCR2 field descriptions (continued)

Field	Description
	Selects the audio Master Clock option used to generate an internally generated bit clock. This field has no effect when configured for an externally generated bit clock. **NOTE:** Depending on the device, some Master Clock options might not be available. See the chip-specific information for the availability and chip-specific meaning of each option. 00 Bus Clock selected. 01 Master Clock (MCLK) 1 option selected. 10 Master Clock (MCLK) 2 option selected. 11 Master Clock (MCLK) 3 option selected.
25 BCP	Bit Clock Polarity Configures the polarity of the bit clock. 0 Bit Clock is active high with drive outputs on rising edge and sample inputs on falling edge. 1 Bit Clock is active low with drive outputs on falling edge and sample inputs on rising edge.
24 BCD	Bit Clock Direction Configures the direction of the bit clock. 0 Bit clock is generated externally in Slave mode. 1 Bit clock is generated internally in Master mode.
23–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
DIV	Bit Clock Divide Divides down the audio master clock to generate the bit clock when configured for an internal bit clock. The division value is (DIV + 1) * 2.

42.4.13 SAI Receive Configuration 3 Register (I2Sx_RCR3)

This register must not be altered when RCSR[RE] is set.

Address: Base address + 8Ch offset

Field	Description
31–29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28–24 WNW	Word N Width Configures the number of bits in each word, for each word except the first in the frame. The value written must be one less than the number of bits per word. Word width of less than 8 bits is not supported.
23–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–16 W0W	Word 0 Width Configures the number of bits in the first word in each frame. The value written must be one less than the number of bits in the first word. Word width of less than 8 bits is not supported if there is only one word per frame.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–8 FBT	First Bit Shifted Configures the bit index for the first bit received for each word in the frame. If configured for MSB First, the index of the next bit received is one less than the current bit received. If configured for LSB First, the index of the next bit received is one more than the current bit received. The value written must be greater than or equal to the word width when configured for MSB First. The value written must be less than or equal to 31-word width when configured for LSB First.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

42.4.16 SAI Receive Data Register (I2Sx_RDR*n*)

Reading this register introduces one additional peripheral clock wait state on each read.

Address: Base address + A0h offset + (4d × i), where i=0d to 0d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Sx_RDRn field descriptions

Field	Description
RDR	Receive Data Register The corresponding RCR3[RCE] bit must be set before accessing the channel's receive data register. Reads from this register when the receive FIFO is not empty will return the data from the top of the receive FIFO. Reads from this register when the receive FIFO is empty are ignored.

42.4.17 SAI Receive FIFO Register (I2Sx_RFRn)

The MSB of the read and write pointers is used to distinguish between FIFO full and empty conditions. If the read and write pointers are identical, then the FIFO is empty. If the read and write pointers are identical except for the MSB, then the FIFO is full.

Address: Base address + C0h offset + (4d × i), where i=0d to 0d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Field	Description
31–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21–16 WFP	Write FIFO Pointer FIFO write pointer for receive data channel.
15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RFP	Read FIFO Pointer FIFO read pointer for receive data channel.

42.4.18 SAI Receive Mask Register (I2Sx_RMR)

This register is double-buffered and updates:

1. When RCSR[RE] is first set
2. At the end of each frame

This allows the masked words in each frame to change from frame to frame.

Address: Base address + E0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	RWM																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Sx_RMR field descriptions

Field	Description
RWM	Receive Word Mask Configures whether the receive word is masked (received data ignored and not written to receive FIFO) for the corresponding word in the frame. 0 Word N is enabled. 1 Word N is masked.

Chapter 43
Smart Direct Memory Access Controller (SDMA)

43.1 Overview

The Smart Direct Memory Access (SDMA) controller offers highly-competitive DMA features combined with software-based virtual-DMA flexibility. It enables data transfers between peripheral I/O devices and internal/external memories.

The SDMA controller helps maximize system performance by off-loading the ARM core in dynamic data routing.

43.1.1 Block Diagram

The figure below shows a block diagram of the SDMA controller. It includes the custom RISC core along with its RAM, ROM, DMA units, and the scheduler.

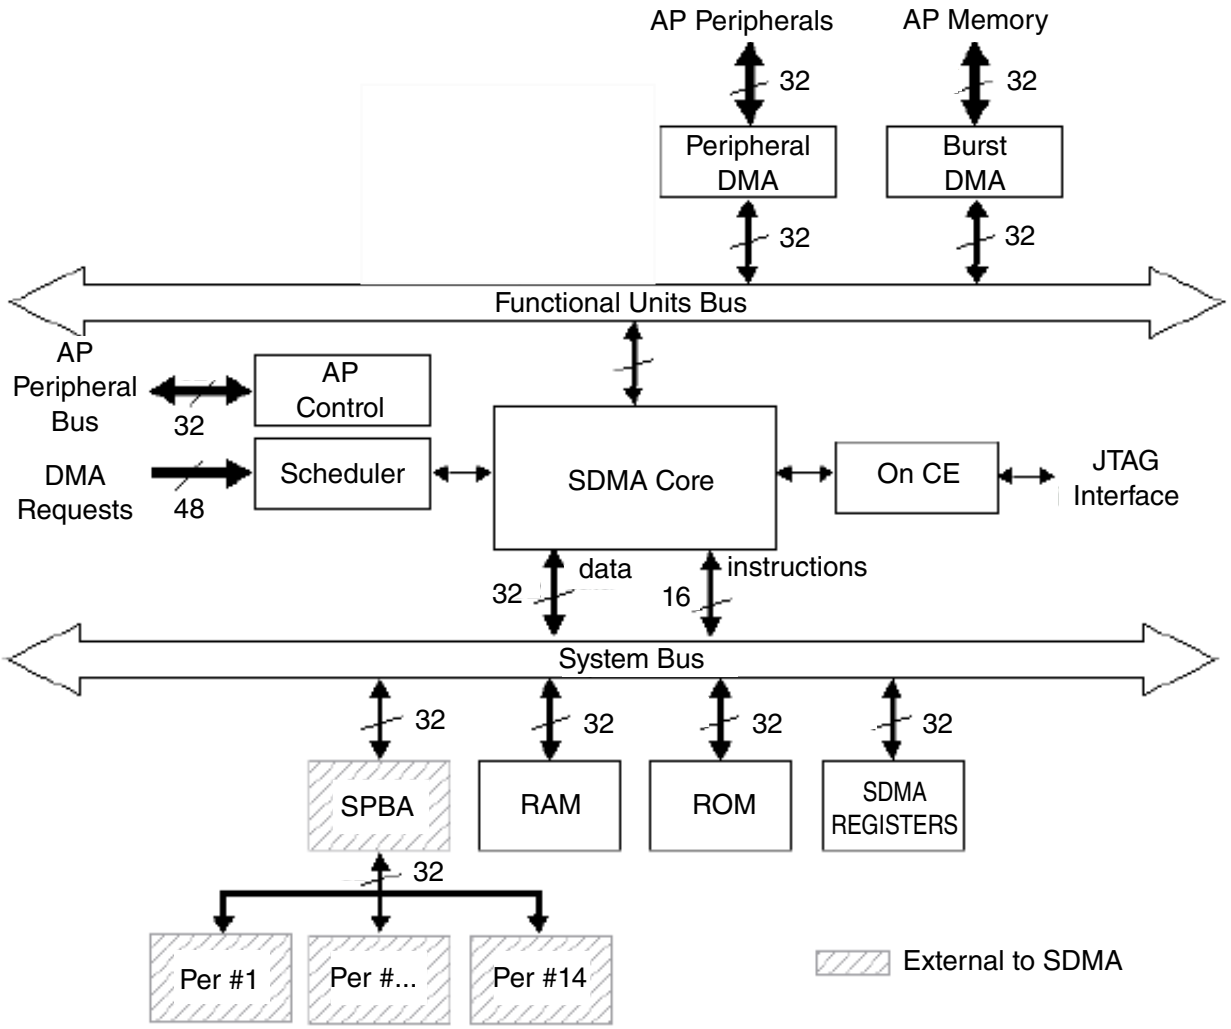

Figure 43-1. SDMA Block Diagram

The SDMA core executes short routines that perform DMA transfers; these routines are called *scripts*. The SDMA core interfaces to its own memory via the SDMA system bus. The SDMA system bus supports a 32-bit data path and a 16-bit address bus. The system bus datapath is used for both 16-bit instruction (program) memory access and 32-bit data access. DMA units interface to the core via the Functional Unit Bus and use dedicated registers to perform DMA transfers.

The SDMA memory contains a ROM and a RAM. The ROM contains startup scripts (for example, boot code) and other common utilities, which are referenced by the scripts that reside in the RAM. The internal RAM is divided into a context area and a script area (more details about this mapping are available in Instruction Memory Map and Data Memory Map).

Every transfer channel requires one context area to keep the contents of all the core and unit registers while inactive. Channel scripts are downloaded into the internal RAM by the SDMA using a dedicated channel that is started during the boot sequence. Downloads are invoked using commands and pointers provided by the ARM platform. Every channel contains a corresponding channel script located in RAM and/or ROM that can be reconfigured independently as-needed. Channel scripts can be stored in an external memory and downloaded when needed. The SDMA can be configured with any mixture of scripts to enable an endless combination of supported services.

The scheduler monitors and detects DMA requests, mapping them to channels, and mapping individual channels to a pre-configured priority. At any given point, the scheduler presents the highest priority channel that requires service to the SDMA core. A special SDMA core instruction is used to "conditionally yield" the current channel being executed to an eligible channel that requires service. If (and only if) there is an eligible channel pending, will the current channel execution be preempted.

There are two yield instructions that differently determine the eligible channels: In the first version, eligible channels are pending channels with a strictly higher priority than the current channel priority. In the second version (yieldge), eligible channels are pending channels with a priority that is greater or equal to the current channel priority. The scheduler detects devices that need service through its 48 DMA request inputs. After a request is detected, the scheduler determines the channel(s) that is (are) triggered by this request and marks it (them) as pending in the "Channel Pending (EP)" register. The priorities of all the pending channels are continuously evaluated in order to update the highest pending priority. The channel pending flag is cleared by the channel script when the transfer has completed.

The ARM platform control block contains the control registers used to configure the 32 individual channels. There are 48 Channel Enable registers, and every register maps one DMA request to any desired combination of channels. The 32 Priority registers are used to assign a programmable 1-of-7 level priority to every possible channel. This block also contains all other control registers that the ARM platform can access.

The 48 DMA requests that are connected to the scheduler come from a variety of sources. The "receive register full" and "transmit register empty" signals found in the UART and USB ports are typical examples of DMA requests that can be connected to the SDMA. These requests can be used to trigger a specific SDMA channel, or several channels.

There is an OnCE compatible debug port for product development. The OnCE includes support for setting breakpoints, single-step and trace, and register dump capability. In addition, all memory locations are accessible from the debug port.

43.1.2 Features

The following are the SDMA features:

- Multi-channel DMA supporting up to 32 time-division multiplexed DMA channels
- Hardware or software driven triggers for each channel
- 48 hardware driven triggers that can be mapped to any channel.
- Memory accesses including linear addressing, FIFO addressing and 2D addressing
- Fast context-switching with two-level, priority-based preemptive multi-tasking
- 16-bit instruction-set micro-RISC engine (the SDMA core)
- Two DMA units with some or all the following features:
  - Auto-flush and prefetch capability
  - Flexible address management (increment, decrement, and no address changes on source and destination address)
  - Misaligned data-transfer support
  - Uni-directional and bi-directional flows (copy mode)
  - Up to eight-word buffers for configurable burst transfers
- Support of byte-swapping
- An available API and library of scripts
- Little-Endian and Big-Endian modes
- Hardware handshakes for low-power entry sequence
- Security support to lock contents of the SDMA script RAM.
- 4-Kbyte ROM containing startup scripts (for example, boot code) and other common utilities that can be referenced by RAM-located scripts
- 8-Kbyte RAM area is divided into a processor context area and a code space area used to store channel scripts that are downloaded from the system memory
- Debug support, including a OnCE port, real-time monitors, and embedded cross-trigger events
- Supported clock frequencies in process:
  - Configurable clock options for the SDMA core and the ARM platform DMA units
    - 1:2 ratio with maximum of SDMA core running at ARM platform Peripheral Bus speed and DMA running at max DMA frequency.
    - 1:1 ratio when both SDMA core and ARM platform DMA clocks are set to the ARM platform Peripheral Bus speed.
- Peripheral bus interface for configuration register programming by the ARM platform
- The SDMA RISC engine (arithmetic and logic operations), which is referred to as the "SDMA core."
- An internal peripheral bus connected to the Shared Peripherals Bus Interface (SPBA) that enables access to up to 14 shared peripherals. SDMA supports 32-bit accesses to word peripherals and 16-bit accesses to half-word peripherals.

- The peripheral DMA unit that is hooked-up to the ARM platform Crossbar Switch to service ARM peripherals
- The burst DMA unit is able to perform burst accesses to the external memory
- All the DMA units are 32-bit AHB masters. They are connected to different buses, thus allowing concurrent accesses.

43.2 External Signals

The table found here describes the external signals of SDMA.

Table 43-1. SDMA External Signals

Signal	Description	Pad	Mode	Direction
SDMA_EVENT0	Event0 signal	GPIO1_IO02	ALT6	I
		JTAG_MOD	ALT6	
		SD1_CMD	ALT6	
SDMA_EVENT1	Event1 signal	JTAG_TMS	ALT6	I
		NAND_DQS	ALT6	

43.3 Clocks

The following table describes the clock sources for SDMA. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information. For functional information regarding module clocks, see SDMA Clocks and Low Power Modes.

Table 43-2. SDMA Clocks

Clock name	Clock Root	Description
events_sync_clk (clk)	ahb_clk_root	ARM peripheral / events clock
ips_hostctrl_clk	ipg_clk_root	Host control clock
ap_ahb_clk	ahb_clk_root	ARM platform bus clock
core_clk	ipg_clk_root	Module / Core clock
tck	-	JTAG access clock

43.4 Functional Description

The figure below shows the SDMA topology, and is composed of the following components:

- SDMA Core (SDMA Core)
- SDMA Scheduler (Scheduler)
- Functional Units:
  - Burst DMA (Burst DMA Unit)
  - Peripheral DMA (Peripheral DMA Unit)
- ARM platform Control for ARM control register access.
- Internal RAM and ROM Memory (SDMA Programming Model)
- OnCE debug Port (The OnCE Controller)

The functional unit bus provides access by the SDMA core to the DMA units. The system bus provides access to SDMA internal memory and also supports up to 14 peripherals.

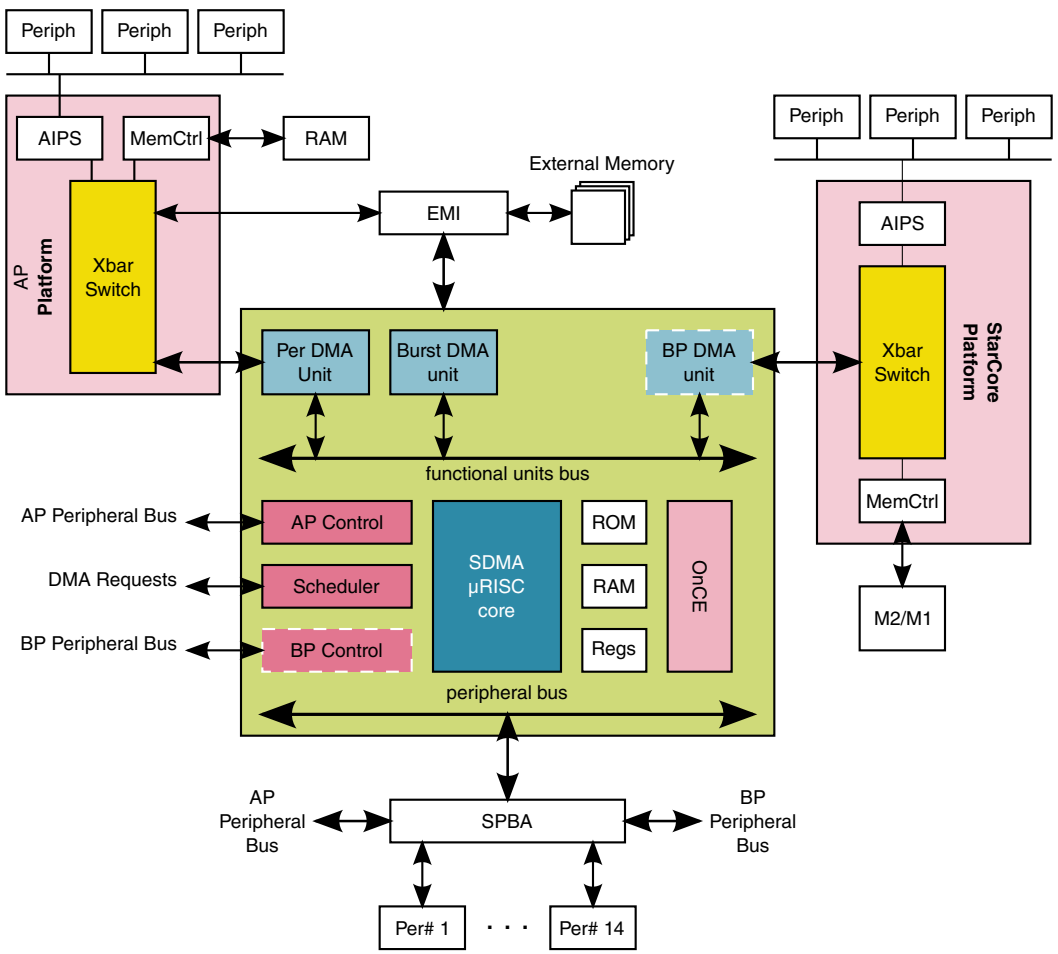

Figure 43-2. SDMA Connections

43.4.1 SDMA Core

The SDMA core is a customized RISC-like processor that is specifically developed to control DMA units and perform L1 tasks like byte-stuffing or framing.

The SDMA core incorporates on-chip debug capability using the OnCE.

The SDMA core is based on a 32-bit register architecture with 16-bit instructions. There are eight general purpose 32-bit registers, four flags (T, LM, SF, and DF), and four PCU registers (PC, RPC, SPC, and EPC) that can address 16,384 16-bit instructions.

43.4.1.1 SDMA Core Structure

The figure found here shows the structure of the SDMA core. It also shows the different registers, calculation resources, and possible data movements.

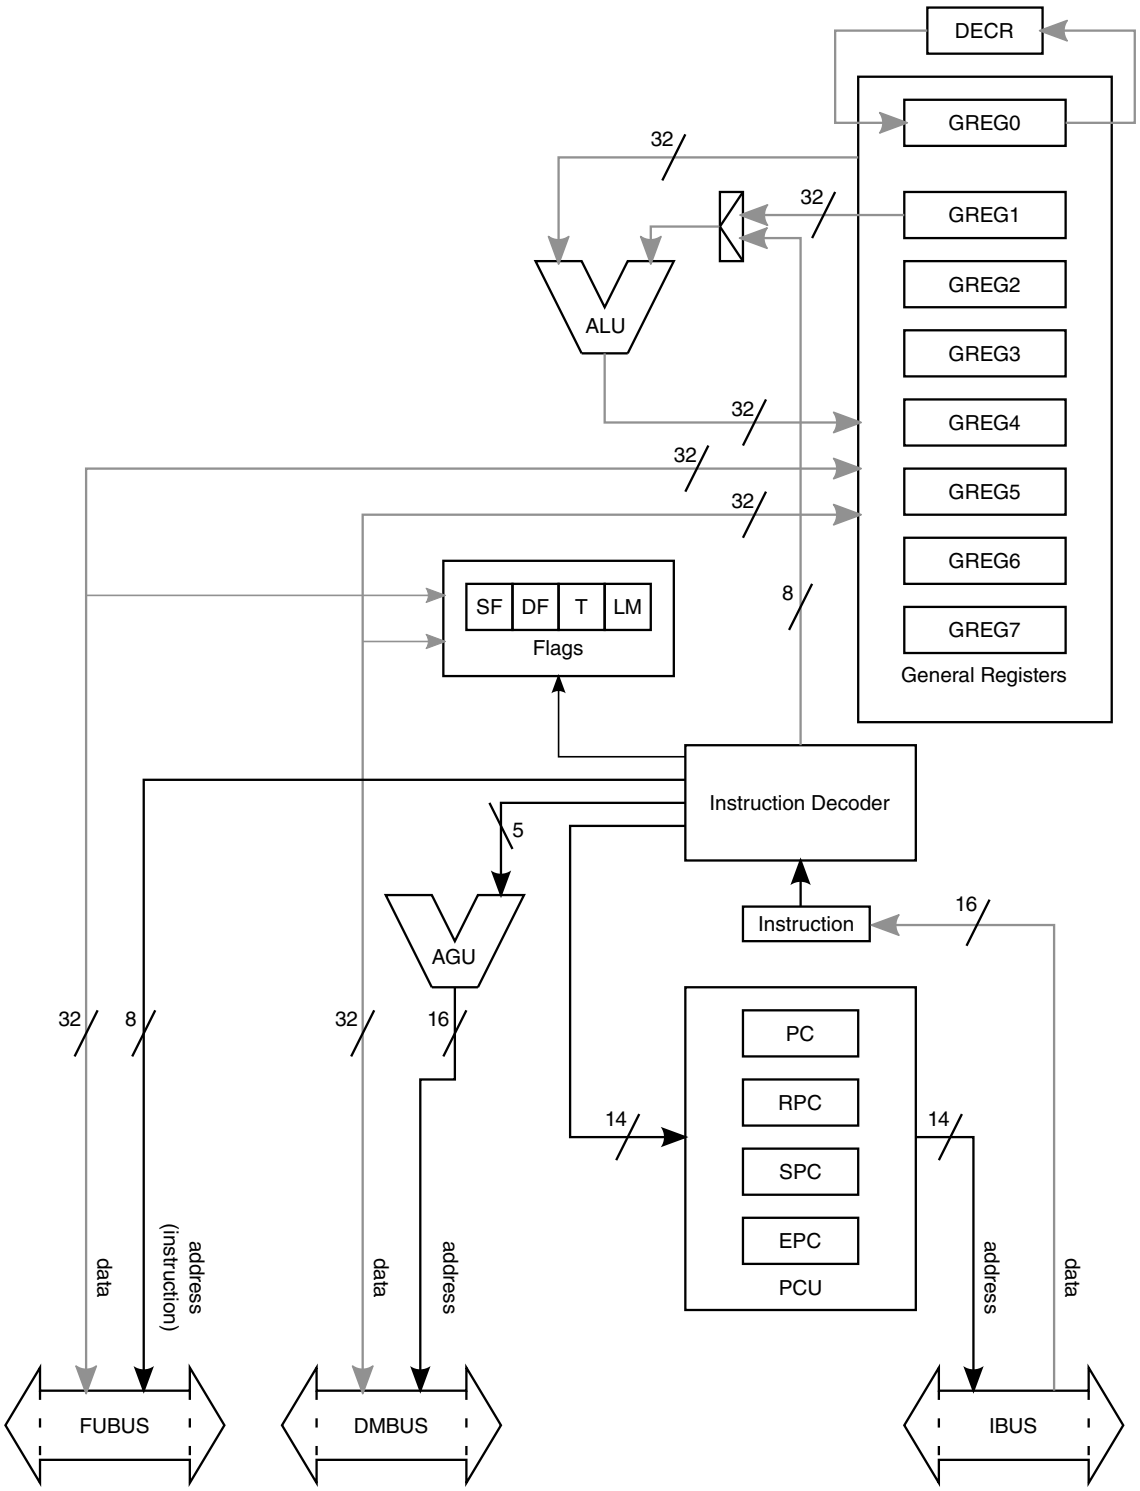

Figure 43-3. SDMA Core

- The Program Control Unit (PCU) is described in Program Control Unit (PCU). It handles the state of the core and generates the instruction fetch addresses. Instructions are retrieved from the Instruction Bus (IBUS) and stored in the SDMA

core instruction register prior to their decoding. The PCU contains the following registers:
    - The Program Counter (PC) contains the address of the current instruction.
    - The Return Program Counter (RPC) contains the address of the instruction that follows a jump to the subroutine.
    - The Start Program Counter (SPC) contains the address of the first instruction of the current hardware loop.
    - End Program Counter (EPC) contains the address of the last instruction of the current hardware loop.
- The other core registers are the general purpose registers (GREGn) and the flags.
    - The general purpose registers can be used to hold data and addresses. They can be loaded with immediate values (for example, 8-bit data that are encoded in the instruction), results of calculations that were performed with the ALU, 32-bit data that comes from the memory or peripherals via the Data Memory Bus (DMBUS), 32-bit data that comes from the DMAs via the Functional Units Bus (FUBUS) or another general purpose register. Their content can be the operands of the ALU, the data to send on either bus (DMBUS or FUBUS), or a pointer to memory (DMBUS address).
    - The general register 0 (GREG0) is also the hardware loop counter. In hardware loops, it cannot be used for any other purpose. This register uses a dedicated decrement unit (DECR) shown in Figure 43-3.
    - The flags reflect the status of operations:
        - SF and DF are set when the last load or store on either bus (FUBUS or DMBUS) received an error response.
        - LM is set when the core is executing instructions inside a hardware loop.
        - T is set when the ALU operation result was 0 or the loop counter reaches 0 (the latter is preponderant when an ALU operation is the last instruction of a hardware loop).
- The ALU has two operands: any general register and either a second general register or an immediate value. The result is always stored into the first general register. A NOP function can be utilized by moving a register's contents into itself (For example, the instruction: mov R0,R0).
- The 16-bit instructions are fetched via the instruction bus (IBUS) whose address is driven by the PC. The SDMA RAM and ROM are visible to the core as 16-bit devices through this interface.
- The memory (RAM and ROM), memory mapped registers, and external peripherals are accessed via the DMBUS. The address is always taken from a general register whose content is added to a 5-bit immediate value. This is the only available addressing mode. The DMBUS is a 32-bit data bus. Except for the peripherals that

are external to the SDMA, the address accuracy is the 32-bit word (for example, adding 1 to an address points to the next word, not the next byte).
- The functional units are accessed via the FUBUS connection. The data is exchanged with any general register, but the address (which in fact is the instruction and the selector of the functional unit) comes from an 8-bit field of the corresponding load or store.

43.4.1.2 Program Control Unit (PCU)

This part of the SDMA core is dedicated to the control of the RISC engine, as implied by the instructions that are executed. Its behavior is determined by the instruction type and the inputs of the SDMA.

It contains the PC, RPC, SPC, and EPC registers that are described in SDMA Core Structure.

43.4.1.2.1 Instruction Types

The state sequence and the delay of execution vary according to the type of the instruction. There are six possible categories of instructions, as follows:

1. Standard: Most of the instructions belong to this category, and always last 1 cycle.
2. ldf/stf: These are respectively the load and store instructions that access the functional units. They last 1+n cycles where n is the number of wait-states of the targeted functional unit.
3. ld/st: These are the load and store instructions that access the memory and peripherals. They last 1+n cycles where n is the number of wait-states of the targeted device (1 for the ROM, RAM, and memory mapped registers, 1 + the external peripheral wait-states). These instructions always last at least two cycles, but the core is able to handle them in one cycle. The first wait-state is inserted outside the core.
4. Branch: These are all the instructions that cause the Program Counter to point to another instruction other than the following one (for example, one that breaks the sequential flow). There are the absolute jumps, the conditional branches, the jump to the sub-routines, and the return from the sub-routine.
5. Loop,Modified Load or Store: The hardware loop instruction modifies the potential behavior of any load or store inside the loop (for example, when the LM flag is set). A jump may be implied after any such load or store if it received an error. The error causes an early exit of the loop, which means a jump to the instruction that follows the one that is pointed to by EPC. An additional cycle is required by the PCU to perform the jump (+1 to the ld/st/ldf/stf original execution delay). Although there is

usually an implicit jump after the last instruction of the loop when the PC goes back to SPC, this is performed at no cycle cost.

6. Done: The done, yield, or yieldge instructions are used to control channel switching. When no channel switching is performed, these instructions last a single cycle. When there is a change of channel or context switch, the delay is variable and depends on many factors (as detailed in Context Switching).

43.4.1.2.2 PCU States

The PCU state is visible through outputs of the SDMA (see Real-Time Debug Outputs) or the OnCE status register(see OnCE Status Register (OSTAT)).

The PCU state is a four-bit field that can take the values shown in the following table. Figure 43-4 shows the possible state transitions and the corresponding conditions.

Table 43-3. PCU States

Value	State	Description
0	Program	This is the usual instruction cycle.
1	Data	This state is inserted when there are wait-states during a load or a store on the data bus (ld/st type).
2	Change of Flow	This is the second cycle of any instruction that breaks the sequence of instructions (branch and done types). This state lasts only a single cycle; it is always followed by the Program state.
3	Error in Loop	This state is used when an error causes a hardware loop exit (loop-modified load or store type). This state only lasts a single cycle; it is always followed by the Program state.
4	Debug	The SDMA is stopped in debug mode.
5	Functional Unit	This state is inserted when there are wait-states during a load or a store on the functional units bus (ldf/stf type).
6	Sleep	No script is running: The core is idle after saving the last channel context.
7	Save	The context switch FSM is saving the current channel.
8	Program in Sleep	Same as Program except there is no associated channel, this state is used when instructions are executed after entering debug mode, whereas the core was in either Sleep mode.
9	Data in Sleep	This is the same as Data except there is no associated channel.
10	Change of Flow in Sleep	This is the same as Change of Flow except there is no associated channel. This state only lasts a single cycle, and is always followed by the Program in Sleep state.
11	Error in Loop in Sleep	This is the same as Error in Loop except there is no associated. channel. This state only lasts a single cycle, and is always followed by the Program in Sleep state.
12	Debug in Sleep	This is the same as Debug except the core was put in debug mode when no channel was active.
13	Functional Unit in Sleep	This is the same as Functional Unit except there is no associated channel.

Table continues on the next page...

Table 43-3. PCU States (continued)

Value	State	Description
14	Sleep after Reset	This shows that no script is running, and the core is idle after a reset. When a channel becomes active, no context is restored but the core starts its boot program located at address 0 (or the address available in register in Channel 0 Boot Address (SDMAARM_CHN0ADDR)).
15	Restore	The context switch FSM is restoring the next channel context.

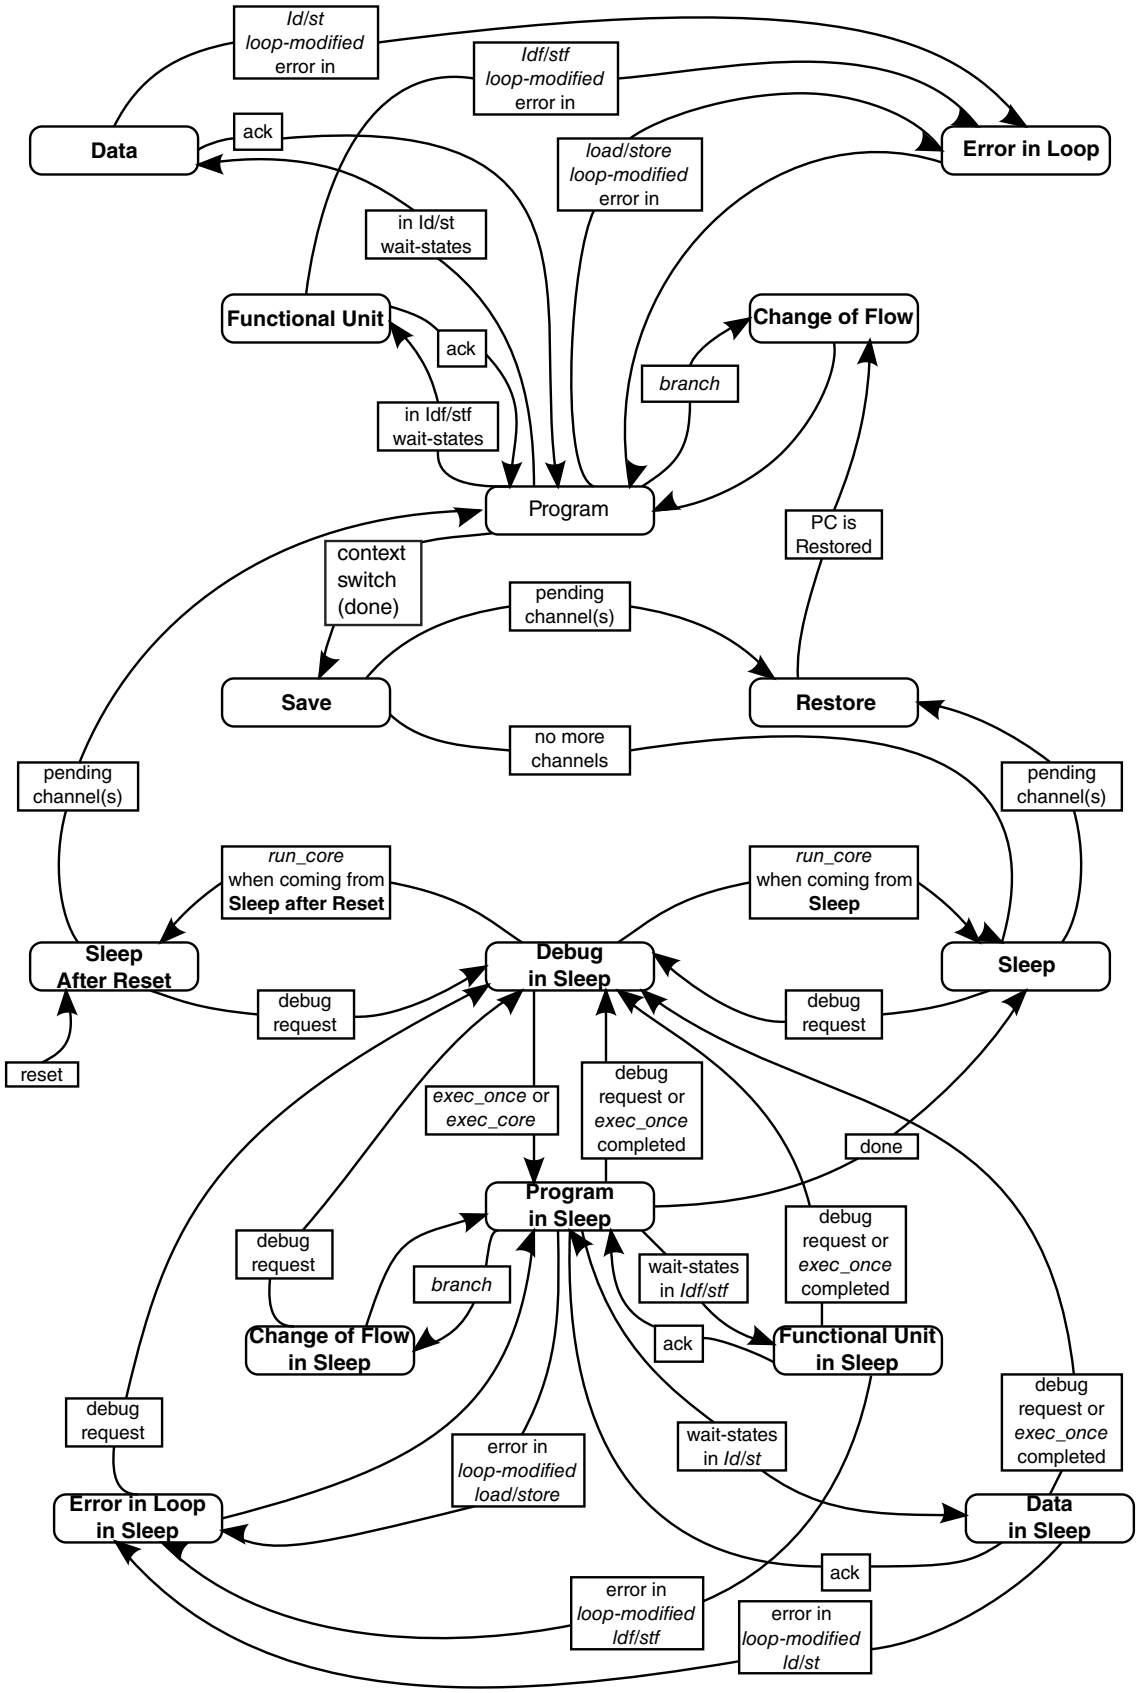

Figure 43-4. PCU State Diagram

43.4.1.3 SDMA Core Memory

The SDMA has two memory spaces: one for the instructions and one for the data. As both spaces share the same resources (ROM and RAM devices), the system bus manages possible conflicts when the core accesses the same resource for both an instruction read and a data read or write.

Program and data memory is further described in Address Space.

Instructions of 16-bit width are stored in 32-bit wide devices and can be accessed as data. The mapping is Big Endian: an even instruction address (terminated by 0) accesses the most significant part of the 32-bit data (bits [31:16]), and an odd instruction address (terminated by 1) accesses the least significant part of the 32-bit data (bits [15:0]). Instructions can be fetched out of internal ROM or RAM.

Data can be read from ROM, RAM, memory mapped registers, and external peripherals, and written to the same devices (except the ROM).

The ROM contains bootload scripts, channel scripts, and common subroutines which may be referenced by channel scripts elsewhere in the ROM or RAM.

The RAM is divided into a context area and a code space area which may be used to store channel scripts. The RAM contains undefined values after a hardware reset. Channel scripts and initial context values are downloaded into RAM using channel 0 which is reserved for bootload functions.

43.4.2 Scheduler

All channel scheduling hardware is included in the Scheduler.

43.4.2.1 Primary Functions

The scheduler is a hardware-based design used to coordinate the timely execution of 32 virtual DMA channels by the SDMA core on the basis of channel status and priority.

The scheduler performs the following functions:

- Monitors, detects, and registers the occurrence of any one of the 48 DMA requests
- Links a specific request to a channel or group of channels (channel mapping)
- Ignores requests that are not mapped to a previously configured channel
- Maintains a list of all the channels that are requesting service

- Assigns a pre-programmed priority level (1 of 7) to every channel requesting service
- Detects and flags overrun/underrun conditions

43.4.2.2 Channels and DMA Requests

43.4.2.2.1 Channels

A Virtual Channel (hereafter simply called a channel) manages a flow of data through the SDMA. Flows are typically unidirectional.

The SDMA can have up to 32 simultaneously operating channels, numbered from 0 to 31. Channel 0 is usually dedicated to control the SDMA script downloading. All the channels can be assigned by the ARM platform software.

43.4.2.2.2 DMA Requests

A DMA request is caused by externally (for example, external to the SDMA) controlled conditions (for example, UART receive FIFO reaches a threshold). The SDMA currently supports up to 48 DMA requests.

43.4.2.2.3 Mapping from DMA Requests to Channels and Priorities

A channel can stall waiting on a single DMA request. A single DMA request can awake more than one channel (in fact, any request can awake any combination of channels).

The mapping between DMA requests and channels is program-controlled. There is a storage element assigned for each of the 48 requests that contains a bitmap table of the channels that are awakened by the event.

Every channel also has a three-bit register that indicates its priority.

43.4.2.3 Scheduler Functional Description

Scheduler Overview describes the behavior of the SDMA scheduler-from the channel enabling conditions to the highest priority pending channel selection.

43.4.2.3.1 Scheduler Overview

The scheduler algorithm is built in hardware. It is provided with possibilities for the ARM platform to control its behavior.

The scheduler processes incoming DMA requests, maps detected requests to 0, one, or several channels, maintains a list of channels that are requesting service (pending channels), identifies the top priority and its associated channel, and selects the next active channel when the current channel yields.

The following figure shows a functional overview.

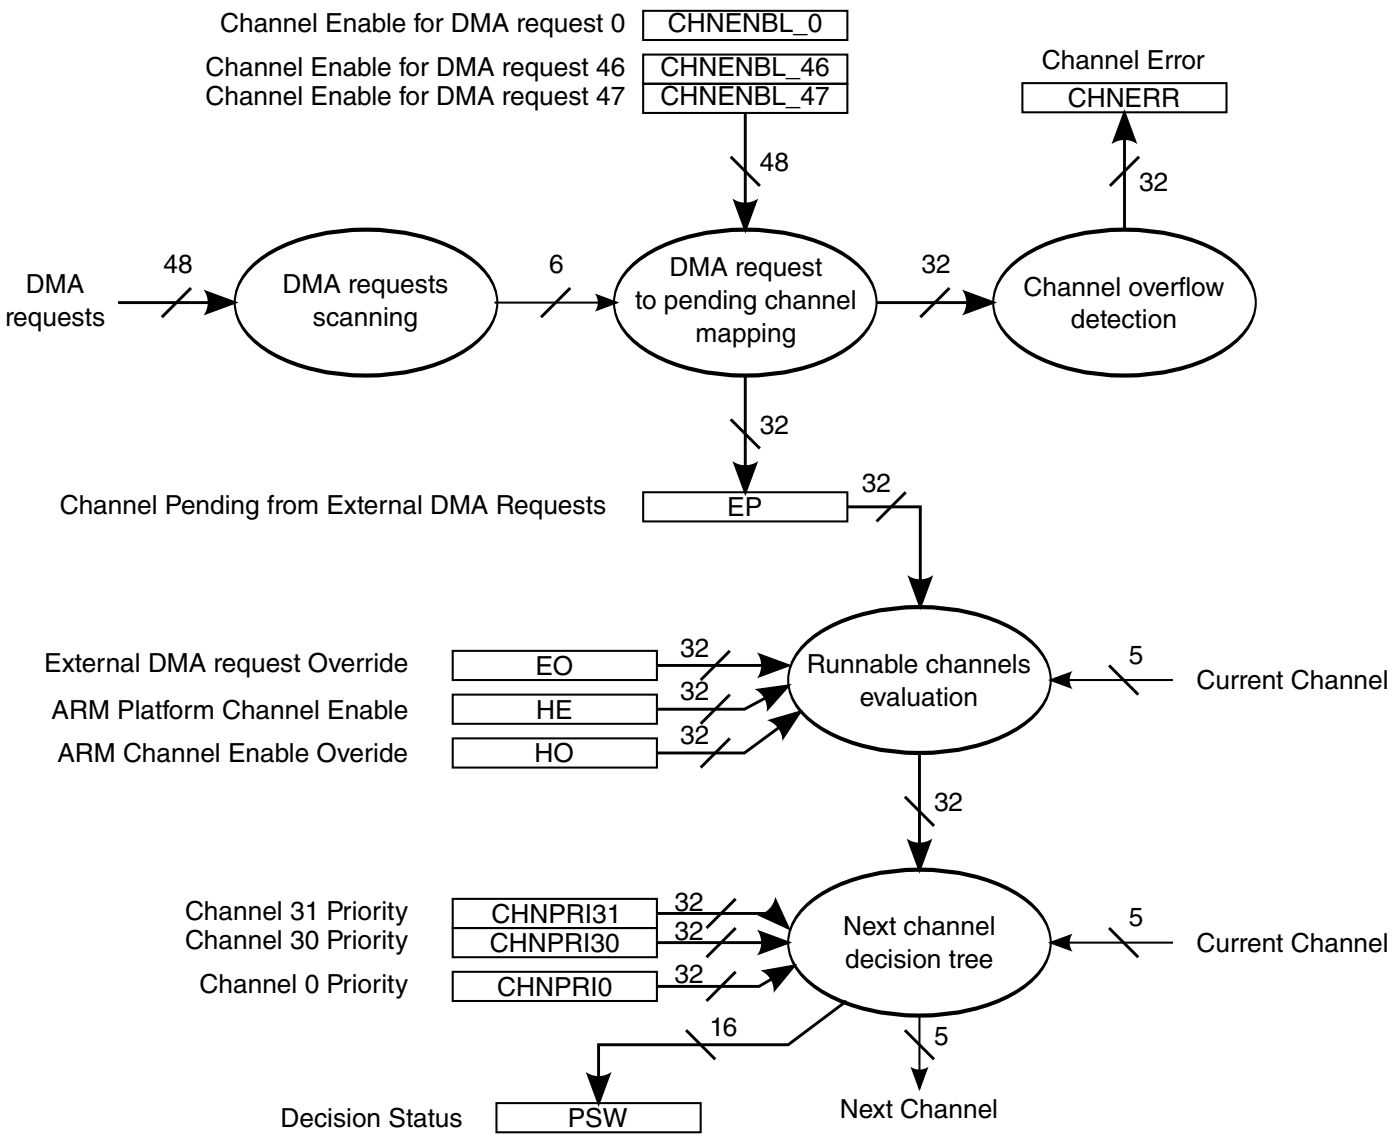

Figure 43-5. SDMA Hardware Scheduler

43.4.2.3.2 DMA Requests Scanning

The scheduler contains a 48-bit edge detection device that detects the rising edge of every DMA request and transmits the request number to the next stage.

The DMA requests are assumed to be generated on the same reference clock as the SDMA core clock; they are detected as soon as the signal goes from a 1-to-n-cycles low state to a 1-to-m-cycles high state.

This system is able to detect single-cycle pulses as well as level-based DMA requests such as a FIFO threshold crossing. In this case, the SDMA provides a memory mapped register that can be used by the channel script to monitor the DMA requests lines, and thus determines whether the data transfer is done or not done, and then continues with the transfer or closes the channel.

When several DMA requests are detected at the same time, they are forwarded to the next scheduler stage at the rate of one request per cycle. No request is lost.

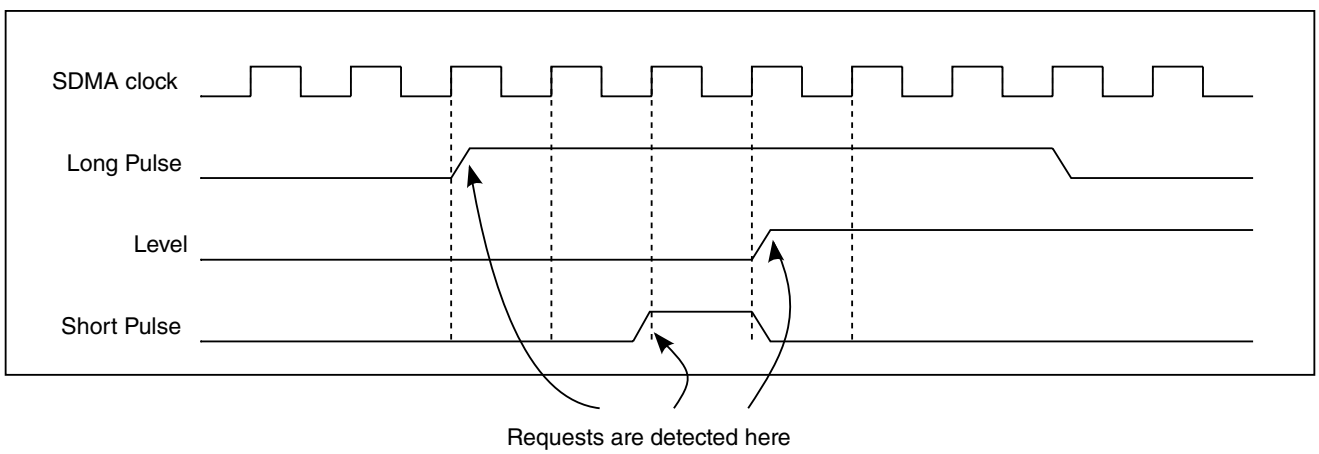

Figure 43-6. Examples of Valid DMA Requests

The DMA request inputs are connected to various sources that depend on the SoC. The exact list of DMA request inputs and their associated number is available in each respective project-specific chapter.

43.4.2.3.3 Mapping DMA Requests to Pending Channels

Whenever a DMA request is detected by the first stage, its number is used in the second stage to determine the channels that have to be activated.

This is performed with an array of 48 registers that are 32 bits wide: There are 48 Channel Enable Registers (CHNENBLn), one register per DMA request. The DMA request number selects the Channel Enable Registers, and every bit of this 32-bit register indicates that the corresponding channel must be activated when it is a 1.

This information is passed on the EP register. For every bit of the Channel Enable Register that is set, the corresponding bit of the EP register is also set, and the remaining bits of EP are left unchanged. The transformation of EP is summarized by the following equation:

EP = EP or CHNENBLn

The EP register is used to know which channels require service because they received a DMA request.

Typical contents of the CHNENBLn registers are all 0s, except for a single bit set. For example, a DMA request triggers one channel, but all 0s or several 1s are possible. One DMA request could activate several channels, and the channel execution sequence can be controlled by the channel priorities and numbers, as explained in the next sections. The following table illustrates an example configuration.

NOTE

From the table, the DMA request 0 is programmed to simultaneously trigger channels 0, 1, and 31. Also, DMA requests 30-47 are not used in this example. The remaining channels 2 to 30, are configured to be triggered by DMA requests 29 to 1, respectively.

Table 43-4. Channel Enable RAM Programming Example

DMA Request Number	Channel																																
	31																																0
0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

43.4.2.3.4 Channel Overflow

A channel overflow occurs when a DMA request requires service from channel *n* by setting bit *n* of the register EP, but this bit is already set, meaning channel *n* is already pending. This can come from an overrun/underrun condition.

This detection is possible only when the DMA requests are pulses, because a level-based DMA request stays high until it is serviced, even though an underrun or overrun condition occurs, thus preventing another edge detection of the DMA request.

The channel overflow information is saved in the 32-bit CHNERR register (1 bit per channel). You can configure the SDMA to trigger an interrupt to the ARM platform when there are 1s in CHNERR. Every bit of CHNERR is masked with the corresponding bit of INTRMASK and if it gives a 1, the corresponding bit of INTR is set, triggering the interrupt.

43.4.2.3.5 Runnable Channels Evaluation

The EP register is used in conjunction with several other 32-bit registers to determine the channels that are runnable.

Registers EO, DO, HO and HE, are controlled by the ARM platform. EP is controlled by the DMA requests and their mapping to channels.

Several channels may be runnable at any given time. The i^{th} channel is runnable if (and only if) the condition below is true:

(HE[i] or HO[i]) and (DO[i]) and (EP[i] or EO[i])

After reset, the HE[i], HO[i], EP[i], and EO[i] bits are all cleared whereas the DO[i] bits are all set. The functions associated with DO are not available for this device. When DO[i] is set, the scheduler condition becomes:

(HE[i] or HO[i]) and (EP[i] or EO[i])

The registers in these equations are controlled as follows:

- ARM platform (host) channel enable flag HE[i] may be set or cleared by the ARM platform with the HSTART and STOP_STAT registers. It can also be cleared by the i^{th} channel script.

  Typical usage is for the ARM platform to set this flag to activate the channel. The flag is cleared by the SDMA core when the transfer is done.

- Externally triggered channel pending flag EP[i] is set by the scheduler when the channel was activated by a DMA request. It can be cleared by the i^{th} channel script.
- The ARM platform channel override flag HO[i] may be set or cleared by the ARM platform. When set, it enables the i^{th} channel to run without the involvement of the ARM platform.

  Typical usage is for the ARM platform to set this flag for channels that do not need ARM platform supervision such as channels that are controlled by DMA request events (EP).

- DO should always be set to 1 so that the runnable channel evaluation considers only HO, HE, EP, and EO.
- Externally triggered channel override flag EO[i] may be set or cleared by the ARM platform. When set, it prevents the i^{th} channel from stopping and stalling on incoming peripheral DMA requests. This is the case when the channel is not handling data transfers with peripherals (for example, a memory to memory transfer).

The SDMA can clear the HE[i], and EP[i] bits by means of a done or notify instruction. The done instruction causes a reschedule; thus, enabling another channel to preempt the current one, while the notify instruction does not. The done and notify instructions can clear either HE[i] or EP[i] (never more than one at a time).

Table 43-5. Runnable Channel Selection Control

Register	Set by	Cleared By
HO	Write to HOSTOVR register	Write to HOSTOVR register
HE	Write to HSTART register	Write to STOP_STAT register or by the channel script with the done or notify instructions.
DO	Write to DSPOVR register	Write to DSPOVR register
EO	Write to EVTOVER register	Write to EVTOVER register
EP	Set by external DMA request event input.	By the channel script with the done or notify instructions

43.4.2.3.6 Next Channel Decision Tree

The next channel number is computed from the runnable channels list, the current channel number, and their respective priorities.

It is re-evaluated every cycle, but is only used when the current channel yields or terminates by executing a yield, yieldge, or done instruction.

The decision tree is based on the selection of the runnable channel that has the highest priority.

The highest priority channel is selected according to the following rules:

- Runnable channels are sorted by priority.
- If one of the channels with the highest priority had been preempted by a channel with a higher priority, but did not want to yield to a channel of the same priority (for example, it executed a yield, not a yieldge), it is elected as the next channel.
- The channels that belong to the highest priority group are sorted by their number and the channel that has the highest number in this group becomes the next channel. For example, if priorities are the same, channel 31 will be selected before channel 30.

When the current channel requires a reschedule with a yield(ge) or a done instruction, the context switch decision is based on the instruction parameter, the current channel number and priority, and the next channel number and priority. The possible cases are all listed in the following table. The grayed cells correspond to unusual cases that should not occur with a typical usage of the SDMA.

Table 43-6. Channel Switching Decision with a yield, yield(ge), or done

Instruction	Current Channel	Next Channel	Priorities Comparison	New Running Channel/Comments
yield (done 0)	Runnable	Not runnable	none	Current
	Runnable	Runnable	Current > Next	Current
			Current = Next	Current
			Current < Next	Next[1]
	Not runnable	Not runnable	none	none[2] (occurs when the channel was disabled by the ARM platform)
	Not runnable	Runnable	none	Next[1] (occurs when the channel was disabled by the ARM platform)
yieldge (done 1)	Runnable	Not runnable	none	Current
	Runnable	Runnable	Current > Next	Current
			Current = Next	Next[1]
			Current < Next	Next[1]

Table continues on the next page...

Table 43-6. Channel Switching Decision with a yield, yield(ge), or done (continued)

Instruction	Current Channel	Next Channel	Priorities Comparison	New Running Channel/Comments
	Not runnable	Not runnable	none	none[2] (occurs when the channel was disabled by the ARM platform)
	Not runnable	Runnable	none	Next[1] (occurs when the channel was disabled by the ARM platform)
done (done>1)	Not runnable	Not runnable	none	none[2]
	Runnable	Not runnable	none	Current[3] (occurs when the done instruction does not disable the channel runnable condition)
	Not runnable	Runnable	none	Next[1]
	Runnable	Runnable	none	Current[3] (occurs when the done instruction does not disable the channel runnable condition)

1. Current channel script execution is stopped, its context is saved; the next channel context is restored and its script execution resumes
2. Current channel context is saved and SDMA enters IDLE mode
3. Current channel context is saved, then restored, and the current channel script resumes execution

Finally, when the SDMA is in IDLE mode and a runnable channel is elected as the next channel, its context is immediately restored and the script execution resumes.

The *combinatorial-decision* tree supports dynamic modifications of the EP, EO, HE, HO, and DO flags as well as dynamic modifications of the channel priorities. The propagation times are detailed in Scheduler Pipeline Timing Diagram.

The decision tree status is available in the PSW register, which is continuously updated. It contains the next channel priority, the next channel number, the current channel priority, and the current channel number. When a priority is read as 0, it means the channel is not runnable.

A few examples of decisions are presented below:

- Channel 31 is running with priority 5, channels 13 and 24 are pending with the same priority 5; channel 24 is eligible as the next channel since 24 > 13.
- Channel 31 is running with priority 7, channels 13 and 24 are pending with priority 5; channel 31 is the next channel because its priority is greater than the other pending channels.
- Channels 7, 23, and 29 are pending with the same priority. Channel 7 is active and runs a yieldge; it is preempted by channel 29. After a period of time, channel 29 runs a yieldge, it is then preempted by channel 23 that is the selected channel since channel 29 is the current channel. Later, channel 23 runs a yieldge and is preempted

by channel 29. Channels 23 and 29 will go on switching after every yieldge until one of them terminates. It is only at that point that channel 7 becomes eligible again.

- Channel 11 is running with priority 3, and channel 15 is pending with priority 4. When the channel 31 script executes a yield instruction, it gets preempted by channel 15; then channels 6 and 18 with priority 3 become pending. Because channel 11 was preempted after executing a yield and there is no pending channel with a strictly greater priority, it is eligible as the next channel (although its number 11 < 18).

43.4.2.3.7 Scheduler State Diagram

The Figure 43-7 summarizes the behavior of the SDMA scheduler with details about the exact mechanism of the priority decision tree. It is important to understand the scheduler is a hardwired pipeline, which means all the stages are performed simultaneously every cycle, but a change on any given stage is reflected on the next stage after the delays presented in Scheduler Pipeline Timing Diagram.

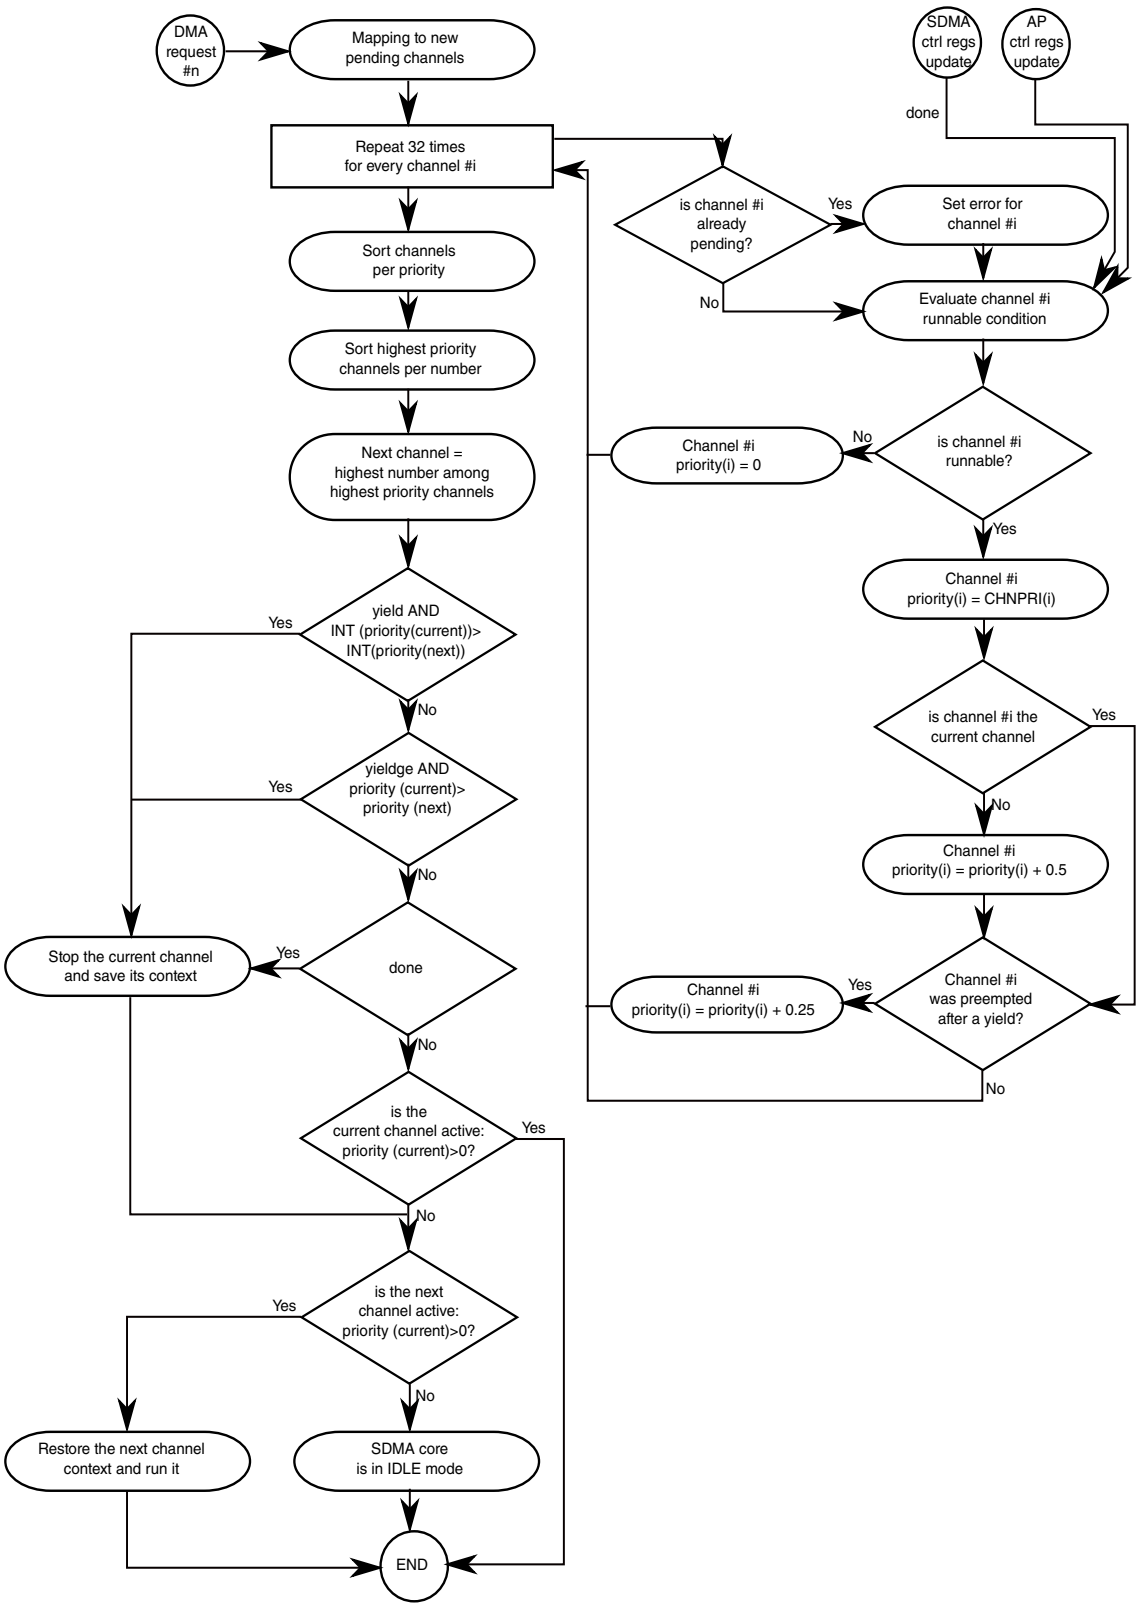

Figure 43-7. Scheduler State Diagram

43.4.2.3.8 Scheduler Pipeline Timing Diagram

The SDMA scheduler process of DMA-request and control-register modifications is not immediate.

The figure below shows the exact delays of all the tasks. The reference clock is the SDMA core clock.

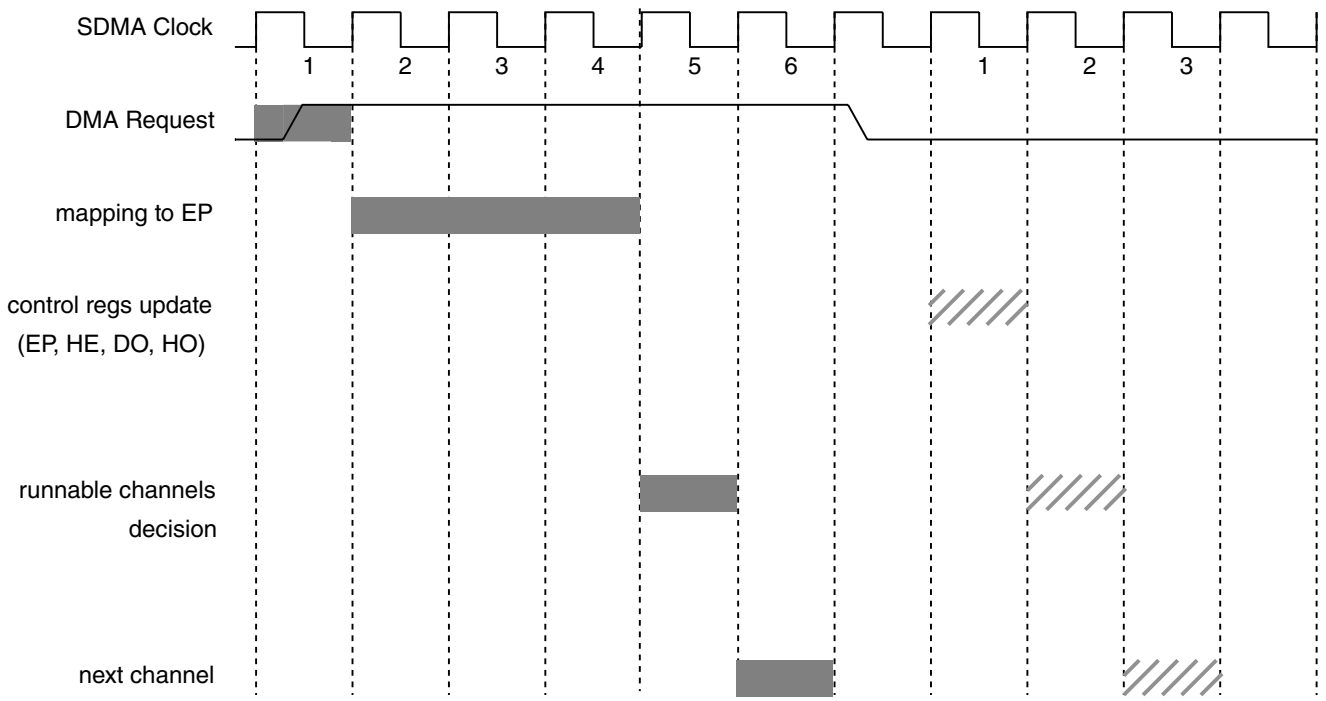

Figure 43-8. Scheduler Timing Diagram

Two numbers can be inferred from this timing diagram. First, it takes six SDMA core clock cycles to update the next channel from a DMA request. Second, it takes three SDMA core clock cycles to update the next channel from a direct modification of the condition registers (EP, DO, HE, or HO) by any processor. The processors that can modify these bits include SDMA with a done instruction or the ARM platform with a write access through the corresponding control port on their respective peripheral bus).

43.4.2.3.9 Channel-DMA Request Mapping

The 48 DMA request inputs to the SDMA scheduler are listed in project-specific chapters. Refer to the respective chapters for this information.

43.4.2.3.10 Examples: How to Start a Channel

A channel can be started when the following equation is true for channel *i*:

(HE[i] or HO[i]) and (DO[i]) and (EP[i] or EO[i])

Once this equation is true, the scheduler can start this channel according to the priority of all pending channels. Several examples of configuration are listed below:

1. To start a channel triggered by ARM platform software:
   - Initially, configure HO[i]=0, DO[i]=1, and EO[i]=1 using registers indicated in Table 43-5.
   - ARM platform software triggers the channel by writing to the HSTART register to set HE[i]=1, thereby setting the above equation true.
2. To start a channel triggered by DMA request event.
   - Initially, configure HO[i]=1, DO[i]=1, and EO[i]=0 using registers indicated in Table 43-5.
   - The DMA request is asserted to trigger the channel by setting EP[i]=1, which makes the above equation true.

43.4.2.4 Context Switching

On execution of a done or yield(ge) instruction, the current channel may be changed either because it has finished (which necessarily happens when the done instruction is executed), or it was preempted by a higher priority channel (which is possible but not systematic when the yield(ge) is executed).

Upon a channel change the SDMA goes through a context switch procedure.

When the current channel yields or ends, the context for that channel is saved into the context RAM locations for that channel. When the next channel starts running, its context is first restored from RAM.

Since context RAM is not yet initialized by reset, there will be no context restore at the beginning of the first channel (bootload channel) run after reset. It is expected that the bootload channel will be used to initialize the context for all other channels. When the bootload channel finishes running or yields, SDMA will enter its SAVE state and save that channel's context into RAM. Then, if the bootload channel is called again later, the context will be restored from RAM when the channel starts again.

The context structure for each channel is defined in Context Switching-Programming and Table 43-11. There will be one context area reserved for each channel. When a channel ends or yields, the SDMA core registers are automatically saved into the context RAM and later restored from the context RAM when the channel is next run. The total RAM space reserved for 32-channel contexts is either 3K or 4K depending on whether the SMSZ bit is set in the CHN0ADDR register, which enables an additional 8 words of scratch RAM for each context.

43.4.2.4.1 Context Switch Modes

The exact procedure to save the context of the old channel, and to restore the context of the new channel depends on the context switch mode selected by the ARM platform in the CONFIG control register.

The following are the context switch modes:

- By default, the "dynamic" context switch is set. This mode provides the most efficient context switch for an average of eight cycles to stop the current channel, save its context, restore the next channel context, and resume its execution. It consists of saving modified registers of the current channel in the background (for example, during the channel execution)-which leaves very few registers to save when the switch is decided-resuming execution of the next channel as soon as possible (for example, when the minimal set of registers is restored), and continuing the restore phase during this execution.
- In "dynamic with no loop" mode, the same principle is followed except the modified registers are only saved in the background when the loop flag is not set. This mode offers almost the same effectiveness as the previous one, but it prevents the system from accessing the RAM during loops to save power. This is the recommended mode for an efficient context-switch when the loop bodies are short.
- In "dynamic power" mode, no background saving is performed, which reduces power consumption to the minimum. The modified registers are only saved when the context switch starts. The restore phase is the same as before. This is the mode that achieves the optimal power consumption at the cost of a slower context-switch.
- In a "static" context switch, all the registers are saved when a context switch is decided, and all the registers are restored before starting the execution of the new channel. This mode enables a predictable behavior of the context switch since all the registers are restored prior to the channel start and all registers are saved after the channel termination.

NOTE

Static context mode should be used for the first channel called after reset to ensure that the all context RAM for that channel is initialized during the context SAVE phase when the channel is done or yields. Subsequent calls to the same channel or different channels may use any of the dynamic context modes. This will ensure that all context locations for the bootload channel are initialized, and prevent undefined values in context RAM from being loaded during the context restore if the channel is re-started later.

43.4.2.4.2 Context Switch Procedure

The Program Control Unit goes into the *save* state, the current context is spilled into memory, and the next channel context is restored according to the context-switch mode that was selected by the ARM platform.

The context switch procedure is as follows:

1. Load the current context's spill base address.
2. Spill the modified registers of the current channel to memory according to the selected context switch mode while the channel is running.

   On a done or yield(ge) that causes the channel preemption, the PCU goes into the *save* state. In *static* mode, all the registers are saved; whereas, in either *dynamic* mode, the registers that were modified but not yet saved are then saved, and the PCU registers and flags are finally saved.

3. Put the SDMA core into *sleep* and wait for new channels to be serviced. This step is skipped if there are pending channels when the current channel is saved.

   As soon as there is at least one pending channel, the PCU goes into its *restore* state to restore the context of the channel that was elected by the scheduler.

   Once a channel is elected, it remains the current channel until its script requests a rescheduling operation with a done or yield(ge) instruction. That means the current channel cannot be modified by the ARM platform, even if it is no more runnable or if its priority is modified.

   The ARM platform can however force a reschedule by writing the corresponding bit in the CONFIG register, which has the same effect as if the script had executed a done instruction. That feature should only be used to stop the SDMA in emergency cases.

4. Load the context base-address of the new channel.

   In "static" mode, all the registers are restored. In either "dynamic" modes, only the PCU registers are restored.

   The new channel is running. In "static" mode, no more activity regarding context restoring or saving is performed. In either "dynamic" modes, the registers are restored in the background every time an access to the context RAM is possible, and priority is given to restoring the registers that are required by the next instruction to be executed. When a register has not been restored and the next instruction needs it, this instruction gets stalled until the register was restored.

In "dynamic" and "dynamic with no loop" modes, background saving of dirty registers is performed every time an access to the context RAM is possible and allowed by the context switch mode.

NOTE

The contents of a channel context space in the context RAM depends on the selected context switch mode. In "dynamic" and "dynamic with no loop" modes, the contents of the context RAM tend to match the contents of the SDMA registers (except for the PCU registers and flags that are never saved in the background). In "dynamic power" and "static" modes, the contents of the context RAM remain unchanged until the channel terminates with a done or gets preempted.

43.4.2.4.3 Context Map in Memory

Refer to Context Switching-Programming.

43.4.3 Functional Units

The functional units are small systems that are used by the SDMA core to handle data transfers between the core and a bus domain external to the SDMA.

The SDMA core is able to control and exchange data with these systems by sending instructions and reading or writing data from/to the functional units' registers via the FUBUS. This is done with the ldf and stf instructions.

The following sections provide introductions to the available functional units. Functional Units Programming Model provides descriptions the functional units' behaviors.

43.4.3.1 Burst DMA Unit

The burst DMA unit enables the SDMA core to perform data transfers to and from the ARM platform memory.

It is optimized for accessing SDRAM-like devices. It does not provide control to assign a privilege level to the DMA access. The burst DMA unit provides the SDMA with means to do the following:

- Perform up to 8-beat read and write bursts to the ARM platform memory, which optimizes throughput when accessing SDRAM-type devices because of an internal, 36-byte FIFO
- Access the ARM platform memory at once or twice the SDMA core frequency
- Copy data from one ARM platform memory location to another ARM platform memory location at the ARM platform bus speed, which provides a very high throughput
- Control the method for addressing the ARM platform memory (automatic increment of addresses or frozen addresses-the former aimed at accessing RAM-like memory and the latter aimed at accessing single-address FIFOs)
- Enable or disable automatic prefetch when reading data from the ARM platform memory. When the prefetch mode is selected, the burst DMA automatically triggers external bursts to fill its FIFO without waiting for the SDMA core to request the corresponding data, greatly improving throughput.
- Rely on the DMA to automatically flush its FIFO content when there is enough data to generate an 8-beat burst to the ARM platform memory. Or, it forces a flush when a data transfer must terminate.
- In the former case, the SDMA core may only be stalled when it tries writing data and there is not enough room left in the FIFO. In the latter case, the core is stalled until the data is effectively written to the ARM platform memory.

  In automatic flush mode, the core receives an acknowledge that does not reflect the actual error status when the data is effectively written into the ARM platform memory. This error status is retrieved by a later access to the burst DMA. Terminating a write data transfer with a forced flush command guarantees that any bus error to the ARM platform memory is caught.

- Handle address alignment issues between the ARM platform memory map and the SDMA core data. This enables the core to read or write 32-bit data from the burst DMA, whereas the corresponding ARM platform address is not 32-bit aligned. This drastically improves the SDMA scripts' efficiency since the same loop that transfers 32 bits at a time can be used regardless of the start and end addresses in the ARM platform memory space.

This unit structure and registers are described in Burst DMA Structure and Burst DMA Registers.

43.4.3.1.1 Burst DMA Structure

The burst DMA is essentially made up of a 36-byte FIFO, address registers, and a controlling state-machine. The 36-byte FIFO enables eight-word buffering with address alignment, and the state-machine manages clock adaptation when required.

The burst DMA is depicted in the figure below.

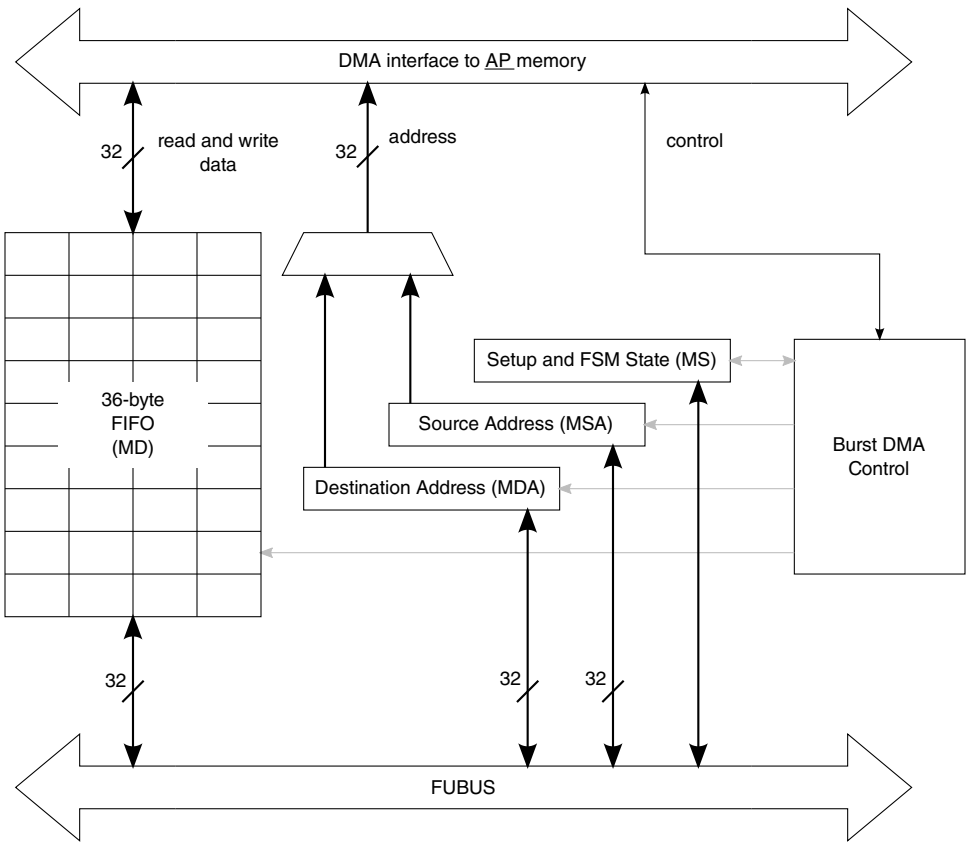

Figure 43-9. Burst DMA Structure

43.4.3.1.2 Burst DMA Registers

There are four registers, as follows, that may be accessed from the SDMA core:

- MSA (Memory Source Address) - Holds the source byte address in the ARM platform memory map for reading data from this location. This register is automatically modified every time the core reads new data from the FIFO.
- MDA (Memory Destination Address) - Holds the destination byte address in the ARM platform memory map for writing data to this location. This register is automatically modified every time the core writes new data into the FIFO.
- MD (Memory Data) - Labels the 36-byte FIFO access point: Reading a byte, halfword, or word from MD respectively retrieves the first 1, 2, or 4 bytes of the

FIFO (for example, the bytes that were stored first by the DMA state-machine when transferring data from the ARM platform memory).

- When the FIFO does not hold as many bytes as required by the SDMA core, the core is stalled until the missing bytes are read from the ARM platform memory. In the case of prefetch mode, the DMA controller decides when it should start a burst to ARM platform memory in order to reduce the risk to not have the required data for the future accesses of the core. When there is no prefetching, a burst is triggered when the required data is not available in the FIFO.

  Writing a byte, halfword, or word to MD stores 1, 2, or 4 bytes, respectively, at the end of the FIFO (for example, these bytes are transmitted to the ARM platform memory after all the other bytes that were previously stored in the FIFO). When the FIFO does not have enough room left to hold the written data, the SDMA core is stalled until a sufficient amount of FIFO contents are flushed out to the ARM platform memory. Flushing is decided by the DMA controller when there are enough bytes in the FIFO to perform the largest allowed burst to ARM platform memory (the exact size depends on the burst start address and the AHB 1 Kbyte boundary rule). However, the SDMA core has the ability to force the flushing operation at any time, for example, when at the end of the data transfer, prior to channel closure.

- MS (Memory Setup) - Contains the state of the burst DMA control, the two flags that define whether each address register is incremented after every access to the external memory, and another flag that is set when a bus error occurred.

43.4.3.1.3 Burst DMA Data Transfers

Three typical usages have been identified that involve the burst DMA: the data transfer startpoint, the endpoint, or both.

Every case requires a different procedure, as listed in the following sections:

43.4.3.1.3.1 Data Retrieval from the ARM platform Memory

The following steps retrieve data from ARM platform memory using the burst DMA unit:

- Set up the MS flags to reflect the mode for the source address (incremented or frozen according to the type of accessed device: memory or peripheral FIFO), then initialize the source address register itself (MSA).
- Read data from the FIFO using the *ldf MD* instruction as many times as needed. If an error occurred during the fetch from ARM platform memory, the DMA control tags the error status on the data and the SDMA core SF flag is set when reading this data from the FIFO.

43.4.3.1.3.2 Storing Data Into the ARM platform Memory

The following steps store data from ARM platform memory using the burst DMA unit:

- Set up the MS flags to reflect the mode for the destination address (incremented or frozen according to the type of accessed device: memory or peripheral FIFO), then initialize the destination address register itself (MDA).
- Store data into the FIFO using the *stf MD* instruction as many times as needed.
- When the transfer is finished and if the DMA worked in automatic flush mode, force the flush of the FIFO. This instruction is stalled until all the FIFO data is effectively sent to the ARM platform memory and the error status of the transfer is available in the DF flag.

43.4.3.1.3.3 Transferring Data Between Two ARM platform Memory Locations-Burst DMA Unit

The following steps copy data between two ARM platform memory locations using the burst DMA unit:

- Set up the MS flags to reflect the modes for the source and destination addresses (all the combinations are possible), then initialize the source address register (MSA) and the destination address register (MDA). Both addresses must be word-aligned.
- Use as many *stf MD* instructions with the *COPY* flag as needed. Every instruction triggers a burst read of a given number of words from the source address (this number is provided to the burst DMA via the SDMA core general purpose register, which is referenced in the *stf* instruction). Once all the data is loaded into the FIFO, the DMA empties it with a write burst of the same count to the destination address. The DMA acknowledges prior to instruction completion, which frees the SDMA core for other tasks at no delay cost.
- Once the transfer is done, there should be a final access to the burst DMA to check the error status.

43.4.3.2 Peripheral DMA Unit

The peripheral DMA unit is the second functional unit that connects the SDMA to the ARM platform memory.

Unlike the burst DMA, it does not support burst transfers and is optimized for accessing peripherals. It does not provide control to assign a privilege level to the DMA access. Its feature list comprises the following:

- Access to the ARM platform peripherals or memory at once or twice the SDMA core frequency

- Data copy from one ARM platform memory location to another ARM platform memory location at memory bus speed, improving throughput
- Control of the method for addressing the ARM platform memory (automatic increment or decrement of addresses or frozen addresses, the first ones aimed at accessing RAM-like memory and the last one aimed at accessing single-address FIFOs)
- Selectable automatic prefetch when reading data from the ARM platform memory. In prefetch mode, the peripheral DMA automatically fetches another data-without waiting for the SDMA core to request it-when its data register is empty, which improves the throughput
- Selectable automatic flush. In this mode, the SDMA core may only be stalled when it tries writing data and the previous write operation is not finished yet; whereas, in forced flush mode, the core is stalled until the data is effectively written to the ARM platform memory.
- In automatic flush mode, the core receives an acknowledge that does not reflect the actual error status when the data is effectively written into the ARM platform memory or the peripheral. This error status is retrieved by a later access to the peripheral DMA. Terminating a write data transfer with a forced flush command guarantees that any bus error to the ARM platform memory has been caught.

  This unit structure and registers are described in Peripheral DMA Structure and Peripheral DMA Registers.

43.4.3.2.1 Peripheral DMA Structure

The peripheral DMA is made up of a 32-bit data register, two address registers, and a controlling state-machine. The state-machine manages clock adaptation, when required.

It is shown in the following figure.

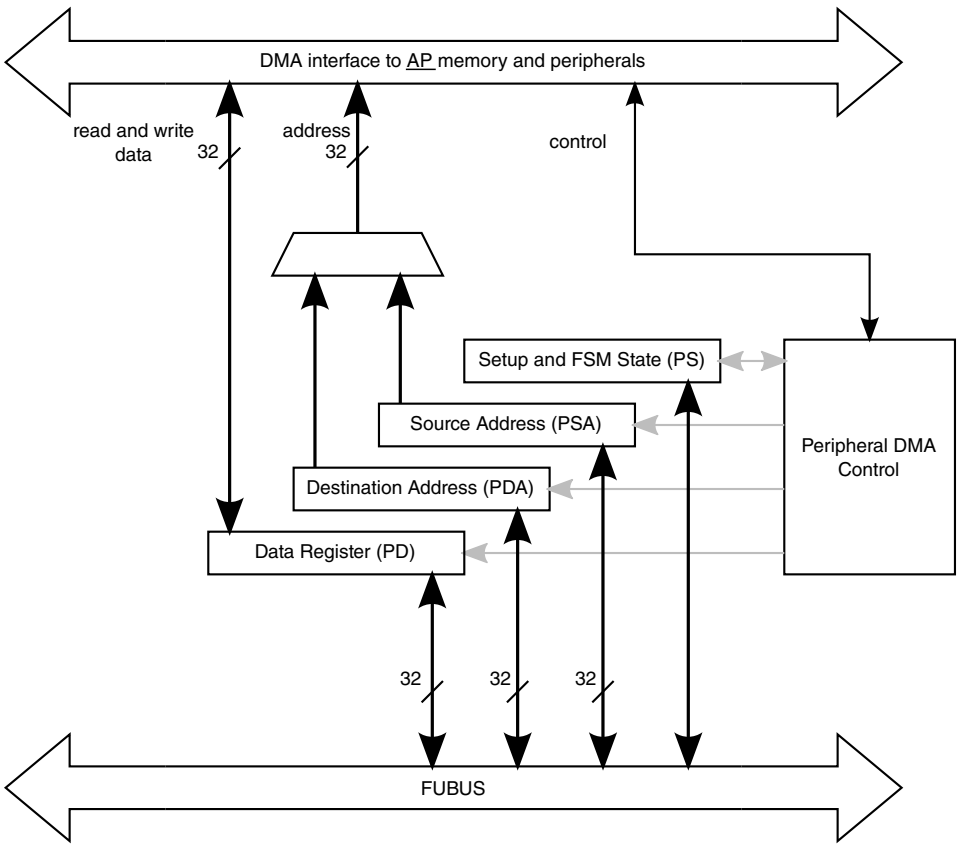

Figure 43-10. Peripheral DMA structure

43.4.3.2.2 Peripheral DMA Registers

According to Figure 43-10, the peripheral DMA has four registers that may be read or written by the SDMA core:

- *PD (Peripheral Data)* is the DMA 32-bit data register.
- *PSA (Peripheral Source Address)* holds the source byte address in the ARM platform memory map for reading data from this location. This register is automatically modified every time the core reads a new data from PD.

- *PDA (Peripheral Destination Address)* holds the destination byte address in the ARM platform memory map for writing data to this location. This register is automatically modified every time the core writes a new data into PD.
- *PS (Peripheral Setup)* contains the state of the peripheral DMA control, two configuration fields that define the way address registers are modified after every data access, two additional configuration fields that define the data size to access the source and destination devices, and another field that contains the latest transfer error status.

43.4.3.2.3 Peripheral DMA Data Transfers

There are three typical usages that involve the peripheral DMA, whether it is the data transfer start-point, endpoint, or both.

Every case requires a different procedure, as described in Data Retrieval from the ARM platform Memory or Peripheral, Storing Data into the ARM platform Memory or Peripheral, and Transferring Data Between Two ARM platform Memory Locations-Peripheral DMA Unit.

43.4.3.2.3.1 Data Retrieval from the ARM platform Memory or Peripheral

The following steps retrieve data from ARM platform memory using the peripheral DMA unit:

- Set up the PS fields to reflect the mode and data size for the source (incremented, decremented, or frozen address register; 8-bit, 16-bit, or 32-bit data transfers), then initialize the source address register itself (PSA) with an address that is aligned to the programmed data size.
- Read data from PD using the ldf PD instruction as many times as needed. If an error occurs during the fetch from the ARM platform memory or peripheral, the DMA control tags the error status on the data and the SDMA core SF flag is set when reading this data from PD.

43.4.3.2.3.2 Storing Data into the ARM platform Memory or Peripheral

The following steps store data to ARM platform memory using the peripheral DMA unit:

- Set up the PS fields to reflect the mode and data size for the destination (incremented, decremented, or frozen address register; 8-bit, 16-bit, or 32-bit data transfers), then initialize the destination address register itself (PDA) with an address that is aligned to the programmed data size.

- Store data into PD using the *stf PD* instruction as many times as needed.
- When the transfer is finished and if the peripheral DMA worked in automatic flush mode, force the flush of PD. This instruction is stalled until PD contents are effectively sent to the ARM platform memory or peripheral, and the error status of the transfer is available in the DF flag.

43.4.3.2.3.3 Transferring Data Between Two ARM platform Memory Locations-Peripheral DMA Unit

The following steps copy data between two ARM platform memory locations using the peripheral DMA unit:

- Set up the PS fields to reflect the modes and data size for the source and destination addresses (all the combinations of addressing modes are possible, but both data sizes must be identical), then initialize the source address register (PSA) and the destination address register (PDA). Both addresses must be aligned with the programmed data size.
- Use as many *stf PD* instructions with the *COPY* flag as needed. Every instruction triggers a single read from the source address; a single write of the received data immediately follows. The DMA acknowledges prior to instruction completion, which frees the SDMA core for other tasks at no delay cost.
- Once the transfer is done, there should be a final access to the peripheral DMA to check the error status.

43.4.4 SDMA Security Support

The SDMA provides support to SDMA software to block unauthorized updates to the scripts in RAM.

SDMA supports the following Security modes:

- Open Mode: has full control to load scripts and context into SDMA RAM. This is the default mode.
- Locked Mode: The ARM platform loads scripts and channel contexts at startup when it is still executing known safe software. When finished, it locks the SDMA to prevent further updates to RAM and selected registers. More details described in Locked Mode.

43.4.4.1 Locked Mode

The LOCK bit in the SDMA_LOCK register provides support for SDMA scripts to freeze RAM contents after the initial bootload routine to prevent future unauthorized updates to SDMA RAM.

After initial RAM contents are uploaded, ARM platform software can set the LOCK bit to secure the RAM contents to prevent future updates by an unauthorized. After the LOCK bit is written with a '1', the SDMA is "locked" until reset.

The LOCK bit can be read in the SDMA's internal memory map in the LOCK register (see Section SDMA LOCK (SDMAARM_SDMA_LOCK)). SDMA scripts which load information into RAM can check the value of the LOCK bit to determine if an upload to RAM is allowed. If not allowed, the script can refuse to allow the request to copy data into the RAM to continue. The exact use of the LOCK bit in SDMA scripts for security control will be described in SDMA software documentation (see SDMA Scripts).

While SDMA is locked, attempts to write to the SDMA_LOCK, CHN0ADR, ILLINSTADDR, and ONCE_ENB registers will be ignored. All registers remain readable. Writes to other registers are still allowed.

Once the SDMA is locked, the LOCK bit can only be cleared by a reset. A hardware reset will always clear the LOCK bit. A software reset initiated by writing to the RESET register will only clear the LOCK bit if the SRESET_LOCK_CLR bit in the SDMA_LOCK register is set. Since SDMA_LOCK register cannot be updated if SDMA is locked, the SRESET_LOCK_CLR bit must be configured before setting the LOCK bit. The SREST_LOCK_CLR bit will also be cleared by resets that clear the LOCK bit.

The SDMA RISC core uses the ILLINST and CHN0ADDR registers as pointers to determine where to jump to after an illegal instruction or upon boot after a reset. The LOCK bit prevents updates to these registers to protect against unauthorized changes to these pointers.

While SDMA is locked, the ONCE_ENB register cannot be written to prevent the OnCE under ARM platform control from being used to gain access to SDMA internal memory. If ARM platform control of the OnCE is enabled before setting the LOCK bit, the ARM platform can use the ONCE for debug purpose after LOCK is set.

43.4.5 OnCE and PCU Debug States

The SDMA has two different debug modes in which the OnCE performs debug instructions.

Refer to Figure 43-4 for an example of the PCU states in debug. The following are the two debug states:

- When a channel is running (that is, when CCR and CCPRI are different from 0, which can be read in the PSW register), SDMA can execute a SoftBkpt instruction from the channel script or receive a debug request. When either happens, the SDMA enters its "Classical" *Debug* state, which is described in OnCE and Real-Time Debug.
- When a channel is not running, the SDMA can be in *Sleep* state or in *Sleep after Reset* state. If a debug request is sent to the core, it enters its *Debug in Sleep* state. This debug mode works similarly to the "Classical" *Debug* state, except it returns to the original state (*Sleep* or *Sleep after Reset*) when the debug mode is left via the exec_core instruction of the OnCE. From this *Debug in Sleep* state, the SDMA can execute a program whereas no channel is running. If a new debug request is sent to the core or if a SoftBkpt is executed, it comes back to this *Debug in Sleep* state.

The OnCE is provided with several instructions that can be executed when the core is in either debug state. The following table summarizes the behavior of these OnCE debug instructions. There exists other secondary OnCE instructions that are described in OnCE and Real-Time Debug.

Table 43-7. SDMA in Debug Mode

Instruction	Debug	Debug in Sleep
exec_once	exec_once <instruction> SDMA executes the <instruction> and returns to the *Debug* state. The Program Counter (PC) is not incremented. This command must not be used with an instruction that modifies the PC value.	exec_once <instruction> SDMA executes the <instruction> and returns to the *Debug in Sleep* state. The Program Counter (PC) is not incremented. This command must not be used with an instruction that modifies the PC value.
run_core	run_core <instruction> SDMA executes the <instruction>, leaves the *Debug* state and continues executing the channel script from the position where it stopped. This command must not be used with an instruction that modifies the PC value.	run_core <instruction> SDMA executes the <instruction> and returns to its *Sleep* or *Sleep after Reset* initial state. This command must not be used with an instruction that modifies the PC value.
exec_core	exec_core <instruction> It is similar to run_core except it requires an instruction that changes the PC value (jump, branch...): the SDMA jumps to the new PC value, leaves the *Debug* state and starts executing instructions from this new PC value.	exec_core <instruction> If the previous state was *Sleep after Reset*, the SDMA returns to this state, and Chn0Addr value overrides the PC value. Otherwise, the SDMA jumps to the new PC value and starts executing instructions from this new PC.

NOTE

The feature exec_core in *Debug in Sleep* after *Sleep after Reset* was added for the Channel boot (channel 0) to allow the debugger to return to *Sleep after Reset* state with a new PC

value. The SDMA will be ready to boot at the Chn0Addr address.

43.4.6 SDMA Clocks and Low Power Modes

The SDMA receives several root clocks from the SoC clock controller block and performs adaptive clock gating to optimize its power consumption. From a user standpoint, clock gating and power mode selection are fully automatized inside the SDMA.

Root clock control is available from the SoC clock controller block.

There are numerous clock sources that are used in the SDMA. They belong to one of two possible clock domains listed in the following table, and have frequency constraints within each domain. Clocks are considered asynchronous between domains.

Within the ARM platform/SDMA clock domain, all clocks must come from the same DPLL. The ARM platform DMA interfaces (peripheral DMA and burst DMA) receive their clock from the ARM platform DMA clock source whose frequency can be once or twice the frequency of the SDMA core clock. The DMA interfaces are designed to work at the ARM platform DMA frequency, but the SDMA core is physically limited to a maximum 104 MHz frequency. Since this is lower than the maximum ARM platform DMA frequency, the SDMA core clock is tied to the ARM platform peripheral clock frequency.

The ARM platform Peripheral Bus Clock source must be an exact sub-frequency of the SDMA Core clock source (any integer value greater or equal to 1).

Table 43-8. Clocking Scheme

Clock Domain	Source Clock	Comments
ARM platform	SDMA core (SDMA main core)	Source clock for the core and all its operations; this clock is thus used by most of the SDMA sub-blocks.
	ARM platform DMA	DMA interface for the peripheral DMA and the burst DMA. It is balanced with the main clock source, and its frequency is either once or twice the main clock frequency.
	ARM platform peripheral	Connection to the ARM platform peripheral bus. It is a sub-frequency of the main clock frequency.
JTAG	TCK	Clock for JTAG access, limited to maximum of 1/8 of the SDMA core clock frequency.

The JTAG clock is sampled by the SDMA main clock to determine its rising edge. This simplifies design and clock management, but it also adds a ratio constraint between those two clocks. It is guaranteed the JTAG interface works properly when the frequency of TCK is lower than $1/8^{th}$ of the frequency of the SDMA main clock (which is about 8 MHz when the SDMA core clock frequency is 66 MHz).

43.4.6.1 Clock Gating and Low Power Modes

The SDMA automatically performs power saving without requiring user involvement. It implements two levels of automatic clock gating.

43.4.6.1.1 Coarse Clock Gating

Every sub-block clock comes from one of the five available sources, and is gated with the sub-block specific enabling condition.

The following table displays the sub-block clocks and their source. It also indicates the relationships that may exist between different sub-blocks clock enables.

Table 43-9. Sub-blocks Clocks

Sub-block	Source Clocks	Enabling Condition and Comments	Related Enabling Conditions
Core	SDMA Main Core	The core sub-block clock is running when the core is not in one of its sleep states (Sleep or Sleep after Reset) or there is a pending channel. Typically, the core sub-block clock is stopped once all the channels are processed and the core enters its sleep state. A new pending channel awakes the core sub-block clock.	None
Memories	SDMA Main Core	The clock activation only occurs during a core access.	Disabled when Core sub-block clock is disabled or no memory access in progress
Scheduler	SDMA Main Core	Its clock only runs when scheduling is needed: for example, when there are pending channels, upon reception of a DMA request, and anytime the ARM platform modifies the channel running conditions.	None
ARM platform Control	SDMA Main Core & ARM platform peripheral	The ARM platform peripheral clock is solely used to determine the frequency ratio with the SDMA main clock. The control registers' clock is based on *SDMA main clock*; it is active when the ARM platform or the SDMA modifies the contents of one of these registers.	None
Burst DMA	SDMA Main Core & ARM platform DMA	The burst DMA has two clocks: The first clock is derived from the SDMA main core clock and drives registers that are connected to the FUBUS. The second clock is derived from the ARM platform DMA clock and drives registers that are connected to the ARM platform DMA bus outside the SDMA. Both clocks are enabled	Disabled when Core sub-block clock is disabled

Table continues on the next page...

Table 43-9. Sub-blocks Clocks (continued)

Sub-block	Source Clocks	Enabling Condition and Comments	Related Enabling Conditions
		during active phases of data transfers (for example, these clocks are turned off when the burst DMA is not used by the running channel script).	
Peripheral DMA	SDMA Main Core & ARM platform DMA	The peripheral DMA has two clocks: The first clock is derived from SDMA main clock and drives registers that are connected to the FUBUS. The second clock is derived from the ARM platform DMA clock and drives registers that are connected to the ARM platform DMA bus outside the SDMA. Both clocks are enabled during active phases of data transfers (for example, these clocks are turned off when the peripheral DMA is not used by the running channel script).	Disabled when Core sub-block clock is disabled
OnCE	SDMA Main Core	The OnCE clock is derived from main source clock. It is disabled by default. In order to use the OnCE, its clock must be explicitly turned on, either by enabling the OnCE access from the ARM platform peripheral bus (register ONCE_ENB), or by driving the clk_gating_off input pin high. This is a SDMA input whose driver depends on the SoC implementation (typically a JTAG controller). The OnCE also receives the TCK input, which is the JTAG clock. It does not use it as a functional clock; the TCK input is sampled instead. Refer to Synchronization Implementation.	When enabled, all other clocks are systematically on (clock gating is off)

43.4.6.1.2 Refined Clock Gating

The SDMA implements a second level of clock gating on a register-per-register basis.

Unlike the first level that covers all the SDMA flip-flops, except the synchronizers (only five flip-flops are always running), the second level is only available for eligible registers, which amounts to about 90% of the SDMA flip-flops.

These gated registers are only clocked when the hardware logic detects a new data loading. This additional gating further reduces dynamic power consumption.

43.4.6.1.3 Low Power Modes and User Control

Power savings are automatically managed by the SDMA hardware without any user involvement; however, one can distinguish three different power modes: SLEEP, RUN, and DEBUG.

The following table describes these modes, and shows how to switch from one mode to another.

Table 43-10. Power Modes

Power Mode	Sub-blocks							Comments
	Core	Memories	Scheduler	ARM platform Control	Burst DMA	Peripheral DMA	OnCE	
SLEEP	off[1]	off	wait[2]	wait	off	off	off	Set when the PCU state is either *Sleep* or *Sleep after Reset* and the SDMA is not in DEBUG mode. This is the default mode after reset.
RUN	on[3]	wait	wait	wait	wait	wait	off	Set for the other PCU states that are reachable out of debug: *Program*, *Data*, *Change of Flow*, *Error in Loop*, *Debug*, *Functional Unit*, *Save,* or *Restore*.
DEBUG	on	on	on	on	on	on	on	Set regardless of the PCU state when clock gating is turned off to use the OnCE features (either *clk_gating_off* pin high or ONCE_ENB[0] set).

1. *off*: no clock
2. *wait*: only clocked when accessed or stimulated
3. *on*: clock is always running

It is possible to control the SDMA power mode. The procedures to force the SDMA into either mode are described in SLEEP Mode.

43.4.6.1.3.1 SLEEP Mode

This is the default mode after reset; therefore, resetting the SDMA forces this mode.

However, the common procedure is as follows:

- Ensure the *clk_gating_off* pin is low and ONCE_ENB[0] is cleared.
- Disable all channels (via the STOP_STAT control register, and the HO, DO, EO if necessary).
- Wait for the active channels to complete or force a reschedule via the reschedule bit in the RESET register.
- The SDMA is in SLEEP mode making it possible to completely shut off its clock from the chip level clock controller using the procedure described in Stop Mode Response.

43.4.6.1.3.2 RUN Mode

This is the default mode when a channel is running:

- Ensure the *clk_gating_off* pin is low and ONCE_ENB[0] is cleared.
- Activate at least one channel (via the HSTART control registers, a DMA request, and/or the HO, DO, EO register bits).

43.4.6.1.3.3 DEBUG Mode

The DEBUG mode must be set when one needs to use the debugging facilities of the SDMA.

- Ensure the SDMA clocks are running from the CCM.
- Set the *clk_gating_off* pin high or use the SDMA to set ONCE_ENB[0].

43.4.6.1.4 Stop Mode Response

The SDMA receives a stop request from the chip level clock controller. This request may be asserted when the chip enters the stop low power mode.

If the SDMA is running when the request is received, then the SDMA will complete all pending channels before returning to the SLEEP state. The SDMA sends an acknowledgement to the clock controller when the SLEEP state is entered indicating that the SDMAs clocks can be turned off.

43.4.6.2 Reset

After reset (either received from the reset block or a software reset required by the ARM platform), the SDMA is in IDLE mode. It will start its boot code located at address 0 once a channel is activated.

Activating a channel can be done by the ARM platform after programming a positive priority and setting the channel bit in the EVTPEND register.

There will not be a context RESTORE for the first channel (bootload channel) called after a reset because the context data in RAM has not been initialized. Static context mode should be used for the first channel called after reset to ensure that the all context RAM for that channel is initialized. Subsequent calls to the same channel or different channels may use any of the dynamic context modes

43.4.7 Software Interface

Appendix A fully describes the SDMA Application Programming Interface (API).

43.4.8 Initialization Information

This section discusses the following:

- Hardware Reset
- Channel Script Execution
- Initialization and Script Execution Setup Sequence

43.4.8.1 Hardware Reset

After reset, the program RAM, context RAM, data RAM, and RAM containing the channel enable registers (CHNENBLn) have unpredictable contents.

The active register set is assigned to channel 0 and the PC is initialized to all zeros. However, since the channel enable register is all zeros, there are no active channels and the SDMA is halted waiting for the boot channel to start.

The ARM platform will have to setup the SDMA in order to boot it. The CONFIG register must be initialized to determine the DMA/core clock ratio (1 or 2). Channel Enable Registers must also be initialized.

To start up the SDMA, the ARM platform first creates some channel control blocks (CCB) and buffer descriptors (BD) in ARM platform memory for the boot channel (channel 0) and then initializes the channel 0 pointer register (SDMA_MC0PTR) to the address of the first control block. Data Structures for Boot Code and Channel Scripts provides an overview of the data structure for the CCB and BD's. The SDMA_HSTART, SDMA_HOSTOVR and SDMA_EVTOVR registers are then configured according to Runnable Channels Evaluation to allow channel 0 to run.

Upon being enabled, the SDMA begins executing the script located at the address indicated by the Channel 0 Boot Address register (SDMA_CHN0ADDR) in the program memory. The reset value of SDMA_CHN0ADDR points to the default bootload script in ROM. This ROM script will read the channel 0 pointer register (SDMA_MC0PTR) to determine the location of the Channel Control Block (SDMA_CCB) in ARM platform memory. The script will then begin fetching by DMA the first channel control block which contains a pointer to the location channel 0 Buffer Descriptor chain which is also fetched via DMA. If the buffer descriptor contains a valid command, the script interprets the command in each buffer descriptor and proceeds to implement the command and move on to the next buffer descriptor control block. The buffer descriptor commands for

channel zero are typically set up to load SDMA's program RAM, Data RAM, and initial values for the channel contexts. Some channel scripts expect particular parameters to be passed

There are two ways to make the SDMA boot on a user-defined script. The OnCE (either via its JTAG interface or its ARM platform Control interface) can be used to download any code in the SDMA RAM and force the SDMA to boot on that code. Also, the SDMA_CHN0ADDR register in the ARM platform programming model can be modified to point to user code in RAM which would need to either have been loaded via the ONCE or default bootload routine (ex before a S/W reset).

43.4.8.2 Channel Script Execution

The execution of an SDMA script depends on both the instructions that make up the script, the data context upon which it operates, and commands or parameters allowed to the buffer. All these items must be initialized before the script is allowed to execute.

Each of the 32 channels has a separate context, but may share scripts and locations in data RAM.

Channels are initialized by the ARM platform by using channel 0 to download any required scripts and data values and the channels initial context. The context contains all the initial values of the SDMA core registers. This includes the Program Counter (PC) which is set to the start of the desired script in SDMA program memory.

The ARM platform selects which trigger conditions that must occur for the channel to start by configuring the SDMA_CHNENBL, SDMA_HOSTOVR and SDMA_EVTOVR registers. The trigger events include ARM platform setting HE (SDMA_HSTART) or a hardware DMA request asserts an event input to SDMA. The channel can become active according to its priority compared with other runnable channels when the selected trigger(s) cause the condition described in Runnable Channels Evaluation to evaluate as true.

The specific parameters to be passed to each script in the buffer descriptor or context are documented in the software documentation for each script. Please refer to SDMA Scripts for complete script documentation. Buffer Descriptor Format provides an overview of the buffer descriptor format.

43.4.8.3 Initialization and Script Execution Setup Sequence

To summarize, the following steps are minimally required to setup SDMA and run channel scripts.

- Perform Hardware Reset. The program RAM, context RAM, data RAM and SDMA_CHNENBLn registers have unpredictable contents after this reset.
- Initialize SDMA_CHNENBLn registers to map DMA request events to desired channels.
- Configure SDMA_CHNPRIn registers to select priority for runnable channels. A non-zero priority is required for the channel to run.
- Configure the SDMA_CONFIG register to select DMA to SDMA core clock ratio .
- Set up channel control blocks and buffer descriptors in ARM platform to specify the loading of SDMA program RAM and channel contexts for each SDMA channel to be used. Reference Data Structures for Boot Code and Channel Scripts.
- Configure SDMA_MC0PTR register with base address of ARM platform Channel Control Block base address.
- Initialize SDMA_CHNENBLn registers to map DMA request events to associated channel. Reference Mapping DMA Requests to Pending Channels.
- Configure SDMA_CHNPRIn registers to set priority for each channel to be run.
- For each channel to be run, configure SDMA_HOSTOVR (HO) and SDMA_EVTOVR (EO) registers to select which events (hardware and/or software trigger events) must occur for the channel to be runnable. Reference Runnable Channels Evaluation.
- Set bit 0 of the SDMA_HSTART register to set HE[0] and allow Channel 0 to run (assumes EO[0] andDO[0] were both set in previous step). This will cause SDMA to load the program RAM and channel contexts configured previously.
- Wait for Channel 0 to finish running. This is indicated by HI[0]=1 in the SDMA_SDMA_INTR register, or by optional interrupt to the ARM platform.
- Set the LOCK bit in the SDMA_SDMA_LOCK register to prevent un-authorized uploads of data to SDMA RAM.
- Additional channel scripts can now be run by enabling the selected software or hardware trigger event according to Runnable Channels Evaluation.

43.4.9 SDMA Programming Model

This section describes the programming model for the SDMA RISC engine, including its processor, memory, and internal control registers.

All addresses are related to the internal SDMA memory map, which is completely different from the ARM platform memory maps. The ARM platform processor has no access to any hardware resource described, except when those resources are described in ARM Platform Memory Map and Control Register Summary. .

43.4.9.1 State and Registers Per Channel

The SDMA can be seen as a set of 32 identical devices that are able to perform one data transfer channel each. Only one channel can work at a time, but every channel state is available at any time.

This chapter lists the components of every channel state.

43.4.9.2 General Purpose Registers

Each channel has eight general purpose registers of 32 bits for use by scripts. General register 0 has a dedicated function for the loop instruction, but otherwise can be used for any purpose.

43.4.9.3 Functional Unit State

Each channel context has some state that is part of the functional units.

The specific allocation of this state is part of the functional unit definition that is described in Burst DMA Unit Programming, Peripheral DMA Unit Programming .

This state must be saved/restored on context switches.

43.4.9.3.1 Program Counter Register (PC)

The PC is 14 bits. Since instructions are 16 bits in width and all memory in the SDMA is 32 bits in width, the low order bit of the PC selects which half of the 32-bit word contains the current instruction.

A low order bit of zero selects the most significant half of the word.[1]

43.4.9.3.2 Flags

Each channel has the following four flags:

- The T bit reflects the status of some arithmetic and test instructions. It is set when the result of an addition or a subtraction is zero and cleared otherwise. It is also the copy of the tested bits. Finally, it can also be set when the loop counter (GReg0) reaches zero. When the last instruction of the hardware loop is an operation that can modify the T flag, its effect on T is discarded and replaced by the GReg0 status.

1. For example, big-Endian.

- Two additional bits, SF and DF, are used to indicate error conditions resulting from loading data sources and storing to destinations, respectively. Access errors set these bits, and successful transactions clear them. They can also be cleared by specific instructions (CLRF and loop). The source fault (SF) is updated by the loads LD and LDF; the destination fault (DF) is updated by the stores ST and STF.
- Access errors are caused by several conditions including writing to the ROM, writing to a read-only memory mapped register, accessing an unmapped address, or any transfer error received by a peripheral when it is accessed.

  The SF and DF flags have a major impact on the behavior of the hardware loop: If SF or DF is set when starting a hardware loop and it is not masked by the loop instruction, the loop body will not be executed. Inside the loop body, if a load or store sets the corresponding SF or DF flag, the loop exits immediately. Testing the status of the T flag at the end of the loop (as well as testing both SF and DF) tells if the loop exited abnormally as any anticipated exit prevents GReg0 from reaching the zero value and thus setting the T flag. This is also valid if the fault occurs at the last instruction of the last loop.

- The last flag is the loop mode flag, LM, which is composed of two bits. The most significant bit indicates when the processor is currently operating in loop mode. It is set by the loop instruction and is cleared after execution of the last instruction of the last loop. The least significant bit is set when the program counter points to the last instruction of a loop on the last path. It is used for a channel that is restored with this configuration to know that the next program counter is EPC. As with the dynamic context switch Greg0, which indicates when the program must get out of the loop, it can be restored only on the last instruction of the loop. This, however, is too late to fetch the next instruction after the loop.

43.4.9.3.3 Return Program Counter (RPC)

The RPC is 14 bits. It is set by the jump to the subroutine instructions and used by the return from the subroutine instructions.

Instructions are available to transfer its contents to and from a general register.

43.4.9.3.4 Loop Mode Start Program Counter (SPC)

The SPC is 14 bits. It is set by the loop instruction to the location immediately following it.

43.4.9.3.5 Loop Mode End Program Counter (EPC)

The EPC is 14 bits. It is set by the loop instruction to the location of the next instruction after the loop.

43.4.9.4 Context Switching-Programming

Each channel has a separate context consisting of the eight general purpose registers and additional registers representing the state of the functional units.

The active registers and functional units contain the context of the active channel. The context of inactive channels is stored in SDMA RAM, which is part of the SDMA address space.

In a function of the selected context switching mode (Context Switching), modified registers by the program can be saved in the channel RAM space while the program is going on. In every cycle, a write access to the RAM is possible.

On a done or yield(ge) instruction, SDMA goes into "real" context switching. In one of the dynamic modes, modified registers not previously saved, as well as the PC-Loop registers, are stored into the context area of the channel that will be closed. The new PC-Loop registers are loaded from the context area of the new channel. All other registers are restored while the program is executed, giving priority to registers used by the decoded instruction. Therefore, in the best case, only the PC and Loop registers should be saved and restored during this context-switching phase, which only requires five SDMA cycles.

In static mode, the context switch stores all registers in the old channel RAM space, and restores all registers from the new channel RAM space. It requires 26 SDMA cycles.

The address of the context memory for channel *i* is *CONTEXT_BASE* + 24**i* or *CONTEXT_BASE* + *32*i w*here CONTEXT_BASE equals 0x0800. The table below presents the layout of a channel context in memory:

Table 43-11. Layout of a Channel Context in Memory for SDMA

OFFSET	31	30	29-16	15	14	13-0

43.4.9.5 Address Space

The SDMA has four internal buses which are listed here.

- The Instruction bus reads instructions from the memory. Its address map is described in Instruction Memory Map.
- The Data bus (DMBUS) accesses the same memories as those visible on the Instruction bus, some memory-mapped registers (scheduler status and OnCE registers), and up to 14 peripherals. Its address map is described in Data Memory Map.

- The Functional Units bus (FUBUS) accesses the , Burst DMA, Peripheral DMA . The addressing mechanism is further detailed in Functional Units Programming Model.
- The Context Switch bus reads/writes registers into context-switch RAM space. It is a 64-bit bus dedicated for accessing this RAM space for updating the context of the running channel. While the program is going on, this bus has the lowest priority compared to the Instruction and Data buses, except for restoring a register needed for the decoded instruction to be executed. On the save part of a context switch (when the PCU is in its slave state), this is the only one used. On the restore part, the Instruction bus has the priority to read the next instruction at the restored PC and otherwise the Context Switch bus is used. It is not possible to control the actual data transfers that occur on this bus.

43.4.9.5.1 Instruction Memory Map

The instruction memory map is based on a 14-bit address bus and a 16-bit data (instruction) bus. Each address corresponds to a 16-bit data location.

Instructions are fetched from either program ROM or program RAM. An SDMA script is able to change the contents of the program RAM, which is also visible from the data bus.

The first two instruction locations (at 0 and 1) are special. Location 0 is where the PC is set on reset. Location 1 is where the PC is set upon the execution of an illegal instruction. It is expected that both of these locations will contain a jmp to handle routines.

Table 43-12. SDMA Instruction Memory Space

Device	SDMA Address (Hex)	Base Address Label	Block Name	WS	Description
ROM	0x0000 ↓ 0x07FF	SDMA_IBUS_ROM_ADDR	-	0	4 Kbyte internal ROM with boot code and standard routines.
RAM	0x1000 ↓ 0x1FFF	SDMA_IBUS_RAM_ADDR	-	0	8 Kbyte internal RAM with channels context and user data/routines.

43.4.9.5.2 Data Memory Map

All of the data accessible to SDMA scripts make up the data memory space of the SDMA.

This address space has several components:

- ROM (also visible on the Instruction bus)
- RAM (also visible on the Instruction bus)

- Shared Peripherals Registers
- SDMA Internal Registers (scheduler, OnCE, and registers that are also accessible by the ARM platform)

SDMA scripts can read and write to the context RAM, data RAM, shared peripheral registers, and internal registers.

The address range is 16 bits and the data width is 32 bits. When accessing peripheral registers (USB and so on), the data width may be different. The exact address map for the peripherals depends on the project (as presented in each respective chapter).

Data access is performed with *ld* and *st* instructions that take the address from a general purpose register in the core (GReg*n*). The mapping between the general purpose register contents and the address bus is given in the following table:

Table 43-13. GReg*n* to DMBUS Address Mapping

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
15	**14**	**13**	**12**	**11**	**10**	**9**	**8**	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
sz	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
address															

Grayed bits are simply discarded but they must be cleared to ensure forward-script compatibility.

- sz (bit 31) indicates the peripheral data width: 0 is used for a 32-bit peripheral and 1 is used for a 16-bit peripheral.
- address (bits 15 down to 0) is the address of the accessed resource (internal memory, internal register, or shared peripheral).

Table 43-14. SDMA Data Memory Space

Device	SDMA Address (Hex)	Size	Description
ROM	0x0000 → 0x03FF	4 Kbyte	4 Kbyte internal ROM with boot code and standard routines
Reserved	0x0400 → 0x07FF	4 Kbyte	4 Kbyte Reserved
RAM	0x0800 → 0x0FFF	8 Kbyte	8 Kbyte internal RAM with channels contexts and user data/routines
per1	0x1000 → 0x1FFF	16 Kbyte	*peripheral 1* memory space (4 Kbyte peripheral's address space)
per2	0x2000 → 0x2FFF	16 Kbyte	*peripheral 2* memory space (4 Kbyte peripheral's address space)
per3	0x3000 → 0x3FFF	16 Kbyte	*peripheral 3* memory space (4 Kbyte peripheral's address space)
per4	0x4000 → 0x4FFF	16 Kbyte	*peripheral 4* memory space (4 Kbyte peripheral's address space)
per5	0x5000 → 0x5FFF	16 Kbyte	*peripheral 5* memory space (4 Kbyte peripheral's address space)
per6	0x6000 → 0x6FFF	16 Kbyte	*peripheral 6* memory space (4 Kbyte peripheral's address space)
Registers	0x7000 → 0x7FFF	16 Kbyte	Memory mapped registers
per7	0x8000 → 0x8FFF	16 Kbyte	*peripheral 7* memory space (4 Kbyte peripheral's address space)

Device	SDMA Address (Hex)	Size	Description
per8	0x9000 → 0x9FFF	16 Kbyte	*peripheral 8* memory space (4 Kbyte peripheral's address space)
per9	0xA000 → 0xAFFF	16 Kbyte	*peripheral 9* memory space (4 Kbyte peripheral's address space)
per10	0xB000 → 0xBFFF	16 Kbyte	*peripheral 10* memory space (4 Kbyte peripheral's address space)
per11	0xC000 → 0xCFFF	16 Kbyte	*peripheral 11* memory space (4 Kbyte peripheral's address space)
per12	0xD000 → 0xDFFF	16 Kbyte	*peripheral 12* memory space (4 Kbyte peripheral's address space)
per13	0xE000 → 0xEFFF	16 Kbyte	*peripheral 13* memory space (4 Kbyte peripheral's address space)
per14	0xF000 → 0xFFFF	16 Kbyte	*peripheral 14* memory space (4 Kbyte peripheral's address space)

43.4.10 SDMA Initialization

Appendix A describes the setup of the SDMA . This section provides a quick description of several initialization procedures.

NOTE

There may be differences with the actual implementation in the API.

43.4.10.1 Hardware Reset-SDMA

After reset, the RAM that holds contexts, data, scripts, and the DMA request-channels matrix has unpredictable content.

The core registers are all reset to 0, including the PC; the PCU state is *Sleep after Reset*. No channel can be activated because all of the priorities are also reset to 0.

43.4.10.2 Standard Boot Sequence

The following is the standard boot sequence:

1. Initialize the CONFIG register-detailed in Configuration Register (SDMAARM_CONFIG)-to determine the ARM platform DMA/core clock ratio (1 or 2)
2. Initialize the DMA request-channels matrix (seeChannel Enable RAM (SDMAARM_CHNENBL*n*)).
3. Program the channel control registers-Channel Event Override (SDMAARM_EVTOVR), Channel BP Override (SDMAARM_DSPOVR), Channel

BP Override (SDMA_HOSTOVR), and Channel Event Pending (SDMAARM_EVTPEND)-according to the channel allocation.
4. Perform any necessary setup as required by the standard boot script in ROM (this is described in Appendix A).
5. Trigger channel 0 with the Channel Start (SDMAARM_HSTART) register, which starts the execution of the ROM script starting at address 0. This boot downloads channel scripts and contexts in RAM.

43.4.10.3 User-Defined Boot Sequence

The following is a user-defined boot sequence:

1. Initialize the Configuration Register (SDMAARM_CONFIG)Channel Enable RAM (SDMAARM_CHNENBL*n*), Channel Event Override (SDMAARM_EVTOVR), Channel BP Override (SDMAARM_DSPOVR), Channel ARM platform Override (SDMAARM_HOSTOVR), and Channel Event Pending (SDMAARM_EVTPEND).
2. Use the OnCE (either via its JTAG interface or its ARM platform control registers) to download any code in the SDMA RAM. Accessing the Memory describes how to write data to the RAM via the OnCE.
3. Use the OnCE instructions to make the PC default value point to the new boot script start address, or rely on the ROM startup script, which first jumps to the address in Channel 0 Boot Address (SDMAARM_CHN0ADDR). (This register default address points to the standard boot script.)

43.4.10.4 Script Loading and Context Initialization

The execution of an SDMA script depends on both the instructions that make up the script and the data context upon which it operates. Both must be initialized before the script is allowed to execute.

Each of the 32 channels has a separate data context, but may share scripts and locations in the data RAM.

The ARM platform manages the space in program RAM and data RAM. It also manages the assignment of SDMA channels to the device drivers that need them. Channels are initialized by the ARM platform via the channel 0 boot script. The boot channel downloads any required scripts with their data and the channels' initial contexts. Every context contains all the initial values of the registers, including the PC. Then the ARM platform can enable any channel that becomes active and begins fetching and executing instructions from its script.

43.4.11 Instruction Description

The following sections introduce the instruction of the SDMA.

Instruction set details are available in Instruction Set.

43.4.11.1 Scheduling Instructions

The following are scheduling instructions:

- done-The instruction causes certain scheduling or interrupt bits to be set or cleared, which may cause a change in the schedule-ability of the running channel. Then the instruction causes the SDMA to evaluate the current scheduling priorities and to choose the highest priority ready channel. If this channel is not the current channel, a context switch will take place. If there are no runnable channels, the SDMA will enter the stopped mode. The done 5 has a special usage reserved for debug, as explained in Debug Instructions.
- yield-These instructions are special cases of the done instruction. They do not modify the scheduling bits, but allow the highest pending channel (if it exists) to preempt the current channel if the pending channel priority is strictly greater than the current channel priority.
- yieldge-These instructions are special cases of the done instruction. They do not modify the scheduling bits, but allow the highest pending channel (if it exists) to preempt the current channel if the pending channel priority is strictly greater or equal to the current channel priority.
- notify-The notify instruction affects the scheduling bits, but does not cause rescheduling.

43.4.11.2 Conditional Branch Instructions

The conditional branch instructions of an 8-bit displacement, which is sign-extended and added to the current PC (which points to the next instruction) if the condition is satisfied.

Otherwise, control passes to the next sequential instruction.

- BF-Branch if False. The branch is taken if the T bit in the processor status is zero (false).
- BT-Branch if True. The branch is taken if the T bit in the processor status is one (true).

- BSF-Branch if Source Fault. The branch is taken if the SF bit in the processor status is one.
- BDF-Branch if Destination Fault. The branch is taken if the DF bit in the processor status is one.

43.4.11.3 Unconditional Jump Instructions

There are two varieties of unconditional control transfers: an absolute transfer and a through-register transfer.

Absolute transfers have a 14-bit address field that replaces the current PC.

- JMP-Jump. Causes the processor to jump to an absolute address encoded in the instruction itself.
- JSR-Jump to Subroutine. Causes the processor to jump to a subroutine, the address of which is encoded in the instruction itself.
- JMPR-Jump through Register. Causes the processor to jump to an absolute address contained in a General register. This instruction is meant to be used when more than one level of subroutines are required.
- JSRR-Jump to Subroutine through Register. Causes the processor to jump to a subroutine, the address of which is contained in a General register. This instruction is meant to be used when more than one level of subroutines are required.

43.4.11.4 Subroutine Return Instructions

The following are subroutine return instructions:

- RET-Return from Subroutine. The RET restores the contents of RPC to PC.
- LDRPC-Load from RPC to Register. THe LDRPC instruction is meant to be used when more than one level of subroutines are required. It stores the contents of RPC in any General register.

43.4.11.5 Loop Instruction

The following is a loop instruction:

LOOP-Enters Loop Mode. Before entering loop mode, the loop instruction can optionally clear the fault flags (SF and/or DF) based on a 2-bit field in the instruction. This feature is linked to the fact that setting SF or DF in loop mode will cause an immediate exit of the loop.

43.4.11.6 Miscellaneous Instructions

The following are miscellaneous instructions:

- CLRF-Clear Fault Flags. This instruction clears any combination of SF and DF.
- MOV r,s-This moves data from GReg[s] to GReg[r].
- LDI r,immediate-This loads GReg[r] with a zero-extended immediate value.

43.4.11.7 Logic Instructions

The following are logic instructions:

- XORr,s-This performs an exclusive or between GReg[r] and GReg[s], and stores the result in GReg[r].
- XORIr,immediate-This performs an exclusive or between GReg[r] and a zero-extended immediate value, and stores the result in GReg[r].
- ORr,s-This performs an or between GReg[r] and GReg[s], and stores the result in GReg[r].
- ORIr,immediate-This performs an or between GReg[r] and a zero-extended immediate value and, stores the result in GReg[r].
- ANDNr,s-This performs an and between GReg[r] and the negated GReg[s], and stores the result in GReg[r].
- ANDNIr,immediate-This performs an and between GReg[r] and the negated zero-extended immediate value, and stores the result in GReg[r].
- ANDr,s-This performs an and between GReg[r] and GReg[s], and stores the result in GReg[r].
- ANDIr,immediate-This performs an and between GReg[r] and a zero-extended immediate value, and stores the result in GReg[r].

43.4.11.8 Arithmetic Instructions

Arithmetic instructions modify the T bit in the processor status according to the result of the operation. The T bit is set if the result is zero, otherwise it is cleared.

- ADD r,s-This performs the addition of GReg[r] and GReg[s], and stores the result in GReg[r].
- ADDI r,immediate-This performs the addition of GReg[r] and a zero-extended immediate value, and stores the result in GReg[r].

- SUB r,s-This performs the subtraction of GReg[s] from GReg[r], and stores the result in GReg[r].
- SUBIr,immediate-This performs the subtraction of a zero-extended immediate value from GReg[r], and stores the result in GReg[r].

43.4.11.9 Compare Instructions

Compare instructions modify the T bit in the processor status according to the result of the operation. The T bit is set if the comparison is true, otherwise it is cleared.

NOTE

Only one version of the immediate form is implemented. Non-equality comparisons to immediate values will require two instructions.

- CMPEQ r,s-This sets T when registers GReg[r] and GReg[s] are equal.
- CMPEQIr,immediate-This sets T when register GReg[r] and the zero-extended immediate value are equal.
- CMPLTr,s-This sets T when register GReg[r] is less than and not equal to GReg[s]. The comparison is signed.
- CMPHS r,s-This sets T when register GReg[r] is greater than or equal to GReg[s]. The comparison is signed.

43.4.11.10 Test Instructions

Test instructions modify the T bit in the processor status according to the result of the operation. The T bit is set if any bit in the result is one, otherwise it is cleared.

- TSTr,s-This performs an and between GReg[r] and GReg[s], and sets T if the result is not zero.
- TSTIr,immediate-This performs an and between GReg[r] and a zero-extended immediate value, and sets T if the result is not zero.

43.4.11.11 Byte Permutation Instructions

These instructions shuffle the bytes in a register. For the purpose of describing these instructions, have the bytes in a register be numbered from the most significant as b_3, b_2, b_1, b_0.

- RORBr-The rotate right byte. The result is b_0, b_3, b_2, b_1.

- REVBr-The reverse bytes in word. The result is b_0, b_1, b_2, b_3.
- REVBLOr-The reverse, two low-order bytes. The result is b_3, b_2, b_0, b_1.

43.4.11.12 Bit Shift Instructions

The following are bit shift instructions:

- ROR1r-The rotate right 1 bit. This instruction does a circular right shift of 1 bit.
- LSR1r-The logical shift right 1 bit. This instruction shifts all bits to the right by 1. The high order bit is replaced by a 0.
- ASR1r-The arithmetic shift right 1 bit. This instruction shifts all bits to the right by 1. The high order bit is replaced by itself.
- LSL1r-The logical shift left 1 bit. This instruction shifts all bits to the left by 1. The low order bit is replaced by zero.

43.4.11.13 Bit Manipulation Instructions

- BCLRIr,n-The bit clear is immediate; clears bit number *i* in register *r*.
- BSETIr,n-The bit set is immediate; sets bit number *i* in register *r*.
- BTSTIr,n-The bit test is immediate; tests bit number *i* in register *r* (T becomes equal to the selected register bit).

43.4.11.14 SDMA Memory Access Instructions

All memory accesses are 32 bits.

Any memory location that is implemented with less than 32 bits (for example, peripheral registers) causes unimplemented bits to be read as 0s.

All memory accesses will cause either the SF or DF flags in the processor status to be set if they cause a fault.

What constitutes a fault, especially when accessing peripheral registers, is a property of the memory location.

- LDr,(b,d)-The load instruction creates an address by adding the displacement field (d) to the contents of the base register (b). The SDMA location at the resulting address is read and placed in the destination register (r).
- STr,(b,d)-The store instruction creates an address in the same manner as the load instruction. The register (r) is stored in the SDMA location at the resulting address.

43.4.11.15 Functional Unit Instructions

The functional unit instructions have an 8-bit field that is placed on the functional unit bus.

Some of these bits are used to select which functional unit should be involved in the transfer. The remaining bits are decoded by the selected functional unit so their specific use depends on the functional unit. See Functional Units Programming Model.

There are two functional unit instructions, as follows:

- LDFr,fub-The 8-bit field is placed on the functional unit bus and a read is issued to the selected functional unit. As a result of this instruction, the SF may be set in the processor status.
- STFr,fub-The 8-bit field is placed on the functional unit bus and a write is issued to the selected functional unit. As a result of this instruction, the DF may be set in the processor status.

43.4.11.16 Illegal Instructions

All instruction encodings that are illegal cause the following actions:

- The current PC (which points to one beyond the offending instruction) is put in the EPC register.
- The loop mode bit is cleared.
- The PC is set to the value stored in the Illegal Instruction Trap Address (SDMAARM_ILLINSTADDR) register (the default value is 0x0001).

ILLEGAL-Although any instruction other than those indicated in the SDMA specification will trigger the illegal instruction mechanism, the ILLEGAL instruction code is preferred as it will always be kept as *illegal* in the possible future versions of the SDMA core.

43.4.11.17 Debug Instructions

The following are debug instructions:

- SOFTBKPT-The software breakpoint instruction causes the core to stop and enter debug mode. The core can then be accessed and started by the OnCE debug block only.

- done 5-This instruction is used for debugging, as it copies the contents of the PCU registers and flags to the context memory. Information on this instruction is described in Saving the Context.
- CpShReg-This instruction copies the context memory into the PCU registers and flags. Modifying the corresponding memory location before executing this instruction enables you to have the channel continue from a new instruction address. This instruction is described in Restoring the Context.

43.4.12 Functional Units Programming Model

The functional unit instructions cause an 8-bit code, found in the low eight bits of the instruction, to be asserted on the functional unit control bus.

Some of these bits are used to select one of several functional units. Functional units which can be selected include SDMA registers such as MSA and MSD which are not mapped in the SDMA memory map, and are accessible only through the functional unit bus. These Functional Unit Registers are listed in the following table. In order to establish a programming convention, assume the selection bits are some number of the most significant bits of the 8-bit code. Furthermore, some number of the least significant bits is decoded by a given functional unit to establish the type of operation to perform.

Table 43-15. Functional Unit Registers

Functional Unit	Register	Register Name	Section/Page
Burst DMA Unit Programming	SDMSA	Memory Source Address Register	Memory Source Address Register (MSA)
	MDA	Memory Destination Address Register	Memory Destination Address Register (MDA)
	MD	Memory Data Buffer Register	Memory Data Buffer Register (MD) (Write) Burst DMA Write (stf) (Read) Burst DMA Read (ldf)
	MS	Memory State Register	State Register (MS)
Peripheral DMA Unit Programming	PSA	Peripheral Source Address Register	Peripheral Source Address Register (PSA)
	PDA	Peripheral Destination Address Register	Peripheral Destination Address Register (PDA)
	PD	Peripheral Data Buffer Register	Peripheral Data Register (PD) (Write) Peripheral DMA Write (stf)-Write Mode

Table continues on the next page...

Table 43-15. Functional Unit Registers (continued)

Functional Unit	Register	Register Name	Section/Page
			(Read) Peripheral DMA Read (ldf)-Read Mode
	PS	Peripheral State Register	Peripheral State Register (PS)

More information regarding the functional units can be found in Peripheral DMA Unit, and Burst DMA Unit.

43.4.12.1 Burst DMA Unit Programming

The DMA instructions control the DMA state machine and may cause a DMA cycle on the associated memory bus.

There are four registers associated with the burst DMA unit: a Memory Source Address register (MSA), a Memory Destination Address register (MDA), a Memory Data buffer (MD), and a state register (MS). The burst DMA has two different uses:

- A data transfer between External Memory Interface and SDMA general register
- A data transfer in copy mode where blocks of data are transferred from the source address to the destination address

43.4.12.1.1 Memory Source Address Register (MSA)

The source address register contains the pointer into EXTMC memory associated with the next read data transfer. It has byte granularity.

Reading the register with the ldf instruction has no side effects, and gives the address value in the EXTMC memory of the next data that is read by the SDMA during an ldf MD instruction.

Writing the source address register has two side effects: If the prefetch bit is set, a DMA read cycle (8-word read access) is issued with the new address. Any data still located in the buffer is lost. If there is valid write data in the buffer, it is necessary to force the DMA to completely flush it out before modifying MSA to guarantee all the data is effectively written to memory.

The MSA register has two modes of programming:

- Frozen-In frozen mode, the MSA register is not modified after DMA accesses.
- Incremented (default mode)-In incremental mode, MSA is incremented by the number of bytes transferred during read cycles.

43.4.12.1.2 Memory Destination Address Register (MDA)

The destination address register contains the pointer into EXTMC memory associated with the next write data transfer. It has byte granularity.

Reading the MDA register with the ldf instruction has no side effects. It gives the address value in the EXTMC memory where the next SDMA data (stf r,MD instruction) is stored when MD FIFO is flushed.

Writing the destination address register has one side effect. Any data still located in the buffer is lost. If there is valid write data in the buffer, it is necessary to force the DMA to completely flush it out before modifying MDA to guarantee all the data is effectively written to memory.

The MDA register has two modes of programming:

- Frozen-In frozen mode, the MDA register is not modified after DMA accesses.
- Incremented (default mode)-The MDA register is incremented by the number of bytes transferred during write cycles.

43.4.12.1.3 Memory Data Buffer Register (MD)

The data buffer register consists of a bank of 36 bytes that behave like FIFO.

This FIFO stores the eight words received when a read burst is triggered by the DMA (DMA is in read mode).

The MD register is in write mode after a writing in MDA or after an stf MD instruction.

In that case, a burst write access is automatically triggered when there are more than eight words in MD. For bandwidth optimization, any transfers between DMA and the EXTMC controller are based on burst accesses.

An ldf r,MD|SIZE instruction that reads the data buffer may cause a DMA cycle, as follows:

- If there are less bytes in the FIFO than the size parameter of the instruction. For instance, if only two bytes are available in MD and a 4-byte read is requested, a burst read access is executed to complete the two bytes.
- If the prefetch bit is set, and after reading there is enough space in the FIFO to store a full burst, a burst read access is triggered.

An stf r,MD|SIZE instruction that writes to the data buffer may cause a DMA cycle if the number of written bytes in MD is higher than 32 (eight words) or if the flush bit is set.

When DMA is used for data transfer between SDMA and EXTMC (reading or writing), no immediate error is possible because the block manages a data misalignment issue; therefore, it is allowed to read/write a word to/from a half-word address. However, the addresses (source or destination) must belong to the EXTMC memory mapping. The only potential error, in this mode, would be the error sent back by the EXTMC controller when an access to a super-user page is detected. The whole transfer on the DMA associated bus will be considered successful when there are no errors seen on the bus during the transfer. In copy mode, an immediate error could be returned to SDMA as described in Burst DMA Unit Error Management.

43.4.12.1.4 State Register (MS)

The state register contains the DMA state-machine value. It can be accessed in case of an error received during a transfer. MS is also accessed to set-up the conditional yielding feature.

The initialization value of this register is 0 and it consists of the following:

Table 43-16. SDMA_MS Structure

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	0	0	0	0	0	0	0	0	0	0	spriv	stype	0	0	dpriv	dtype
W																
R	0	0	0	0	y	d	e		0	0	n					
W																

Table 43-17. SDMA_MS Field Descriptions

Field	Description
31-22	Reserved
21 spriv	The spriv value is ignored for this device. 0 = valid value 1 = Reserved
20 stype	Source Mode. Indicates if MSA has to be incremented (or not) during accesses. 0 Frozen-MSA is not modified. 1 Incremented-MSA is incremented by the number of transferred bytes during read access.
19-18	Reserved
17 dpriv	The dpriv value is ignored for this device. 0 = valid value 1 = Reserved
16	Destination Mode. Indicates if MDA has to be incremented (or not) during accesses.

Table continues on the next page...

Table 43-17. SDMA_MS Field Descriptions (continued)

Field	Description
dtype	0 Frozen-MDA is not modified. 1 Incremented-MDA is incremented by the number of transferred bytes during write access.
15-12	Reserved
11 y	Conditional Yielding selector. When selected, theyield/yieldge instructions will not switch channels if the Burst DMA is in Write Mode, and it has less than four bytes in its FIFO. This is aimed at reducing the number of inefficient FIFO flushes due to context switches. 0 Always yields 1 Yields conditionally (when there are less than four bytes in the FIFO in write mode)
10 d	Access Direction or DMA Mode. DMA is in write mode when data was written into MD by stf MD instructions, or if a previous DMA cycle on the external bus was a write access. Writing MDA or MSA changes the DMA mode to the respective value. DMA is in read mode when a previous DMA cycle was a read access, and DMA stays in read mode when data is read by SDMA with an ldf MD instruction. Reading MDA or MSA does not change the DMA mode. 0 Read Mode 1 Write Mode
9-8 e	Error. Indicates if the previous access was acknowledged with a bus error. 00 No error was received. 01 *reserved* 10 Error mode 11 error read burst
7-6	Reserved
5-0 n	Number of bytes in the MD FIFO.

43.4.12.1.5 Burst DMA Write (stf)

When received from a stf instruction, the function code bits are interpreted as follows, depending on the addressed register:

Table 43-18. STF Code Bits

Register	7	6	5	4	3	2	1	0
MSA	s		p	freeze	r			spriv
MDA								dpriv
MD			f	cpy			sz	
MS								

Table 43-19. STF Code Bit Field Descriptions

Field	Description
7-6 s	Functional Unit selector 00 for Burst DMA
5 p (MSA)	Prefetch Flag 0 No prefetch 1 Prefetch required from new MSA
5 f (MD)	Forced Flush Flag 0 Automatic flush 1 FIFO contents are flushed (including the new written data).
4 freeze (MSA/MDA)	Address Freeze Mode 0 Address is normally incremented. 1 Address is frozen.
4 cpy (MD)	Copy Mode selection 0 Write Mode 1 Copy Mode
3-2 r	Register selection 00 MSA 01 MDA 10 MD 11 MS
1-0 sz (MD/MS)	Transfer Size 00 size 0 (no data stored in the FIFO) 01 byte (8 bits) 10 half-word (16 bits) 11 word (32 bits)
0 spriv (MSA)	The spriv value is ignored for this device. 0 = valid value 1 = Reserved
0 dpriv (MDA)	The dpriv value is ignored for this device. 0 = valid value 1 = Reserved

The possible write instructions are listed in the table below (unused bits should always be cleared).

Table 43-20. Burst DMA STF Instruction List

Binary	Assembly	Comments
00_0_0_00_00	stf r,MSA	Writes content of the SDMA general register (r) to the source address register. MSA is in incremented mode.

Table continues on the next page...

Table 43-20. Burst DMA STF Instruction List (continued)

Binary	Assembly	Comments
00_0_1_00_00	stf r,MSA|FR	Writes content of the SDMA general register (r) to the source address register. MSA is in frozen mode.
00_1_0_00_00	stf r,MSA|PF	Writes content of the SDMA general register (r) to the source address register, and starts a read burst access. MSA is in incremented mode.
00_1_1_00_00	stf r,MSA|PF|FR	Writes content of the SDMA general register (r) to the source address register, and starts a read burst access.
00_0_0_01_00	stf r,MDA	Writes content of the SDMA general register (r) to the destination address register. MDA is in incremented mode.
00_0_1_01_00	stf r,MDA|FR	Writes content of the SDMA general register (r) to the destination address register. MDA is in frozen mode.
00_1_0_10_00	stf r,MD|SZ0|FL	No data transfers between the SDMA and MD, but all valid written data of the MD is flushed to the memory. An acknowledge or error is sent back to the SDMA core on transfer completion.
00_0_0_10_01	stf r,MD|SZ8	8-bit (byte) transfer to write buffer MD
00_1_0_10_01	stf r,MD|SZ8|FL	8-bit (byte) transfer to write buffer MD and flush after transfer. All valid written data of the MD is flushed to memory.
00_0_0_10_10	stf r,MD|SZ16	16-bit (half-word) transfer to write buffer MD
00_1_0_10_10	stf r,MD|SZ16|FL	16-bit (half-word) transfer to write buffer MD and flush after transfer. All valid written data of the MD is flushed to memory.
00_0_0_10_11	stf r,MD|SZ32	32-bit (word) transfer to write buffer MD
00_1_0_10_11	stf r,MD|SZ32|FL	32-bit (word) transfer to write buffer MD and flush after transfer. All valid written data of MD is flushed to memory.
00_0_1_10_00	stf r,MD|CPY	No data transfer between SDMA and MD but starts a copy transfer whose length is given by the 4 LSB of *r* register. (Maximum burst length is eight words.)
00_0_0_11_11	stf r,MS	32-bit (word) transfer to status register MS
00_0_0_11_00	stf r,MS|SZ0	Clears the error flag (if set). Other MS bits are unchanged; this instruction is also known as clref MS.

NOTE

When a flush bit is set, the SDMA flushes the FIFO including the newly written data. An acknowledge is sent to the core before the flush completes (except if size 0 is used). The goal of this flush bit is to force a flush, but it is recommended to use it only when needed (for example, when finishing a row of pixels during 2D data transfers). Indeed, if this bit is omitted and if there are more than 32 bytes in the FIFO, a burst write access is automatically triggered.

Since all the stf r,MD instructions (including the copy mode) acknowledge the SDMA core before the store is effective (except if size 0 is used), it is recommended to perform an ldf

from MS before terminating a channel in order to check the final error status. (The ldf from MS will stall the core until all the data was flushed out and the transfer status is known.)

After every stf MD instruction, the MDA is incremented by the number of bytes that are written in MD, except when it is programmed in frozen mode.

43.4.12.1.6 Burst DMA Read (ldf)

When received from an ldf instruction, the function code bits are interpreted as follows, depending on the addressed register:

Table 43-21. LDF Code Bits

Register	7	6	5	4	3	2	1	0
MSA	s				r			
MDA								
MD			p				sz	
MS								

Table 43-22. LDF Code Bit Field Descriptions

Field	Description
7-6 s	Functional Unit selector 00 for Burst DMA
5 p (MD)	Prefetch Flag 0 no prefetch 1 automatic prefetch
3-2 r	Register selection 00 MSA 01 MDA 10 MD 11 MS
1-0 sz (MD)	Transfer Size 00 reserved 01 byte (8 bits) 10 half-word (16 bits) 11 word (32 bits)

The table below lists the possible write instructions (unused bits should always be cleared).

Table 43-23. Burst DMA LDF Instruction List

Binary	Assembly	Comments
00_0_0_00_00	ldf r,MSA	Copies the source address register value into an SDMA general register. It gives the memory address of the next data that will be read with an ldf MD instruction.
00_0_0_01_00	ldf r,MDA	Copies the destination address register value into an SDMA general register. It gives the memory address where the next incoming data will be flushed.
00_0_0_10_01	ldf r,MD|SZ8	8-bit (byte) read
00_1_0_10_01	ldf r,MD|SZ8|PF	8-bit (byte) read. If after this reading and the MD FIFO is empty, a burst read access at the MSA address is triggered.
00_0_0_10_10	ldf r,MD|SZ16	16-bit (half-word) read
00_1_0_10_10	ldf r,MD|SZ16|PF	16-bit (half-word) read. If after this reading, and the MD FIFO is empty, a burst read access at the MSA address is triggered.
00_0_0_10_11	ldf r,MD|SZ32	32-bit (word) read
00_1_0_10_11	ldf r,MD|SZ32|PF	32-bit (word) read. If after this reading and the MD FIFO is empty, a burst read access at the MSA address is triggered.
00_0_0_11_00	ldf r,MS	Copy the status register value into an SDMA general register.

NOTE

Read data is 0-extended before writing in the SDMA general registers. When reading the MD register, the DMA takes data from the FIFO if it is available. If part or whole data is not in the FIFO, an external burst read access is performed to provide the missing data. The SDMA is stalled as long as the required read data is not complete.

After every reading, MSA is incremented by the number of read bytes from MD FIFO, except when MSA is programmed in frozen mode.

43.4.12.1.7 Prefetch/Flush and Auto-Flush Management-Burst DMA Unit

The prefetch and auto-flush management enables the SDMA RISC machine to go on while a DMA access is performed.

When the RISC core requires a prefetch (p = 1) to the Burst DMA, it will receive an immediate transfer acknowledge before the DMA has finished the external access. This enables the RISC core to do other things like accessing another DMA machine.

The basic principle in prefetch mode is for the DMA to anticipate data reads from the SDMA RISC engine by fetching external bursts of data as soon as there is enough space in the DMA FIFO to store it. If ever the RISC engine required data that is not available in the FIFO, the read acknowledge is delayed until the data is available, but it does not have to wait until the burst completes.

The auto-flush basic principle is similar: An automatic flush is triggered every time there are eight words to be written in the FIFO. If the FIFO is full and the RISC engine requires another write, it is stalled until the burst has started and enough space was freed in the FIFO to store that new data. This means the SDMA RISC engine does not have to wait for the completion of a burst to receive its acknowledge and continue its processing.

In particular, an auto-flush is executed when DMA is in write mode and if the following is true:

- If the FIFO is empty and the first write is to a word-aligned address of any size (ex: the 2 LSB of MDA[1:0]= 0x0), the auto-flush is triggered immediately after the write of the 32'nd byte.
- If the FIFO is empty, and if MDA is an odd byte address (1, 3, 5, 7,...) and an stf MD|SZ8 is executed, the byte is flushed to memory. Once MDA increments to a word aligned address, the auto-flush will be triggered every 32 bytes.
- If the FIFO is empty, and if MDA is a half-word address (2, 6, 0xA,...) and an stf MD|SZ16 is executed, the two bytes of the incoming data are flushed to memory. Once MDA increments to a word aligned address, the auto-flush will be triggered every 32 bytes.
- If the FIFO is empty, and if MDA is not a word-aligned address (ex 1, 2, 3, 5, 6, 7, 9,...), and an stf MD|SZ32 is executed, the first 1 to 3 bytes will be flushed up to the next word aligned address. Afterwards, an auto-flush will be triggered each time the FIFO receives 32-bytes.
- Therefore, if an stf MD|SZ32 is executed with MDA equal to 0x1 and with an empty MD FIFO, the bytes located at addresses 1, 2, and 3 are flushed, and the byte located at address 4 remains in MD FIFO. This solves the misalignment issue. Additionally, the next write instructions (stf) complete the FIFO until it contains eight words; then a burst write is executed by the DMA to empty the FIFO. Protocol on the external bus does not support bursts of different data types (byte, half-word, or word).

  For example, consider the case where data is written using a byte access, stf MD|SZ8. The value of MDA during the very first byte write determines when the auto-flush will occur as follows:

- If MDA=0x0, the flush occurs following the write of byte 32
- If MDA=0x1, the flush occurs following the write of byte 1, byte 3 and byte 35.
- If MDA=0x2, the flush occurs following the write of byte 2 and byte 34.

- If MDA=0x3, the flush occurs following the write of byte 1 and byte 33.
- If MDA=0x4, the flush occurs following the write of byte 32

The flush command forces the DMA to flush all MD valid bytes to the EXTMC controller. An acknowledge is sent immediately to the SDMA, and any potential error is reported on a future access. It is thus essential to conclude a transfer with a last read from MS, which will stall the core until all data was flushed out and returned to the transfer status (acknowledge or error).

NOTE

During this kind of auto-flush (which occurs only at the beginning of a misaligned write transfer) no acknowledge is sent back to the SDMA, which is stalled until a flush is completed.

43.4.12.1.8 Data Alignment and Endianness-Burst DMA Unit

43.4.12.1.8.1 Burst DMA in Read Mode

For every read access to MD, the data returned to the SDMA core and the new FIFO state depends on the MSA status and the access size.

The FIFO is considered as a stack of 36 bytes: Data is fetched externally on a 32-bit bus, but the valid bytes only are stored in the FIFO and left-aligned (for a transfer of consecutive words, it is only the first word that may be truncated). The following table shows the FIFO byte alignment strategy and the corresponding MSA, the returned data, and the new FIFO state for any access size of an internal read from MD.

Table 43-24. FIFO Read Configuration

Before read		Internal read access size	Read data	After read	
MSA[1:0]	FIFO state			MSA[1:0]	FIFO state
00	x0 x1 x2 x3 y0 y1 y2 y3 z0 z1 z2 z3 and so on...	sz8	00 00 00 x0	01	x1 x2 x3 y0 y1 y2 y3 z0
		sz16	00 00 x0 x1	10	x2 x3 y0 y1 y2 y3 z0 z1
		sz32	x0 x1 x2 x3	00	y0 y1 y2 y3 z0 z1 z2 z3
01	x1 x2 x3 y0 y1 y2 y3 z0 z1 z2 z3 t0 and so on...	sz8	00 00 00 x1	10	x2 x3 y0 y1 y2 y3 z0 z1
		sz16	00 00 x1 x2	11	x3 y0 y1 y2 y3 z0 z1 z2
		sz32	x1 x2 x3 y0	01	y1 y2 y3 z0

Table continues on the next page...

Table 43-24. FIFO Read Configuration (continued)

Before read		Internal read access size	Read data	After read	
MSA[1:0]	FIFO state			MSA[1:0]	FIFO state
					z1 z2 z3 t0
10	x2 x3 y0 y1 y2 y3 z0 z1 z2 z3 t0 t1 and so on...	sz8	00 00 00 x2	11	x3 y0 y1 y2 y3 z0 z1 z2
		sz16	00 00 x2 x3	00	y0 y1 y2 y3 z0 z1 z2 z3
		sz32	x2 x3 y0 y1	10	y2 y3 z0 z1 z2 z3 t0 t1
11	x3 y0 y1 y2 y3 z0 z1 z2 z3 t0 t1 t2 and so on...	sz8	00 00 00 x3	00	y0 y1 y2 y3 z0 z1 z2 z3
		sz16	00 00 x3 y0	01	y1 y2 y3 z0 z1 z2 z3 t0
		sz32	x3 y0 y1 y2	11	y3 z0 z1 z2 z3 t0 t1 t2

43.4.12.1.8.2 Burst DMA in Write Mode

For every write access to the MD, the new FIFO state depends on the MDA status and the access size.

The FIFO is considered as a stack of 36 bytes: Data is stored in the FIFO according to the internal access size and the former MDA value. The following table shows the FIFO byte alignment strategy corresponding to MDA, as well as the new FIFO state for any access size of an internal write to MD.

Table 43-25. FIFO Write Configuration

Before write		Internal write access size	Written data	After write	
MDA[1:0]	FIFO state			MDA[1:0]	FIFO state
00	tt uu vv ww ?? ?? ?? ?? ?? ?? ?? ?? and so on...	sz8	?? ?? ?? x0	01	tt uu vv ww x0 ?? ?? ?? ?? ?? ?? ??
		sz16	?? ?? x0 x1	10	tt uu vv ww x0 x1 ?? ?? ?? ?? ?? ??
		sz32	x0 x1 x2 x3	00	tt uu vv ww x0 x1 x2 x3 ?? ?? ?? ??
01	tt uu vv ww	sz8	?? ?? ?? x0	10	tt uu vv ww

Table continues on the next page...

Table 43-25. FIFO Write Configuration (continued)

Before write		Internal write access size	Written data	After write	
MDA[1:0]	FIFO state			MDA[1:0]	FIFO state
	xx ?? ?? ?? ?? ?? ?? ?? and so on...				xx x0 ?? ?? ?? ?? ?? ??
		sz16	?? ?? x0 x1	11	tt uu vv ww xx x0 x1 ?? ?? ?? ?? ??
		sz32	x0 x1 x2 x3	01	tt uu vv ww xx x0 x1 x2 x3 ?? ?? ??

		sz16	?? ?? x0 x1	00	tt uu vv ww xx yy x0 x1 ?? ?? ?? ??
		sz32	x0 x1 x2 x3	10	tt uu vv ww xx yy x0 x1 x2 x3 ?? ??
11	tt uu vv ww xx yy zz ?? ?? ?? ?? ?? and so on...	sz8	?? ?? ?? x0	00	tt uu vv ww xx yy zz x0 ?? ?? ?? ??
		sz16	?? ?? x0 x1	01	tt uu vv ww xx yy zz x0 x1 ?? ?? ??
		sz32	x0 x1 x2 x3	11	tt uu vv ww xx yy zz x0 x1 x2 x3 ??

NOTE

If the FIFO mode changes from a write to a read mode, all remaining written bytes in MD are lost but no error is returned. Typically, this happens if an ldf MD is executed after stf MD instructions. Before a mode change, it is recommended to force the flush of a potential remaining byte by a stfMD|SZ0|FL instruction. In the same way, if a FIFO mode changes from a read to a write mode, all prefetched data present in the FIFO is lost and no error is returned.

43.4.12.1.8.3 Endianness-Burst DMA Unit

Big and Little Endian are supported by the Burst DMA, but data is always stored in MD in Big Endian.

Byte manipulation is performed when data is exchanged with an Burst controller (for example, during read or write burst accesses).

43.4.12.1.9 Burst DMA Unit Copy Mode

A mechanism is available to perform fast ARM-to-ARM transfers.

Data does not flow through the SDMA core: It is kept in the DMA FIFO. This mechanism is selected when writing MD with a special option in the instruction code (copy flag).

It is possible to transfer up to eight words in one SDMA instruction (this does not mean in one cycle). In this mode, every time an stf MD|CPY is executed, a read burst is executed and directly followed by a write burst transfer. Burst transfers are limited to eight words. The size of the transfer (in words)-given by the SDMA general register (4 LSB)-is also limited to eight. The following SDMA code shows how 100 bytes could be copied from the MSA address to the MDA address. This is sample code only.

Burst DMA copy mode example

```
          ldi r0,@src
          stf r0,MSA                          // Source address setup
          ldi r1,@dst
          stf r1,MSA                          // Destination address setup
          ldi r0,0x64                         // data transfer counter
          ldi r1,0x8
MAIN_XFER:
          cmphs r0,r1                         // Is r0 >= 0x8
          bf LAST_XFER                      // If not, jump to last transfer label
          stf r1,MD|CPY                        // Copy 8 words from MSA to MDA address.
          subi r0,0x8                         // Decrement counter
          jmp MAIN_XFER                     // return to main transfer loop
LAST_XFER:
          stf r0,MD|CPY
```

The main transfer loop is executed 12 times; then r0 equals 4 and the last transfer loop is run.

In this mode, an acknowledge is transmitted to the core as soon as the read burst can start; thus, a first copy instruction returns an immediate acknowledge and subsequent copy instructions will be acknowledged as soon as the previous copy has finished.

43.4.12.1.10 Burst DMA Unit Error Management

Another point to consider is the management of errors.

Because the DMA immediately sends an acknowledge to the RISC core (except for the stf MS|SZ0|FLS instruction), it assumes no error will occur. If an error occurs, it is flagged (transfer error acknowledge) for the following DMA access.

This should not be a problem if the DMA is used properly. The MD accesses are meant to stall the SDMA as little as possible to optimize throughput and hide calculation time. Therefore, final access to MS should be performed before closing a channel. This access waits until any pending operation is finished in the burst DMA and gather any remaining error.

In copy mode, an error could be immediately returned to the SDMA on execution of the ldf copy or stf copy instruction. It happens when MSA or MDA are not word addresses (for example, 0[4]). This is because copy mode must only be used for transferring a large packet of aligned data.

When an error is received during a *read* transfer to the external bus, which may occur during the burst accesses, the MD FIFO contains the valid beats of the burst, and the error flag of MS is set to 2'b11 (error read burst). It is possible to read MS ("n" field) to know how much valid data remains in MD and when MD is empty (after ldf instructions). The next read MD instruction sets the MS error flag to 2'b10 (error mode), and an error is sent back to the SDMA core. In error mode, it is possible to read MSA, which gives the address of the error data. Any attempt to read or write MD, or to modify MDA or MSA in error mode, gives rise to an error; therefore, an error flag must be reset by clearing MS at the end of the SDMA code section responsible for error management.

In "error read burst" mode, writing MDA, MSA, or MD, or starting a copy transfer by a stf MD|COPY instruction will cancel the error mode. The following table shows when an immediate error is sent back according to the executed instruction.

Table 43-26. Possibilities in ERROR READ BURST Mode

DMA Instruction	Immediate Error	Comments
stf rn, MD stf rn, MSA (|U |PF) stf rn, MDA stf rn,MD|COPY	NO	Error mode is reset. MSA, MDA, or MD are updated and a DMA cycle may start. For the stf MD|COPY, a copy loop is executed.
stf rn, MS	NO	MS is updated.

Table continues on the next page...

Table 43-26. Possibilities in ERROR READ BURST Mode (continued)

DMA Instruction	Immediate Error	Comments
ldf rn, MS ldf rn, MSA ldf rn, MDA	NO	MS, MSA, and MDA could be read in ERROR READ mode without any side effects (for example, no DMA cycle is triggered).
ldf rn, MD	YES/NO	Immediate error if there is no more data available for read in the FIFO.

When an error is received during a *write* transfer, the error is reported to the next DMA access. In this case, an error is sent to the SDMA core and the DMA goes to its error mode. Reading MS gives the number of bytes that remain in MD; reading MDA gives the address of the error data. Any attempt to read or write MD, or to modify MDA or MSA in error mode, give rise to an error; therefore, an error flag must be reset by clearing MS at the end of the SDMA code section responsible for error management.

Table 43-27. Possibilities in ERROR Mode

DMA Instruction	Immediate Error	Comments
stf rn, MD stf rn, MSA stf rn, MDA	Yes	Any attempt to modify MD, MSA, MDA will raise an immediate error and burst DMA remains in error mode. When address registers are write-accessed, an error is returned.
stf rn, MS	No	This is the only way to exit error mode. MS[9:8] must be reset by an stf MS|SZ0 instruction.
ldf rn, MS ldf rn, MSA ldf rn, MDA	No	MS, MSA, and MDA could be read in error mode without any side effects (for example, no DMA cycle is triggered).
ldf rn, MD	Yes	Whatever the DMA direction (read or write), an ldf rn triggers an immediate error.

43.4.12.1.11 Conditional Yielding-Burst DMA Unit

The standard SDMA transfer is based upon a hardware loop that has the following structure:

Hardware Loop

```
loop
load Rn,source            // can be ldf or ld
<computation>            // can be done through functional units
store Rn,dest              // can be st or stf
done 0               // yield
```

This structure needs to be kept independent of the functional units' particularities regarding the context switch. However, there can be variations in the context switch's efficiency, which can depend on the number of data received up to that point, and on the data itself.

The DMA, with its 8-word burst capability, has a preferable context switch period when its address register is 8-word aligned: It is the only moment that occurs once every eight loops when the succession of bursts is not broken by the context switch. When this is not the case, a context switch requires the storing (or loading) of less than eight words, which requires separate accesses and is far less efficient. The rest of the 8-word packet is stored (or loaded) after the context restore, and this is done as separate accesses.

The proposed solution is a conditional yielding, which occurs only when the DMA is in an optimum state. It does not require any modification to the scripts. The condition is decided at the DMA level.

The DMA can be programmed in two modes-conditional or always-true-for every channel, which provides complete flexibility. By default, the DMA is not in conditional mode.

The DMA condition is computed from the FIFO fill level and the various modes, as follows:

- When copy mode is selected, regardless of the transfer direction ('read' or 'write'), the condition is always true.
- In read mode, the condition is always true.
- In write mode, the condition is true when there are four bytes or less in the FIFO; it is false when there are more than four bytes. The 4-byte limit comes from the possibility of saving those bytes as MD with absolutely no impact on the bus accesses.

The aim at conditional yielding is to avoid splitting bus accesses (especially bursts).

43.4.12.2 Peripheral DMA Unit Programming

The peripheral DMA unit is connected to the Multi-Layer DMA Crossbar Switch of the ARM platform.

Its goal is to perform data transfers between any blocks connected to the DMA bus of this platform. These blocks are either peripherals or memories. The peripheral DMA could be seen as the ARM platform DMA controller.

The DMA performs data transfers in three modes:

- Read mode, where data is read from peripherals or from memory connected to the ARM platform and copied in a SDMA general register.
- Write mode, where data of a general register has to be written in a peripheral or a memory.
- Copy mode, where data is read from a peripheral (or memory) at a source address (PSA) and automatically written to a peripheral (or memory) at a destination address (PDA).

In copy mode, no SDMA general register is involved as transferred data only goes through the data register of the DMA.

The peripheral DMA has three addressing modes: frozen, incremented, and decremented, as follows:

- Frozen mode-When source or destination addresses are frozen, their value is not modified after a transfer. This mode is typically used for addressing peripheral FIFOs located at a fixed address.
- Incremented mode-When source or destination addresses are in incremented mode, after every transfer they are incremented by the number of bytes transferred.
- Decremented mode-In decremented mode, addresses are decremented by the number of bytes transferred.

The peripheral DMA registers are as follows:

- Two, 32-bit address registers (PSA and PDA) that respectively contain the source address for a read access and the destination address for a write access
- A 32-bit status register (PS) that contains information on the peripheral DMA configuration, such as the number of valid bytes in the data register, the error flag, the source and destination address mode, and so on.
- A 32-bit data register (PD) that stores data involved in a data transfer

43.4.12.2.1 Peripheral Source Address Register (PSA)

The source address register contains a pointer to a source peripheral or a memory associated with the next read data transfer. It has byte granularity.

It is based on the following:

- A 32-bit register (PSA) to store the address value
- A 2-bit register (stype) to store the source address mode (frozen, incremented, or decremented)
- A 2-bit register (ssize) to store the source target data path size (byte, half-word, or word)

Reading the register with the ldf instruction has no side effects and gives the address value of the next data that will be read by the SDMA during an ldf MD instruction. Writing the source address register may have side effects. If there is valid write data in the data register and the source address is changed, the write data is discarded. If the prefetch bit is set, a DMA read cycle is issued with the new address.

When PSA is to be written, you must specify the source target address mode, providing its size (byte, half-word, or word). This enables omission of the size field in all ldf MD instructions. When DMA performs a read cycle, its size is given by the value of the PSA source size register (ssize). If source is a memory in incremented mode, first programmed in word mode (stf PSA|SZ32|I), and if an SDMA script needs to read bytes from this memory, the size of the source target must be updated before executing new accesses. The source address mode and its size are given by labels added to the stf PSA instruction as described in the write section. The ssize and stype registers are part of the DMA status register (PS).

Writing to PSA may issue an immediate error if the source size is not compatible with the value to be written into the PSA register. For instance, writing a 2 in PSA and specifying that it is memory-accessed in word mode creates an immediate error.

43.4.12.2.2 Peripheral Destination Address Register (PDA)

The destination address register contains a pointer to a source peripheral or a memory associated with the next write data transfer. It has byte granularity.

It is based on the following:

- A 32-bit register (PDA) to store the address value
- A 2-bit register (dtype) to store the destination address mode (frozen, incremented, or decremented)
- A 2-bit register (dsize) to store the destination target data path size (byte, half-word, or word)

Reading the register with the ldf instruction has no side effects, and gives the address value of the next data that will be written by SDMA during an stfMD instruction. Writing the destination register has no side effect. Similar to the PSA register, the destination address mode and source are specified in the stf PDA instruction and may also generate an error in case of incorrect programming.

43.4.12.2.3 Peripheral Data Register (PD)

The data register of the peripheral DMA is a 32-bit register. When the destination address is correctly set up, any writing to PD will automatically flush the new input data.

The number of SDMA bytes that will be transferred is given by the PDA size register. Unlike other SDMA DMAs, PD is not a FIFO: It is not used to accumulate bytes that from the SDMA and must be packed before being sent to external memories. In read mode, and if the source address is correctly set up, an ldf instruction will empty PD. If a prefetch is required along with the instruction, the DMA will initiate a new read transfer.

Reading PD in prefetch mode only stalls the SDMA when the prefetched data is not yet available. Writing PD only stalls the SDMA if the previous write operation was not completed. As soon as the previous operation is over, the acknowledge is sent back to the SDMA RISC engine.

An error flag-part of PS-is set when an external access fails. The error is thus reported to the next SDMA instruction that involves the peripheral DMA.

43.4.12.2.4 Peripheral State Register (PS)

The state register contains the DMA state-machine value. It can be accessed in case of an error received during a transfer.

Although all PS fields can be written by an stf instruction, it is recommended to access only the error bit (to reset it). Modifying other PS fields will provide an un-guaranteed DMA behavior.

The initialization value of PS is 0, and it consists of the following structure:

Table 43-28. PS Structure

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0	0	0	0	0	0	0	0	ssize		stype		dsize		dtype	
W																
R	0	0	0	0	0	d	e		0	0	0	0	0	n		
W																

Table 43-29. PS Field Descriptions

Field	Description
31-24	Reserved
23-22 ssize	Source Target Size. Determines the size of the read transfers on the external bus. It should match the accessed device characteristics. 00 *reserved* 01 Byte (8 bits) 10 half-word (16 bits) 11 word (32 bits)

Table continues on the next page...

Table 43-29. PS Field Descriptions (continued)

Field	Description
21-20 stype	Source address Mode. Determines whether PSA is incremented, decremented, or kept unmodified after every read from the external bus. 00 Frozen Mode 01 Incremented Mode 10 Decremented Mode 11 *reserved*
19-18 dsize	Destination Target Size. Determines the size of the write transfers on the external bus. It should match the accessed device characteristics. 00 *reserved* 01 Byte (8 bits) 10 half-word (16 bits) 11 word (32 bits)
17-16 dtype	Destination address Mode. Determines whether PDA is incremented, decremented, or kept unmodified after every write on the external bus. 00 Frozen Mode 01 Incremented Mode 10 Decremented Mode 11 *reserved*
15-11	Reserved
10 d	Direction Flag or DMA Mode. DMA is in write mode when data was written into PD by stf PD instructions, or if a previous DMA cycle on the external bus was a write access. Writing PDA or PSA does not change the DMA mode. DMA is in read mode when a previous DMA cycle was a read access, and DMA stays in read mode when data is read by the SDMA with an ldf PD instruction. Reading PDA or PSA does not change the DMA mode. 0 Read Mode 1 Write Mode
9-8 e	Error. Indicates if the previous access was acknowledged with a bus error. 00 No error was received. 01 *reserved* 10 Error mode 11 Error read
7-3	Reserved
2-0 n	number of bytes in PD

NOTE

dtype, dsize, stype, and ssize are updated when PSA and PDA are written.

43.4.12.2.5 Peripheral DMA Write (stf)-Write Mode

When written by an stf instruction, the function code bits are interpreted as follows:

Table 43-30. STF Code Bits

Register	7	6	5	4	3	2	1	0
PSA	s		p	ar	am		sz	
PDA								
PD			pdsel					
PS			pssel					

Table 43-31. STF Code Bits Field Descriptions

Field	Description
7-6 s	Functional Unit selector 11 for Peripheral DMA
5 p (PSA)	Prefetch Flag 0 no prefetch 1 automatic prefetch
4 ar (PSA/PDA)	Address Register Selector 0 PSA 1 PDA
3-2 am (PSA/PDA)	Address Mode. Determines how PSA or PDA is modified after every read or write access to the PD. 00 Frozen-Address registers are not modified after the transfer. 01 Incremented-Address registers are incremented by the number of transferred bytes. 10 Decremented-Address registers are decremented by the number of transferred bytes. 11 Updated-PSA and PDA are not modified. Either address mode is not modified, but the width of the data path is updated by the sz field.
1-0 sz	Transfer Size 00 *reserved* 01 byte (8 bits) 10 half-word (16 bits) 11 word (32 bits)
5-0 pdsel	PD access selector 001000 is the only valid option
5-0 pssel	PS access selector 111111 writes to PS 001100 only clears the error flag in PS

Due to the large number of possible stf instructions, the following table provides only a short list of all the possible write instructions:

Table 43-32. Peripheral DMA STF Instruction List

Binary	Assembly	Comments
11_00_00_01 11_00_00_10 11_00_00_11	stf Rn, PSA|SZ8 |F stf Rn, PSA|SZ16|F stf Rn, PSA|SZ32|F	• Source is a byte, half-word, or word target at the Rn address. Any further PD read instructions will trigger a byte, half-word, or word access to the source. • Source address is frozen.
11_10_00_01 11_10_00_10 11_10_00_11	stf Rn,PSA|SZ8 |F|PF stf Rn,PSA |SZ16|F|PF stf Rn,PSA |SZ32|F|PF	• Source is a byte, half-word, or word target at the Rn address. Any further PD read instructions will trigger a byte, half-word, or word access to the source. • 1, 2, or 4 bytes are *fetched* from the peripheral source. • Source address is frozen.
11_00_01_01 11_00_01_10 11_00_01_11	stf Rn, PSA|SZ8 |I stf Rn, PSA|SZ16|I stf Rn, PSA|SZ32|I	• Source is a byte, half-word, or word target at the Rn address. Any further PD read instructions will trigger a byte, half-word, or word access to the source. • Source address is in incremented mode: PSA = PSA + 1,2 or 4 after read PD.
11_10_01_01 11_10_01_10 11_10_01_11	stf Rn, PSA|SZ8 |I|PF stf Rn, PSA|SZ16|I|PF stf Rn, PSA|SZ32|I|PF	• Source is a byte, half-word, or word target at the Rn address. Any further PD read instructions will trigger a byte, half-word, or word access to the source. • Source address is in incremented mode: PSA = PSA + 1, 2, or 4 after read PD. • 1, 2, or 4 bytes are *fetched* from the peripheral source.
11_00_10_01 11_00_10_10 11_00_10_11	stf Rn, PSA|SZ8 |D stf Rn, PSA|SZ16|D stf Rn, PSA|SZ32|D	• Source is a byte, half-word, or word target at the Rn address. Any further PD read instructions will trigger a byte, half-word, or word access to the source. • Source address is in incremented mode: PSA = PSA-1,2, or 4 after read PD.
11_10_10_01 11_10_10_10 11_10_10_11	stf Rn, PSA|SZ8 |D|PF stf Rn, PSA|SZ16|D|PF stf Rn, PSA|SZ32|D|PF	• Source is a byte, half-word, or word target at the Rn address. Any further PD read instructions will trigger a byte, half-word, or word access to the source. • Source address is in incremented mode: PSA = PSA-1,2, or 4 after read PD. • 1, 2, or 4 bytes are *fetched* from the peripheral source.
11_00_11_01 11_00_11_10 11_00_11_11	stf Rn, PSA|SZ8 |U stf Rn, PSA|SZ16 |U stf Rn, PSA|SZ32 |U	• *Update* source pointer to memory, which becomes a pointer to a memory accessed in byte, half-word, or word. • PSA value is not modified by Rn. • Bytes present in PD are lost.
11_10_11_01 11_10_11_10 11_10_11_11	stf Rn, PSA|SZ8 |PF|U stf Rn, PSA|SZ16 |PF|U stf Rn, PSA|SZ32 |PF|U	• *Update* source pointer, which becomes a pointer to a target accessed in byte, half-word, or word. • PSA value is not modified by Rn. • Bytes present in PD are lost. • 1, 2, or 4 bytes are *fetched* from the memory source.
11_01_00_01 11_01_00_10 11_01_00_11	stf Rn, PDA|SZ8 |F stf Rn, PDA|SZ16|F stf Rn, PDA|SZ32|F	• Destination is a byte, half-word, or word target at the Rn address, and any further PD write instructions will trigger byte, half-word, or word access to the destination. • Destination address is frozen.
11_01_01_01 11_01_01_10 11_01_01_11	stf Rn, PDA|SZ8 |I stf Rn, PDA|SZ16|I stf Rn, PDA|SZ32|I	• Destination is a byte, half-word, or word target at the Rn address, and any further PD write instructions will trigger byte, half-word, or word access to the destination. • Destination address is in incremented mode: PDA = PDA + 1, 2, or 4 after write PD.

Table continues on the next page...

Table 43-32. Peripheral DMA STF Instruction List (continued)

Binary	Assembly	Comments
11_01_10_01 11_01_10_10 11_01_10_11	stf Rn, PDA|SZ8 |D stf Rn, PDA|SZ16|D stf Rn, PDA|SZ32|D	• Destination is a byte, half-word, or word target at the Rn address, and any further PD write instructions will trigger byte, half-word, or word access to the destination. • Destination address is in incremented mode: PDA = PDA-1, 2, or 4 after write PD.
11_01_11_01 11_01_11_10 11_01_11_11	stf Rn, PDA|SZ8 |U stf Rn, PDA|SZ16 |U stf Rn, PDA| SZ32 |U	• *Update* destination pointer to memory, which becomes a pointer to a memory accessed in byte, half-word, or word. • PDA value is not modified by Rn • bytes present in PD are lost
11_00_10_00	stf Rn, PD	• Write "dsize" bytes of Rn in PD and automatically flush to destination target
11_11_11_11	stf Rn, PS	• Write status register
11_00_11_00	stf Rn,clrefPS	• Clear error flag if set

NOTE

When writing PD, size information is not important: It is embedded in the dsize field of PDA register. If dsize is 1, 2, or 4, then one, two, or four bytes from Rn is written to the PD register, and automatically flushed out to the destination target.

43.4.12.2.6 Peripheral DMA Read (ldf)-Read Mode

When received from an ldf instruction, the function code bits are interpreted as follows.

Table 43-33. LDF Code Bits

Register	7	6	5	4	3	2	1	0
PSA	s			ar	a			
PDA								
PD			p	cpy				
PS			pssel					

Table 43-34. LDF Code Bits Descriptions

Field	Description
7-6 s	Functional Unit selector 11 for Peripheral DMA
5 p (PD)	Prefetch Flag 0 no prefetch 1 automatic prefetch
4 ar (PSA/PDA)	Address Register Selector 0 PSA

Table continues on the next page...

Table 43-34. LDF Code Bits Descriptions (continued)

Field	Description
	1 PDA
4 cpy (PD)	Copy Mode 0 standard access 1 copy mode access
3 a	Register Set selection 0 PSA or PDA 1 PD or PS
5-0 pssel	PS access selector 111111 is the only valid option to read PS

Table 43-35. Peripheral DMA LDF Instruction List

Binary	Assembly	Comments
11_0_0_0_000	ldf Rn, PSA	Reads 32-bit of PSA value
11_0_1_0_000	ldf Rn, PDA	Reads 32-bit of PDA value
11_0_0_1_000	ldf Rn, PD	Reads programmed source size bytes of PD (0-extended)
11_1_0_1_000	ldf Rn, PD|PF	Reads programmed source size bytes of PD (0-extended), and starts a prefetch at PSA address.
11_0_1_1_000	ldf Rn, PD|COPY	Starts a copy transfer from the source target at the PSA address to the destination target at the PDA address. No data transmits through Rn, but Rn contents are lost (Rn is loaded with PD temporary contents that are *not* the copied data).
11_111111	ldf Rn, PS	Reads 32-bit of PS value

NOTE

When reading PD, size information is not important: It is embedded in the ssize field of the PSA register. If ssize is 1, 2, or 4, the one, two, or four bytes is transferred from PD to Rn. Read data is 0-extended.

43.4.12.2.7 Peripheral DMA Unit Copy Mode

Like burst DMA, the peripheral DMA unit has a copy mode that is used when data transfers do not involve SDMA general registers.

Data is read from the source target at a PSA address, stored in PD, and then automatically flushed to the destination target at the PDA address. Copy mode is only available for transfers that involve two targets of the same data path width.

Since copy mode is invoked with an ldf instruction, the *loaded* general purpose register loses its previous contents. (However, the new contents are unpredictable as they depend on temporary values that are seen on the external DMA bus.)

43.4.12.2.8 Error Management

Peripheral DMA generates two kinds of errors: the immediate error that sanctioned incorrect register programming; and the error triggered by the previous access and stored in the error flag of PS until a DMA instruction is executed.

43.4.12.2.8.1 Immediate Errors

The following table lists all incorrect DMA register setups.

Table 43-36. Immediate Errors with Peripheral DMA

Rn[1:0] values	DMA instruction	Comments
0x01 0x11	stf Rn, PSA|SZ16|F stf Rn, PSA|SZ16|I stf Rn, PDA|SZ16|F stf Rn, PDA|SZ16|I	If PSA points to a half-word peripheral or to a half-word address in memory, its value must be 0 modulo 2.
0x01 0x10 0x11	stf Rn, PSA|SZ32|F stf Rn, PSA|SZ32|I stf Rn, PDA|SZ32|F stf Rn, PDA|SZ32|I	If PSA points to a word peripheral or to a word address in memory, its value must be 0 modulo 4.
PSA[1:0]-PDA[1:0]	DMA instruction	Comments
0x01 0x10 0x11	stf Rn, PSA|SZ32|U stf Rn, PDA|SZ32|U	When PDA or PSA is updated and becomes a pointer to a word address in memory, its content must be 0 modulo 4.
0x01 0x11	stf Rn, PSA|SZ16|U stf Rn, PDA|SZ16|U	When PDA or PSA is updated and becomes a pointer to a half-word address in memory, its content must be 0 modulo 2.
Read/Write PD instruction	Comments	
stf Rn,PD ldf Rn,PD	If PDA size (dsize) has never been set up before an stf PD instruction (dsize=0) If PSA size (ssize) has never been set up before an ldf PD instruction (ssize=0)	
ldf Rn,PD|CPY	Copy mode is possible only between two targets whose data path width is identical. It is P8↔P8, P16↔P16, or P32↔P32 regardless of the way the address registers are incremented.	

43.4.12.2.8.2 Data Transfer Errors

When PSA and PDA are correctly set up, the only error that may arise for an ldf PD or stf PD instruction would be the error of the previous DMA cycle.

Error handling is driven by a single consideration: When an error occurred during a data read on the DMA interface, this error should appear as a transfer error to the core when the core attempts to retrieve the data that was not successfully read from the accessed device (memory or peripheral).

When an error occurred during a write access to the DMA interface, the data is still available in PD and should not be destroyed by subsequent core accesses: The core must be warned about the error issue.

There are three error handling mechanisms for each case: Read Error (First Phase), Write Error and Read Error (Second Phase), and Copy Mode Errors handling.

43.4.12.2.8.3 Read Error (First Phase)

If an error occurred during a prefetch command, the peripheral DMA enters its ERROR READ mode (PS[9:8]=11). In this mode, the error is reported on the next ldf PD instruction and writing PSA, PDA, or PD will cancel the error flag.

The block returns no error mode and instructions are normally executed (a DMA cycle may be triggered). Similarly, initiating a copy transfer will reset the error flag and start a copy transfer. The following table details which instructions can be executed in this mode.

Table 43-37. Possibilities in ERROR READ Mode

DMA Instruction	Immediate Error	Comments
stf rn, PD stf rn, PSA (IU IPF) stf rn, PDA ldf rn,PD|COPY	NO	Error mode is reset, PSA or PDA are updated, or a write cycle is started. For the ldf PD|COPY, a copy loop is executed.
stf rn, PS	NO	PS is updated.
ldf rn, PS ldf rn, PSA ldf rn, PDA	NO	PS, PSA, and PDA could be read in ERROR READ mode without any side effects (for example, no DMA cycle is triggered).
ldf rn, PD	YES	Error of the previous read access is reported here and the peripheral DMA enters its ERROR mode.

43.4.12.2.8.4 Write Error and Read Error (Second Phase)

The peripheral DMA enters its ERROR mode (PS[9:8]=10) when the previous DMA write cycle failed, or, as explained in Read Error (First Phase), when an ldf PD is executed while the block is in ERROR READ mode. When a DMA cycle failed, address registers (PSA, PDA) are not modified and continue to point to the problematic address. In ERROR mode, stf instructions may raise an immediate error, and ldf instructions will not (as detailed in the table below).

Table 43-38. Possibilities in ERROR Mode

DMA Instruction	Immediate Error	Comments
stf rn, PD stf rn, PSA stf rn, PDA	YES	Any attempt to modify PD, PSA, or PDA will raise an immediate error, and the peripheral DMA stays in ERROR mode. When address registers are write accessed, an error is returned.
stf rn, PS	NO	This is the only way to exit the ERROR mode. PS[3] must be reset by an stf PS instruction.
ldf rn, PS ldf rn, PSA ldf rn, PDA	NO	PS, PSA, and PDA could be read in ERROR mode without any side effects (for example, no DMA cycle is triggered).
ldf rn, PD	YES	Whatever the DMA direction (read or write), an ldf rn, PD instruction will show an immediate error.

43.4.12.2.8.5 Copy Mode Errors

Because copy mode is a write access that follows a read access, there are two possible cases of bus error.

When the read access incurs a bus error, the peripheral DMA behaves exactly as described in Read Error (First Phase) and Write Error and Read Error (Second Phase) : It enters its ERROR READ mode, and so on.

When the error occurred during the write access of the copy transfer, the DMA enables the core to retrieve the data that was read because it is assumed the read from the peripheral removed the data from its source device. Therefore, the data to be flushed is still in PD. Any subsequent access to PD triggers an error to the core, which should execute its error handling procedure.

Once the ERROR mode is left (after writing to PS), it is possible for the core to retrieve the data in PD with an ldf instruction or try to flush PD contents once again (for example, when the error was due to a full FIFO and the script waited for the FIFO to be emptied) with another ldf instruction in copy mode. This latter instruction detects that there is valid data in PD, tries to flush it, and thus skips the read phase of the copy instruction. This is a different behavior from the usual stf PD instruction that overwrites PD with the selected General Purpose register contents. The same mechanism can be used any time PD holds data that is not written because of a bus error on the DMA interface; when the data was written via a copy instruction, or via the usual stf PD instruction.

43.4.12.2.8.6 Error Check Example

The following code illustrates an example checking for both immediate and data transfer errors on a store to the PD register. The first bdf instruction checks for an immediate error, but if a data transfer error occurred it is reported until the next instruction to access the Peripheral DMA. A second check of the error flags is done after the ldf PS

instruction. The value of PS here can be ignored. The act of reading any register in Peripheral DMA while it is in an error mode that returns the error to the core to set either the SF or DF flag. Any error returned on an ldf command sets the SF flag and any error returned on an stf instruction sets the DF flag. This can create a situation as shown in the example where a bus error during a DMA write which would normally be considered as a destination fault is reported as a source fault because the error was reported to the SDMA core during an ldf instruction.

Peripheral DMA Error Check

```
    clrf    0            // Clear SF and DF flags
 stf    R4, PD        // Write data to memory
bdf    error_routine    // Check for immediate error from write to PD.
ldf    r3, PS        // Read PS (PS value in R3 can be ignored)
    bsf    error_routine    // Check for bus error from "stf R4,PD"
            // SF is set because it is a ldf instruction, even though
            // the original error was a destination fault
```

43.4.12.2.9 Peripheral DMA Unit Prefetch/Flush Management

There is no flush bit because every time data is stored in PD by a stf PD instruction-assuming PDA is correctly programmed-it is automatically flushed to the destination.

An acknowledge is returned in the cycle of the DMA instruction, and the SDMA is only stalled by an instruction that addresses the peripheral DMA when the previous DMA access is not over.

43.4.12.3 OnCE and Real-Time Debug

The On-Chip Emulation block (OnCE) is the debug interface to the SDMA.

It supports the access to all core internal devices (registers, memory, and so on), and provides a set of mechanisms that control the core. The OnCE is accessed by JTAG ports at the chip's board level, or by the host via its peripheral bus.

To reduce the size of the hardware material involved, all tasks supported by the OnCE are performed on the SDMA core. The architecture of the SDMA OnCE is relatively simple and very flexible.

The commands supported by the SDMA OnCE are listed in the following sections.

43.4.12.3.1 Memory and Register Access

A set of mechanisms is provided to access SDMA memory and register locations. Both reading and writing are allowed. The access is supported if the processor is in debug mode.

Those registers can also be accessed through the ARM platform Control interface when the OnCE is controlled by the ARM platform, as described in the "Using BP" section.

43.4.12.3.2 Hardware Breakpoints

An event detection unit is implemented to support memory breakpoints. The unit watches the data exchanged between the SDMA memory bus and the core.

A debug request is sent to the core when matching conditions occur. The unit supports mixed conditions based on address range, access type, and data value. Event detection unit configuration registers are memory mapped in the SDMA space (see ARM platform Channel 0 Pointer (SDMAARM_MC0PTR)): You can modify them through a regular memory access or the ARM platform control interface.

43.4.12.3.3 Watchpoints

One output pin is provided to monitor matching trigger conditions that are defined in the event detection unit.

43.4.12.3.4 Software Breakpoints

The SDMA instruction set contains a software breakpoint. Upon executing a software breakpoint instruction, the core suspends normal execution and enters debug mode.

No hardware step execution mode is implemented in the OnCE, but this feature may be implemented at the software level with this instruction.

43.4.12.3.5 Core Control

Commands are provided to monitor and control processor activity. You can halt the core, rerun the core from another address location, and get processor status.

Any hardware breakpoint on the instruction bus is not supported, but this feature may be implemented by inserting a software breakpoints program.

43.4.13 The OnCE Controller

The OnCE controller receives commands from the ARM platform or from the JTAG controller. Each command is interpreted before being sent to the core.

43.4.13.1 OnCE Commands

A small set of commands supports the communication between the OnCE and the external world.

This command set enables you to perform any of the following tasks: control processor activity, save core context, and execute an SDMA instruction from the OnCE. Combined together, these tasks perform more complex commands.

A full OnCE command contains a 4-bit instruction (the OnCE command opcode) and a variable length data field (the OnCE data). During command execution, the OnCE data is transferred in a OnCE internal register before being exchanged with the SDMA. Some data values are also exported. This mechanism creates a link between the processor and the external world. Nine commands are defined: The following table presents their formats.

Table 43-39. OnCE Command Opcode Values

Instruction Opcode	Name	Action	Register	Data Field Size	Mode
0000	rstatus	Reads the OnCE status register	STATUS	16-bit	normal/debug
0001	dmov	Updates general register GReg1	GREG1	32-bit	debug
0010	exec_once	Runs the instruction from the SDMA instruction register	INSTRUCTION	16-bit	debug
0011	run_core	Returns to normal execution	BYPASS	1-bit	debug
0100	exec_core	Returns to normal execution via a jump instruction that specifies the new address	INSTRUCTION	16-bit	debug
0101	debug_rqst	Stops the core after execution of current instruction	BYPASS	1-bit	normal
0110	rbuffer	Reads the real time buffer	RTB	32-bit	normal/debug
0111-1110	reserved	Reserved	BYPASS	1-bit	normal/debug
1111	bypass	Bypasses TARM platform controller	BYPASS	1-bit	normal/debug

Each instruction corresponds to a specific action performed on the OnCE. The nature of the associated data field is clearly identified. The dmov command is followed by a 32-bit data value (which is a data value for the SDMA); the exec_once and the exec_core commands are followed by a 16-bit data value (which is an instruction for the SDMA); the rstatus command is followed by a 16-bit control value (which is the content of the OnCE status register); the rbuffer command is followed by a 32-bit data value. The

debug_rqst and the run_core commands are followed by a single bit data field (this is a bypass value). Finally, the bypass instruction enables the SDMA JTAG TAP controller to be daisy-chained with another JTAG TAP controller. This is a JTAG-only feature. The set of commands is simple, but enables you to perform any possible task on the SDMA during a debug process.

43.4.13.2 Sending Commands to the OnCE Controller

The JTAG access is the standard access to the OnCE, but sometimes the JTAG is not available to fix some bugs (if the chip is in production for instance), an additional access is then required. Therefore, one ARM platform access to the OnCE is provided.

43.4.13.2.1 Using the JTAG Interface

A serial access is performed through the five JTAG pins TCK, TRST, TMS, TDI, and TDO. A Test Access Port controller is provided to decode the TMS control signal.

It produces shift-enable signals (shift_ir and shift_dr), and updates enable signals (update_ir and update_dr). It is fully compliant with the IEEE 1149.1 testability (JTAG) standard.

During the shift_ir state, the command opcode is shifted into the OnCE controller (for example, the signal from the TDI pin is shifted into the command register and the TDO pin receives the signal shifted out). After transferring the four bits of the command, an update_ir signal is asserted and the command is decoded. The target data register is now clearly identified and the corresponding control signal is produced, as follows: bypass enable signal (bp_en), instruction enable signal (inst_en), data enable (data_en), and status enable signal (stat_en).

During the shift_dr state, the TDI signal is shifted into one of the following target registers: bypass register (1 bit), SDMA instruction register (16 bits), SDMA data register (32 bits), or OnCE status register (16 bits). The TDO pin is connected to the output of the selected register to receive the signals shifted out.

The JTAG access is disabled when the ARM platform access is enabled.

43.4.13.2.2 Using the ARM platform

The ARM platform access to the OnCE is not the standard access, but it is required if the JTAG is not available.

For example, if the SDMA ROM is out of use on a chip in production, and the ARM platform needs to download new code and restart the SDMA, the OnCE can easily perform this operation. This type of debug operation justifies the use of an ARM platform access to the OnCE.

To drive the OnCE, the ARM platform uses some registers contained in the ARM platform Control block of the SDMA. These registers are accessed through the ARM platform peripheral bus. Most of these registers are connected to another register in the OnCE controller. Thus, accessing one of these registers is equivalent to accessing the associated register in the OnCE controller.

The set of registers in the ARM platform Control block is listed below:

- ONCE_ENB register (1 bit, read/write)-This 1-bit register enables the ARM platform access to the OnCE. When this bit is set, the signals from the JTAG are ignored. When it is cleared, all writing operations to the following registers through the Host Control interface are ignored. This register is reset on a JTAG reset.
- ONCE_CMD register (4 bits, read/write)-This 4-bit register receives the command opcode. It is connected to the command register in the controller. A write access to this register causes the associated command to be executed on the OnCE. For example, after writing "0001" in this register, a dmov command is executed.

NOTE

On the ARM platform side, the rstatus and bypass commands are not supported. This register is reset on a JTAG reset.

- ONCE_DATA register (32 bits, read/write)-This 32-bit register is connected to the SDMA data register. This register is used when executing a dmov or rbuffer command.

NOTE

Before requesting a dmov command, the 32-bit data to transfer must be written in the ONCE_DATA register. At the end of the execution, the register is updated with GReg1 former value. This register is reset on a JTAG reset.

- ONCE_INSTR register (16 bits, read/write)-This 16-bit register is connected to the SDMA instruction register. This register is used when executing an exec_core or an exec_once command.

NOTE

Before requesting an exec_core or an exec_once command, the appropriate instruction must be written in the ONCE_INSTR register. This register is reset on a JTAG reset.

- ONCE_STAT register (16 bits, read only)-A read access to the ONCE_STAT register returns the content of the OnCE status register (OSTAT). This register is read only.
- The bypass register is not useful when the ARM platform controls the OnCE, therefore no register is defined in the ARM platform Control block to access the bypass register.

43.4.13.2.3 Conflicts Between the JTAG and the ARM platform Accesses

When ARM platform access to the SDMA OnCE is enabled (that is, when the bit in the ONCE_ENB register is set), the JTAG access is disabled. This guarantees that the block is not accessed at the same time on both sides.

It is possible to check whether the JTAG access to the SDMA OnCE is enabled from the JTAG port. When the JTAG access is disabled, the SDMA TDO always returns 1. The check requires the following steps:

- Execute a dmov command from debug mode (with neither 0xffffffff nor 0x0 as dmov value: 0x5a5a5a5a is good).
- Execute another dmov command (the value here is not important).
- The returned value from the latter dmov command should be the original one if the JTAG access is enabled; if it is 0xffffffff instead of the original input value, this means the JTAG access is disabled.

43.4.13.3 Executing a Command from the OnCE

All the commands defined in OnCE Commands can be accessed through the JTAG. The ARM platform can access all these commands except the rstatus command.

On the ARM platform side, the OnCE status is directly accessed by reading the ONCE_STAT register.

43.4.13.3.1 Nature of the Commands

Two types of commands may be distinguished. First, there are two commands that do not interact with the core: rstatus and rbuffer. Those commands may be requested at any time: They do not depend on the core status.

NOTE

Each of these commands exports a data value or a status value from the SDMA.

There are also commands that interact with the core: dmov, run_core, exec_core, exec_once, and debug_rqst. These commands are core status dependent, as follows:

- During user mode only the debug_rqst is taken into account.
- During debug mode, all these commands are taken into account except the debug_rqst. For example, an exec_once command requested while not in debug mode has no effect.

43.4.13.3.2 Execution Request

The SDMA starts executing a task in debug mode when requested by the OnCE controller. The execution starting time depends on the type of access used to communicate with the OnCE.

If the JTAG is used, the request is send after decoding the update_dr state in the TAP controller. Therefore, always cross this state when sending a command through the JTAG. If the OnCE is driven from the ARM platform side, the request is sent after detecting a write access to the ONCE_CMD register. All the registers involved in this operation must be loaded first.

The following is an example of an exec_core command execution from the ARM platform side: After writing '010' in the ONCE_CMD register, the OnCE controller asks the SDMA to execute the instruction contained in the ONCE_INSTR register. The instruction involved should be available in the ONCE_INSTR register before the beginning of the execution.

43.4.13.3.3 Command Execution

The following list shows the commands and details how each command is executed:

- rstatus command execution-The rstatus command exports the content of the OnCE status register (OSR). If the JTAG is used, the status information is captured in the OnCE status register during the capture_dr state, and shifted out after 16 TCK clock cycles in the shift_dr state. The rstatus command is not supported on the ARM platform side, but a status register is provided instead. The rstatus may be performed in both debug and user modes.
- dmov command execution-The dmov command accesses SDMA internal registers. Executing a dmov instruction exchanges the 32-bit data values between the SDMA data register and the general register GReg[1].
- If the JTAG is used, the content of GReg1 is captured in the SDMA data register during the capture_dr state, then it is shifted out after 32 TCK clock cycles in the shift_dr state. During the update_dr state, GReg1 is updated with the new, shifted-in 32-bit data value. If the OnCE is driven from the ARM platform side, the data values

contained in GReg1 and the SDMA data register are exchanged after detecting a write access to the ONCE_CMD register. The ONCE_DATA register must therefore be loaded first.

- exec_once command execution-The exec_once command executes the instruction loaded in the SDMA instruction register. The command may only be requested from debug mode. The SDMA returns to debug mode at the end of the execution.
- Change of flow instructions as well as instructions that may cause a context switch are not supported: The comprehensive list comprises done/yield/yiedge (except done 5), BF, BT, BSF, BDF, JMP, JSR, JMPR, JSRR, RET, and LOOP, as well as all the illegal instructions.

  No other command should be requested before the SDMA returns to debug mode. The SDMA status (for example, whether it is in debug mode or not) can be detected by polling with the rstatus OnCE command, monitoring the debug_mode pin, or checking the OnCE Status Register (SDMAARM_ONCE_STAT) register via the ARM platform control interface.

NOTE

Most of the instructions are single-cycle, which omits the step of polling the status. Loads and stores to DMA units are typical instructions that might require this polling.

If the JTAG is used, the 16-bit instruction is shifted in the SDMA instruction register after 16 TCK clock cycles in the shift_dr state. A request is sent to the core when the update_dr state is decoded in the TAP controller. If the OnCE is driven from the ARM platform side, the request is sent to the SDMA when detecting a write access to the ONCE_CMD register. The ONCE_INSTR register must be therefore be loaded first.

- run_core command execution-The run_core command leaves debug mode and resume normal program execution. The next instruction executed is the last instruction decoded before entering debug mode. Be sure to restore core context before re-running the core. This procedure is detailed in Restoring the Context.
- If the JTAG is used, a 1-bit bypass value is shifted in the bypass register in the shift_dr state. The SDMA is rerun when the update_dr state is decoded in the TAP controller. If the OnCE is driven from the ARM platform side, the core is rerun when detecting a write access to the ONCE_CMD register.

- exec_core command execution-The exec_core command resumes program execution from any address. The 16-bit instruction provided with the exec_core overwrites the last instruction decoded before entering debug mode. This command is designed to support change of flow instructions, so that a program execution can be restarted

from any address. After executing an exec_core command, the SDMA leaves debug mode. The exec_core command is usually used with a jmp instruction.

- If the JTAG is used, the 16-bit branch instruction is shifted in the SDMA instruction register after 16 TCK clock cycles in the shift_dr state. The SDMA is rerun when the update_dr state is decoded in the TAP controller. If the OnCE is driven from the ARM platform side, the SDMA reruns when detecting a write access to the ONCE_CMD register. The ONCE_INSTR register must therefore be loaded first. For example, to restart the SDMA from the program address 0x100, the instruction loaded should be a jump to address 0x100 instruction.
- debug_rqst command execution-The debug_rqst command puts the SDMA in debug mode. If the JTAG is used, a 1-bit bypass value is shifted in the bypass register during the shift_dr state. A debug request is sent to the SDMA when the update_dr state is decoded in the TAP controller. If the OnCE is driven from the ARM platform side, the debug request is sent when detecting a write access to the ONCE_CMD register. When the SDMA is already in debug mode, this command is simply ignored.
- rbuffer command execution-The rbuffer command exports the content of the real time buffer (RTB). If the JTAG is used, the content of the real time buffer (RTB) is captured in the SDMA data register during the capture_dr state. The register is completely shifted out after maintaining the shift_dr state during 32 TCK clock cycles. If the OnCE is driven from the ARM platform side, the content of the RTB is captured in the ONCE_DATA register after detecting a write access to the ONCE_CMD register.
- bypass command execution-This command is only available from the JTAG interface. It enables daisy-chaining of the SDMA JTAG TAP controller with other JTAG TAP controllers. This command does not change the SDMA state and can be executed in any mode (run, debug, or sleep). It selects the bypass register of the TAP controller.

43.4.13.4 Registers Descriptions

See SDMACORE, and SDMAARM, for detailed information on each register.

43.4.13.4.1 Event Cell Counter Register (ECOUNT)

The event cell counter register is a 16-bit register that contains the number of times minus one that an event detection occurs before generating a debug request.

This register should be written before attempting to use the event detection counter during an event detection process. The event cell counter register is cleared on a JTAG reset.

43.4.13.4.2 Event Cell Address Registers (EAA or EAB)

The event cell contains two address registers-the event cell address register (a), called EAA, and the event cell address register (b), called EAB. Every address register is a 16-bit register that stores a user-defined address value. This value computes one of the following address conditions: addra_cond or addrb_cond. Every address register is cleared on a JTAG reset.

43.4.13.4.3 Event Cell Address Mask Register (EAM)

The event cell address mask register is a 16-bit register that contains a user-defined address mask value. This mask is applied to the address value latched from the memory address bus before comparing addresses.

NOTE

There is a common address mask value for the two address comparators. If bit *i* of this register is set, then bit *i* of the address value latched from the memory bus does not influence the result of the address comparison. The event cell address mask register is cleared on a JTAG reset.

43.4.13.4.4 Event Cell Data Register (ED)

The event cell data register is a 32-bit register that contains a user-defined data value. This data value is an input for the data comparator, which generates the data_cond condition.

The event cell data register is cleared on a JTAG reset.

43.4.13.4.5 Event Cell Data Mask Register (EDM)

The event cell data mask register is a 32-bit register that contains a user-defined data mask value. This mask is applied to the data value latched from the memory bus before comparing data.

Setting bit *i* of the event cell data mask register means that bit *i* of the data value latched from the address bus does not influence the result of the data comparison. The event cell data mask register is cleared on a JTAG reset.

43.4.13.4.6 Real Time Buffer Register (RTB)

The real Time Buffer register is a 32-bit register that stores and retrieves run-time information without putting the SDMA in debug mode.

Refer to Real Time Buffer for more details.

43.4.13.4.7 Event Control Register (ECTL)

The event cell control register is a 16-bit register that defines cell event occurrence conditions.

The event cell control register is cleared on a JTAG reset. See also OnCE Event Detection Unit for more details.

43.4.13.4.8 Trace Buffer (TB)

The Trace Buffer register retrieves the information in the Trace Buffer.

See Trace Buffer for more details.

43.4.13.4.9 OnCE Status Register (OSTAT)

The OnCE status register is a 16-bit register that contains processor and event detection unit status. The OSTAT is a read-only register.

Refer to OnCE Status Register (SDMAARM_ONCE_STAT) for detailed description of the individual fields in the OSTAT register.

The following figure shows the OSTAT structure.

Table 43-40. OnCE Status Register (OnCE)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PST[3:0]				RCV	EDR	ODR	SWB	MST					ECDR[2:0]		

Where PST[3:0] is the SDMA core state, RCV is set when the real-time buffer (RTB) is modified. EDR, ODR, and SWB are set, respectively, when the SDMA has entered debug mode because of an external debug request, a OnCE debug_rqst command, or a software breakpoint. MST is set when the OnCE is controlled from the ARM platform control interface, and when ECDR is a three-flag set that shows the event cell condition(s) that put the core in debug mode. The OSTAT never provides more than one reason for entering debug mode.

There are two ways of accessing OSTAT content, as follows:

1. Send an rstatus command to the OnCE controller through the JTAG, or read the ONCE_STAT register through the ARM platform access. Executing the rstatus command through the JTAG can be performed in both user and debug modes.
2. Perform an SDMA read access to the location in the SDMA core memory map (OSTAT register) debug mode using the exec_once command. With this method of access, the SDMA state reflected by the PST (processor status bit) is always DATA.

The register may also be accessed by a running application.

43.4.13.5 JTAG Interface Requirements

Because the signals received from the JTAG (running on TCK) are transferred to the OnCE controller (running on the SDMA clock), a synchronization mechanism is required.

43.4.13.5.1 TCK Speed Limitation

In the JTAG top-level layer, the TDO signal is always captured on a TCK falling edge. To guarantee a stable TDO signal from the SDMA during this operation, a falling edge detection is performed on TCK.

Before being latched in the *I* flip-flop (see Figure 43-11) on TCK falling edge, the TDO signal must be stable at the input of the flip-flop. This condition is verified if the TCK period is superior to the following delay:

worst-case edge detection delay + negative-edge signal propagation delay + JTAG top-level logic propagation delay

The frequency relationship, TCK < CLK/8, limitation guarantees that all operations are performed as expected.

43.4.13.5.2 Synchronization Implementation

The figure found here shows the synchronization mechanism.

Flip-flops tck0, tck1, and tck2 perform falling- and rising-edge detections on TCK. They generate the posedge_detected and negedge_detected nets that are used to sample the TDI and TMS inputs into the respective tdi and tms flip-flops, and update the tdo flip-flop to yield the TDO output. In the design, the only signal that might go metastable is the output of the tck0 flip-flop. This signal is captured in the tck1 flip-flop and no logical operation is performed on it to minimize a metastability propagation risk.

The TDI and TMS flip-flops also cannot go metastable: The propagation time of the rising-edge detection signal through tck0, tck1, and tck2 guarantees that the TDI and TMS inputs are stable when captured in the TDI and TMS flip-flops.

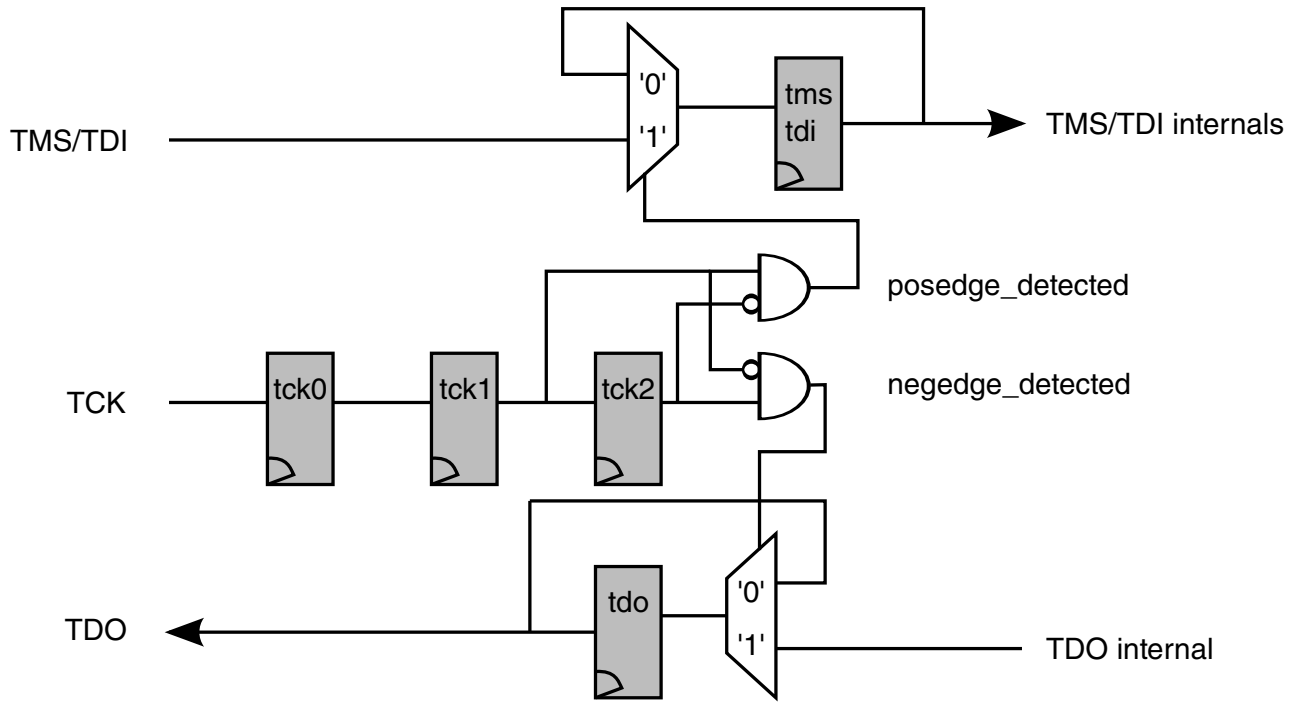

Figure 43-11. OnCE Synchronization Layer

The following figure shows synchronization timings. It takes three CLK clock cycles to synchronize TDI on the SDMA clock.

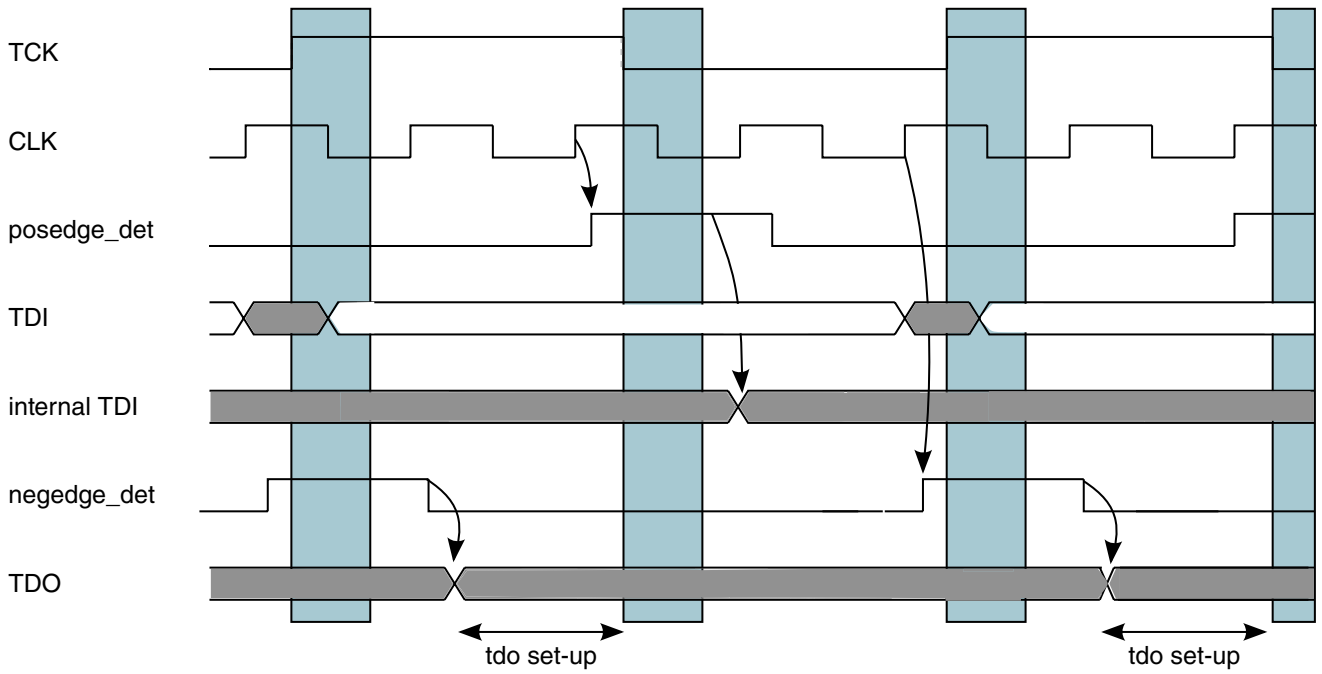

Figure 43-12. Synchronization Timings

43.4.13.5.3 JTAG Controller Start-Up Recommended Procedure

To ensure correct TAP controller initialization, it is recommended to use the following procedure:

1. Assert JTAG reset TRSTB (for example, set low).
2. Set TMS low.
3. Wait for 1 TCK clock.
4. Release JTAG reset TRSTB (for example, set high).
5. Wait for a minimum of five TCK cycles.

43.4.14 Using the OnCE

This section provides the elements necessary to run the OnCE during a debug process.

In addition to the basic set of commandsdescribed in OnCE Commands, more complex commands can be built to meet users' requirements.

43.4.14.1 Activating Clocks in Debug Mode

For power consumption issues, some clocks in the SDMA are disabled when not needed.

This is the case for instances when the SDMA is in sleep mode. Clock gating management depends on the interface used to control the OnCE.

- For the JTAG access, the SDMA clock gating must be turned off via the clk_gating_off input.
- For the ARM platform access, the SDMA clock gating is automatically turned off when the ARM platform access is enabled (see OnCE Enable (SDMAARM_ONCE_ENB)).

43.4.14.2 Getting the Current Status

Most of the commands the OnCE supports have an impact on the status of the SDMA.

It is not permissible to request the execution of an instruction on the SDMA from the OnCE while the SDMA is not in debug mode. Such a violation may cause unpredictable behavior, and it might be necessary to reset the SDMA.

Therefore, the value of the PST bits provided in the OnCE status register should always be checked before sending any request to the SDMA.

43.4.14.3 Methods of Entering Debug Mode

A debug request may be asserted at any time, but it is not always taken into account immediately. Debug mode cannot be entered in the middle of an instruction, or during the save or restore states of a context switch.

The request is ignored when the core is already in debug mode. Refer to Figure 43-4, which shows all possible transitions to the debug state, as there are several ways to enter debug mode.

43.4.14.3.1 External Debug Request During Reset

To enter debug mode after exiting reset, the external debug line has to be maintained high. This line is handled by the JTAG top-level block.

NOTE

The SDMA detects the debug requests only if the SDMA clock is running (see Activating Clocks in Debug Mode). The debug request line should be not be maintained high when the SDMA is in debug mode.

NOTE

The debug_rqst command (from the OnCE command set) is not supported during system reset.

43.4.14.3.2 Debug Request During Normal Activity

During normal activity, the SDMA enters debug mode when the following is true:

1. If the debug request line from the JTAG top-level is asserted, or
2. If the OnCE controller receives a debug_rqst command.

   The debug_rqst command can be sent by the JTAG access or by an access on the ARM platform side (if the ARM platform access is enabled).

43.4.14.3.3 Software Breakpoint Instruction

The SDMA enters debug mode at the end of the execution of a software breakpoint instruction. This instruction must be inserted in program flow executed by the core.

43.4.14.3.4 Event Detection Unit Matching Condition

If the event detection is enabled, a debug request is sent to the core after detecting a matching condition on the SDMA memory bus.

See OnCE Event Detection Unit for more details.

43.4.14.4 Executing Instructions in Debug Mode

The OnCE supports a mechanism to execute instructions in debug mode. If the SDMA is in debug mode, then the exec_once command can be used to execute an SDMA instruction from the OnCE controller. The SDMA returns to debug mode at the end of each execution.

Some instructions are not supported by the exec_once command: done/yield/yiedge (except done 5), BF, BT, BSF, BDF, JMP, JSR, JMPR, JSRR, RET, and LOOP, as well as all the illegal instructions are not supported.

NOTE

While instructions are executed in debug mode from the OnCE, the program counter of the SDMA is not incremented.

43.4.14.5 Command Sequences Examples

This section provides examples of command sequences that run the SDMA in debug mode. These sequences are available for both the ARM platform and JTAG accesses.

The following presents the syntax used in this section. The data field provided with each command is put in parenthesis with the command name. A '-' is used if the data field provided is a *don't care* value.

```
my_command(data_field);                 // executing my_command with a data field
my_command(-);                        // executing my_command with a don't care data field
```

The value returned by the command (if there is one) is referred by an assignment. In case the value returned by the command is not used, the assignment is omitted. For an ARM platform access, the value returned (it is always a data value) is obtained by reading back into the SDMA data register.

```
data_out = my_command(data_in); // returning a data value
```

To clarify the syntax, the instructions' opcodes are referred to by their names. In practice, use the corresponding 16-bit encoding.

43.4.14.5.1 Getting the SDMA Status

NOTE

Before executing any command that affects the SDMA (like dmov or exec_once), check that the SDMA is in debug mode.

Use the following snippet:

```
rstatus();        // read SDMA status until the SDMA is in debug mode
...
rstatus();
```

If the SDMA is not in debug mode, then a debug request must be generated. In this case, the SDMA enters debug mode at the end of the execution of the current instruction. Use this snippet:

```
debug_rqst(-);   // debug request
```

In the following sections, it is assumed that the SDMA was successfully put into debug mode.

43.4.14.5.2 Saving the Context

The first debug task is to save the SDMA context, which is the content of the eight general-purpose registers, the loop and PC-related registers, and the flags.

Use the general register GReg[1] as an intermediate register to export the entire context of the SDMA.

The following example shows how to save GReg[0], GReg[1], GReg[2] and GReg[3]. The sequence of commands used to export additional general registers is very similar to this.

Save GReg[0], GReg[1], GReg[2], and GReg[3]

```
GReg1_data = dmov(-);                          // the value exported is the content of
GReg[1]
exec_once("mov GReg1,GReg0");                      // puts the content of GReg[0] into
GReg[1]
GReg0_data = dmov(-);                          // the value exported is the content of
GReg[0]
exec_once("mov GReg1, GReg2");                     // puts the content of GReg[2] into
GReg[1]
GReg2_data = dmov(-);                          // the value exported is the content of
GReg[2]
exec_once("mov GReg1, GReg3");                     // puts the content of GReg[3] into
GReg[1]
GReg3_data = dmov(-);                          // the value exported is the content of
GReg[3]
```

Get the value of the internal flags (SF, DF, T, and LM), of the loop related registers (EPC and SPC), and of the PC-related registers (PC and RPC). Use a done 5, which is the formatting instruction dedicated to the debug. This instruction formats the flags and the values contained in the registers. It also writes the resulting values into the channel context memory. It should not be used when entering debug from the IDLE state (for example, with no active channel script running on the SDMA), because it will update a channel context that may belong to any channel.

```
exec_once("done 5");                   // formatting the value of flags and registers
```

At this point, the channel context should be up-to-date in memory, and debug operations should now be possible. However, the context can be exported with the following instructions:

Exporting the Context

```
dmov(ctx_base_addr);                             // loading GReg[1] with the channel
context base address
exec_once("ld GReg0,(GReg1,0)");                     // get RPC-PC into GReg0
exec_once("ld GReg1, (GReg1,1)");                    // get SPC-EPC into GReg1
Loop_data = dmov(-);                           // read back the value of Loop registers
exec_once("mov GReg1, GReg0");                     // puts the PC info into GReg1
PC_data = dmov(-);                             // reads back the content of the PC registers
```

After this sequence of operations, the entire SDMA context is exported via the OnCE.

43.4.14.5.3 Restoring the Context

At this point in the operation, restore the context of the SDMA. It can be different from the original context located in memory, and the content previously saved into the debugging application via the OnCE.

The example found hereshows how it is possible to modify the current channel context.

Modifying the Current Channel Context

```
dmov(Loop_data);                                  // put Loop former value into GReg[1]
exec_once("mov GReg0, GReg1");                        // copy to GReg[0]
dmov(PC_data);                                    // put PC former value into GReg[1]
exec_once("mov GReg2, GReg1");                        // copy to GReg[2]
dmov(ctx_base_addr);                                 // put channel context base address into
GReg[1]
exec_once("st GReg0, (GReg1,1)");                          // restore Loop context
exec_once("st GReg2, (GReg1,0)");                          // restore PC context
```

Once the context in memory is the desired context (with or without applying the previous instruction sequence), it can be restored to the *real* PC and loop registers in the SDMA core:

```
exec_once("cpShReg");                    // restore flags and PC & loop related registers
```

After this command, the SDMA core PC, RPC, SPC, EPC registers, as well as the flags contain the same data as what is stored in the context RAM for the current channel.

The following example shows how to restore the context of general registers GReg[0], GReg[1], GReg[2] and GReg[3].

Restoring the General Register Context

```
dmov(GReg3_data);                     // put GReg[3] restore value in GReg[1]
exec_once("mov GReg3, GReg1"); // restore GReg[3]
dmov(GReg2_data);                     // put GReg[2] restore value in GReg[1]
exec_once("mov GReg2, GReg1"); // restore GReg[2]
dmov(GReg0_data);                     // put GReg[0] restore value in GReg[1]
exec_once("mov GReg0, GReg1"); // restore GReg[0]
dmov(GReg1_data);                     // restore GReg[1]
```

At this point, it is possible to restart the normal program execution.

NOTE

Every SDMA core general register value can be modified by a mov instruction, which makes modification of these registers easy during debug. Unfortunately, there is no such instruction as a mov to directly modify the contents of either PCU register or flag (PC, RPC, SPC, EPC, T, LM, SF, or DF). The cpShReg instruction is meant to provide a means for changing these register contents via the context memory.

43.4.14.5.4 Accessing the Memory

In the example shown here, it is assumed that the SDMA context is entirely saved. If true, it is permissible to modify the general purpose registers during debugging activity.

To perform a memory read access, the target address is stored via the OnCE in GReg[1], then the load instruction is executed on the SDMA (the data loaded from the memory overwrites the address contained in GReg[1]), and then the result value is read back via the OnCE.

```
macro READ:            dmov(target_addr);                                  // put the target
address in GReg[1]
                    exec_once("ld GReg1,(GReg1,0)");                        // execute the
load instruction
                    res_data = dmov(-);                                 // exports the result
data value
```

For a memory write access, the target address is written in GReg[0], and the value to store is written in GReg[1]. Then the store instruction is executed on the SDMA.

```
macro WRITE:            dmov(target_addr);                                  // puts the
target address in GReg[1]
                    exec_once("mov GReg0,GReg1");                       // puts the target
address in GReg[0]
                    dmov(target_data);                                  // puts the target
data in GReg[1]
                    exec_once("st GReg1,(GReg0,0)");                        // performs the
store operation
```

This sequence is shown as an example; however, many other sequences are possible.

NOTE

This sequence of commands can also be applied to memory-mapped registers.

43.4.14.5.5 Resuming Program Execution

Before resuming program execution, it is assumed that the SDMA context is properly restored. There are two ways to restart the SDMA.

Start by executing the last instruction fetched before entering debug mode, as follows.

```
run_core(-);                          // resume execution from where we stopped before
```

If necessary, restart the execution from a different address. In this case, use the exec_core command. The data field provided with this command must be the encoding of a jump instruction.

```
exec_core("jmp start_addr"); // rerun the SDMA from another address
```

In these two examples, the SDMA exits debug mode and keeps executing the code fetched from the memory.

43.4.14.5.6 Single Stepping in RAM

To execute a program step-by-step from the RAM, insert software breakpoints in the program flow at appropriate places so that the SDMA only executes one instruction before returning to debug mode.

First, read the next instruction to execute in the RAM. Then, depending on the value of this instruction, compute the address where a software breakpoint instruction should be inserted. The instruction at the corresponding address must be saved, and, the software breakpoint instruction is inserted. After restarting the SDMA, there is only one instruction executed before meeting the software breakpoint.

The following example shows the macro functions READ and WRITE, which correspond to the sequence of commands (described above) used to access the memory.

NOTE

The data read from the memory are 32-bit values, while the instructions are 16-bit values only. This is why it is best to only use addresses divided by two when accessing the memory.

READ and WRITE Macro Functions

```
next_instr = READ(run_addr/2);                          // read the next instruction to execute
// the tool now has to compute the address where the breakpoint
// instruction should be inserted, this address is the "bkpt_addr"
instr_save = READ(bkpt_addr/2);                          // save the instruction before
overwriting
STORE("bkpt instruction",bkpt_addr/2);                        // store the bkpt instruction
in memory
exec_core("jmp run_addr");                              // rerun the SDMA
rstatus(-);                                           // wait for the SDMA to enter debug mode
...
rstatus(-);
STORE(instr_save,bpkt_addr/2);                           // restore the instruction
overwritten
```

In case of branched conditional instructions, a breakpoint instruction should be written at the two possible target addresses.

43.4.14.5.7 Single Stepping in ROM

No single-step mechanism is supported in ROM. The program code can be loaded in the RAM, where the single-step mechanism can be executed.

43.4.14.6 OnCE Event Detection Unit

The event detection unit watches signals from the data memory bus (DMBUS), which the SDMA core uses to access its RAM, ROM, and memory mapped registers.

A debug request is sent to the OnCE controller when user-defined conditions on address and/or data values are true.

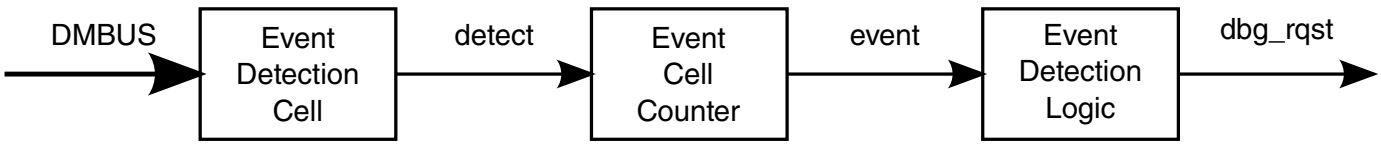

Figure 43-13. Event Detection Unit

A counter, provided with the detection cell, is decreased after an event detection. A debug request is sent to the core only when the counter reaches the value of 0. It is possible to disable the use of the counter if a debug request has to be generated after each event detection.

The event cell is the basic block that supports hardware breakpoints on an address value and/or data values coming from the SDMA memory bus. The trigger condition that generates the debug request is a mixed condition based on those values.

The following figure shows the event cell architecture. The event cell contains the address (stored in the memory address register) and the data (stored in the memory data register) used during the last memory access. There are some user-defined reference values located in memory mapped registers-the event cell addresses, the event cell address mask, the event cell data, and the event cell data mask. These registers are accessed by standard load/store instructions just like regular memory locations.

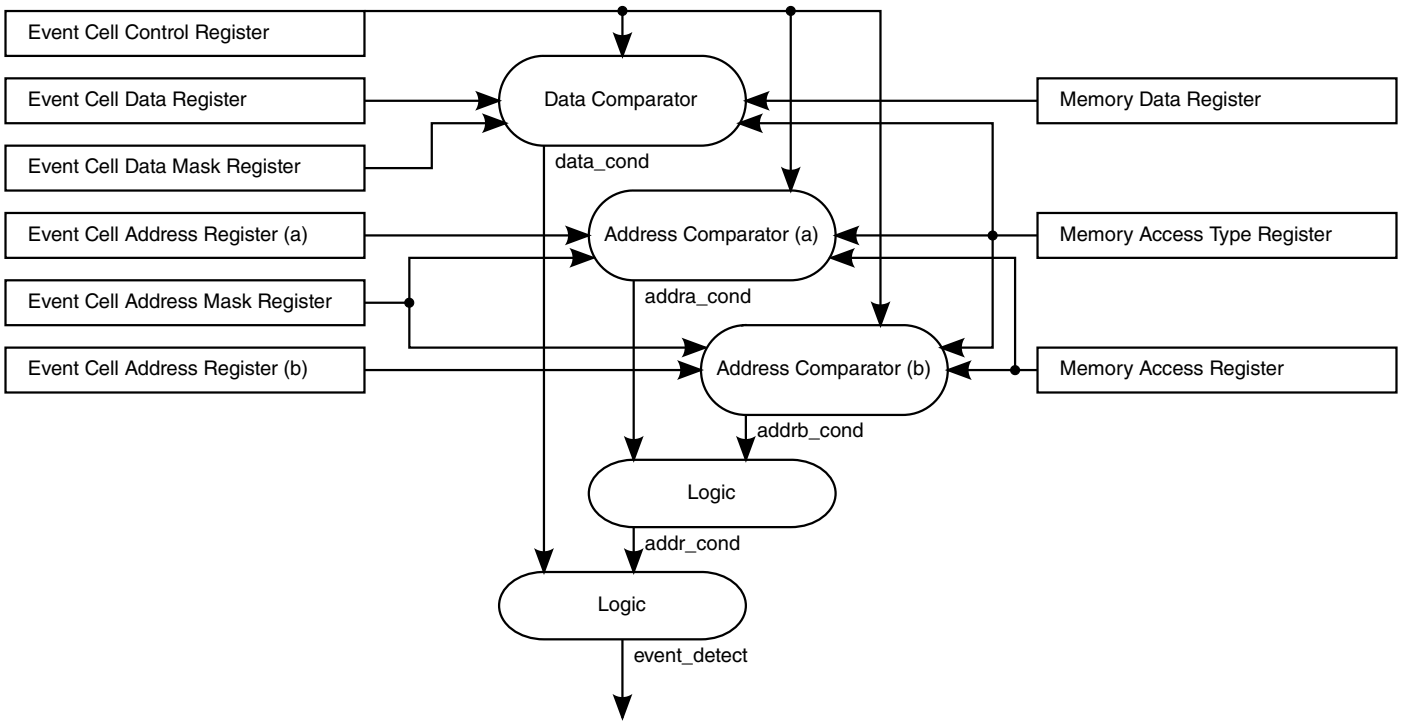

Figure 43-14. Event Cell Architecture

To define a memory breakpoint, three conditions are taken into account: The first two conditions are comparisons of the current memory address with user-defined reference addresses (these conditions are called addressA and addressB). The third condition consists of a comparison between the data received on the DMBUS and a user-defined reference data (this condition is called data). An intermediate address condition is set to express a dependency between addressA and addressB conditions.

43.4.14.7 Clock Gating and Reset

This section details how to use the clocks and handle the reset signals.

43.4.14.7.1 Clocks

Because the SDMA uses clock gating to save power, it is necessary to disable the clock gating and force the clocks to be enabled when using the OnCE.

When the OnCE is accessed through its JTAG interface, clock gating must be disabled outside the SDMA via a dedicated SDMA input port clk_gating_off. The reason why detection is not performed automatically by the SDMA internal hardware is that it would cost power to monitor activity on the JTAG interface.

When the OnCE is accessed through the ARM platform Control interface, clock gating is automatically turned off. This is done when bit 0 of the ONCE_ENB register (see OnCE Enable (SDMAARM_ONCE_ENB)) is set. A write access to this register is possible even when the OnCE clock is not running. If the ARM platform access is used, the bit in the ONCE_ENB register must be set before any attempt to access any other OnCE register.

43.4.14.7.2 Resets

The OnCE reset is different from the SDMA main reset.

Normally, activating the SDMA reset while keeping the OnCE reset inactive (when possible) enables you to reset the core without having to reprogram the OnCE.

43.4.14.8 Real Time Features

To rebuild the skeleton of a program execution, it is necessary to store the addresses of the program instructions where jumps are taken: A trace buffer is therefore provided. A real time buffer has also been added to receive data values written during a program execution.

The content of this register may be exported through JTAG ports without stopping the core.

43.4.14.8.1 Trace Buffer

The Trace Buffer is a 32-stage buffer that contains appropriate information to identify the 32 last changes of flow detected during a program execution.

The following figure shows an overview of the Trace Buffer.

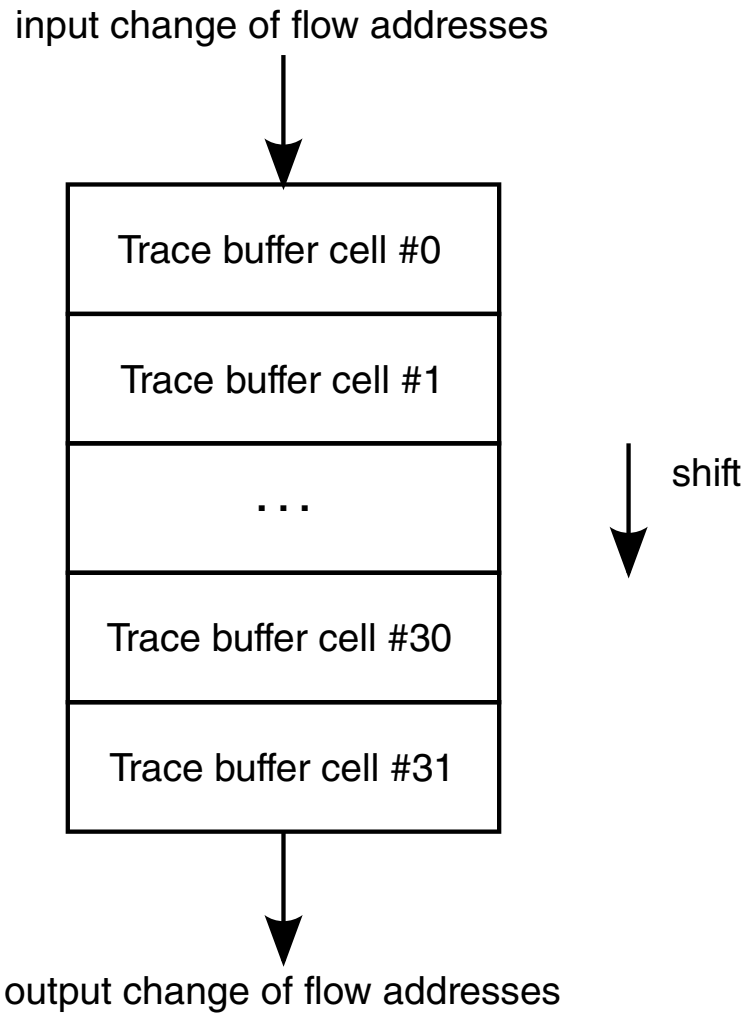

Figure 43-15. Trace Buffer

Each cell of the trace buffer contains two reference addresses and a flag. The flag is set when the addresses stored in the cell correspond to a valid change of flow; otherwise, the flag is cleared. The three most significant bits are unused.

After every change of flow detection, the address of current instruction and the address of the target instruction are stored at the top of the Trace Buffer (cell #0). The flag in the cell is set to indicate that a valid change of flow was detected. Former cell values are shifted one level down. The Trace Buffer contains the 32 last changes of flow. All the flags are reset on a software or a hardware reset, and after each transition from debug mode to user mode.

A memory mapped register of SDMA core, the Trace Buffer register (TB), is provided to read the content of the Trace Buffer. This operation should be done in debug mode. Performing a read access to the Trace Buffer register returns the content of the bottom of the Trace Buffer (cell #31). After every read access, the trace buffer is shifted one level down, and the flag at the top of the trace buffer is cleared.

A typical OnCE command sequence that retrieves the oldest change-of-flow information is a follows:

```
exec_once("mov r1, TB");                              // stores the oldest change-of-flow in
GReg1
dmov(-);                                          // retrieves GReg1 contents
```

This sequence requires the SDMA to be put in debug mode.

43.4.14.8.2 Real Time Buffer

The Real Time Buffer register (RTB) is a memory mapped register that can be accessed as a regular memory location by the SDMA core during program execution. This register is located in the OnCE.

Executing ar rbuffer command (see The OnCE Controller for further details) exports the content of this register through JTAG ports.

When a write access is performed at the memory location corresponding to the RTB, the receive flag (for example, the RCV bit) is set in the OnCE Status Register (OSR). This flag is cleared at the end of the execution of a rbuffer command.

NOTE

Every write access to the RTB memory location updates the RTB register even if the RCV flag is set. The RTB is cleared on a JTAG reset.

43.4.14.8.3 Emulation Pin

The debug_matched_event emulation pin reflects the matching condition status detected by the Event Detection Unit.

Since it can be necessary to detect conditions without triggering debug requests, it is possible to disable the generation of debug requests by the Event Detection Unit and still have the matching condition available on the emulation pin. This can be done by clearing the EN flag in the ECTL register.

43.4.14.8.4 Real-Time Debug Outputs

The table found here shows the debug signals that are available at the SDMA boundaries. Their availability at chip boundaries depends on the project.

Table 43-41. Real-Time Debug Output Pins

Pin	Description
debug_core_state[3:0]	The core_state bits reflect the state of the SDMA core. • The "Program" state is the usual instruction execution cycle. • The "Data" state is inserted when there are wait-states during a load or a store on the data bus (ld or st). • The "Change of Flow" state is the second cycle of any instruction that breaks the sequence of instructions (jumps and channel switching instructions). • The "Change of Flow in Loop" state is used when an error causes a hardware loop exit. • The "Debug" state means the SDMA is in debug mode. • The "Functional Unit" state is inserted when there are wait-states during a load or a store on the functional units bus (ldf or stf). • In "Sleep" modes, no script is running (this is the core idle state); the "after Reset" is slightly different because no context restoring phase will happen when a channel is triggered: The script located at address 0 is executed (boot operation). • The "in Sleep" states are the same as above except they do not have any corresponding channel: they are used when entering debug mode after reset; the reason is that it is necessary to return to the "Sleep after Reset" state when leaving debug mode. 0 Program 1 Data 2 Change of Flow 3 Change of Flow in Loop 4 Debug 5 Functional Unit 6 Sleep 7 Context Switch Saving Channel 8 Program in Sleep 9 Data in Sleep 10 Change of Flow in Sleep 11 Change of Flow in Loop in Sleep 12 Debug in Sleep 13 Functional Unit in Sleep 14 Sleep after Reset 15 Context Switch Restoring Channel
debug_yield	Pulse that is active when a yield (done 0) or a yieldge (done 1) instruction is executed. 0 - 1 yield/yieldge executed
debug_core_run	Active when the SDMA core is executing instructions. 0 Debug or sleep mode

Table continues on the next page...

Table 43-41. Real-Time Debug Output Pins (continued)

Pin	Description
	1 Run mode
debug_event_channel_sel	Indicates if debug_event_channel displays current channel or last received event 0- debug_event_channel[5:0] gives the number of the current channel 1- debug_event_channel[5:0] gives the number of the last received event
debug_event_channel[5:0]	Gives the number of any DMA request as soon as it is received or the number of the current channel. The value of debug_event_channel_sel indicates if debug_event_channel displays the current channel or last received event. The signal debug_event_channel_sel must be observed to determine what information is provided on debug_event_chanel at any given time.
debug_pc[13:0]	Program Counter value; it has a meaning when the core is in run mode.
debug_mode	Set when the core is in debug. 0 - 1 Core is in debug
debug_bus_error	Set when an error was received during a load or a store (ld, st, ldf, or stf instruction) and registered in SF or DF flag. 0 No error during last load/store 1 Error during last load/store
debug_bus_device[4:0]	Indicates the device or functional unit that is accessed by the current instruction. The debug_bus_device output is always valid when in sleep mode, debug mode, or executing any instruction that does not access the functional units or the memory mapped devices, "no access" is output. 0 No access 1 MSA 2 MDA 3 MD 4 MS 5 PSA 6 PDA 7 PD 8 PS 9 RESERVED 10 RESERVED 11 RESERVED 12 RESERVED 13 CA 14 CS 15 Reserved 16 Memory (RAM or ROM) 17 Memory mapped register

Table continues on the next page...

Table 43-41. Real-Time Debug Output Pins (continued)

Pin	Description
	18 Peripheral #1 19 Peripheral #2 20 Peripheral #3 21 Peripheral #4 22 Peripheral #5 23 Peripheral #6 24 Peripheral #7 25 Peripheral #8 26 Peripheral #9 27 Peripheral #10 28 Peripheral #11 29 Peripheral #12 30 Peripheral #13 31 Peripheral #14
debug_bus_rwb	Indicates the direction of the access given by debug_bus_device 0 Write access (st or stf) 1 Read access (ld or ldf)
debug_matched_dmbus	Pulse indicating the OnCE event detection unit has detected a match on the data bus during an access to memory (RAM or ROM), a memory mapped register or a peripheral that is hooked to the SDMA. 0 - 1 data bus match detected
debug_rtbuffer_write	Pulse indicating when the real-time buffer is written by the core. 0 - 1 RTB was modified
debug_evt_chn_lines[7:0]	Eight lines that generate short pulses when DMA requests are received or channels are (re)started. Every line is controlled through two parameters defined in registers Cross-Trigger Events Configuration Register 1 (SDMAARM_XTRIG_CONF1) (as described in SDMAARM). The following two parameters are available for every line: • CNF-Indicates what is monitored on the line: 0 for a channel start, 1 for a DMA request reception • NUM[5:0]-Gives the number of the DMA request or channel to monitor

The matched_event emulation pin reflects the matching condition status detected by the Event Detection Unit. Because it can be necessary to detect conditions without triggering debug requests, it is possible to disable the generation of debug requests by the Event Detection Unit and still have the matching condition available on the emulation pin. This can be done by clearing the EN flag in the ECTL register.

All real-time debug outputs are disabled by default (for example, they are stuck to 0) to avoid power consumption when they are not used. They are enabled when bit 11 (RTDOBS) of the Configuration Register (SDMAARM_CONFIG) is set. Signals provided to the system JTAG controller for SDMA debug mode status will also be enabled when the *clk_gating_off* input is asserted.

43.5 Instruction Set

43.5.1 Instruction Encoding

This section presents a short summary of the instruction codes. All context switch instructions are listed for information only; they cannot function properly out of the context switch routine.

```
x...x - don't care

rrr - destination/source general register

sss - additional source general register

bbb - general register used as address base register

ddddd - address displacement

nnnnn - bit number
uuuuuuuu - function unit command bits

pppppppp - branch displacement (signed)

iiiiiiii - 8-bit immediate

jjj - control bit to clear

ff - flag to clear

43.5.2 SDMA Instruction Set

This section describes all the useful instructions from the SDMA set.

Table 43-42. SDMA Instruction List

Instruction	Description	Page
ADD	Addition	ADD (Addition)
ADDI	Add with Immediate Value	ADDI (Add with Immediate Value)
AND	Logical AND	AND (Logical AND)
ANDI	Logical AND with Immediate Value	ANDI (Logical AND with Immediate Value)
ANDN	Logical AND NOT	ANDN (Logical AND NOT)
ANDNI	Logical AND with Negated Immediate Value	ANDNI (Logical AND with Negated Immediate Value)
ASR1	Arithmetic Shift Right by 1 Bit	ASR1 (Arithmetic Shift Right by 1 Bit)
BCLRI	Bit Clear Immediate	BCLRI1 (Bit Clear Immediate)
BDF	Conditional Branch if Destination Fault	BDF (Conditional Branch if Destination Fault)
BF	Conditional Branch if False	Functional Units Programming Model
BSETI	Bit Set Immediate	BSETI (Bit Set Immediate)
BSF	Conditional Branch if Source Fault	BSF (Conditional Branch if Source Fault)
BT	Conditional Branch if True	BT (Conditional Branch if True)
BTSTI	Bit Test immediate	BTSTI (Bit Test immediate)
CLRF	Clear ARM platform flags	CLRF (Clear ARM platform flags)
CMPEQ	Compare for Equal	CMPEQ (Compare for Equal)
CMPEQI	Compare with Immediate for Equal	CMPEQI (Compare with Immediate for Equal)
CMPHS	Compare for Higher or Same	CMPHS (Compare for Higher or Same)
CMPLT	Compare for Less Than	CMPLT (Compare for Less Than)
cpShReg	Update Context of PCU Registers and Flags	cpShReg (Update Context of PCU Registers and Flag)
DONE	DONE, Yield	DONE (DONE, Yield)
ILLEGAL	ILLEGAL Instruction	ILLEGAL (ILLEGAL Instruction)
JMP	Unconditional Jump Immediate	JMP (Unconditional Jump Immediate)
JMPR	Unconditional Jump	JMPR (Unconditional Jump)
JSR	Unconditional Jump to Subroutine Immediate	JSR (Unconditional Jump to Subroutine Immediate)
JSRR	Unconditional Jump to Subroutine	JSRR (Unconditional Jump to Subroutine)
LD	Load Register	LD (Load Register)
LDF	Load Register from Functional Unit	LDF (Load Register from Functional Unit)

Table continues on the next page...

Table 43-42. SDMA Instruction List (continued)

Instruction	Description	Page
LDI	Load Register with Immediate Value	LDI (Load Register with Immediate Value)
LDRPC	Load from RPC to Register	LDRPC (Load from RPC to Register)
LOOP	Hardware Loop	LOOP (Hardware Loop)
LSL1	Logical Shift Left by 1 Bit	LSL1 (Logical Shift Left by 1 Bit)
LSR1	Logical Shift Right by 1 Bit	LSR1 (Logical Shift Right by 1 Bit)
MOV	Logical Move	MOV (Logical Move)
NOTIFY	Notify to ARM platform	NOTIFY (Notify to ARM platform)
OR	Logical OR	OR (Logical OR)
ORI	Logical OR with Immediate Value	ORI (Logical OR with Immediate Value)
RET	Return from Subroutine	RET (Return from Subroutine)
REVB	Reverse Byte Order	REVB (Reverse Byte Order)
REVBLO	Reverse Low Order Bytes	Reverse Low Order Bytes(REVBLO)
ROR1	Rotate Right by 1 Bit	ROR1 (Rotate Right by 1 Bit)
RORB	Rotate Right by 1 Byte	RORB (Rotate Right by 1 Byte)
SOFTBKPT	Software Breakpoint	SOFTBKPT (Software Breakpoint)
ST	Store Register	ST (Store Register)
STF	Store Register in Functional Unit	STF (Store Register in Functional Unit)
SUB	Subtract	SUB (Subtract)
SUBI	Subtract with Immediate	SUBI (Subtract with Immediate)
TST	Test with Zero	TST (Test with Zero)
TSTI	Test Immediate	TSTI (Test Immediate)
XOR	Logical Exclusive OR	XOR (Logical Exclusive OR)
XORI	Exclusive OR with Immediate	XORI (Exclusive OR with Immediate)

43.5.2.1 ADD (Addition)

Operation:

```
GReg[r] ← GReg[s] + GReg[r]

T ← (GReg[r] == 0)
```

Assembler:

```
Syntax: add r,s

Example: add 0,3
```

ADD GReg[3] and GReg[0] and store the result in GReg[0]

CPU Flags: T

Cycles: 1

Description: Performs the ADDition of the source general register *s* and the destination general register *r*, and stores the result in the destination general register *r*. The T flag is set if the result of the operation is 0. It is cleared if the result is not 0.

Instruction Format:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	0	0	1	1	s	s	s

Instruction Fields:

rrr / sss - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.2 ADDI (Add with Immediate Value)

Operation:

```
GReg[r] ← GReg[r] + immediate

T ← (GReg[r] == 0)
```

Assembler:

```
Syntax: addi r,immediate

Example: add 6,112
```

ADD GReg[6] and decimal value 112 and store the result in GReg[6]

CPU Flags: T

Cycles: 1

Description: Adds a 0-extended immediate value to a general register; stores the result in the general register. The flag T is set when the result of the operation is 0; otherwise, it is cleared. The immediate value is the low-order byte of the instruction and has a maximum value of 255 (0xFF).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	1	1	r	r	r	i	i	i	i	i	i	i	i

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

iiiiiiii - immediate value:

```
00000000 - 0

00000001 - 1

 ...

11111110 - 254

11111111 - 255
```

43.5.2.3 AND (Logical AND)

Operation:

```
GReg[r] ← GReg[s] & GReg[r]
```

Assembler:

```
Syntax: and r,s

Example: and 1,2
```

AND GReg[1] and GReg[2] and store the result in GReg[1]

CPU Flags: Unaffected

Cycles: 1

Description: Performs the AND of the source general register *s* and the destination general register *r*, and stores the result in the destination general register *r*.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	0	1	1	1	s	s	s

Instruction Fields:

rrr / sss - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.4 ANDI (Logical AND with Immediate Value)

Operation:

```
GReg[r] ← GReg[r] & immediate
```

Assembler:

```
Syntax: andi r,immediate

Example: andi 7,45
```

AND GReg[7] and decimal value 45 and store the result in GReg[7]

CPU Flags: unaffected

Cycles: 1

Description: Performs an AND between a 0-extended immediate value and a general register; stores the result in the general register. The immediate value is the low-order byte of the instruction and has a maximum value of 255 (0xFF).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	1	1	r	r	r	i	i	i	i	i	i	i	i

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

iiiiiiii - immediate value:

```
00000000 - 0

00000001 - 1

...

11111110 - 254

11111111 - 255
```

43.5.2.5 ANDN (Logical AND NOT)

Operation:

```
GReg[r] ← ~GReg[s] & GReg[r]
```

Assembler:

```
Syntax:andn r,s

Example: andn 3,4
```

AND GReg[3] and NOT GReg[4] (bit inverted) and store the result in GReg[3]

CPU Flags: Unaffected

Cycles: 1

Description: Performs the AND of the negation of the source general register *s* and the destination general register *r*, and stores the result in the destination general register *r*.

Instruction Format:

Table 43-43. Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	0	1	1	0	s	s	s

Instruction Fields:

rrr /sss - destination register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.6 ANDNI (Logical AND with Negated Immediate Value)

Operation:

```
GReg[r] ← GReg[r] & ~immediate
```

Assembler:

```
Syntax: andni r,immediate

Example: andni 0,2
```

AND GReg[0] and decimal value -3 (inverted 32-bit value 2) and store the result in GReg[0]

CPU Flags: unaffected

Cycles: 1

Description: Performs an AND between the negation of a 0-extended 8-bit immediate value and a general register; stores the result in the general register. The immediate value is the low-order byte of the instruction and has a maximum value of 255 (0xFF).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	1	0	r	r	r	i	i	i	i	i	i	i	i

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

iiiiiiii - immediate value:

```
00000000 - 0

00000001 - 1

...

11111110 - 254

11111111 - 255
```

43.5.2.7 ASR1 (Arithmetic Shift Right by 1 Bit)

Operation:

```
GReg[r]:{b31,b30,...,b1,b0} ← GReg[r]:{b31,b31,b30,...,b1}
```

Assembler:

```
Syntax: asr1 r

Example: asr1 3
```

divide by 2 the signed value of GReg[3] and store the result in GReg[3]

CPU Flags: Unaffected

Cycles: 1

Description: Shift the bits of any general register to the right and keep the same sign: The left bit (bit 31) is kept untouched.

Instruction Format:

Table 43-44. Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	0	0	1	0	1	1	0

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.8 BCLRI1 (Bit Clear Immediate)

Operation:

```
GReg[r]:{b31,...,b(i+1),0,b(i-1),...,b0} ← GReg[r]:{b31,...,b(i+1),b(i),b(i-1),...,b0}
```

Assembler:

```
Syntax: bclri r,i

Example: bclri 1,12
```

clear bit 12 in GReg[1]

CPU Flags: Unaffected

Cycles: 1

Description: Clear the bit of register r specified by the 5-bit immediate field

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table continues on the next page...

0	0	0	0	0	r	r	r	0	0	1	i	i	i	i	i

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

iiiii - immediate value:

```
00000 - 0

00001 - 1

...

11110 - 30

11111 - 31
```

43.5.2.9 BDF (Conditional Branch if Destination Fault)

Operation:

```
if (DF == 1) PC ← PC + 1 + displacement else PC ← PC + 1
```

Assembler:

```
Syntax:bdf label

Example: bdf LLL
```

Jump to LLL if DF is set, or go to the next instruction if DF is cleared; the displacement value is calculated by the assembler.

CPU Flags: Unaffected

Cycles: 2 when the branch is done, 1 otherwise

Description: If flag DF is set, jump to the new address that is calculated by adding the sign-extended 8-bit displacement to the next PC address. If flag DF is cleared, no jump is performed: The next instruction is located at the next PC address.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	1	1	1	1	p	p	p	p	p	p	p	p

Instruction Fields:

ppppppp - signed displacement field:

```
00000000 - 0

00000001 - 1

...

01111110 - 126

01111111 - 127

10000000 - (-128)

10000001 - (-127)

...

11111110 - (-2)

11111111 - (-1)
```

43.5.2.10 BF (Conditional Branch if False)

Operation:

```
if (T == 0)

PC ← PC + 1 + displacement

else

PC ← PC + 1
```

Assembler:

```
Syntax: bf label

Example: bf LLL
```

Jump to LLL if T is cleared, or go to the next instruction if T is set. The displacement value is calculated by the assembler.

CPU Flags: Unaffected

Cycles: 2 when the branch is done, 1 otherwise

Description: Conditional branch: If flag T is cleared, jump to the new address that is calculated by adding the sign-extended 8-bit displacement to the next PC address. If flag T is set, no jump is performed: The next instruction is located at the next PC address.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	1	1	0	0	p	p	p	p	p	p	p	p

Instruction Fields:

pppppppp - signed displacement field:

```
00000000 - 0

00000001 - 1

...

01111110 - 126

01111111 - 127

10000000 - (-128)

10000001 - (-127)

...

11111110 - (-2)

11111111 - (-1)
```

43.5.2.11 BSETI (Bit Set Immediate)

Operation:

```
GReg[r]:{b31,...,b(i+1),1,b(i-1),...,b0} ← GReg[r]:{b31,...,b(i+1),b(i),b(i-1),...,b0}
```

Assembler:

```
Syntax: bseti r,i

Example: bseti 6,5
```

Set bit 5 in GReg[6]

CPU Flags: Unaffected

Cycles: 1

Description: Sets bit number i in the selected General Register.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	1	0	i	i	i	i	i

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

iiiii - bit number field:

```
00000 - 0

00001 - 1

...

11110 - 30

11111 - 31
```

43.5.2.12 BSF (Conditional Branch if Source Fault)

Operation:

```
if (SF == 1) PC ← PC + 1 + displacement else PC ← PC + 1
```

Assembler:

```
Syntax: bsf label

Example: bsf LLL
```

Jump to LLL if SF is set, or go to the next instruction if SF is cleared. The displacement value is calculated by the assembler.

CPU Flags: Unaffected

Cycles: 2 when the branch is done, 1 otherwise

Description: Conditional branch: If flag SF is set, jump to the new address that is calculated by adding the sign-extended 8-bit displacement to the next PC address. If flag SF is cleared, no jump is performed: The next instruction is located at the next PC address.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	1	1	1	0	p	p	p	p	p	p	p	p

Instruction Fields:

pppppppp - signed displacement field:

```
00000000 - 0

00000001 - 1

...

01111110 - 126

01111111 - 127

10000000 - (-128)

10000001 - (-127)

...

11111110 - (-2)

11111111 - (-1)
```

43.5.2.13 BT (Conditional Branch if True)

Operation

```
if (T == 1)

PC ← PC + 1 + displacement

else

PC ← PC + 1
```

Assembler

```
Syntax: bt label

bt LLL
```

Jump to LLL if T is set, or go to the next instruction if T is cleared. The displacement value is calculated by the assembler.

CPU Flags: Unaffected

Cycles: 2 when the branch is done, 1 otherwise

Description: Conditional branch: If flag T is set, jump to the new address that is calculated by adding the sign-extended 8-bit displacement to the next PC address. If flag T is cleared, no jump is performed: The next instruction is located at the next PC address.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	1	1	0	1	p	p	p	p	p	p	p	p

pppppppp - signed displacement field:

```
00000000 - 0

00000001 - 1

...

01111110- 126

01111111 - 127

10000000 - (-128)

10000001 - (-127)

...

11111110 -  (-2)

11111111 - (-1)
```

43.5.2.14 BTSTI (Bit Test immediate)

Operation:

```
T ← GReg[r]:b(i)
```

Assembler:

```
Syntax: btsti r,i

Example: btsti 2,29
```

Test bit 29 in GReg[2] and copy its value in flag T

CPU flags: T

Cycles: 1

Description: T is loaded with the value of bit number i from the selected general register.

Instruction Format:

Table 43-45. Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	1	1	i	i	i	i	i

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

iiiii - bit number field:

```
0000 - 0

0001 - 1

...

11110 - 30

11111 - 31
```

43.5.2.15 CLRF (Clear ARM platform flags)

Operation:

```
 if (ff%2 == 0)

SF ← 0

if (ff/2 == 0)

DF ← 0
```

Assembler:

```
Syntax: clrf ff

Example: clrf 2
```

Clear flag SF and keep flag DF unchanged

CPU Flags: SF, DF

Cycles: 1

Description: Clears a selection of the ARM platform fault flags: SF, DF, both SF and DF or none can be cleared.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	f	f	0	0	0	0	0	1	1	1

Instruction Fields:

ff - flags field:

```
00 - clear SF and clear DF

01 - clear DF

10 - clear

SF 11 - no clear
```

43.5.2.16 CMPEQ (Compare for Equal)

Operation:

```
T ← (GReg[s] == GReg[r])
```

Assembler:

```
Syntax: cmpeq r,s

Example: cmpeq 7,5
```

Compare GReg[7] and GReg[5] and set flag T if they are equal

CPU flags: T

Cycles: 1

Description: Subtracts the destination general register *r* from the source general register *s*, and sets T if the result is 0, clears T if the result is not 0.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	1	0	0	1	s	s	s

Instruction Fields:

rrr / sss - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.17 CMPEQI (Compare with Immediate for Equal)

Operation:

```
T ← (GReg[r] == immediate)
```

Assembler:

```
Syntax: cmpeqi r,immediate

Example: cmpeqi 2,13
```

Compare GReg[2] and decimal value 13 and set flag T if they are equal

CPU Flags: T

Cycles: 1

Description: Subtracts the 0-extended 8-bit immediate value from the general register, and sets T if the result is 0, clears T if the result is not 0. The immediate value is the low-order byte of the instruction.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	1	r	r	r	i	i	i	i	i	i	i	i

Instruction Fields:

rrr - destination register field:

```
000 - GReg[0]
```

```
001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

iiiiiiii - immediate value:

```
00000000 - 0

00000001 - 1

...

11111110 - 254

11111111 - 255
```

43.5.2.18 CMPHS (Compare for Higher or Same)

Operation:

```
T ← (GReg[r] ≥ GReg[s])
```

Assembler:

```
Syntax: cmphs r,s

Example: cmphs 0,1
```

Compare GReg[0] and GReg[1] and set flag T if GReg[0] is higher than or equal to GReg[1]

CPU Flags: T

Cycles: 1

Description: Compares the destination general register *r* and the source general register *s*, and sets T if the destination general register *r* is higher than or equal to the source general register *s*, clears T otherwise. The comparison is unsigned.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	1	0	1	1	s	s	s

Instruction Fields:

rrr / sss - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.19 CMPLT (Compare for Less Than)

Operation:

```
T ← (GReg[r] < GReg[s])
```

Assembler:

```
Syntax: cmplt r,s

Example: cmplt 7,4
```

Compare GReg[7] and GReg[4] and set flag T if GReg[7] is lower than GReg[4]

CPU Flags: T

Cycles: 1

Description: Compares the destination general register *r* and the source general register *s*, and sets T if the destination general register *r* is lower than the source general register *s*, clears T otherwise. The comparison is signed.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	1	0	1	0	s	s	s

rrr / sss - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]
```

```
011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.20 cpShReg (Update Context of PCU Registers and Flag)

Assembler:

```
Syntax: cpShReg
```

CPU Flags: none

Cycles: 1

Description: SF, RPC, T, PC,LM, EPC, DF, and SPC registers are updated according to the value of their corresponding bits in the context memory. This instruction must only be used in debug mode via the OnCE. It reverses the done *5* operation.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	1	0	1	1	1	0	0	0	1	0

43.5.2.21 DONE (DONE, Yield)

Operation:

```
if (jjj&6 == 2) HE[CCR] ← 0

if (jjj == 3) HI[CCR] ← 1

if (jjj == 4) EP[CCR] ← 0

if ((jjj == 0) && (NCP > CCP)) CCR ← NCR

else if ((jjj == 1) && (NCP >= CCP))

CCR ← NCR

else

CCR ← NCR
```

(CCR stands for Current Channel Register; NCR stands for Next Channel Register)

Assembler:

```
Syntax: done jjj

Example: done 3
```

Clear HE bit for the current channel, send an interrupt to the ARM platform for the current channel and reschedule.

CPU Flags: Unaffected

Cycles: Variable if a context switch is done, 1 otherwise

Description: Clears one of the channel enabling bits (HE or EP for the corresponding channel number) if required. Sends an interrupt to the corresponding ARM platform by setting the appropriate flag, if required (HI for the corresponding channel number). Reschedules according to the mode and the NCP (Next Channel Priority) and CCP (Current Channel Priority) values. According to the scheduling decision, the NCR (Next Channel Register) is copied to the CCR (Current Channel Register) and channel contexts are switched. If several channels with the same highest priority are pending, they are ordered by their number from 31 down to 0. The higher number is selected (for example, channel 26 is selected if channels 3, 12, 14, and 26 with the same highest priority are pending). If no flag is modified, the reschedule can allow the replacement of the current channel by another channel with a priority strictly greater than the current channel priority (yield). Or, it can allow the replacement of the current channel by another channel with a priority greater than or equal to the current channel priority (yieldge). In the latter case, the selected channel will always be the first one with the same priority, starting from channel number 31 down to channel 0 (the current channel does not belong to the set of selectable channels).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	j	j	j	0	0	0	0	0	0	0	0

jjj - Channel Flags field:

000 - No channel flags affected: Reschedule only if the next channel priority is greater than current channel priority (yield)

001 - No channel flags affected: Reschedule only if the next channel priority is greater than or equal to the current channel priority (yieldge)

010 - Clear HE for the current channel and reschedule 011 - Clear HE, set HI for the current channel and reschedule 100 - Clear EP for the current channel and reschedule

101 - Reserved for debug to copy relevant registers into context memory

110 - RESERVED

111 - RESERVED

For the scheduling rules, refer to Scheduler Functional Description. Every possible done instruction is further described as follows:

- done 0/yield is executed by a channel script when it accepts preemption by a higher priority channel;
- done 1/yieldge is executed by a channel script when it accepts preemption by a higher priority channel and it also accepts a roll-up with other channels that have the same priority;
- done 2 is executed by a channel script that was triggered by a ARM platform start via the Channel Start (SDMAARM_HSTART) register, when its task is completed and it requires termination;
- done 3 is executed by a channel script that was triggered by a ARM platform start via the Channel Start (SDMAARM_HSTART) register, when its task is completed, it requires termination and it needs to trigger an interrupt to the ARM platform upon closure;
- done 4 is executed by a channel script that was triggered by a DMA request, when its task is completed and it requires termination;
- done 5 is used in debug mode only; it copies the PCU registers and flags to the context memory of the current channel;

43.5.2.22 ILLEGAL (ILLEGAL Instruction)

Operation:

```
PC ← 0001
```

Assembler:

```
Syntax: illegal
```

CPU Flags: Unaffected

Cycles: 2

Description: Jumps to the Illegal instruction routine located at address 0001. All unauthorized instructions result in an Illegal instruction behavior; however, the ILLEGAL instruction must be used to guarantee software compatibility with future versions of the SDMA.

Instruction Format

Table 43-46. Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1

43.5.2.23 JMP (Unconditional Jump Immediate)

Operation:

```
PC ← absolute_address
```

Assembler:

```
Syntax: jmp label

Example: jmp LLL
```

The assembler translates the label to the exact address

CPU Flags:Unaffected

Cycles: 2

Description: Jumps to the absolute address contained the lower 14 bits of the instruction (the PC is a 14-bit register).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	a	a	a	a	a	a	a	a	a	a	a	a	a	a

aaaaaaaaaaaaaa - address field:

```
00000000000000 - 0

00000000000001 - 1

...

11111111111110 - 16382

11111111111111 - 16383
```

43.5.2.24 JMPR (Unconditional Jump)

Operation:

```
PC ← GReg[r]
```

Assembler:

```
Syntax: jmpr r

Example: jmpr 0
```

Jump to address stored in GReg[0]

CPU Flags: Unaffected

Cycles: 2

Description: Jumps to the absolute address contained in a General Register.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	0	0	0	1	0	0	0

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.25 JSR (Unconditional Jump to Subroutine Immediate)

Operation:

```
RPC ← PC + 1

PC ← absolute_address
```

Assembler:

```
Syntax: jsr r

Example:jsr LLL
```

Jumps to subroutine starting at LLL; the assembler translates the label to exact address

CPU Flags: Unaffected

Cycles: 2

Description: Jumps to the subroutine located at the absolute address contained the lower 14 bits of the instruction (the PC is a 14-bit register).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	a	a	a	a	a	a	a	a	a	a	a	a	a	a

aaaaaaaaaaaaaa - address field:

```
00000000000000 - 0

00000000000001 - 1

...

11111111111110 - 16382

11111111111111 - 16383
```

43.5.2.26 JSRR (Unconditional Jump to Subroutine)

Operation:

```
RPC ← PC + 1

PC ← GReg[r]
```

Assembler:

```
Syntax: jsrr r

Example:jsrr 5
```

Jumps to subroutine located at address stored in GReg[5]

CPU Flags: Unaffected

Cycles: 2

Description: Jumps to the subroutine at address contained in a General Register

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	0	0	0	1	0	0	1

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.27 LD (Load Register)

Operation:

```
GReg[r] ← [GReg[b] + displacement]

if (transfer_error)

SF ← 1

else

SF ← 0
```

Assembler:

```
Syntax: ld r,(b,displacement)

Example: ld 1,(2,23)
```

Loads data into GReg[1]; the data is located at address obtained by adding decimal value 23 to GReg[2]

CPU Flags: SF

Cycles: 2+n where n is 0 for ROM, RAM or memory mapped registers, and n is the number of wait-states of the peripheral for a peripheral access

Description: Adds a 5-bit 0-extended displacement to a base address in General Register b; the result is the address of the data to fetch on the DM bus. The data received from the bus is stored in the destination General Register r. If an error occurs during the transfer, the flag SF is set, else it is cleared.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	1	0	r	r	r	d	d	d	d	d	b	b	b

rrr / bbb - register field:

```
000 - GReg[0]

001 - GReg[1]

...

111 - GReg[7]
```

ddddd - displacement value:

```
00000 - 0

00001 - 1

...

11111 - 31
```

43.5.2.28 LDF (Load Register from Functional Unit)

Operation:

```
GReg[r] ← [fu_address]

if (transfer_error)

SF ← 1

else

SF ←0
```

fu_address is an 8-bit field and depends on addressed functional unit

Assembler:

```
Syntax: ldf r,fu_address

Example: ldf 0,13
```

Loads data coming from the Burst DMA register MD into GReg[0]; it is a 32-bit access with no prefetch

CPU Flags: SF

Cycles: 1+n where n is the number of wait-states that may be inserted by the functional unit

Description: Sends an 8-bit address on the Functional Unit Bus (FU bus) and stores the data received from the bus in the destination General Register r. If an error occurs during the transfer, the flag SF is set, else it is cleared.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	0	0	r	r	r	f	f	f	f	f	f	f	f

See the following sections for more details of the LDF instruction usage with each functional unit:

- Burst DMA Read (ldf) for Burst DMA
- Peripheral DMA Read (ldf)-Read Mode for Peripheral DMA

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

ffffffff - functional unit source register and action (unspecified values are reserved):

```
00000000 - MSA

00000100 - MDA

00001001 - MD byte

00001010 - MD halfword

00001011 - MD word

00001100 - MS

00101001 - MD byte - prefetch

00101010 - MD halfword - prefetch

00101011 - MD word - prefetch

01000000 - DSA
```

```
11000000 - PSA

11001000 - PD

11010000 - PDA

11011000 - PD in copy mode (rrr contents are lost)

11101000 - PD - prefetch next data

11111111 - PS
```

43.5.2.29 LDI (Load Register with Immediate Value)

Operation:

```
GReg[r] ← immediate
```

Assembler:

```
Syntax: ldi r,immediate

Example: ldi 6,1
```

loads decimal value 1 into GReg[6]

CPU Flags: Unaffected

Cycles: 1

Description: Stores a 0-extended immediate value in a General Register. The immediate value is the low-order byte of the instruction and has a maximum value of 255 (0xFF).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	1	r	r	r	i	i	i	i	i	i	i	i

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]
```

110 - GReg[6]

111 - GReg[7]

iiiiiiii - immediate value:

00000000 - 0

00000001 - 1

...

11111110 - 254

11111111 - 255

43.5.2.30 LDRPC (Load from RPC to Register)

Operation:

GReg[r] ← RPC

Assembler:

Syntax: ldrpc r

Example: ldrpc 3

copies RPC to GReg[3]

CPU Flags: Unaffected

Cycles: 1

Description: Stores the contents of the RPC in a General Register. That instruction may be used to have more than one level of subroutines.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	0	0	0	1	0	1	0

Instruction Fields:

rrr - register field:

000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

```
101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.31 LOOP (Hardware Loop)

Operation:

```
if (ff%2 == 0)
   SF ← 0
if (ff/2 == 0)
  DF ← 0
if ((GReg[0] == 0) || (SF == 1) || (DF == 1))
   PC ← PC + loop_size + 1
else
   {
      SPC ← PC + 1
      EPC ← PC + loop_size + 1
      LM ← 1
      PC ← PC + 1
   }
```

during every instruction execution in the loop:

```
if ((SF == 1) || (DF == 1))
 {
    LM ← 0
    PC ← EPC
  }
else if ((PC + 1) == EPC)
 {
    GReg[0] ← GReg[0] - 1
    if (GReg[0] == 0)
      {
         LM ← 0
         PC ← EPC
```

```
       }
     else
         PC ← SPC
   }
else
  PC ← nextPC(instruction)
```

after the execution of the last instruction of the loop body:

```
if (GReg[0] == 0)
   T ← 1
else
   T ← 0
```

Assembler:

```
Syntax: loop n{,ff}
Example: loop 3,1
```

Executes GReg[0] times the instructions comprised between PC+1 and PC+3 (included); ff=1 clears the DF flag before starting the loop. When omitted, the ff field is set to 0 (clearing both SF and DF).

CPU Flags: LM[1:0], T

Cycles: 2 when the loop count (GReg[0]) is 0 or SF or DF is set at loop start, 1+1 when the loop starts but exits abnormally (SF or DF set inside the loop which adds 1 cycle to the offending load or store to jump to EPC), 1 when the loop is executed normally

Description: The loop instruction executes a sequence of instructions several times. The number of times is given by the contents of GReg[0], the loop counter. SDMA will jump to the first instruction after the end of the loop if the value in GReg[0] is 0. Otherwise the SDMA enters loop mode. It sets the most significant bit of the LM flag that will only be reset once the last instruction of the last loop is executed. The instructions in the loop are executed GReg[0] times. The management of fault flags (SF and DF) is as follows. When entering the hardware loop, SF and DF can be cleared according to the ff field of the instruction. After that operation, if any flag is still set the loop will not be executed. The SDMA will jump to the first instruction after the end of the loop without entering loop mode. During the execution of the loop, if any fault flag is set by a LD, LDF, ST, or STF instruction, the SDMA will immediately exit loop mode and jump to the first instruction after the end of the loop. In that case, GReg0 is not decremented for that last piece of the loop body execution (even if the SF or DF flag is set at the last instruction of the loop body). The T flag reflects the state of GReg[0] after the end of the loop, which is an indicator of the complete execution of the loop. If the loop exited because of an error (SF

or DF set), GReg[0] will not be 0 at the end of the loop, hence T will be cleared. If the loop executes without fault, GReg[0] will be 0 at the end of the loop, hence T will be set. The boundary case when a source or destination fault occurs at the last instruction of the last loop is considered as an anticipated exit of the loop, which causes the T flag to be cleared. If the last instruction executed before leaving the hardware loop also tries to modify the T flag, the flag is updated according to the value of GReg[0], NOT according to the result of the last executed instruction.

Limitations:

1. 1. Jump instructions (JMP, JMPR, JSR, JSRR, BF, BT, BSF, BDF) are not allowed inside the hardware loop.
2. 2. GReg[0] cannot be written to inside the hardware loop (it can be read).
3. 3. The empty loop (0 instruction in the body) is forbidden.
4. 4. If GReg[0] == 0 at the start of the loop, which causes a jump to EPC, the T flag is not updated.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	1	0	f	f	n	n	n	n	n	n	n	n

Instruction Fields:

```
ff - flags field:

00 - clear SF and clear DF

01 - clear DF

10 - clear SF

11 - no clear
```

nnnnnnnn - loop size

```
00000000 - empty loop: forbidden value

00000001 - 1 instruction in the loop

00000010 - 2 instructions in the loop

...

11111111 - 255 instructions in the loop
```

43.5.2.32 LSL1 (Logical Shift Left by 1 Bit)

Operation:

```
GReg[r]:{b30,...,b1,b0,0} ← GReg[r]:{b31,b30,...,b1,b0}
```

Assembler:

```
Syntax: lsl1 r

Example: lsl1 2
```

multiplies by 2 the value in GReg[2]

CPU Flags: Unaffected

Cycles: 1

Description: Shift the bits of any General Register to the left. The right bit (bit 0) is set to 0. No overflow is detected by the hardware.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	0	0	1	0	1	1	1

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.33 LSR1 (Logical Shift Right by 1 Bit)

Operation:

```
GReg[r]:{0,b31,b30,...,b1} ← GReg[r]:{b31,b30,...,b1,b0}
```

Assembler:

```
Syntax: lsr1 r

Example: lsr1 4
```

divides by 2 the unsigned value contained in GReg[4]

CPU Flags: Unaffected

Cycles: 1

Description: Shift the bits of any General Register to the right. The left bit (bit 31) is set to 0.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	0	0	1	0	1	0	1

Instruction Fields:

rrr - destination register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.34 MOV (Logical Move)

Operation:

```
GReg[r] ← GReg[s]
```

Assembler:

```
Syntax: mov r,s

Example: mov 4,0
```

copies GReg[0] to GReg[4]

CPU Flags: Unaffected

Cycles: 1

Description: Move the contents of the source General Register s to the destination General Register r.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	0	0	0	1	s	s	s

Instruction Fields:

rrr / sss - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.35 NOTIFY (Notify to ARM platform)

Operation:

```
 if (jjj & 4 == 0)
 {
   if (jjj&2 == 2)
      HE[CCR] ← 0
   if (jjj&1== 1)
       HI[CCR] ← 1
  }
else if (jjj == 4)
   EP[CCR] ← 0
else
```

(CCR stands for Current Channel Register)

Assembler:

```
Syntax: notify jjj

Example: notify 3
```

clears the HE bit for the current channel and sends an interrupt to the Host for the current channel

CPU Flags: Unaffected

Cycles: 1

Description: Clears one of the channel enabling bits (HE or EP for the corresponding channel number) if required, sends an interrupt to the corresponding ARM platform by setting the appropriate flag if required (HI for the corresponding channel number).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	j	j	j	0	0	0	0	0	0	0	1

jjj - Channel Flags field:

```
000 - unused

001 - set HI for the current channel

010 - clear HE for the current channel

011 - clear HE, set HI for the current channel

100 - clear EP for the current channel

101 - RESERVED

110 - RESERVED

111 - RESERVED
```

43.5.2.36 OR (Logical OR)

Operation:

```
GReg[r] ← GReg[s] | GReg[r]
```

Assembler:

```
Syntax: or r,s

Example: or 3,6
```

ORs GReg[3] and GReg[6] and stores the result in GReg[3]

CPU Flags: Unaffected

Cycles: 1

Description: Performs the OR of the source General Register s and the destination General Register r, and stores the result in the destination General Register r.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	0	1	0	1	s	s	s

Instruction Fields:

rrr / sss - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.37 ORI (Logical OR with Immediate Value)

Operation:

```
GReg[r] ← GReg[r] | immediate
```

Assembler:

```
Syntax: ori r,immediate

Example: ori 1,56
```

ORs GReg[1] and the decimal value 56 and stores the result in GReg[1]

CPU Flags: unaffected

Cycles: 1

Description: Performs an OR between a 0-extended 8-bit immediate value and a General Register; stores the result in the General Register. The immediate value is the low-order byte of the instruction and has a maximum value of 255 (0xFF).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	0	1	r	r	r	i	i	i	i	i	i	i	i

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

iiiiiiii - immediate value:

```
00000000 - 0

00000001 - 1

...

11111110 - 254

11111111 - 255
```

43.5.2.38 RET (Return from Subroutine)

Operation:

```
PC ← RPC
```

Assembler:

```
Syntax: ret
```

CPU Flags: Unaffected

Cycles: 2

Description: Return from subroutine.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0

43.5.2.39 REVB (Reverse Byte Order)

Operation:

```
GReg[r]:{B3,B2,B1,B0} ← GReg[r]:{B0,B1,B2,B3}
```

Assembler:

```
Syntax: revb r

Example:  revb 5
```

reverses bytes order in GReg[5]

CPU Flags: Unaffected

Cycles: 1

Description: Reverse the byte order of any General Register.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	0	0	1	0	0	0	0

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.40 Reverse Low Order Bytes(REVBLO)

Operation:

```
GReg[r]:{B3,B2,B0,B1} ← GReg[r]:{B3,B2,B1,B0}
```

Assembler:

```
Syntax: revblo r

Example: revblo 0
```

reverses low order bytes in GReg[0]

CPU Flags: Unaffected

Cycles: 1

Description: Reverse both low order bytes of any General Register.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	0	0	1	0	0	0	1

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.41 ROR1 (Rotate Right by 1 Bit)

Operation:

```
GReg[r]:{b0,b31,b30,...,b1} ← GReg[r]:{b31,b30,...,b1,b0}
```

Assembler:

```
Syntax: ror1 r

Example: ror1 3
```

rotates bits to the right in GReg[3]

CPU Flags: Unaffected

Cycles: 1

Description: Rotate the bits of any General Register to the right.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	0	0	1	0	1	0	0

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.42 RORB (Rotate Right by 1 Byte)

Operation:

```
GReg[r]:{B0,B3,B2,B1} ← GReg[r]:{B3,B2,B1,B0}
```

Assembler:

```
Syntax: rorb r

Example: rorb 2
```

rotates bytes to the right in GReg[2]

CPU Flags: Unaffected

Cycles: 1

Description: Rotate the bytes of any General Register to the right.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	0	0	0	1	0	0	1	0

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.43 SOFTBKPT (Software Breakpoint)

Operation:

Stops the current script and enters debug mode

Assembler:

```
softbkpt
```

CPU Flags: Unaffected

Description: When the core executes this instruction, it has the same effect as receiving a debug request from the OnCE or via the external debug request input: the script execution halts, the PCU enters its debug state and waits for the OnCE commands that are described in OnCE and Real-Time Debug.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1

43.5.2.44 ST (Store Register)

Operation:

```
[GReg[b] + displacement] ← GReg[r]

if (transfer_error)
```

```
 DF ← 1

 else

DF ← 0
```

Assembler:

```
Syntax: st r,(b,displacement)

Example: st 7,(0,9)
```

stores the value from GReg[7] into memory at address obtained by adding decimal value 9 to GReg[0]

CPU Flags: DF

Cycles: 2+n where n is 0 for ROM, RAM or memory mapped registers, and n is the number of wait-states of the peripheral for a peripheral access

Description: Adds a 5-bit 0-extended displacement to a base address in General Register b; the result is the address of the data to store on the DM bus. The data sent on the bus comes from the source General Register r. If an error occurs during the transfer, the flag DF is set, else it is cleared.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	1	1	r	r	r	d	d	d	d	d	b	b	b

Instruction Fields:

rrr / bbb - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

ddddd - displacement value:

```
00000 - 0

00001 - 1
```

```
...

11111 - 31
```

43.5.2.45 STF (Store Register in Functional Unit)

Operation:

```
[fu_address] ← GReg[r] 0

if (transfer_error) 0

DF ← 1 0

else 0

DF ← 0
```

fu_address is an 8-bit field

Assembler:

```
Syntax: stf r,fu_address

Example: stf 3,0x2B
```

stores the 32-bit contents of GReg[3] to the Burst DMA register MD; waits until the flush to external memory is completed

CPU Flags: DF

Cycles: 1+n where n is the number of wait-states that may be inserted by the functional unit

Description: Sends an 8-bit address on the Functional Unit Bus (FU bus) and sends the contents of the source General Register r on the bus. If an error occurs during the transfer, the flag DF is set, else it is cleared.

Table 43-47. Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	0	1	r	r	r	f	f	f	f	f	f	f	f

See the following sections for more details of the STF instruction usage with each functional unit:

- Burst DMA Write (stf) for Burst DMA
- Peripheral DMA Write (stf)-Write Mode for Peripheral DMA

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

ffffffff - functional unit destination register and action (unspecified values are reserved):

00000000 - MSA in incremented mode

00000100 - MDA in incremented mode

00001001 - MD byte

00001010 - MD halfword

00001011 - MD word

00001100 - clear MS error flag

00001111 - MS

00010000 - MSA in frozen mode

00010100 - MDA in frozen mode

00011000 - MD in copy mode - number of words in rrr

00100000 - MSA in incremented mode - start prefetch

00101000 - MD no data - flush

00101001 - MD byte - flush

00101010 - MD halfword - flush

00101011 - MD word - flush

00110000 - MSA in frozen mode - start prefetch

11000001 - PSA in frozen mode - 8-bit data width

11000010 - PSA in frozen mode - 16-bit data width

11000011 - PSA in frozen mode - 32-bit data width

11000101 - PSA in incremented mode - 8-bit data width

11000110 - PSA in incremented mode - 16-bit data width

11000111 - PSA in incremented mode - 32-bit data width

11001000 - PD

11001001 - PSA in decremented mode - 8-bit data width

11001010 - PSA in decremented mode - 16-bit data width

11001011 - PSA in decremented mode - 32-bit data width

11001100 - clear PS error flag

11001101 - PSA data width becomes 8-bit

11001110 - PSA data width becomes 16-bit

11001111 - PSA data width becomes 32-bit

11010001 - PDA in frozen mode - 8-bit data width

11010010 - PDA in frozen mode - 16-bit data width

11010011 - PDA in frozen mode - 32-bit data width

11010101 - PDA in incremented mode - 8-bit data width

11010110 - PDA in incremented mode - 16-bit data width

11010111 - PDA in incremented mode - 32-bit data width

11011001 - PDA in decremented mode - 8-bit data width

11011010 - PDA in decremented mode - 16-bit data width

11011011 - PDA in decremented mode - 32-bit data width

11011101 - PDA data width becomes 8-bit

11011110 - PDA data width becomes 16-bit

11011111 - PDA data width becomes 32-bit

11100001 - PSA in frozen mode - 8-bit data width - prefetch data

11100010 - PSA in frozen mode - 16-bit data width - prefetch data

11100011 - PSA in frozen mode - 32-bit data width - prefetch data

11100101 - PSA in incremented mode - 8-bit data width - prefetch data

11100110 - PSA in incremented mode - 16-bit data width - prefetch data

11100111 - PSA in incremented mode - 32-bit data width - prefetch data

11101001 - PSA in decremented mode - 8-bit data width - prefetch data

11101010 - PSA in decremented mode - 16-bit data width - prefetch data

11101011 - PSA in decremented mode - 32-bit data width - prefetch data

11101101 - PSA data width becomes 8-bit - prefetch data

11101110 - PSA data width becomes 16-bit - prefetch data

11101111 - PSA data width becomes 32-bit - prefetch data

11111111- PS

43.5.2.46 SUB (Subtract)

Operation:

```
GReg[r] ← GReg[r] - GReg[s]

T ← (GReg[r] == 0)
```

Assembler:

```
Syntax: sub r,s

Example: sub 4,7
```

SUBtracts GReg[7] from GReg[4] and stores the result in GReg[4]

CPU Flags: T

Cycles: 1

Description: Subtracts the source General Register s from the destination General Register r, and stores the result in the destination General Register r. The T flag is set if the result of the operation is 0; it is cleared if the result is not 0.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	0	1	0	0	s	s	s

Instruction Fields:

rrr / sss - register fields:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.47 SUBI (Subtract with Immediate)

Operation:

```
GReg[r] ← GReg[r] - immediate

T ← (GReg[r] == 0)
```

Assembler:

```
Syntax: sub r,immediate

Example: sub 1,255
```

SUBtracts decimal value 255 from GReg[1] and stores the result in GReg[1]

CPU Flags: T

Cycles: 1

Description: Subtracts a 0-extended 8-bit immediate value from a General Register; stores the result in the General Register. The flag T is set when the result of the operation is 0; otherwise, it is cleared. The immediate value is the low-order byte of the instruction and has a maximum value of 255 (0xFF).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	0	0	r	r	r	i	i	i	i	i	i	i	i

Instruction Fields:

rrr - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

iiiiiiii - immediate value:

```
00000000 - 0

00000001 - 1

...

11111110 - 254

11111111 - 255
```

43.5.2.48 TST (Test with Zero)

Operation:

```
T ← ((GReg[s] & GReg[r]) != 0)
```

Assembler:

```
Syntax: tst r,s

Example: tst 2,3
```

ANDs GReg[2] and GReg[3] and sets T if the result is non-null

CPU Flags: T

Cycles: 1

Description: Performs the AND of the source General Register s and the destination General Register r, and sets T if the result is not 0, clears T if the result is 0.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	1	0	0	0	s	s	s

Instruction Fields:

rrr / sss - register field:

```
000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

43.5.2.49 TSTI (Test Immediate)

Operation:

```
T ← ((GReg[r] & immediate) != 0)
```

Assembler:

```
Syntax: tsti r,immediate

Example: tsti 5,13
```

ANDs GReg[5] and decimal value 13 and sets T if the result is non-null

CPU Flags: T

Cycles: 1

Description: Performs the AND of a 0-extended 8-bit immediate value and the destination General Register r, and sets T if the result is not 0, clears T if the result is 0. The immediate value is the low-order byte of the instruction and has a maximum value of 255 (0xFF).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	r	r	r	i	i	i	i	i	i	i	i

Instruction Fields:

rrr - destination register field:

```
000 - GReg[0]
```

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]

iiiiiiii - immediate value:

00000000 - 0

00000001 - 1

...

11111110 - 254

11111111 - 255

43.5.2.50 XOR (Logical Exclusive OR)

Operation:

GReg[r] ← GReg[s] ^ GReg[r]

Assembler:

Syntax: xor r,s

Example: xor 0,3

XORs GReg[0] and GReg[3] and stores the result in GReg[0]

CPU Flags: Unaffected

Cycles: 1

Description: Performs the eXclusive OR of the source General Register s and the destination General Register r, and stores the result in the destination General Register r.

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	r	r	r	1	0	0	1	0	s	s	s

Instruction Fields:

rrr / sss - register field:

000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]

43.5.2.51 XORI (Exclusive OR with Immediate)

Operation:

GReg[r] ← GReg[r] ^ immediate

Assembler:

Syntax: xori r,immediate

Example: xor 7,5

XORs GReg[5] and decimal value 5 and stores the result in GReg[7]

CPU Flags: Unaffected

Cycles: 1

Description: Performs an eXclusive OR between a 0-extended 8-bit immediate value and a General Register; stores the result in the General Register. The immediate value is the low-order byte of the instruction and has a maximum value of 255 (0xFF).

Instruction Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	1	0	r	r	r	i	i	i	i	i	i	i	i

Instruction Fields:

rrr - register field:

000 - GReg[0]

001 - GReg[1]

010 - GReg[2]

011 - GReg[3]

```
100 - GReg[4]

101 - GReg[5]

110 - GReg[6]

111 - GReg[7]
```

iiiiiiii - immediate value:

```
00000000 - 0

00000001 - 1

...

11111110 - 254

11111111 - 255
```

43.5.2.52 YIELD, YIELDGE (DONE, Yield)

By default, unsupported assembler syntax. Can be aliased to the corresponding done instructions (yield = done 0; yieldge = done 1). Refer to the done instruction description DONE (DONE, Yield) .

43.6 Software Restrictions

43.6.1 Unsupported Burst DMA Access Sequence

The SDMA does not support triggering a pre-fetch followed by a flush of the Burst DMA without reading or writing any data. If the flush occurs while the background pre-fetch DMA operation is still in progress, it could result in un-defined behavior.

An example of the sequence which could result in undefined results is shown in the following example:

Instruction sequence not supported

```
stf r1, MSA|PF          ; Update source address, triggers data pre-fetch in the
                        ; background
mov R0,R0               ; Execute multiple assembly instructions, none of which
                        ; read
mov R0,R0               ; or write data to/from MD
stf MD|SZ0|FL           ; Flush FIFO without writing data. If the pre-fetch is still
                        ; in progress when this instruction is executed, there
                        ; could be undefined operation
```

A work-around to avoid any undesirable results is to first read MD to ensure the pre-fetch is complete before the flush is attempted.

Work-Around to previous example

```
stf r1, MSA|PF          ; Update source address, triggers data pre-fetch.
mov R0,R0               ; Execute multiple assembly instructions, none of which
                        ; read
mov R0,R0               ; or write data to/from MD
ldf r2, MD              ; dummy read of MD to ensure pre-fetch is complete
                        ; before the next instruction
stf MD|SZ0|FL           ; Flush FIFO without writing data
```

43.7 Application Notes

43.7.1 Data Structures for Boot Code and Channel Scripts

SDMA boot code downloads the different channel contexts and the scripts that will be executed on SDMA channels during the application.

The boot code is run after reset when channel 0 is started by the ARM platform. The boot code is also known as channel 0 script.

The boot code is based on the Channel Control Block (CCB) and Buffer Descriptor (BD) mechanisms that are data structures located into the ARM platform memory space. With these data structures, it is possible to instruct SDMA to download scripts and contexts but also to dump a context or a script to a destination data buffer. Channel scripts also use the CCB and BD data structures to pass instructions and/or pointers to data to be copied.

The format, processing, and field definition of the CCB and BD are defined and performed entirely by the software script rather than the SDMA hardware. An overview of the format and structure is provided here, but for complete details refer to the SDMA software documentation (see SDMA Scripts).

The CCB and BD data structures are accessed by SDMA using DMA and processed by the SDMA scripts. The ROM contains common sub-routines for processing these data structures which may be called by the bootload and channel scripts.

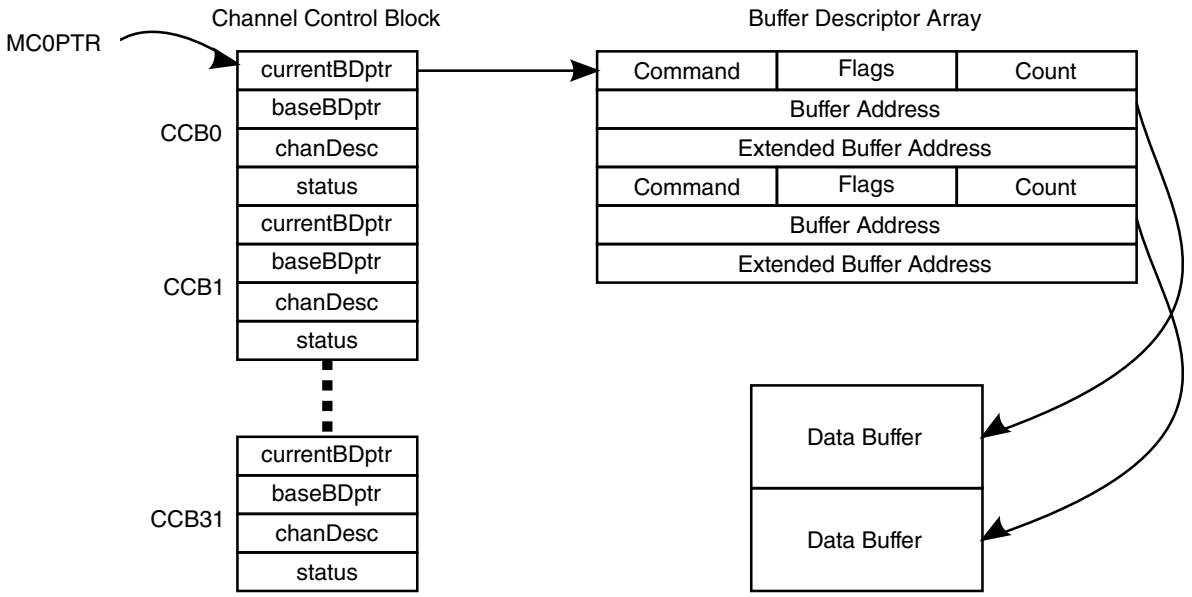

Figure 43-16. Data Structures Layout

The previous figure shows an example how these data structures are linked to pass command and pointers to data buffers. The SDMA's MC0PTR register holds the base address of the Channel 0 Control Block (CCB0). The Channel 0 control block holds a pointer to the array of buffer descriptors. The buffer descriptors are used to tell the channel 0 (boot channel) what to do as described Buffer Descriptor Format.

43.7.1.1 Buffer Descriptor Format

Buffer descriptors are three longs (32-bit words) in size as, shown in the figure found here.

A buffer descriptor describes the properties of the data buffer it points to. The buffer descriptors can be used for linear or circular data buffers in the ARM platform processor memory. The CCB contains a pointer to the base BD as well as the current BD.

Table 43-48. Buffer Descriptor

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Buffer Address																															
Extended Buffer Address																															

Table 43-49. Buffer Descriptor Field Descriptions

Field	Description
31-24 Command	Command. The command field is used to differentiate operations performed within a script when the script accesses this particular buffer descriptor. The use of this field can be defined by the script. The command values defined for the bootload script are defined in Buffer Descriptor Commands for Bootload scripts. Refer to the individual script definition in script library documents in SDMA Scripts for command field definitions for other scripts.
23	Reserved
22	Reserved
21 L	Last Buffer Descriptor: This bit is set in SDMA IPC scripts to indicate to the receiving Core that the transfer has ended. Whenever the source finishes transferring the count it wanted to transfer, it sets LAST_BIT in the destination BD, to let the destination know that transfer is over.This bit also tells the destination software that when it processes the destination BDs, they need not process any BD after the BD with the LAST_BIT set.For example, when the DSP prepares a single buffer descriptor with count equals to 25 and ARM platform prepares a single buffer descriptor with count equals 100. When 25 bytes have been transferred from DSP to ARM platform, the DSP buffer descriptor is normally closed while the ARM platform buffer descriptor will have the L bit set and the byte count updated to 25.
20 R	erroR. Indicates an error occurred on the channel's buffer descriptor requested command. Some scripts may overwrite the command field with an error code indicating the source of the error. 0 No Error 1 Error
19 I	Interrupt. When SDMA has finished to process data transfer attached to this buffer descriptor, send an interrupt to the ARM platform. 0 No Interrupt 1 Interrupt the processor when BD is complete
18 C	Continuous. This buffer is allowed to receive multiple transmit buffers or is allowed to transmit to multiple receive buffers.The Continuous bit is decoded at the end of the processing of a BD to determine if the SDMA script must open a new BD to potentially continue the data transfer. 0 No further buffer descriptors 1 SDMA should move to the next Buffer descriptor after this one
17 W	Wrap. Indicates if this buffer descriptor is the last one for the channel control block. When encountering this bit set, the SDMA scripts updates the CurrentBD pointer to point to the first Buffer Descriptor of the array. This bit is set if the ARM platform wants to organize the array of BD in a circular way (like a ring). When all BD have been processed and if Wrap bit and CONtinuous bit are set in the last BD, the SDMA script will wrap around and it will try to re-open the first BD. 0 No Error 1 Wrap to first buffer descriptor after this one is processed.
16 D	D - "Done": bit 16: indicates the "ownership" of the buffer descriptor. When D=0 the host owns the buffer descriptor; when D=1 SDMA owns the buffer descriptor. In the case of the channel 0, D=1 indicates the SDMA has not yet processed this buffer, D=0 indicates the SDMA has processed this buffer. 0 ARM platform owns the buffer. 1 SDMA owns the buffer
15-0 Count	Count. the count field (bit 15-0) indicates the size of the data to be transmitted, the size of the data buffer pointed to by the buffer descriptor. The SDMA memory structure is different for program memory (16-bits shorts/half-words) and data memory (32-bits long). For channel 0 buffer descriptors, Count is expressed in 16-bit half-words when PM is addressed and in 32-bit words when DM is addressed. Count is typically expressed in bytes for other channel scripts, but the unit is dependant on the script.
31-0	Buffer address. Address pointer to the data buffer.
31-0	Extended buffer address. Additional pointer or other information required by some scripts.

The buffer descriptors form an array of programmable size. If the last buffer descriptor is marked by the Wrap flag-bit W=1, the array of buffer descriptor is treated as a ring with some logically continuous portion owned by the ARM platform with D=0, and the remainder owned by the SDMA with D=1. The count field of the buffer descriptor indicates how much data has been transmitted.

If ARM platform has prepared 3 buffers to be filled by the SDMA script, it has also prepared 3 BD, one for each buffer. The *Cont* and *Wrap* bits are used to organize the buffers in a circular way. For example, *CONT*inous bit is set to 1 in the 2 first BDs and *Wrap* is set in the 3rd BD. The SDMA script opens and processes BD#1. Since *CONT*inous bit is set for this BD, the SDMA will open the second BD and it will process it. Each time a BD is processed, its *Done* bit is reset by the SDMA. After the 3rd BD, if *CONT*inous is not set but if *Wrap* is set, the SDMA script stops here and the next time the channel will be triggered, the script will open the BD pointed by the currentBDptr pointer of the CCB and it will correspond to the first buffer descriptor.

If the *CONT*inous bit and *Wrap* bits are both set in the 3rd BD, the script will close it and it will try to open the first BD. An error may occur at this point if the BD#1 has already been processed and its *Done* bit is 0. The SDMA script cannot process a BD with a *Done* bit to 0. It means the BD is not ready to be processed. To avoid this situation, the *CONT*inous bit should not be set for the last BD if *Wrap* is set, and the Interrupt flag must set for the last BD. It will warn the owner of the BD that all the BDs have been processed and it has to re-set to 1 the *Done* bit of all the BD's if it desires the SDMA to fill them again. Basically, if the ARM platform expects the SDMA to fill up the buffers in a circular fashion, then it's the responsibility of the ARM platform to set the *Done* bit of a buffer descriptor at an appropriate time.

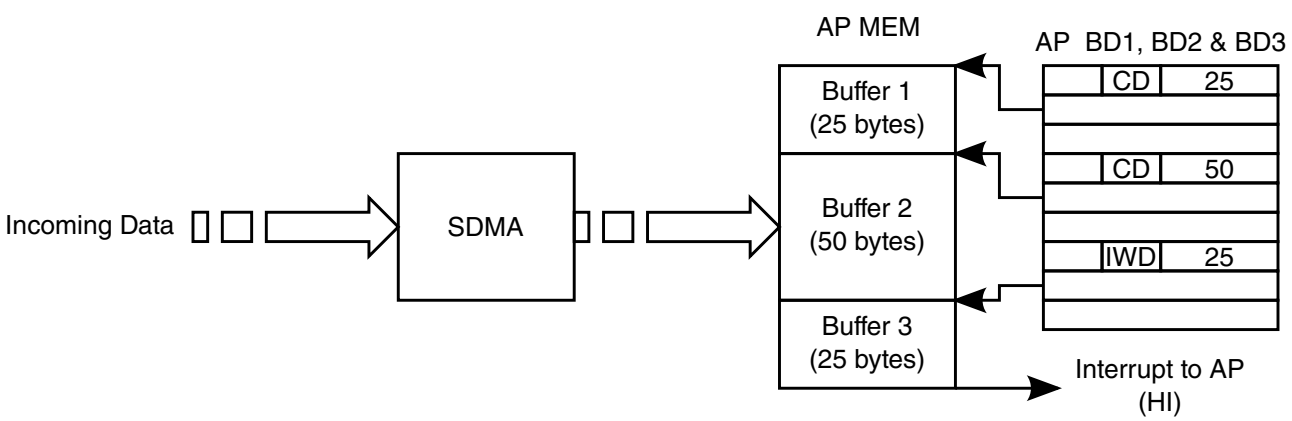

Figure 43-17. Buffer Descriptor Flow

The previous figure shows an example buffer descriptor flow. When the incoming data is stored and fills the first buffer of 25 bytes, the SDMA script opens the second BD because the CONTinuous bit was set. Then next incoming data is put in the second buffer. After receiving 50 bytes, the second buffer descriptor is also closed. The Done bit is reset and the third BD is opened. After receiving another 25 bytes, the third buffer is full and an interrupt is sent to the ARM platform because the Interrupt flag is set in the 3rd BD. The CONTinuous flag is not present the transfer is over. The next time the script will be triggered, the BD to be opened will be the first buffer descriptor since the Wrap flag was set in the 3rd BD. It is the ARM platform responsibility to set the Done bit of all the BD if it wants to use the same buffers.

43.7.1.2 Buffer Descriptor Commands for Bootload scripts

The command field of the buffer descriptor is defined separately for each script.

The following table lists the buffer descriptor commands defined for the channel 0 bootload script.

Table 43-50. Channel Zero Buffer Descriptor Commands

Command Field (binary)	Command	Description	Buffer Address	Extended Buffer Address
0000_0001 (0x01)	C0_SET_DM	Load SDMA data memory (RAM) from ARM platform memory buffer	ARM platform memory source address	SDMA memory destination address
0000_0010 (0x02)	C0_GET_DM	Copy SDMA data memory (RAM) to ARM platform memory buffer	ARM platform memory destination address	SDMA memory source address
0000_0100 (0x04)	C0_SET_PM	Load SDMA program memory (RAM) from ARM platform memory buffer	ARM platform memory source address	SDMA memory destination address
0000_0110 (0x06)	C0_GET_PM	Copy SDMA program memory (RAM) to ARM platform memory buffer	ARM platform memory destination address	SDMA memory source address
cccc_c111 (0x07 | CHN)	C0_SETCTX	Load Context for channel cccc into SDMA RAM from ARM platform memory buffer	ARM Platform memory source address	-
cccc_c011 (0x03 | CHN)	C0_GETCTXT	Copy Context for channel ccccc from SDMA RAM to ARM platform memory buffer	ARM platform memory destination address	-

The Channel 0 bootload commands are summarized as follows:

- C0_SET_[PM-DM]: load the buffer descriptor data in the SDMA local memory at the address pointed to by the "extended buffer address" field. The SDMA RAM can be seen as a Program Memory (PM, 16-bit address) or Data Memory (DM 32-bit address). When C0_SET_PM is used, the count field is expressed in "shorts" (16-bit

half words), this command can be used to download scripts. When C0_SET_DM is used, the count field is expressed in "long" (32-bit words), this command can be used to download channel contexts to the context channel area in RAM.

- C0_GET_[PM-DM]: write to the buffer descriptor's data buffer the content of the SDMA local memory from the address pointed to by the "extended buffer address" field for the length defined by the count in the buffer descriptor. C0_GET_PM is used to dump some part of the Program Memory (may be used to dump context of a channel), therefore count is expressed in "shorts"; while C0_GET_DM is used to dump to the buffer descriptor's data buffer, so the count field is in "longs."
- C0_SETCTX: load a context into the SDMA context page area. The handling script decodes the channel number from the 5 MSB of the command field of the buffer descriptor. Using the channel number the script computes the offset of the context data pointer for the channel relative to the context page base to use as the destination address in SDMA memory. Then the C0_SET_DM command explained above is invoked to load SDMA RAM from memory. The counter indicates the size in words of the context structure.
- Command value: (in binary) cccc c111, where ccccc is the channel number (5 bits). For instance, 0x0F means set context for channel 1, 0xFF means set context for channel 31.

- C0_GETCTX: write to the buffer descriptor's data buffer the content of the SDMA context page area. The handling script decodes the channel number from the 5 MSB of the command field of the buffer descriptor. Using this channel number, the script computes the offset of the context data pointer for the channel relative to the context page base to use as the source address for the copy. Then the C0_GET_DM command explained above is invoked to copy the context to memory. The counter indicates the size in words of the context structure.
- Command value: (in binary): cccc c011, where ccccc is the channel number (5 bits). For instance, 0x03 means get context of channel 1, 0xFB means get context of channel 31.

NOTE

To download channel context, C0_SETDM and C0_SETCTXT command can be used but the second one is easier because the channel number is embedded into the command field, whereas with the C0_SETDM, the pointer to the channel context area must be written into the extended buffer address field of the buffer descriptor.

43.7.1.3 Example of Buffer Descriptors for Channel 0.

Figure 43-19 illustrates the buffer descriptors that must be set in ARM platform memory space, before execution of boot code, to download contexts and scripts of channels 1, 4, and 10. After boot code execution, SDMA memory will be populated with the different contexts and scripts as presented in the following figure.
